12.5 Application Notes

12.5.1 MIPI

For register update, the signal force_update comes from ISP MI module, and achieves automatic update of channel's frame end.
Under different modes, the hardware will complete adaptive configuration for some register combinations.
Using mipi mode, configure VI_DPCL[9:8] if_select = 2 in MAIN_CONTROL (0X0000).
CSI2RX register base address is 0x1c00.
For especial HDR sensor:
Configure DATA_IDS_1.sw_csi_id0[5:0] = data_type (e.g. raw8, raw10, raw12...)
If sensor AR0239, configure sw_hdr_esp_mode = 1.
If sensor IMX327, configure sw_hdr_esp_mode = 2.
Note: all mode support especial HDR sensor.

12.5.1.1 normal mode (Single ID)

For this mode:
Configure sw_ibuf_op_mode = 0.
All dmatx are available, but all dmarx are unavailable.
For example: raw10, lanex4

CTRL0 = 0x0. (if sensor AR0239, CTRL0 = 0X4; if sensor IMX327, CTRL0 = 0X8)
CTRL1 = 0x3.
DATA_IDS_1 = 0x2b.

12.5.1.2 frame_x2_ddr mode (2IDs--hdr mode)

For this mode:
Configure sw_ibuf_op_mode = 8.
For example: raw10, lanex4
CTRL0 = 0x800.
CTRL1 = 0x3.
DATA_IDS_1 = 0x6b2b.
Configure ISP_MI register for address and size:
RAW0_WR_BASE = "dmatx0 base address in DDR"
RAW0_WR_SIZE = "pic_width*pic_height*1.5"

12.5.1.3 line_x2_ddr_mode (2IDs--hdr mode)

For this mode:
Configure sw_ibuf_op_mode = 9.
For example: raw10, lanex4
CTRL0 = 0x900.
CTRL1 = 0x3.
DATA_IDS_1 = 0x6b2b.
Configure ISP_MI register for address and size:
RAW0_WR_BASE = "dmatx0 base address in DDR"
RAW0_WR_SIZE = "pic_width*pic_height*1.5"

12.5.1.4 line_x2_noddr mode (2IDs--hdr mode)

For this mode:
Configure sw_ibuf_op_mode = 10.
For example: raw10, lanex4
CTRL0 = 0xa00.
CTRL1 = 0x3.
DATA_IDS_1 = 0x6b2b.

12.5.1.5 user mode

For this mode:
Configure sw_ibuf_op_mode = 3.
User defined mode. All dmatx and dmarx are available.

12.5.1.6 raw_rdback_framex1 mode

For this mode:
Configure sw_ibuf_op_mode = 4.
For example: raw10, lanex4 (all dmatx configurable, recommend dmatx2)
CTRL0 = 0x400.
CTRL1 = 0x3.
DATA_IDS_1 = 0x2b.
RAW2_WR_CTRL = 0x101.
Configure ISP_MI register for address and size:
MI_WR_CTRL2 = 0x1
RAW2_WR_BASE = "dmatx2 base address in DDR"
RAW2_WR_SIZE = "pic_width*pic_height*1.5"
RAWS_RD_BASE = RAW2_WR_BASE
Then, the time to start dmarxs is up to the user (maybe dmatx2 frame end):
Configure CTRL0 = 0x401.

12.5.1.7 raw_rdback_framex2 mode (hdr mode)

For this mode:
Configure sw_ibuf_op_mode = 5.
For example: raw10, lanex4 (all dmatx configurable, recommend dmatx2 and dmatx0)

CTRL0 = 0x500.
CTRL1 = 0x103.
DATA_IDS_1 = 0x6b2b.
RAW2_WR_CTRL = 0x101.
RAW0_WR_CTRL = 0x201.
Configure ISP_MI register for address and size:
MI_WR_CTRL2 = 0x3
RAW2_WR_BASE = "dmatx2 base address in DDR"
RAW2_WR_SIZE = "pic_width*pic_height*1.5"
RAW0_WR_BASE = "dmatx0 base address in DDR"
RAW0_WR_SIZE = "pic_width*pic_height*1.5"
RAWS_RD_BASE = RAW2_WR_BASE
RAW0_RD_BASE = RAW0_WR_BASE
Then, the time to start dmarxs is up to the user (maybe both dmatx2 and dmatx0 frame end):
Configure CTRL0 = 0x501.

12.5.2 MI

Three are three points to note:
1) The signal sw_mi_wr_init_offset_en in MI_WR_CTRL register needs to be set to 1, otherwise, the address of MI will not be updated.
2) If output address need ping-pong, the signal sw_mp_wr_auto_upd in MI_WR_CTRL register needs to be set to 1.
3) The signal sw_mi_cfg_upd in MI_WR_INIT register needs to be set to 1 after all MI registers configuration complete when it is the first frame.
4) The respective force update(sys_dbrself_force_upd、sys_gainself_force_upd、sys_bay3dself_force_upd) is added to the register MI_WR_CTRL2, can be used to update the enable signal and shadow address.

12.5.3 HDRMGE

1) HDR-merge global register configuration：
Enable and select mode, choose gain or Anti-gain, other configurations such as curves use the default typical value.
2) Curves：
L curve: The first quarter is divided into 16 sections; other is equal to 1023.
S curve: Middle 1/2 divided into 16 sections; other is equal to 1023.
E curve: Last 1/2 divided into 16 segments; other is equal to 0.
3) Software configuration：
sw_hdr_mode: 0:noraml; 1:framex2; 2:framex3
sw_hdr_lightz =0.1*(short_gain/16)^3)
sw_hdr_gain2 =1
sw_hdr_gain1 = exposure_L÷exposure_M; (Anti-gain1 is1/gain1)
sw_hdr_gain0 = exposure_L÷exposure_S ; (Anti-gain0 is1/gain0)
sw_hdr_lightzone = 0.1*(short_gain/16)^3
light_zone = img_short > sw_hdr_lightzone= 0.1*(short_gain/16)^3

12.5.4 BayerNR

1) Configure sw_rawnr_en_i to 1 to turn on rawnr module.
2) According to HDR mode or not, configure sw_rawnr_log_bypass.
3) Except for the enable switch, all parameters are determined by ISO, and the post configuration needs to be obtained from the C_model. The parameter tables corresponding to different ISO are given below for reference. After reset, the ISO is equal to 50.

15.1.1 HDR-DRC

HDR-DRC global register configuration:
Enabling and select mode, lgscl and lgscl_inv, other configurations such as curves use the default typical value.

15.1.2 GIC

User can open GOC module through ISP top,in this case GIC will work in a usual ISO

situation with value 50 when reset.
If outside environment is too dark or too bright, then you need configure the coefficient register in the reg block from CPU. All the register value need acquire by c_model first.
Following are GIC register values (decimal system):

Table 12-3 GIC parameters

Registers	ISO100	ISO200	ISO400
sw_gic_en	1	1	1
sw_regminbusy_thre	160	160	160
sw_regmingrad_thrdark1	64	64	64
sw_regmingrad_thrdark2	32	32	32
sw_regdark_threhi	960	960	960
sw_regmaxcorv_both	80	80	80
sw_regdark_thre	480	480	480
sw_reggb_thre	7	7	6
sw_regkgrad1	5	5	5
sw_regkgrad2	1	1	1
sw_regdark_threstep	9	9	9
sw_regstrenth_global_fix	8	8	8
sw_regkgrad1_dark	6	6	6
sw_regkgrad2_dark	1	1	1
sw_regmingrad_thr1	32	32	32
sw_regmingrad_thr2	32	32	32
sw_regmaxcov	40	64	96
sw_regluma_points_step	7	7	7
sw_dnhi_scale	128	128	128
sw_dnlo_scale	102	102	102
sw_fusion_rationhi_limit	96	96	96
sw_gvalue_limit_hi	1760	1760	1760
sw_gvalue_limit_lo	1280	1280	1280
regstrength_fix	128	128	128
sw_sigma_y0	0	153	0
sw_sigma_y1	702	935	0
sw_sigma_y2	1000	1313	1947
sw_sigma_y3	1228	1605	1947
sw_sigma_y4	1420	1851	2754
sw_sigma_y5	1589	2068	2754
sw_sigma_y6	1741	2264	3374
sw_sigma_y7	1881	2445	3374
sw_sigma_y8	2012	2613	3896
sw_sigma_y9	2466	3199	3896
sw_sigma_y10	2848	3693	5511
sw_sigma_y11	3185	4128	5511
sw_sigma_y12	3490	4522	6749
sw_sigma_y13	3770	4884	6749
sw_sigma_y14	4030	5220	7794

15.1.3 DEBAYER

The debayer module has four important regiter configurations:
1) sw_debayer_en: When it is 0, it corresponds to black and white mode; when it is 1, it corresponds to RGB mode.
2) sw_debayer_filter_g_en: When it is 0, G filter module will be bypassed.
3) sw_debayer_filter_c_en: When it is 0, C filter module will be bypassed.
4) sw_debayer_clip_en: Determine whether the horizontal and vertical interpolation result will clip according to the maximum value in the window when G interpolation.
The rest of the configuration is to adjust the algorithm effect. The following points need to be noted：

1）sw_debayer_filter1_coe and sw_debayer_filter2_coe is a signed number, the value range is -8~7.
2）sw_debayer_order_max has to be bigger than sw_debayer_order_min, and the difference value has to be 3, 5, 9, 17 when sw_debayer_shift_num is 0, 1, 2, 3 respectively.
3）The step of sw_debayer_max_ratio is 1/4, the step of sw_debayer_dist_scale is 1/8, the step of sw_debayer_thed0 and sw_debayer_thed1 is 1/32.

15.1.4 CCM

1) Set sw_ccm_en_i to 1, open CCM module, otherwise, CCM moduel will be close, and data path will be bypassed.
2) Signals sw_ccm_coeff0_r [10:0]~ sw_ccm_coeff2_b[10:0] are CCM 3x3 matrix parameters. These nine parameters are all 11 bit signed numbers which have 7 bit decimal places. The range is[-8,7.992].
3) Signals sw_ccm_offset_r[11:0], sw_ccm_offset_g[11:0], and sw_ccm_offset_b[11:0] are offsets in calculation, which are 12 bit signed integers.
4) Signals sw_ccm_coeff0_y[10:0]~sw_ccm_coeff2_y[10:0] are RGB2Y parameters, which are 11bit signed number with 7bit decimal, range from -2 to 1.992.
5) Signals sw_ccm_alp_y0[10:0]~sw_ccm_alp_y16[10:0] are 17 vertices of 16 segment alpha interpolation curve.
6) Signals sw_ccm_bound_bit[4:0] is alpha power exponent configuration of inflexion of interpolation curve. The value of the inflection point is2^sw_ccm_bound_bit, range from 0 to 4.

15.1.5 GAMMA_OUT

The GAMMA_OUT module is opened when user sets sw_gamma_out_en to 1.This module is realized by interpolation.
When sw_gamma_out_equ is asserted to 1, the segment length of x orientation is equal and the curve uses 32 segments.
When sw_gamma_out_equ is asserted to 0, the segment length of x orientation is not equal and the curve uses 44 segments.

15.1.6 DHAZ

1) Set sw_dhaz_en to be 1, open dehaze module.
2) When sw_dhaz_en is 1, set sw_dhaz_dc_en to be 1, then open dark channel function.
3) When sw_dhaz_en is 1, set sw_dhaz_hist_en to be 1, turn on histogram equalization. When sw_dhaz_hist_en is 1, and sw_dhaz_hpara_en==1, the sw_dhaz_hist_scale need to be configured too.
4) When sw_dhaz_enhance_en==1, sw_dhaz_enhance_value need to be configured too.
5) Control the number of iterative frames sw_dhaz_stab_fnum for IIR, the corresponding sigma parameters can be configured according to the user's requirements, but it should not exceed the bit width and the minimum value is 1.
6) sw_dhaz_iir_pre_wet is used for dark channel IIR, the corresponding factors can be configured according to the user's requirements, but it should not exceed the bit width and the minimum value is 1.
7) If the user only needs adaptive processing, then set sw_dhaz_cfg_alpha to zero, otherwise, sw_dhaz_cfg_air, sw_dhaz_cfg_wt, sw_dhaz_cfg_tmax and sw_dhaz_cfg_gratio need to be configured by software.

15.1.7 3DLUT

The 3DLUT module is opened when user sets sw_lut3d_en to 1.
The LUT of this module is updated by setting sw_lut3d_lut_update_en to 1.

15.1.8 AF

The AF module is opened when user sets sw_rawaf_en to 1. This module includes Gamma and Gaus Filter which are opened by sw_gamma_en and sw_gaus_en separately. There are 15x15 windows here which is configurable by user, and each window statistic the AF result independently.
User needs set 1 to sw_rawaf_meas_flag to clear this signal, after one frame is finished and the statistic data is read by user.

15.1.9 AE

Two versions of AE are named RAWAE_BIG and RAWAE_LITE here. The mean of reading

back statistic is different. RAWAE_LITE uses normal method which give a address and then read back. RAWAE_BIG read the fix address RO_MEAN_BASE_ADDR 225 times. RAWAE_BIG supports 15x15 window grid, it still support 4 separated windows.
ModuleA(RAWAE_LITE or RAWAE_BIG) needs config as follows:
1) Config ModuleA window size, window offset, and other signals.
2) Set sw_ModuleA_en signal to 1.
3) Waiting for ModuleA's interruption.
4) Read back the statistics data when the interruption is 1.
5) Write 1 to sw_ModuleA_done to clear this signal.
6) Waiting for the interruption of next frame.
Here have some constraints for AE:
1) The sub window size and offset must even.
2) The Minimum of sub window is 16x4.
3) The 4 separated window config coordinate directly instead of window size.

15.1.10 AWB

1)Data Pre-Process
RAWAWB input data is 10 bit raw format and the input picture could crop by the crop module. The cropped picture should aligning at the down sample window size, 4 or 8 configurable, and the hardware would guarantee this by force.The RGB data down sampled from RAW data and y data converted from RGB data will do some limitation(the limitation is configurable) and then output to detection module.
2)White Point Detection
There are three region white point detection method, xy region, uv region and yuv region. The xy and uv region detection are used for all 7 lights, but yuv detection is only used for 4 lights. The each 4 lights number is configurable by sw_rawawb_3dyuv_ls_idx0 to sw_rawawb_3dyuv_ls_idx3. The left 3 lights white point detection are disable in yuv region and it wouldn't affect the white point detection result in uv and xy region.The enable of three detection method is configurable too.
3)Block Measurement
The down sampled picture would divide into 15x15 blocks and then accumulate the each block input data. The input data could been down sampled data, xy white point data or uv white point data and it is configured by sw_rawawb_blk_measure_mode. The block will measure three lights white point detection result too and this three lights are selected by sw_rawawb_store_wp_flag_ls_idx0 to sw_rawawb_store_wp_flag_ls_idx2.
4)Data Read Back
The all measurement information could read back to software by AHB BUS. When the measurement is over the hardware will pull up the sw_rawawb_meas_done signal. And then the software could read back all the information. The software should pull the signal down by setting this signal to 1 when read is over. The next frame measurement is valid only if the sw_rawawb_meas_done is 0 before the next frame start.

15.1.11 HIST

Two versions of HIST are named RAWHIST_BIG and RAWHIST_LITE here. The mean of reading back statistic is same for them. Both need reads the fix address RO_BASE_BIN 256 times when read back.
ModuleA(RAWHIST_LITE or RAWHIST_BIG) needs config as follows:
1) Config ModuleA window size, window offset, and other signals.
2) Set sw_ModuleA_en signal to 1.
3) Waiting for ModuleA's interruption.
4) Read back the statistics data when the interruption is 1.
5) Write 1 to sw_ModuleA_done to clear this signal.
6) Waiting for the interruption of next frame.
Here have some constraints for HIST:
1) The sub window size and offset must even.
2) When user sets the weights of RAWHIST_BIG, sw_config_wram_en bit needs set to1 ahead.
3) The coefficient sw_rawae_gcc needs half because there are two G(Gr, Gb) in the RAW2Y formula.

15.1.12 IRQ

There are three important interrupt registers in ISP. One offset address is 0x400+0x1c4, which named ISP_MIS. Another offset address is 0x400+0x1d8, which named ISP3A_MIS. The last offset address is 0x1400+0x100, which means MI_MIS.
The following chart shows the interrupt sequence between several interrupts:

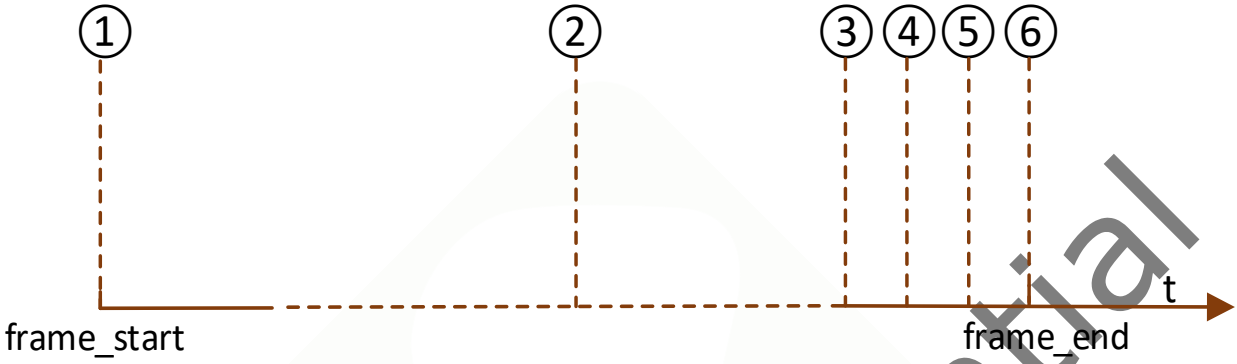

Fig. 12-6 interrupt sequence

The meanings of the above numerical symbols are as follows:

Table 12-4 meanings of IRQ

No.	Interrupt name	Registers name	Meaning
①	MIS_V_START	ISP_MIS	start edge of v_sync，pull up time is the same as first pixel valid is ISP
②	MIS_RAWXX_DONE	ISP3A_MIS	3A module done signal
③	MIS_FRAME_IN	ISP_MIS	INFORM module frame end signal
④	MIS_HDR_DONE	ISP_MIS	HDR module frame end signal
⑤	MIS_FRAME_OUT	ISP_MIS	ISP module frame end signal
⑥	mp_frame_end/mpfbc_wr_frame_end	MI_MIS	MI module frame end signal

MIS_RAWXX_DONE of above table indicates different 3A interrupts, which interrupt time are determined by the size of the window in different 3A module.
The No.6 choose mp_frame_end or mpfbc_wr_frame_end is determined by whether the MPFBC module is open. If MPFBC is open, then the end of one frame flag is mpfbc_wr_frame_end.

15.1.13 SHD_REG

All shadow register are list in following table:

Signal	In which module	Registers addr	Bit	Meaning
sw_csi_raw0_wr_en_shd	MIPI	0X1C40	31	Raw0_wr enable shadow, hold when enable. Update when mp frame end. The channel that write csi data to ddr. 1'b1: Enable the channel 1'b0: Disable teh channel
sw_csi_raw1_wr_en_shd	MIPI	0X1C50	31	Raw1_wr enable shadow, hold when enable. Update when mp frame end. The channel that write csi data to ddr. 1'b1: Enable the channel

Signal	In which module	Registers addr	Bit	Meaning
				1'b0: Disable teh channel
sw_csi_raw2_wr_en_shd	MIPI	0X1C60	31	Raw2_wr enable shadow, hold when enable. Update when mp frame end. The channel that write csi data to ddr. 1'b1: Enable the channel 1'b0: Disable teh channel
sw_csi_raw3_wr_en_shd	MIPI	0X1C70	31	Raw3_wr enable shadow, hold when enable. Update when mp frame end. The channel that write csi data to ddr. 1'b1: Enable the channel 1'b0: Disable teh channel
path_enable_in	MI	0x1474	3:0	path_enable shadow register for module MI_IN (former raw_enable_in, jpeg_enable_in, sp_enable_in, mp_enable_in)
path_enable_out	MI	0x1474	19:16	path_enable shadow register for module MI_OUT (former raw_enable_out, jpeg_enable_out, sp_enable_out, mp_enable_out)
sw_mp_wr_y_base_shd	MI	0x1478	31:4	Base address of main picture Y component ring buffer, JPEG ring buffer or raw data ring buffer. --- MI_MP_WR_Y_BASE_SHD --- Note: This register protects from non-aligned access. Refer to MI_MP_WR_Y_BASE register description for details.
sw_mp_wr_y_size_shd	MI	0X147C	28:4	Size of main picture Y component ring buffer, JPEG ring buffer or raw data ring buffer. --- MI_MP_WR_Y_SIZE_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_y_offs_cnt_shd	MI	0x1480	28:4	Current offset counter of main picture Y component, JPEG or raw data ring buffer for address generation. Note: Soft reset will reset the contents to reset value. --- MI_MP_WR_Y_OFFS_CNT_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_y_irq_offs_shd	MI	0x1484	28:4	Reaching this offset value by the current offset counter for addressing main picture Y component, JPEG or raw data leads to generation of fill level interrupt fill_mp_y. --- MI_MP_WR_Y_IRQ_OFFS_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_cb_base_shd	MI	0x1488	31:4	Base address of main picture Cb component ring buffer. --- MI_MP_WR_CB_BASE_SHD --- Note: This register protects from non-

Signal	In which module	Registers addr	Bit	Meaning
				aligned access.
sw_mp_wr_cb_size_shd	MI	0x148C	27:4	Size of main picture Cb component ring buffer. --- MI_MP_WR_CB_SIZE_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_cb_offs_cnt_shd	MI	0x1490	27:4	Current offset counter of main picture Cb component ring buffer for address generation. Note: Soft reset will reset the contents to reset value. --- MI_MP_WR_CB_OFFS_CNT_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_cr_base_shd	MI	0x1494	31:4	Base address of main picture Cr component ring buffer. --- MI_MP_CR_BASE_AD_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_cr_size_shd	MI	0x1498	27:4	Size of main picture Cr component ring buffer. --- MI_MP_WR_CR_SIZE_SHD --- Note: This register protects from non-aligned access.
sw_mp_wr_cr_offs_cnt_shd	MI	0x149C	27:4	Current offset counter of main picture Cr component ring buffer for address generation. Note: Soft reset will reset the contents to reset value. --- MI_MP_WR_CR_OFFS_CNT_SHD --- Note: This register protects from non-aligned access.
sw_sp_wr_y_base_shd	MI	0x14A0	31:4	Base address of self picture Y component ring buffer. --- MI_SP_WR_Y_BASE_SHD --- Note: This register protects from non-aligned access.
sw_sp_wr_y_size_shd	MI	0x14A4	28:4	Size of self picture Y component ring buffer. --- MI_SP_WR_Y_SIZE_SHD --- Note: This register protects from non-aligned access.

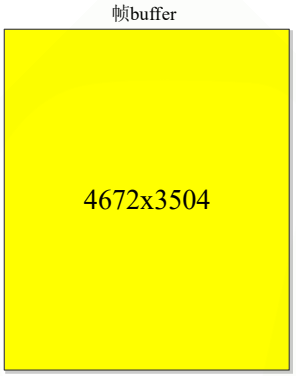
How to update the shaow register:
You can choose to update through forced_upd and frame end update.
The forced UPD is generally used before the start of a frame. The configuration mode is to enable ISP Ctrl, which is the 9th bit of 0x400.
If you need to enable the end of frame update, you need to pull up the 8th bit of 0x400, otherwise it will not be updated by default.
10th bit of 0x400 can update shadow registers only one time while frame_end is coming.

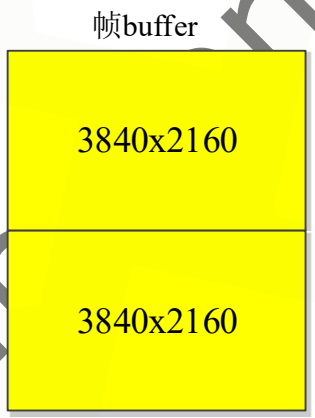
15.1.14 Multi-Sensor

Multi-sensor mainly uses the frame buffers to cache the data of the previous frame to solve the problem of previous frame data caching. The maximum resolution of frame buffer with different sensors is supported as follows.

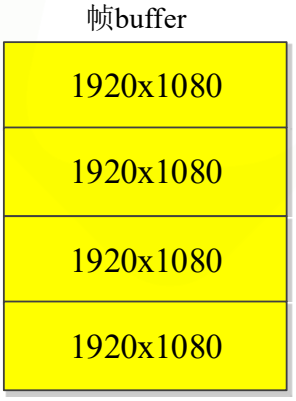
（1）single sensor: the maximum resolution is 4672x3504



（2）dual sensor: The previous frame data is stored by dividing the frame buffer in two, and the storage space is reduced by half. In normal mode, the maximum resolution is 1920x1080, In big mode, the maximum resolution is 3840x2160.



（3）four sensor: The previous frame data is stored by quartering the frame buffer, and the storage space is reduced to one fourth of the original one. In normal mode, the maximum resolution is 960x540, In big mode, the maximum resolution is 1920x1080.



Multi-sensor register configuration at 0X408, and there are two registers to cnfigure:

（1）sw_sensor_mode: used to configure the number of sensor

0:one sensor；
1:two sensor；
2:four sensor.

（2）sw_sensor_index: sensor ID of the current sensor. software is required to number and configure each sensor.

Switching parameters between different sensors need to be configured at the end of current and before of next frame. The shadow register can be configured using force_upd or frame end update. Note：different sensor switch need set first_frame register(0x404) in mult-sensor mode.

CHAPTER 13 VOP

13.1 Overview

VOP2 is the display interface from memory frame buffer to display device. VOP is connected to an AHB bus through an AHB slave and AXI bus through an AXI master. The register setting is configured through the AHB slave interface and the display frame data is read through the AXI master interface.VOP2 supports the following features:

- Display interface
  - 1 HDMI
    - Max support 4096x2160@60Hz
    - Support RGB/YUV420(up to 10bit) format
  - 1 LVDS
    - Max support 1280x800@60Hz
    - Support RGB(up to 8bit) format
  - 1 EDP
    - Max support 2560x1600@60Hz
    - Support RGB(up to 10bit) format
  - 2 MIPI
    - Max support 1920x1080@60Hz per channel
    - Support RGB(up to 8bit) format
    - Support dual MIPI: left-right mode.
    - Dual MIPI support 2048x1536@60Hz
  - 1 BT656
    - support PAL and NTSC
    - Support RGB(up to 8bit) format
  - 1 RGB/BT1120
    - Max support 1920x1080@60Hz
    - Support RGB(up to 8bit) format

- BUS
  - One 32bit AHB Slave to configure registers
  - Two 128bit AXI read bus
  - One 128bit AXI write bus
- Video ports
  - Video port0
    - Resolution
      - Max output resolution: 4096x2304@60Hz
      - Bits per component: 10
    - Color bar
      - Horizontal mode
      - Vertical mode
    - BCSH(10bit)
      - Brightness(8bit), Contrast(9bit), Saturation(10bit), Hue adjustment(9bit)
    - 3D_LUT
      - Support 9x9x9(12bit) LUT
    - CSC
      - YUV2RGB: bt601-f / bt709-l/bt601-l/bt2020
      - RGB2YUV: bt601-f/bt709-l/bt601-l/bt2020
    - Gamma
    - Dither down
      - Allegro
      - FRC
    - Post scale down for TV over_scanning
      - Horizontal scale down using bilinear, 0.5~1.0
      - Vertical scale down using bilinear, 0.5~1.0
    - Post LB mode
      - 4096pixelx4 mode

        - 2048pixelx8 mode
      - Display mode
        - P2I/Interlace display
        - X-mirror
        - Blank display
        - Black display
        - Standby mode
  - Video port1/2
    - Resolution
      Max output resolution: 1920x1080@60Hz
        - Bits per component: 8
    - Color bar
      - Horizontal mode
      - Vertical mode
    - BCSH(8bit)
      - Brightness(6bit), Contrast(9bit), Saturation(10bit), Hue adjustment(9bit)
    - CSC
      - YUV2RGB: bt601-f / bt709-l/bt601-l/bt2020
      - RGB2YUV: bt601-f/bt709-l/bt601-l/bt2020
    - Gamma
    - Dither down
      - Allegro
      - FRC
    - Post scale down for TV over_scan
      - Horizontal scale down using bilinear, 0.5~1.0
      - Vertical scale down using bilinear, 0.5~1.0
    - Post LB mode
      - 2048pixelx4 mode
      - 1024pixelx8 mode
    - Display mode
      - P2I/Interlace display
      - X-mirror
      - Blank display
      - Black display
      - Standby mode
- Cluster0/1
  - Resolution
    - Max input resolution: 4096x2304
    - Max output resolution: 4096x2304
  - Data format
    - AFBCD: RGBA8888/RGB888/RGB565/RGBA1010102/ YUV420/YUV422 8bit/10bit
  - Image
    - Support virtual width(max 8k word)
    - Support active offset
    - Support display offset
    - Support Y-mirror/x-mirror/rotation-90/rotation-270
      - If rotation-90 or rotation-270 is enable, the maximum height of the source image is 2048
    - Swap: RB/UV swap
    - Support YUV clip
  - Cluster mode
    - Mode0: 4k layer mode
    - Mode1: 2*2048 layer mode
    - Mode2: rotation 2048 layer mode
  - Support Gauss filter
  - Scale

        - Scale down
            - Support scale rate 1/4~1
            - Scale mode: bilinear
        - Scale up
            - Support scale rate 1~4
            - Scale mode: bilinear
    - CSC
        - YUV2RGB: bt601-f / bt709-l/bt601-l/bt2020
        - RGB2YUV: bt601-f/bt709-l/bt601-l/bt2020
- ESMART0/1
    - Resolution
        - Max input resolution: 4096x2304
        - Max output resolution: 4096x2304
    - Data format
        - RGB: ARGB8888/RGB888/RGB565
        - YUV: YUV420/YUV422/YUV444 8bit/10bit
        - YUYV: YUYV422/420; UYVY420/422
        - BPP:8BPP
    - Image
        - Support virtual width(max 8k word)
        - Support active offset
        - Support display offset
        - Support Y-mirror
        - Swap: alpha/RB/UV swap
        - Support YUV clip
    - Multi-region
        - Only one region at one line
        - All regions are RGB or YUV format
        - Up to 4 regions
    - Scale
        - Scale down
            - Support scale rate 1/8~1
            - Scale mode: nearest/bilinear/average
        - Scale up
            - Support scale rate 1~8
            - Scale mode: nearest/bilinear/bicubic
    - CSC

13.2 Block Diagram

The following diagram shows the VOP2 architecture.

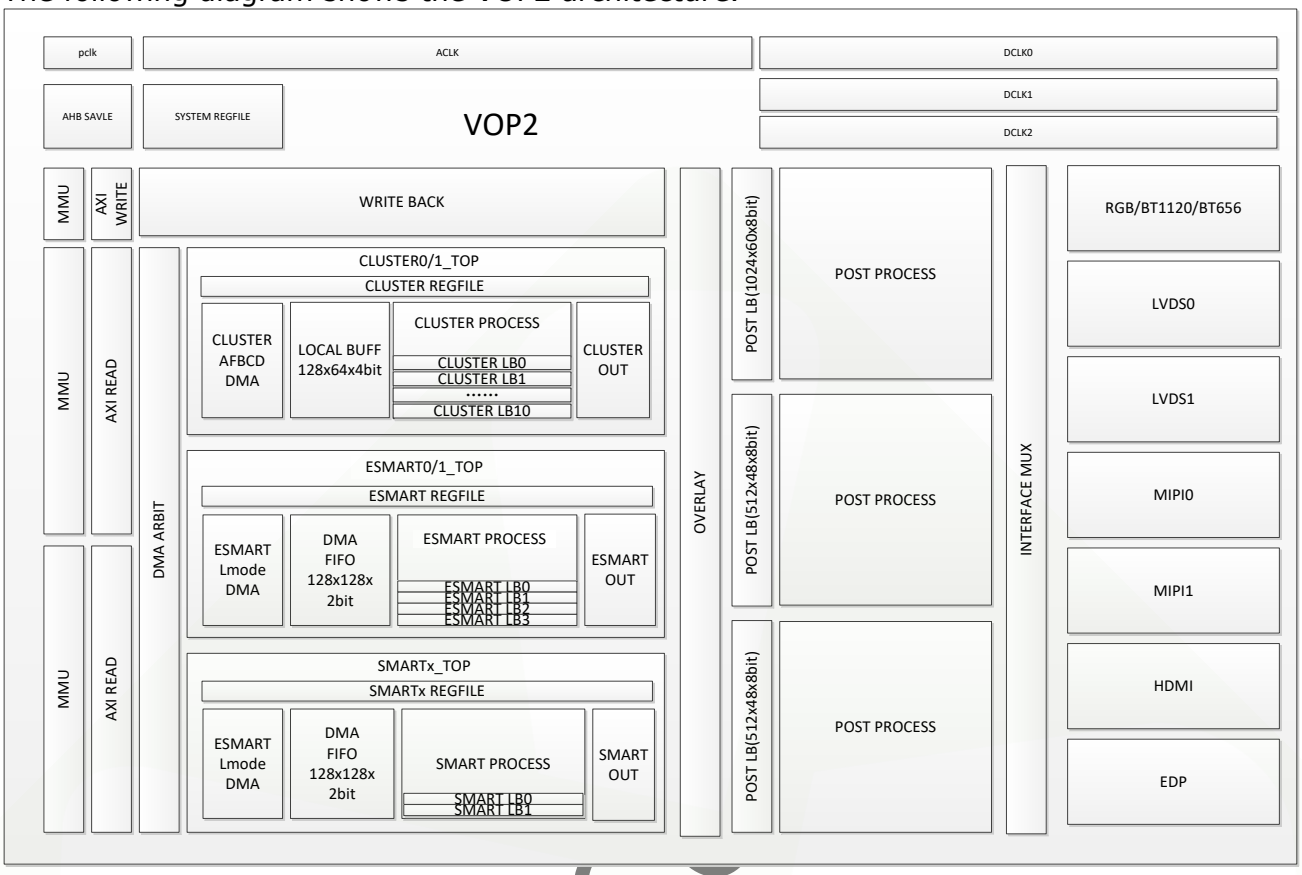

Fig. 13-1 VOP2 Architecture

13.3 Function Description

13.3.1 Pixel format

The pixel stored in memory is shown as follows, usually the data is very compact. The Y and UV component of YUV are stored in different storage location. Even though the number of odd and even rows data of YUYV420 is different, they have the same amount of storage.

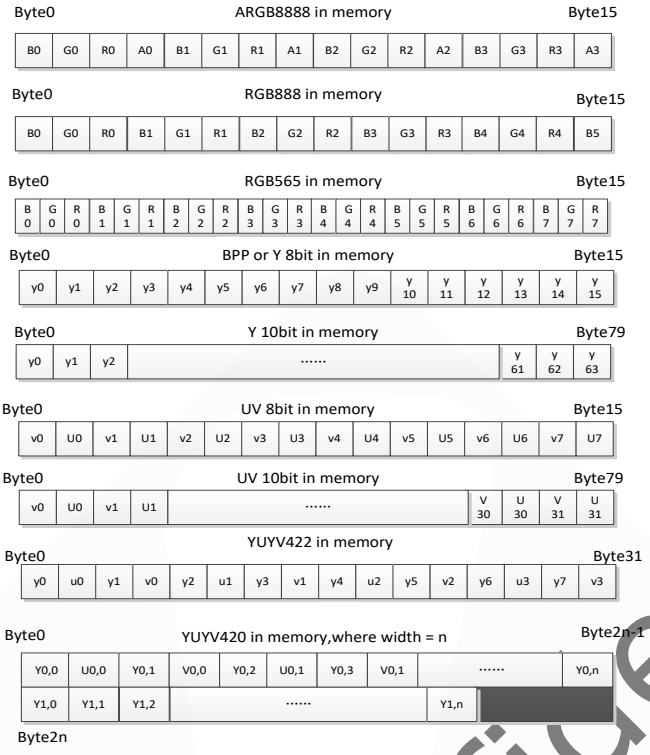

Fig.13-2 VOP2 data format

13.3.2 Virtual display

When in virtual display, the active image is part of the virtual (original) image in frame buffer memory as shown below. The virtual width is indicated by setting VIR_STRIDE for different data format. Note that RGB/BPP has one stride (yrgb_vir_stride), YCbCr has two virtual stride (yrgb_vir_stride and cbcr_vir_stride).For RGB-8bit and YUV-8bit，the stride should be multiples of word (32-bit), with dummy bytes in the end of virtual line if the original width is not 32-bit aligned.

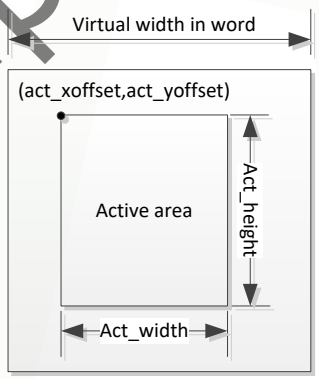

Fig.13-3 virtual width

13.3.3 AFBCD

This compression format is designed to be used for textures and frame buffers. It has been optimized to decrease external bandwidth as well as being random access and decodable at line speed for the texture cache.

Random access is available to individual 16x16 blocks, which in turn index individual 4x4 blocks. This is done using a structure where a header block is stored for each 16x16 block at a predictable memory address in what is referred to as the header buffer. If the horizontal size is given by "width" and A is the start address of the head buff, the address of the header for the 16x16 block containing a given pixel at position x, y is given by A+16*(x/16+((y/16)*(width/16))). A consequence of the 16x16 block structure is that only multiples of 16 are allowed as width and height as shown below.

The data that is used to store the individual 4x4 blocks in a 16x16 block is referred to as the payload data for that block. It is stored continuously in body buff from the offset that is supplied in the header. Each section in the body buffer contains payload data which is used to decode a 16x16 block. The header contains an offset to the payload that resides inside of the body buffer, which is typically allocated after allocated after the header buffer in the memory. The offset to the payload data is relative to the start of the header buffer. In some cases it may sense to store payload data inside the header buffer, such as when encoding blocks that are less than 16x16 in size and not all sub block sizes are used in a header.

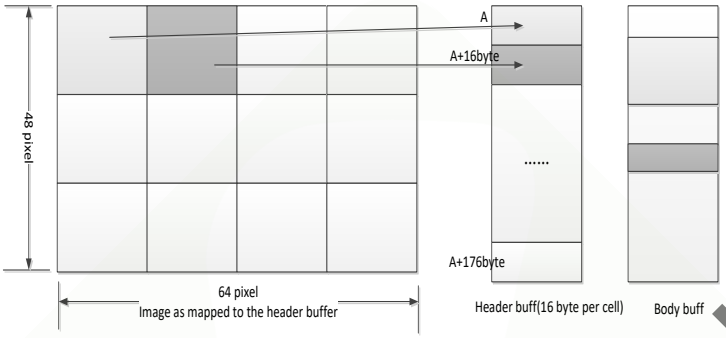

Fig. 13-5 An example of 16x16 pixel blocks with header and body buffer

13.3.3.1 Half block mode

In the full block decoding mode, the decoder fetches full payload of 16x16 blocks and sends then to the decode core, which decodes and outputs 16x16 pixel blocks. In the half block decoding mode, the decoder fetches half of the payload at each time. The decoder output in the half mode is in 16x8 blocks. The half block mode is designed to support custom hardware with limited buffer size, for example a typical display controller with 8-line buffers.

13.3.4 Scale

With all various video resolutions, scaling is usually needed in almost every solution. Average interpolation is used in scaling down and bicubic interpolation is used in scaling up besides nearest neighbor and bilinear interpolation. The summary of scaling factor calculation is shown as follows:

$$scale\_down\_bli\_factor = (src-1)/(dst-1)*2^{12}$$

$$scale\_down\_avg\_factor = (dst-1)/(src-1)*2^{16}$$

$$scale\_up\_bli\_factor = (src-1)/(dst-1)*2^{16}$$

$$scale\_up\_bic\_factor = (src-1)/(dst-1)*2^{16}$$

Where vertical scale_down_bli_factor range is 1~2. If dst_height/src_height >= 2 and bilnear scaling down is enable, line dropping must be enable. If gt2 is enable , src_height = src_height/2. If gt4 is enable, src_height = src_height/4.

13.3.5 Post scale down

Post scale down after overlay is supported to fix panel over_scanning, that draws the border of the image beyond the normal visible area on the screen(see below figure). The scale factor range is 1 to 2.

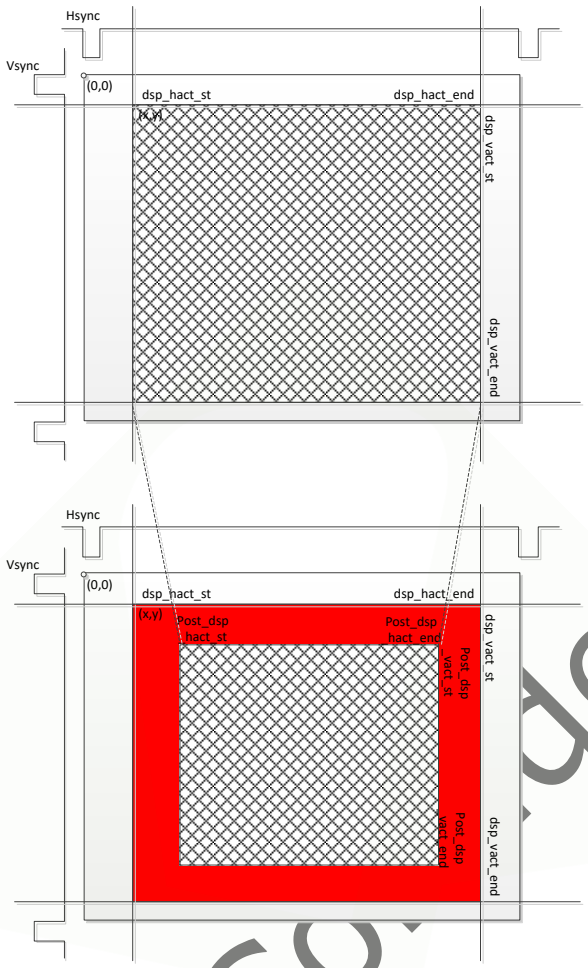

Fig. 13-6 Post scaling

13.3.6 CSC

The red, green, and blue(RGB) color space is widely used for computer graphics and displays. Red, green and blue are three primary additive colors. The YCbCr color space is used by the PAL and NTSC composite color video standards. The black-and-white system used only luma(Y) information. Color information(Cb and Cr) was added in such a way that a black-and-white receiver would still display a normal black-and-white picture. Color receivers decoded the additional color information to display a color picture.

There are four equations used to convert between RGB and YCbCr space.

YUV2RGB:

1.yuv to rgb (BT601L)

R = 1.164(Y-16) + 1.596(V-128)

G = 1.164(Y-16) - 0.391(U-128) - 0.813(V-128)

B = 1.164(Y-16) + 2.018(U-128)

2.yuv to rgb (BT601F)

R = (Y-16) + 1.402(V-128)

G = (Y-16) - 0.344(U-128) - 0.714(V-128)

B = (Y-16) + 1.772(U-128)

3. yuv to rgb (BT709L)

R = 1.164(Y-16) + 1.793(V-128)

G = 1.164(Y-16) - 0.213(U-128) - 0.534(V-128)

B = 1.164(Y-16) + 2.115(U-128)

yuv to rgb(BT2020)

R = 1.1636(Y-64) + 1.6778(V-512)

G = 1.1636(Y-64) - 0.1872(U-512) - 0.6501(V-512)

B = 1.1636(Y-64) + 2.1406(U-512)

RGB2YUV:

1. rgb to yuv(BT601L)
Y = 0.257R + 0.504G + 0.098B + 16
Cb =-0.148R - 0.291G + 0.439B + 128
Cr = 0.439R - 0.368G - 0.071B + 128
2. rgb to yuv(BT601F)
Y = 0.299R + 0.5870G + 0.1140B + 0
Cb = -0.1687R - 0.3313G + 0.5000B + 512
Cr = 0.500R - 0.4187G - 0.0813B + 512
3. rgb to yuv(BT709L)
Y = 0.183R + 0.614G + 0.062B + 16
Cb =-0.101R - 0.338G + 0.439B + 128
Cr = 0.439R - 0.399G - 0.040B + 128
4.rgb to yuv(BT2020)
Y = 0.2250R + 0.5807G + 0.0508B + 64
Cb = -0.1223R - 0.3157G + 0.4380B + 512
Cr = 0.4380R - 0.4028G - 0.0352B + 512

13.3.7 BCSH

Working in YCbCr color space simplifies the implementation of brightness, contrast, saturation, and hue controls, as shown below. Also illustrated are multiplexers to allow the output of black screen, blue screen, and color bars.
The contrast control is implemented by multiplying the YCbCr data by a constant. If Cb and Cr are not adjusted, a color shift will result whenever the contrast is changed. A typical 8-bit contrast adjustment range is 0~1.992x.
The brightness control is implemented by adding or subtracting from the Y data. Brightness is done after the contrast to avoid introducing a vary DC offset due to adjusting the contrast. A typical 8-bit brightness adjusting range is -128 to + 127.
The hue control is implemented by mixing the Cb and Cr data:

$$Cb' = Cb * \cos\theta + Cr * \sin\theta$$

$$Cr' = Cr * \cos\theta - Cb * \sin\theta$$

Where θ is the desired hue angle. A typical 8-bit hue adjustment range is -30° to +30°.
The saturation control is implemented by multiplying both Cb and Cr by a constant. A typical 8-bit saturation adjustment range is 0~1.992x.

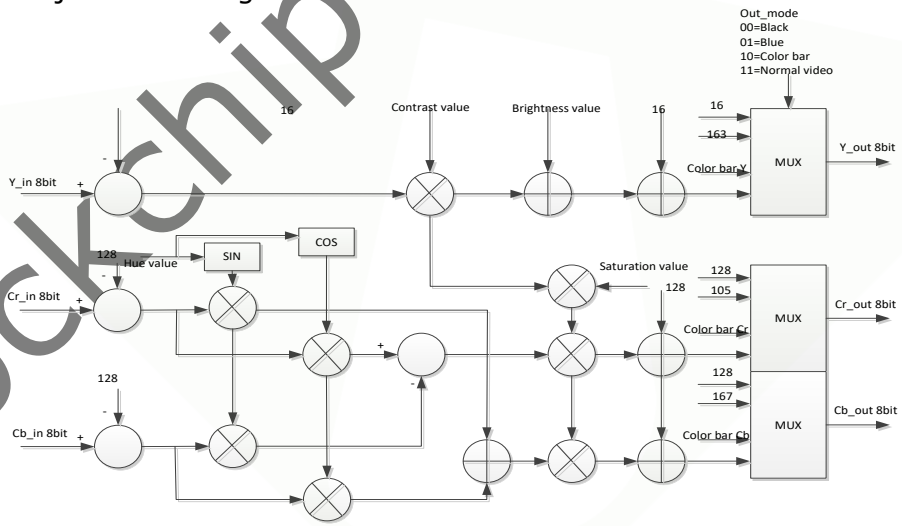

Fig. 13-7 BCSH structure when inputs are 8bit

13.3.8 Gamma

The transfer function of many displays produces an intensity that is proportional to some power of the signal amplitude. As a results, high-intensity ranges are expanded and low-intensity ranges are compressed. This is an advantage in combatting noise, as the eye is approximately sensitive to equally relative intensity changes. By gamma correcting the video signals before transmission, the intensity output of the display is roughly linear. We assume a transform at the display with a gamma of 2.2. To compensate for the nonlinear display, linear

RGB was gamma-corrected prior to transmission by the inverse transform:

$$R' = (R/1024)^{2.2} * 1024, R = 0,1...,1023$$

$$G' = (G/1024)^{2.2} * 1024, G = 0,1...,1023$$

$$B' = (B/1024)^{2.2} * 1024, B = 0,1...,1023$$

13.3.9 3D_LUT

Color space transformation using a 9-level 3D lookup table with trilinear interpolation is used to correlate the source and destination color values in the lattice points of a 3D table, where non-lattice points are interpolated by using the nearest lattice points. The 3D table which consists of 729 points data is stored in memory. Then, it's fetched by AXI master. The rule for 3D table data alignment is shown as below.

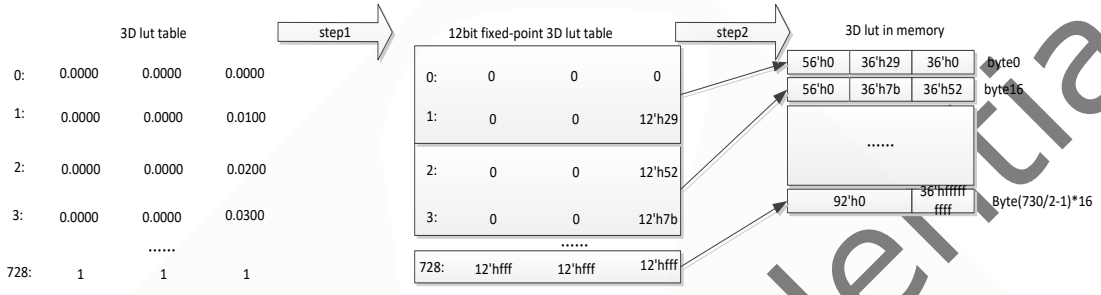

Fig. 13-8 3D LUT table in memory

13.3.10 Write back

The data which is mixed in overlay and send to post-processing module can be wrote back to memory with AXI master. The data format can be ARGB8888, RGB888, RGB565 or YUV420. The max size is 1920x1080. Note that wb_fifo_thold * 16 must be equal or greater than the byte number of one line data. Otherwise, it may causes WB dma fifo overflow and results in some data errors. For example, the size is 1920x1080 and the format is ARGB8888, wb_fifo_thold can be set to 480.

13.3.11 Overlay

Mixing video signals maybe as simple as switching between two video sources. For most other applications, a technique known as alpha blending should be used to overlay computer-generated text and graphics on to a video signal. The figure illustrates mixing 8 layers in VOP.

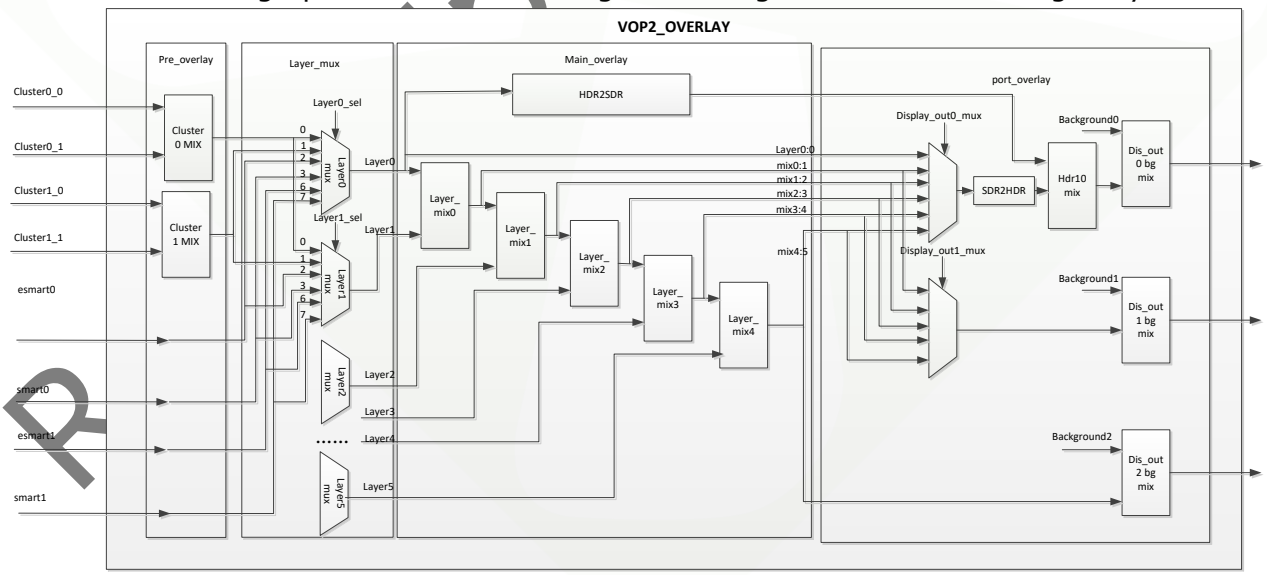

Fig. 13-9 VOP2 overlay structure

It consists of pre_overlay, layer_mux, main_overlay and post_overlay. The pre_overlay is implemented to mix the two windows from the same cluster. The layer_mux is implemented to distribute windows to layers which have the same number of windows. The main_overlay is used to mix layers one by one. The post_overly is added to distribute different layers to different display outputs in different applications. Finally, before the mixed data gets through display outputs, it is mixed with a background color. In addition, only display output0 supports

HDR10.

13.3.11.1 Alpha mixing

Every two layer that one is called source layer and another is called destination layer are mixed by alpha mixing. They are proportionally multiplied and added together. Mathematically, with normalized to have value of 0~1, data mixing is implemented as:

$$Ad * Cd = As' * Cs' + (1 - As') * Cd' * Ad'$$

$$Ad = As' + Ad' - As' * Ad'$$

Where A is alpha and C is color data. Implementation block diagram is given as below.

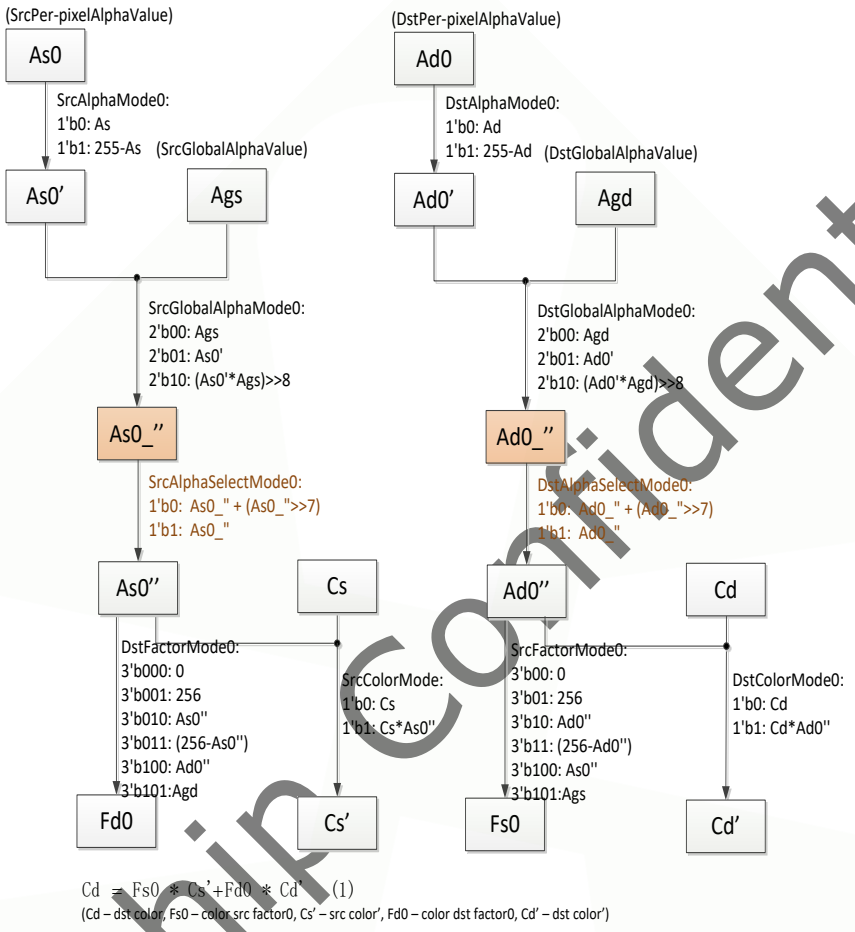

Fig. 13-10 Data calculation flow

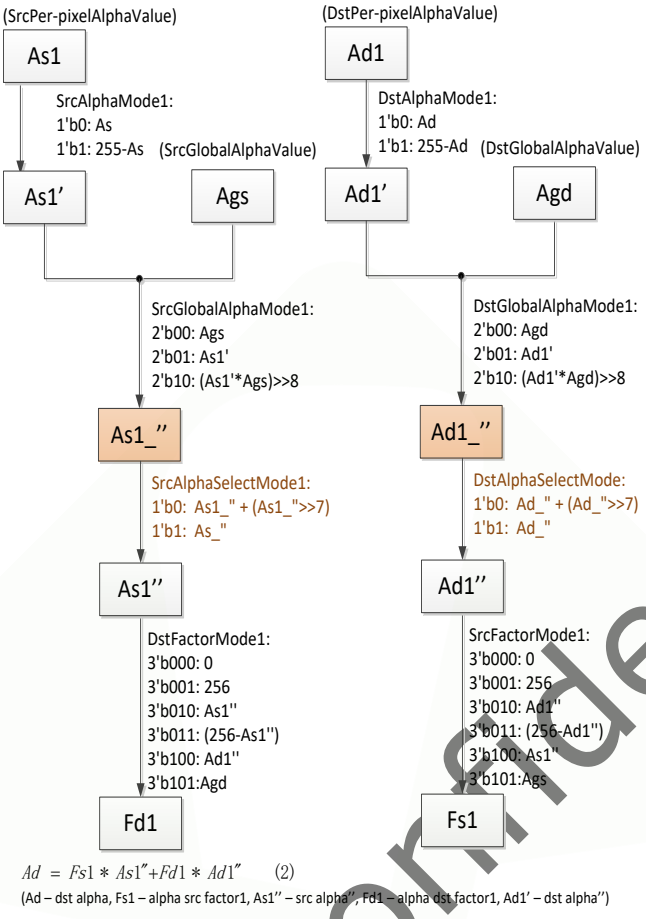

Fig. 13-11 Alpha calculation flow

13.3.11.2 Background mixing

It's known that the alpha of the background is 1. A simplified formula is used as shown below:

$$Cd = As'*Cs'+(1-As')*Cd'$$

Where Cd' is background data, Cs' is mixing video and graphic data. It's implemented as fellows.

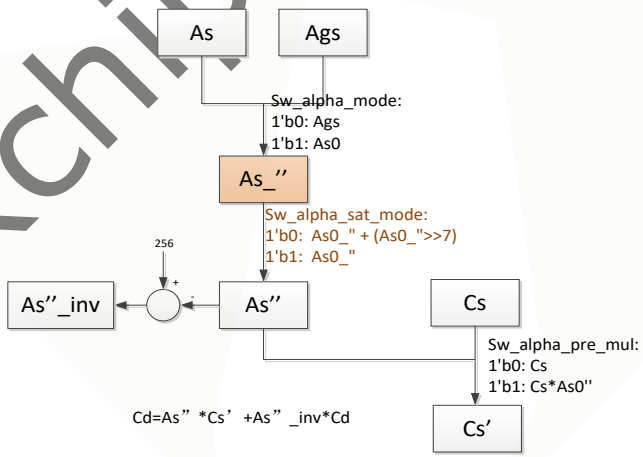

Fig. 13-12 Background alpha blending

13.3.12 HDR10

A high-dynamic-range(HDR) system is able to transmit the camera-captured dynamic range of luminance levels from the production process all the way to the consumer end without any degradation in this dynamic range. But due to the technological limitations of conventional displays, current standard-dynamic-range(SDR) production restricts luminance levels to a maximum of 100 cd/m^2 and supports only the ITU-R BT.709 standard color space. It's necessary to implement HDR2SDR to improve display quality in the system that HDR image is send to a low-luminance display. Similarly SDR2HDR is implemented in the system that a high-luminance panel displays a SDR image. HDR2SDR and SDR2HDR can be achieved using

appropriate transfer functions(OETF/EOTF). In order to decrease registers, now the registers used to configure transfer functions are stored in memory as shown below.

byte0	eetf_oetf_y0	eetf_oetf_y1	eetf_oetf_y2	eetf_oetf_y3

Fig. 13-13 Configures for HDR10 transfer function in memory

13.3.13 Mirror display

Mirror display is necessary for the panel with mirror timing interface. There are two types of mirror mode: horizontal mirror(X-mirror) and vertical mirror(Y-mirror). If Y-mirror is enable, set the MST of window to the beginning of the last line.

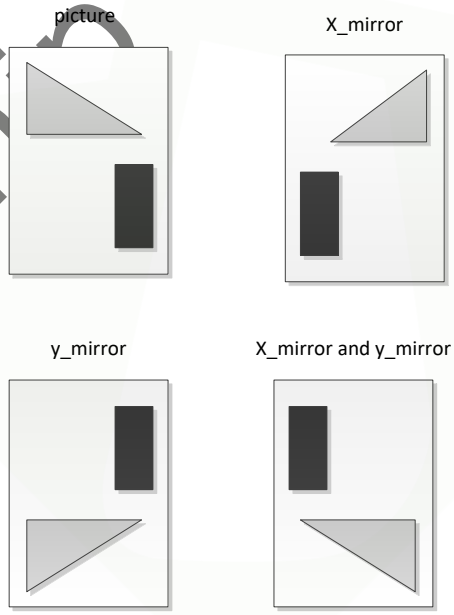

Fig.13-4 Mirror

13.3.14 Display outputs

VOP2 can output video in 4K with up to 30-bit color mode. The video data output mapping is defined by dsp_out_mode as shown below.

Table 13-1 Output data mapping

Output format			Output data		
Color Space	Color depth	dsp_out_mode	data_o[29:20]	data_o[19:10]	data_o[9:0]
RGB4:4:4	24-bit	0	{R[7:0],2'b0}	{G[7:0],2'b0}	{B[7:0],2'b0}
	30-bit	15	R[9:0]	G[9:0]	B[9:0]

13.4.2 Overlay register description

13.4.2.1 Registers Summary

The base address of overlay registers is 0x0600.

Name	Offset	Size	Reset Value	Description
VOP2_OVERLAY_CTRL	0x0000	W	0x00000000	OVERLAY control register.
VOP2_LAYER_SEL	0x0004	W	0x00763210	OVERLAY layer select.
VOP2_PORT_SEL	0x0008	W	0x84000743	OVERLAY port select.
VOP2_CLUSTER0_MIX_SRC_COLOR_CTRL	0x0010	W	0x00000000	To configure the source color of cluster0 MIX.
VOP2_CLUSTER0_MIX_DST_COLOR_CTRL	0x0014	W	0x00000000	To configure the destination color of cluster0 MIX.

Name	Offset	Size	Reset Value	Description
VOP2_CLUSTER0_MIX_SRC_ALPHA_CTRL	0x0018	W	0x00000000	To configure the source alpha of cluster0 MIX.
VOP2_CLUSTER0_MIX_DST_ALPHA_CTRL	0x001C	W	0x00000000	To configure the destination alpha of cluster0 MIX.
VOP2_CLUSTER1_MIX_SRC_COLOR_CTRL	0x0020	W	0x00000000	To configure the source color of cluster1 MIX.
VOP2_CLUSTER1_MIX_DST_COLOR_CTRL	0x0024	W	0x00000000	To configure the destination color of cluster1 MIX.
VOP2_CLUSTER1_MIX_SRC_ALPHA_CTRL	0x0028	W	0x00000000	To configure the source alpha of cluster1 MIX.
VOP2_CLUSTER1_MIX_DST_ALPHA_CTRL	0x002C	W	0x00000000	To configure the destination alpha of cluster1 MIX.
VOP2_MIX0_SRC_COLOR_CTRL	0x0050	W	0x00000000	To configure the source color of MIX0.
VOP2_MIX0_DST_COLOR_CTRL	0x0054	W	0x00000000	To configure the destination color of MIX0.
VOP2_MIX0_SRC_ALPHA_CTRL	0x0058	W	0x00000000	To configure the source alpha of MIX0.
VOP2_MIX0_DST_ALPHA_CTRL	0x005C	W	0x00000000	To configure the destination alpha of MIX0.
VOP2_MIX1_SRC_COLOR_CTRL	0x0060	W	0x00000000	To configure the source color of MIX1.
VOP2_MIX1_DST_COLOR_CTRL	0x0064	W	0x00000000	To configure the destination color of MIX1.
VOP2_MIX1_SRC_ALPHA_CTRL	0x0068	W	0x00000000	To configure the source alpha of MIX1.
VOP2_MIX1_DST_ALPHA_CTRL	0x006C	W	0x00000000	To configure the destination alpha of MIX1.
VOP2_MIX2_SRC_COLOR_CTRL	0x0070	W	0x00000000	To configure the source color of MIX2.
VOP2_MIX2_DST_COLOR_CTRL	0x0074	W	0x00000000	To configure the destination color of MIX2.
VOP2_MIX2_SRC_ALPHA_CTRL	0x0078	W	0x00000000	To configure the source alpha of MIX2.
VOP2_MIX2_DST_ALPHA_CTRL	0x007C	W	0x00000000	To configure the destination alpha of MIX2.
VOP2_MIX3_SRC_COLOR_CTRL	0x0080	W	0x00000000	To configure the source color of MIX3.
VOP2_MIX3_DST_COLOR_CTRL	0x0084	W	0x00000000	To configure the destination color of MIX3.
VOP2_MIX3_SRC_ALPHA_CTRL	0x0088	W	0x00000000	To configure the source alpha of MIX3.
VOP2_MIX3_DST_ALPHA_CTRL	0x008C	W	0x00000000	To configure the destination alpha of MIX3.
VOP2_MIX4_SRC_COLOR_CTRL	0x0090	W	0x00000000	To configure the source color of MIX4.
VOP2_MIX4_DST_COLOR_CTRL	0x0094	W	0x00000000	To configure the destination color of MIX4.
VOP2_MIX4_SRC_ALPHA_CTRL	0x0098	W	0x00000000	To configure the source alpha of MIX4.
VOP2_MIX4_DST_ALPHA_CTRL	0x009C	W	0x00000000	To configure the destination alpha of MIX4.

Name	Offset	Size	Reset Value	Description
VOP2_MIX5_SRC_COLOR_CTRL	0x00A0	W	0x00000000	To configure the source color of MIX5.
VOP2_MIX5_DST_COLOR_CTRL	0x00A4	W	0x00000000	To configure the destination color of MIX5.
VOP2_MIX5_SRC_ALPHA_CTRL	0x00A8	W	0x00000000	To configure the source alpha of MIX5.
VOP2_MIX5_DST_ALPHA_CTRL	0x00AC	W	0x00000000	To configure the destination alpha of MIX5.
VOP2_MIX6_SRC_COLOR_CTRL	0x00B0	W	0x00000000	To configure the source color of MIX6.
VOP2_MIX6_DST_COLOR_CTRL	0x00B4	W	0x00000000	To configure the destination color of MIX6.
VOP2_MIX6_SRC_ALPHA_CTRL	0x00B8	W	0x00000000	To configure the source alpha of MIX6.
VOP2_MIX6_DST_ALPHA_CTRL	0x00BC	W	0x00000000	To configure the destination alpha of MIX6.
VOP2_HDR0_MIX_SRC_COLOR_CTRL	0x00C0	W	0x00000000	To configure the source color of HDR0 MIX.
VOP2_HDR0_MIX_DST_COLOR_CTRL	0x00C4	W	0x00000000	To configure the destination color of HDR0 MIX.
VOP2_HDR0_MIX_SRC_ALPHA_CTRL	0x00C8	W	0x00000000	To configure the source alpha of HDR0 MIX.
VOP2_HDR0_MIX_DST_ALPHA_CTRL	0x00CC	W	0x00000000	To configure the destination alpha of HDR0 MIX.
VOP2_DP0_BG_MIX_CTRL	0x00E0	W	0x26000000	To contro the background MIX of video port0.
VOP2_DP1_BG_MIX_CTRL	0x00E4	W	0x26000000	To contro the background MIX of video port1.
VOP2_DP2_BG_MIX_CTRL	0x00E8	W	0x26000000	To contro the background MIX of video port2.
VOP2_Cluster_DLY_NUM	0x00F0	W	0x00000000	To configure the delay cycle of cluster.
VOP2_SMART_DLY_NUM	0x00F8	W	0x14141414	To configure the delay cycle of esmart.

13.4.3 Post-process0 register description

13.4.3.1 Registers Summary

The base address of post-process0 registers is 0x0c00.

Name	Offset	Size	Reset Value	Description
VOP2_POST0_DSP_CTRL	0x0000	W	0x8000000F	To control the display mode of video port0.
VOP2_POST0_MIPI_CTRL	0x0004	W	0x00000000	To control the MIPI display of video port0.
VOP2_POST0_COLOR_CTRL	0x0008	W	0x00000000	To control color bar.
VOP2_POST0_RESERVED2	0x000C	W	0x00000000	Register0000 Description
VOP2_POST0_3D_LUT_CTRL	0x0010	W	0x00000000	To control 3D LUT.
VOP2_POST0_3D_LUT_R	0x0014	W	0x00000000	To configure the red component of 3D LUT.

Name	Offset	Size	Reset Value	Description
VOP2_POST0_3D_LUT_G	0x0018	W	0x00000000	To configure the green component of 3D LUT.
VOP2_POST0_3D_LUT_B	0x001C	W	0x00000000	To configure the blue component of 3D LUT.
VOP2_POST0_3DLUT_MST	0x0020	W	0x00000000	To configure the starting address of 3D LUT in memory.
VOP2_POST0_DSP_BG	0x002C	W	0x00000000	To configure the background color of video port0.
VOP2_POST0_PRE_SCAN_HTIMING	0x0030	W	0x00000000	To configure the pre-process timing of video port0.
VOP2_POST0_DSP_HACT_INFO	0x0034	W	0x00000000	To configure the post-process horizontal timing of video port0.
VOP2_POST0_DSP_VACT_INFO	0x0038	W	0x00000000	To configure the post-process vertical timing of video port0.
VOP2_POST0_SCL_FACTOR_YRGB	0x003C	W	0x00000000	To configure the scaling factor of post-process.
VOP2_POST0_SCL_CTRL	0x0040	W	0x00000000	To enable the scaling of post-process.
VOP2_POST0_DSP_VACT_INFO_F1	0x0044	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST0_DSP_HTOTAL_HS_END	0x0048	W	0x00000000	To configure the horizontal timing of video port0.
VOP2_POST0_DSP_HACT_ST_END	0x004C	W	0x00000000	To configure the horizontal timing of video port0.
VOP2_POST0_DSP_VTOTAL_VS_END	0x0050	W	0x00000000	To configure the vertical timing of video port0.
VOP2_POST0_DSP_VACT_ST_END	0x0054	W	0x00000000	To configure the vertical timing of video port0.
VOP2_POST0_DSP_VS_ST_END_F1	0x0058	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST0_DSP_VACT_ST_END_F1	0x005C	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST0_BCSH_CTRL	0x0060	W	0x00000000	To control BCSH.
VOP2_POST0_BCSH_BCS	0x0064	W	0x00000000	To configure the brightness, contrast, sat and output mode of BCSH.
VOP2_POST0_BCSH_H	0x0068	W	0x00000000	To configure the hue of BCSH.
VOP2_POST0_BCSH_COLOR_BAR	0x006C	W	0x00000000	To enable BCSH.
VOP2_POST0_FRC_LOWER01_0	0x00A0	W	0x12844821	To configure the filter coefficients of FRC.
VOP2_POST0_FRC_LOWER01_1	0x00A4	W	0x21488412	To configure the filter coefficients of FRC.
VOP2_POST0_FRC_LOWER10_0	0x00A8	W	0xA55A9696	To configure the filter coefficients of FRC.
VOP2_POST0_FRC_LOWER10_1	0x00AC	W	0x5AA56969	To configure the filter coefficients of FRC.
VOP2_POST0_FRC_LOWER11_0	0x00B0	W	0xDEB77BED	To configure the filter coefficients of FRC.
VOP2_POST0_FRC_LOWER11_1	0x00B4	W	0xED7BB7DE	To configure the filter coefficients of FRC.

13.4.3.2 Detail Registers Description

VOP2_POST0_DSP_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x1	vop_standby_en_imd Writing "1" to turn LCDC into standby mode, All the layer would disable and the data transfer from frame buffer memory would stop at the end of current frame. The output would be blank. When writing "0" to this bit, standby mode would disable and the LCDC go back to work immediately. 1'b0: Disable 1'b1: Enable * Black display is recommended before setting standby mode enable.
30	RW	0x0	vop_fp_standby_en_imd Writing "1" to turn LCDC into standby mode, All the layer would disable and the data transfer from frame buffer memory would stop at the end of current frame. The output would be blank. When writing "0" to this bit, standby mode would disable and the LCDC go back to work immediately. 1'b0: Disable 1'b1: Enable * Black display is recommended before setting standby mode enable.
29	RO	0x0	reserved
28	RW	0x0	dsp_lut_en 1'b0: Disable 1'b1: Enable *This bit should be "0" when CPU updates the LUT, and should be "1" when Display LUT mode enable.
27	RW	0x0	dsp_black_en When this bit enable, the pixel data output is all black(0x000000).
26	RW	0x0	dsp_out_zero 1'b0: normal output 1'b1: all output '0'
25	RO	0x0	reserved
24	RW	0x0	dsp_blank_en When this bit enable, the Hsync/Vsync/Den output is blank.
23	RW	0x0	post_lb_mode 1'b0: 4x4096 1'b1: 8x2048 if post_act_width > 2048 post_lb_mode =0;else config 0 or 1

31:16	RW	0xed7b	lower11_frm3 FRC parameter lowerbit = 2'b11, frm3.
15:0	RW	0xb7de	lower11_frm2 FRC parameter lowerbit = 2'b11, frm2.

13.4.4 Post-process1 register description

13.4.4.1 Registers Summary

The base address of post-process1 registers is 0x0d00.

Name	Offset	Size	Reset Value	Description
VOP2_POST1_DSP_CTRL	0x0000	W	0x00000000	To control the display mode of video port0.
VOP2_POST1_MIPI_CTRL	0x0004	W	0x00000000	To control the MIPI display of video port0.
VOP2_POST1_COLOR_CTRL	0x0008	W	0x00000000	To control color bar.
VOP2_POST1_RESERVED2	0x000C	W	0x00000000	Register0000 Description
VOP2_POST1_DSP_BG	0x002C	W	0x00000000	To configure the background color of video port0.
VOP2_POST1_PRE_SCAN_HTIMING	0x0030	W	0x00000000	To configure the pre-process timing of video port0.
VOP2_POST1_DSP_HACT_INFO	0x0034	W	0x00000000	To configure the post-process horizontal timing of video port0.
VOP2_POST1_DSP_VACT_INFO	0x0038	W	0x00000000	To configure the post-process vertical timing of video port0.
VOP2_POST1_SCL_FACTOR_YRGB	0x003C	W	0x00000000	To configure the scaling factor of post-process.

Name	Offset	Size	Reset Value	Description
VOP2_POST1_SCL_CTRL	0x0040	W	0x00000000	To enable the scaling of post-process.
VOP2_POST1_DSP_VACT_INFO_F1	0x0044	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST1_DSP_HTOTAL_HS_END	0x0048	W	0x00000000	To configure the horizontal timing of video port0.
VOP2_POST1_DSP_HACT_ST_END	0x004C	W	0x00000000	To configure the horizontal timing of video port0.
VOP2_POST1_DSP_VTOTAL_VS_END	0x0050	W	0x00000000	To configure the vertical timing of video port0.
VOP2_POST1_DSP_VACT_ST_END	0x0054	W	0x00000000	To configure the vertical timing of video port0.
VOP2_POST1_DSP_VS_ST_END_F1	0x0058	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST1_DSP_VACT_ST_END_F1	0x005C	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST1_BCSH_CTRL	0x0060	W	0x00000000	To control BCSH.
VOP2_POST1_BCSH_BCS	0x0064	W	0x00000000	To configure the brightness, contrast, sat and output mode of BCSH.
VOP2_POST1_BCSH_H	0x0068	W	0x00000000	To configure the hue of BCSH.
VOP2_POST1_BCSH_COLOR_BAR	0x006C	W	0x00000000	To enable BCSH.
VOP2_POST1_CABC_CTRL_0	0x0070	W	0x00000000	To control CABC.
VOP2_POST1_CABC_CTRL_1	0x0074	W	0x00000000	To enable CABC LUT.
VOP2_POST1_CABC_CTRL_2	0x0078	W	0x00000000	To configure the stage of CABC.
VOP2_POST1_CABC_CTRL_3	0x007C	W	0x00000000	To configure the limited global value of CABC.
VOP2_POST1_CABC_GAUSS_LINE0_0	0x0080	W	0x00000000	To configure the filter coefficients of CABC.
VOP2_POST1_CABC_GAUSS_LINE0_1	0x0084	W	0x00000000	To configure the filter coefficients of CABC.
VOP2_POST1_CABC_GAUSS_LINE1_0	0x0088	W	0x00000000	To configure the filter coefficients of CABC.
VOP2_POST1_CABC_GAUSS_LINE1_1	0x008C	W	0x00000000	To configure the filter coefficients of CABC.
VOP2_POST1_CABC_GAUSS_LINE2_0	0x0090	W	0x00000000	To configure the filter coefficients of CABC.
VOP2_POST1_CABC_GAUSS_LINE2_1	0x0094	W	0x00000000	To configure the filter coefficients of CABC.
VOP2_POST1_PWM_CTRL	0x00C0	W	0x0000200A	The register provides the cotrol of PWM.
VOP2_POST1_PWM_PERIOD_HPR	0x00C4	W	0x00000000	To configure the period of the output waveform.
VOP2_POST1_PWM_DUTY_LPR	0x00C8	W	0x00000000	To configure the duty cycle of the output waveform.
VOP2_POST1_PWM_CNT	0x00CC	W	0x00000000	The register indicates the status of PWM.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

13.4.4.2 Detail Registers Description

VOP2_POST1_DSP_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	vop_standby_en_imd Writing "1" to turn LCDC into standby mode, All the layer would disable and the data transfer from frame buffer memory would stop at the end of current frame. The output would be blank. When writing "0" to this bit, standby mode would disable and the LCDC go back to work immediately. 1'b0: Disable 1'b1: Enable * Black display is recommended before setting standby mode enable.
30	RW	0x0	vop_fp_standby_en_imd Writing "1" to turn LCDC into standby mode, All the layer would disable and the data transfer from frame buffer memory would stop at the end of current frame. The output would be blank. When writing "0" to this bit, standby mode would disable and the LCDC go back to work immediately. 1'b0: Disable 1'b1: Enable * Black display is recommended before setting standby mode enable.
29	RO	0x0	reserved
28	RW	0x0	dsp_lut_en 1'b0: Disable 1'b1: Enable *This bit should be "0" when CPU updates the LUT, and should be "1" when Display LUT mode enable.
27	RW	0x0	dsp_black_en When this bit enable, the pixel data output is all black(0x000000).
26	RW	0x0	dsp_out_zero 1'b0: normal output 1'b1: all output '0'
25	RO	0x0	reserved
24	RW	0x0	dsp_blank_en When this bit enable, the Hsync/Vsync/Den output is blank.
23	RW	0x0	post_lb_mode 1'b0: 4x4096 1'b1: 8x2048 if post_act_width > 2048 post_lb_mode =0; else config 0 or 1
22:21	RO	0x0	reserved
20	RW	0x0	dither_down_mode 1'b0: RGB888 to RGB565 1'b1: RGB888 to RGB666
19:18	RW	0x0	dither_down_sel 2'b0: Allegro 2'b1: FRC
17	RW	0x0	dither_down_en 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
16	RW	0x0	pre_dither_down_en 10bit->8bit (allegro).
15	RW	0x0	dsp_win_bypass If all layer are closed,enable dsp_win_bypass.
14	RW	0x0	dsp_y_mir_en 1'b0: no y_mirror 1'b1: y_mirror
13	RW	0x0	dsp_x_mir_en 1'b0: no x_mirror 1'b1: x_mirror
12	RW	0x0	dsp_dummy_swap 1'b0: B+G+R+dummy 1'b1: dummy+B+G+R
11	RW	0x0	dsp_delta_swap 1'b0: Disable 1'b1: Enable *See detail description in Delta display charpter
10	RW	0x0	dsp_rg_swap 1'b0: RGB 1'b1: GRB
9	RW	0x0	dsp_rb_swap 1'b0: RGB 1'b1: BGR
8	RW	0x0	dsp_bg_swap 1'b0: RGB 1'b1: RBG
7	RW	0x0	dsp_interlace 1'b0: Disable 1'b1: Enable
6	RW	0x0	dsp_filed_pol 1'b0: normal 1'b1: invert
5	RW	0x0	dsp_p2i_en Enable p2i. 1'b0: Disable 1'b1: Enable
4	RW	0x0	dsp_core_dclk_sel If panel is 480i or 576i, it's enable. 1'b0: dclk_core sel dclk 1'b1: dclk_core sel dclk div2
3:0	RW	0x0	dsp_out_mode 4'b0000: Parallel 24-bit output {R[7:0],2'b0,G[7:0],2'b0,B[7:0],2'b0} 4'b0001: Parallel 18-bit RGB666 output {R[5:0],4'b0,G[5:0],4'b0,B[5:0],4'b0} 4'b0010: Parallel 16-bit RGB565 output {R[4:0],5'b0,G[5:0],4'b0,B[4:0],5'b0} 4'b1110: YUV420 output for HDMI 4'b1111: Parallel 30-bit RGBaaa output {R[9:0],G[9:0],B[9:0]} Others: Reserved

VOP2_POST1_MIPI_CTRL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	edpi_wms_fs Frame start in hold mode. 1'b0: Disable 1'b1: Enable
30	RW	0x0	edpi_wms_hold_en Enable hold mode. 1'b0: Disable 1'b1: Enable
29	RW	0x0	edpi_te_mode 1'b0: new frame is started by te. 1'b1: new frame is started by te and wms_fs.
28	RW	0x0	edpi_te_en Enable MIPI TE. 1'b0: Disable 1'b1: Enable
27:24	RW	0x0	dual_channel_overlap_num 4'h0: overlap num 0 4'h1: overlap num 2 4'h2: overlap num 4 4'h3: overlap num 6 4'h4: overlap num 8 4'h5: overlap num 10 4'h6: overlap num 12 4'h7: overlap num 14 4'h8: overlap num 16
23:22	RO	0x0	reserved
21	RW	0x0	dual_channel_swap Swap two channel data of MIPI.
20	RW	0x0	dual_channel_en Enable mipi dual channel. 1'b0: Disable 1'b1: Enable
19:6	RO	0x00000	reserved
5:4	RW	0x0	dclk_out_ddr_ctrl 2'b00: normal 2'b01: dclk_out is ddr clk Others: reserved
3:0	RO	0x0	reserved

VOP2_POST1_COLOR_CTRL

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	color_bar_mode Select color bar mode. 1'b0: horizontal mode 1'b1: vertical mode
0	RW	0x0	color_bar_en Enable color bar. 1'b0: Disable 1'b1: Enable

VOP2_POST1_RESERVED2

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Field0000

VOP2_POST1_DSP_BG

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:20	RW	0x000	dsp_bg_red 10bit red color of background.
19:10	RW	0x000	dsp_bg_blue 10bit blue color of background.
9:0	RW	0x000	dsp_bg_green 10bit green color of background.

VOP2_POST1_PRE_SCAN_HTIMING

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	pre_scan_hactive Pre_scan horizontal active pixel.
15:13	RO	0x0	reserved
12:0	RW	0x0000	pre_scan_hblank Pre_scan horizontal blank pixel.

VOP2_POST1_DSP_HACT_INFO

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_hact_st_post Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_hact_end_post Panel display scanning horizontal active end point.

VOP2_POST1_DSP_VACT_INFO

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vact_st_post Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vact_end_post Panel display scanning horizontal active end point.

VOP2_POST1_SCL_FACTOR_YRGB

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	post_vs_factor Factor=((src_height[31:16])/(dst_height[31:16]))*2^12.
15:0	RW	0x0000	post_hs_factor Factor=((src_width[15:0])/(dst_width[15:0]))*2^12.

VOP2_POST1_SCL_CTRL

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	post0_ver_sd_en 1'b0: post ver scl down disable 1'b1: post ver scl down enable
0	RW	0x0	post0_hor_sd_en 1'b0: post hor scl down disable 1'b1: post hor scl down enable

VOP2_POST1_DSP_VACT_INFO_F1

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vact_st_post_f1 Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vact_end_post_f1 Panel display scanning horizontal active end point.

VOP2_POST1_DSP_HTOTAL_HS_END

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_htotal Panel display scanning horizontal period.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_hs_end Panel display scanning hsync pulse width.

VOP2_POST1_DSP_HACT_ST_END

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_hact_st Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_hact_end Panel display scanning horizontal active end point.

VOP2_POST1_DSP_VTOTAL_VS_END

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vtotal Panel display scanning vertical period.
15	RW	0x0	sw_dsp_vtotal_imd Dsp vtotal number valid immediately enable. 1'b0: valid after frame start 1'b1: valid immediately
14:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vs_end Panel display scanning vsync pulse width.

VOP2_POST1_DSP_VACT_ST_END

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vact_st Panel display scanning vertical active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vact_end Panel display scanning vertical active end point.

VOP2_POST1_DSP_VS_ST_END_F1

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vs_st_f1 Panel display scanning vertical vsync start point of 2nd field (interlace display mode).
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vs_end_f1 Panel display scanning vertical vsync end point of 2nd field(interlace display mode).

VOP2_POST1_DSP_VACT_ST_END_F1

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vact_st_f1 Panel display scanning vertical active start point of 2nd field (interlace display mode).
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vact_end_f1 Panel display scanning vertical active end point of 2nd field (interlace display mode).

VOP2_POST1_BCSH_CTRL

Address: Operational Base + offset (0x0060)

VOP2_POST1_PWM_CTRL

Address: Operational Base + offset (0x00C0)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	rpt This field defines the repeated effective periods of output waveform in one-shot mode. The value N means N+1 repeated effective periods
23:16	RW	0x00	scale This fields defines the scale factor applied to prescaled clock. The value N means the clock is divided by 2*N. If N is 0, it means that the clock is divided by 512(2*256)
15	RO	0x0	reserved
14:12	RW	0x2	prescale This field defines the prescale factor applied to input clock. The value N means that the input clock is divided by 2^N
11:10	RO	0x0	reserved
9	RW	0x0	clk_sel 1'b0: non-scaled clock is selected as PWM clock source. It means that the prescale clock is directly used as the PWM clock source 1'b1: scaled clock is selected as PWM clock source
8	RW	0x0	lp_en 1'b0: Disable 1'b1: Enable When PWM channel is inactive state and Low Power Mode is enabled, the path to PWM Clock prescale module is blocked to reduce power consumption
7:6	RO	0x0	reserved
5	RW	0x0	output_mode 1'b0: left aligned mode 1'b1: center aligned mode
4	RW	0x0	inactive_pol This defines the output waveform polarity when PWM channel is in inactive state. The inactive state means that PWM finishes the complete waveform in one-shot mode or PWM channel is disabled. 1'b0: negative 1'b1: positive
3	RW	0x1	duty_pol This defines the polarity for duty cycle. PWM starts the output waveform with duty cycle. 1'b0: negative 1'b1: positive

Bit	Attr	Reset Value	Description
2:1	RW	0x1	pwm_mode 2'b00: One shot mode. PWM produces the waveform within the repeated times defined by PWMx_CTRL_rpt . 2'b01: Continuous mode. PWM produces the waveform continuously 2'b10: Capture mode. PWM measures the cycles of high/low polarity of input waveform. 2'b11: reserved
0	RW	0x0	pwm_en 1'b0: Disable 1'b1: Enable If the PWM is worked the one-shot mode, this bit will be cleared at the end of operation

VOP2_POST1_PWM_PERIOD_HPR

Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pwm_period If PWM is operated at the continuous mode or one-shot mode, this value defines the period of the output waveform. Note that, if the PWM is operated at the center-aligned mode, the period should be an even one, and therefore only the bit [31:1] is taken into account and bit [0] always considered as 0. If PWM is operated at the capture mode, this value indicates the effective high polarity cycles of input waveform. This value is based on the PWM clock. The value ranges from 0 to (2^32-1)

VOP2_POST1_PWM_DUTY_LPR

Address: Operational Base + offset (0x00C8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pwm_duty If PWM is operated at the continuous mode or one-shot mode, this value defines the duty cycle of the output waveform. The PWM starts the output waveform with duty cycle. Note that, if the PWM is operated at the center-aligned mode, the period should be an even one, and therefore only the [31:1] is taken into account. If PWM is operated at the capture mode, this value indicates the effective low polarity cycles of input waveform. This value is based on the PWM clock. The value ranges from 0 to (2^32-1)

VOP2_POST1_PWM_CNT

Address: Operational Base + offset (0x00CC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pwm_cnt The 32-bit indicates current value of PWM Channel 0 counter. The counter runs at the rate of PWM clock. The value ranges from 0 to (2^32-1)

13.4.5 Post-process2 register description

13.4.5.1 Registers Summary

The base address of post-process2 registers is 0x0e00.

Name	Offset	Size	Reset Value	Description
VOP2_POST2_DSP_CTRL	0x0000	W	0x00000000	To control the display mode of video port0.
VOP2_POST2_MIPI_CTRL	0x0004	W	0x00000000	To control the MIPI display of video port0.
VOP2_POST2_COLOR_CTRL	0x0008	W	0x00000000	To control color bar.
VOP2_POST2_RESERVED2	0x000C	W	0x00000000	Register0000 Description
VOP2_POST2_DSP_BG	0x002C	W	0x00000000	To configure the background color of video port0.
VOP2_POST2_PRE_SCAN_HTIMING	0x0030	W	0x00000000	To configure the pre-process timing of video port0.
VOP2_POST2_DSP_HACT_INFO	0x0034	W	0x00000000	To configure the post-process horizontal timing of video port0.
VOP2_POST2_DSP_VACT_INFO	0x0038	W	0x00000000	To configure the post-process vertical timing of video port0.
VOP2_POST2_SCL_FACTOR_YRGB	0x003C	W	0x00000000	To configure the scaling factor of post-process.
VOP2_POST2_SCL_CTRL	0x0040	W	0x00000000	To enable the scaling of post-process.
VOP2_POST2_DSP_VACT_INFO_F1	0x0044	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST2_DSP_HTOTAL_HS_END	0x0048	W	0x00000000	To configure the horizontal timing of video port0.
VOP2_POST2_DSP_HACT_ST_END	0x004C	W	0x00000000	To configure the horizontal timing of video port0.
VOP2_POST2_DSP_VTOTAL_VS_END	0x0050	W	0x00000000	To configure the vertical timing of video port0.
VOP2_POST2_DSP_VACT_ST_END	0x0054	W	0x00000000	To configure the vertical timing of video port0.
VOP2_POST2_DSP_VS_ST_END_F1	0x0058	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST2_DSP_VACT_ST_END_F1	0x005C	W	0x00000000	To configure the interlace vertical timing of video port0.
VOP2_POST2_BCSH_CTRL	0x0060	W	0x00000000	To control BCSH.
VOP2_POST2_BCSH_BCS	0x0064	W	0x00000000	To configure the brightness, contrast, sat and output mode of BCSH.
VOP2_POST2_BCSH_H	0x0068	W	0x00000000	To configure the hue of BCSH.
VOP2_POST2_BCSH_COLOR_BAR	0x006C	W	0x00000000	To enable BCSH.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

13.4.5.2 Detail Registers Description

VOP2_POST2_DSP_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	vop_standby_en_imd Writing "1" to turn LCDC into standby mode, All the layer would disable and the data transfer from frame buffer memory would stop at the end of current frame. The output would be blank. When writing "0" to this bit, standby mode would disable and the LCDC go back to work immediately. 1'b0: Disable 1'b1: Enable * Black display is recommended before setting standby mode enable.
30	RW	0x0	vop_fp_standby_en_imd Writing "1" to turn LCDC into standby mode, All the layer would disable and the data transfer from frame buffer memory would stop at the end of current frame. The output would be blank. When writing "0" to this bit, standby mode would disable and the LCDC go back to work immediately. 1'b0: Disable 1'b1: Enable * Black display is recommended before setting standby mode enable.
29	RO	0x0	reserved
28	RW	0x0	dsp_lut_en 1'b0: Disable 1'b1: Enable *This bit should be "0" when CPU updates the LUT, and should be "1" when Display LUT mode enable.
27	RW	0x0	dsp_black_en When this bit enable, the pixel data output is all black(0x000000).
26	RW	0x0	dsp_out_zero 1'b0: normal output 1'b1: all output '0'
25	RO	0x0	reserved
24	RW	0x0	dsp_blank_en When this bit enable, the Hsync/Vsync/Den output is blank.
23	RW	0x0	post_lb_mode 1'b0: 4x4096 1'b1: 8x2048 if post_act_width > 2048 post_lb_mode =0; else config 0 or 1
22:21	RO	0x0	reserved
20	RW	0x0	dither_down_mode 1'b0: RGB888 to RGB565 1'b1: RGB888 to RGB666
19:18	RW	0x0	dither_down_sel 2'b0: Allegro 2'b1: FRC
17	RW	0x0	dither_down_en 1'b0: Disable 1'b1: Enable
16	RW	0x0	pre_dither_down_en 10bit->8bit (allegro).
15	RW	0x0	dsp_win_bypass If all layer are closed,enable dsp_win_bypass.

Bit	Attr	Reset Value	Description
14	RW	0x0	dsp_y_mir_en 1'b0: no y_mirror 1'b1: y_mirror
13	RW	0x0	dsp_x_mir_en 1'b0: no x_mirror 1'b1: x_mirror
12	RW	0x0	dsp_dummy_swap 1'b0: B+G+R+dummy 1'b1: dummy+B+G+R
11	RW	0x0	dsp_delta_swap 1'b0: disable 1'b1: enable *See detail description in Delta display charpter
10	RW	0x0	dsp_rg_swap 1'b0: RGB 1'b1: GRB
9	RW	0x0	dsp_rb_swap 1'b0: RGB 1'b1: BGR
8	RW	0x0	dsp_bg_swap 1'b0: RGB 1'b1: RBG
7	RW	0x0	dsp_interlace 1'b0: Disable 1'b1: Enable
6	RW	0x0	dsp_filed_pol 1'b0: Normal 1'b1: Invert
5	RW	0x0	dsp_p2i_en Enable p2i. 1'b0: Disable 1'b1: Enable
4	RW	0x0	dsp_core_dclk_sel If panel is 480i or 576i, it's enable. 1'b0: dclk_core sel dclk 1'b1: dclk_core sel dclk div2
3:0	RW	0x0	dsp_out_mode 4'b0000: Parallel 24-bit output {R[7:0],2'b0,G[7:0],2'b0,B[7:0],2'b0} 4'b0001: Parallel 18-bit RGB666 output {R[5:0],4'b0,G[5:0],4'b0,B[5:0],4'b0} 4'b0010: Parallel 16-bit RGB565 output {R[4:0],5'b0,G[5:0],4'b0,B[4:0],5'b0} 4'b1110: YUV420 output for HDMI 4'b1111: Parallel 30-bit RGBaaa output {R[9:0],G[9:0],B[9:0]} Others: Reserved

VOP2_POST2_MIPI_CTRL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	edpi_wms_fs Frame start in hold mode. 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
30	RW	0x0	edpi_wms_hold_en Enable hold mode. 1'b0: Disable 1'b1: Enable
29	RW	0x0	edpi_te_mode 1'b0: New frame is started by te. 1'b1: New frame is started by te and wms_fs.
28	RW	0x0	edpi_te_en Enable MIPI TE. 1'b0: Disable 1'b1: Enable
27:24	RW	0x0	dual_channel_overlap_num 4'h0: Overlap num 0 4'h1: Overlap num 2 4'h2: Overlap num 4 4'h3: Overlap num 6 4'h4: Overlap num 8 4'h5: Overlap num 10 4'h6: Overlap num 12 4'h7: Overlap num 14 4'h8: Overlap num 16
23:22	RO	0x0	reserved
21	RW	0x0	dual_channel_swap Swap two channel data of MIPI.
20	RW	0x0	dual_channel_en Enable mipi dual channel. 1'b0: Disable 1'b1: Enable
19:6	RO	0x00000	reserved
5:4	RW	0x0	dclk_out_ddr_ctrl 2'b00: normal 2'b01: dclk_out is ddr clk Others: reserved
3:0	RO	0x0	reserved

VOP2_POST2_COLOR_CTRL

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	color_bar_mode Select color bar mode. 1'b0: Horizontal mode 1'b1: Vertical mode
0	RW	0x0	color_bar_en Enable color bar. 1'b0: Disable 1'b1: Enable

VOP2_POST2_RESERVED2

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Field0000

VOP2_POST2_DSP_BG

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:20	RW	0x000	dsp_bg_red 10bit red color of background.
19:10	RW	0x000	dsp_bg_blue 10bit blue color of background.
9:0	RW	0x000	dsp_bg_green 10bit green color of background.

VOP2_POST2_PRE_SCAN_HTIMING

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	pre_scan_hactive Pre_scan horizontal active pixel.
15:13	RO	0x0	reserved
12:0	RW	0x0000	pre_scan_hblank Pre_scan horizontal blank pixel.

VOP2_POST2_DSP_HACT_INFO

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_hact_st_post Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_hact_end_post Panel display scanning horizontal active end point.

VOP2_POST2_DSP_VACT_INFO

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vact_st_post Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vact_end_post Panel display scanning horizontal active end point.

VOP2_POST2_SCL_FACTOR_YRGB

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	post_vs_factor Factor=((src_height[31:16])/(dst_height[31:16]))*2^12.
15:0	RW	0x0000	post_hs_factor Factor=((src_width[15:0])/(dst_width[15:0]))*2^12.

VOP2_POST2_SCL_CTRL

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	post0_ver_sd_en 1'b0: Post ver scl down disable 1'b1: Post ver scl down enable

Bit	Attr	Reset Value	Description
0	RW	0x0	post0_hor_sd_en 1'b0: Post hor scl down disable 1'b1: Post hor scl down enable

VOP2_POST2_DSP_VACT_INFO_F1

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vact_st_post_f1 Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_vact_end_post_f1 Panel display scanning horizontal active end point.

VOP2_POST2_DSP_HTOTAL_HS_END

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_htotal Panel display scanning horizontal period.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_hs_end Panel display scanning hsync pulse width.

VOP2_POST2_DSP_HACT_ST_END

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_hact_st Panel display scanning horizontal active start point.
15:13	RO	0x0	reserved
12:0	RW	0x0000	dsp_hact_end Panel display scanning horizontal active end point.

VOP2_POST2_DSP_VTOTAL_VS_END

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	dsp_vtotal Panel display scanning vertical period.
15	RW	0x0	sw_dsp_vtotal_imd Dsp vtotal number valid immediately enable. 1'b0: Valid after frame start 1'b1: Valid immediately

Bit	Attr	Reset Value	Description
15:14	RW	0x0	win0_yrgb_ver_scl_mode 2'b00: no scale 2'b01: Scale up 2'b10: Scale down 2'b11: No scale
13:12	RW	0x0	win0_yrgb_hor_scl_mode 2'b00: No scale 2'b01: Scale up 2'b10: Scale down 2'b11: No scale
11:4	RO	0x00	reserved
3:2	RW	0x0	win0_bic_coe_sel 2'b00: PRECISE 2'b01: SPLINE 2'b10: CATROM 2'b11: MITCHELL
1	RO	0x0	reserved
0	RW	0x0	win0_yrgb_axi_gather_en Win0 axi bus yrgb data gather transfer enable.

VOP2_CLUSTER_WIN0_CTRL2

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8:5	RW	0x0	win0_rid_cbr Axi read id of win0 cbr channel
4	RO	0x0	reserved
3:0	RW	0x0	win0_rid_yrgb Axi read id of win0 yrgb channel

VOP2_CLUSTER_WIN0_YRGB_MST

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	win0_yrgb_mst Win0 YRGB frame buffer memory start address.

VOP2_CLUSTER_WIN0_VIR

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	win0_vir_stride Number of words of Win0 yrgb Virtual width. ARGB888: win0_vir_width RGB888: (win0_vir_width*3/4) + (win0_vir_width%3) RGB565: ceil(win0_vir_width/2) YUV: ceil(win0_vir_width/4) YUV tile: ceil(win0_vir_width/4) YUYV,YVYU,UYVY,VYUY: ceil(win0_vir_width/4)

VOP2_CLUSTER_WIN0_ACT_INFO

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:16	RW	0x0000	win0_act_height win_act_height = (win0 vertical size -1).
15:13	RO	0x0	reserved
12:0	RW	0x0000	win0_act_width win_act_width = (win0 horizontal size -1).

VOP2_CLUSTER_WIN0_DSP_INFO

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	win0_dsp_height win0_dsp_height = (win0 vertical size -1).
15:12	RO	0x0	reserved
11:0	RW	0x000	win0_dsp_width win0_dsp_width = (win0 horizontal size -1).

VOP2_CLUSTER_WIN0_DSP_ST

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	win0_dsp_yst Win0 vertical start point(y) of the display region.
15:13	RO	0x0	reserved
12:0	RW	0x0000	win0_dsp_xst Win0 horizontal start point(x) of the display region.

VOP2_CLUSTER_WIN0_DSP_BG

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31	RW	0x0	win0_bg_en 1'b0: Disable 1'b1: Enable
30	RO	0x0	reserved
29:20	RW	0x000	win0_dsp_bg_red Win0 layer Background Red color.
19:10	RW	0x000	win0_dsp_bg_green Win0 layer Background Green color.
9:0	RW	0x000	win0_dsp_bg_blue Win0 layer Background Blue color.

VOP2_CLUSTER_WIN0_SCL_FACTOR_YRGB

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win0_vs_factor_yrgb factor=((LCDC_WIN0_ACT_INFO[31:16]) / (LCDC_WIN0_DSP_INFO[31:16]))*2^12.
15:0	RW	0x0000	win0_hs_factor_yrgb factor=((LCDC_WIN0_ACT_INFO[15:0]) / (LCDC_WIN0_DSP_INFO[15:0]))*2^12.

VOP2_CLUSTER_WIN0_SCL_OFFSET

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x00	win0_vs_offset_yrgb (0x00~0xff)/0x100 = 0~0.99.
15:8	RO	0x00	reserved
7:0	RW	0x00	win0_hs_offset_yrgb (0x00~0xff)/0x100 = 0~0.99.

VOP2_CLUSTER_WIN0_TRANSFORMED_OFFSET

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:16	RW	0x0	transformed_yoffset The y_offset between the first acitve pixel and the first pixel of column.
15:4	RO	0x000	reserved
3:0	RW	0x0	transformed_xoffset The x_offset between the first acitve pixel and the first pixel of line.

VOP2_CLUSTER_WIN0_AFBCD_OUTPUT_CTRL

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x1	win0_afbcd_gating_en win0 afbcd gating enable
0	RW	0x0	win0_afbcd_output_mask_en 1'b0: AFBCD output must be aligned to 16 width/height 1'b1: AFBCD output can be random integer yuv420 width/height is even, yuv422 width is even.

VOP2_CLUSTER_WIN0_AFBCD_MODE

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	win0_ymir_en 1'b0: Ymirror disable 1'b1: Ymirror when afbcd output
2	RW	0x0	win0_xmir_en 1'b0: Xmirror disable 1'b1: Xmirror when afbcd output
1	RW	0x0	win0_rot270_en 1'b0: Rotation 270 disable 1'b1: Rotation 270 angle, when afbcd output
0	RW	0x0	win0_rot90_en 1'b0: Rotation 90 disable 1'b1: Enable, rotation 90 angle when afbcd output

VOP2_CLUSTER_WIN0_AFBCD_HDR_PTR

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	win0_afbcd_hdr_ptr AFBC encode stream starting address in DDR.

VOP2_CLUSTER_WIN0_AFBCD_VIR_WIDTH

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win0_afbcd_tail_num header/payload arbiter tail number.
15:0	RW	0x0000	win0_afbcd_pic_vir_width Number of bytes of AFBCD header virtual width. when afbcd mode is x_mirror/rot90/rot270, it must be aligned to 64pixels, or it must be aligned to 16 pixels.

VOP2_CLUSTER_WIN0_AFBCD_SIZE

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win0_afbcd_pic_height When win0_afbcd_output_mask_en is 1, it can be random,or it must be aligned to 16bit. Real - 1
15:0	RW	0x0000	win0_afbcd_pic_width When win0_afbcd_output_mask_en is 1, it can be random,or it must be aligned to 16bit. Real - 1

VOP2_CLUSTER_WIN0_AFBCD_PIC_OFFSET

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win0_afbcd_pic_yoffset Display image vertical offset in DDR. When win0_afbcd_output_mask_en is 1, it can be random, or it must be aligned to 16bit.
15:0	RW	0x0000	win0_afbcd_pic_xoffset Display image horizon offset in DDR. When win0_afbcd_output_mask_en is 1, it can be random, or it must be aligned to 16bit.

VOP2_CLUSTER_WIN0_AFBCD_DIS_OFFSET

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win0_afbcd_dis_yoffset Display image vertical offset in panel. it can be random.
15:0	RW	0x0000	win0_afbcd_dis_xoffset Display image horizon offset in panel. it can be random.

VOP2_CLUSTER_WIN0_AFBCD_CTRL

Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10	RW	0x0	win0_afbcd_uv_swap_en win0 afbcd mode uv swap enable
9	RW	0x0	win0_afbcd_rb_swap_en win0 afbcd mode rb swap enable
8	RW	0x0	win0_afbcd_block_split 1'b0: Disable 1'b1: Enable
7	RW	0x0	win0_afbcd_half_block 1'b0: Afbcd full mode, 16 line one tail line 1'b1: Afbcd half mode, 8 line one tail line

Bit	Attr	Reset Value	Description
6:2	RW	0x00	win0_afbcd_pixel_packing_fmt AFBCD data format. 4'h0: RGB565 4'h2: RGBA1010102 4'h3: YUV420_101010 4'h4: RGB888 4'h5: RGBA8888 4'h9: YUV420_888 4'hb: YUV422_888 4'he: YUV422_101010 Others: Reserved [4]: color transform 1'b0: Disable 1'b1: Enable
1:0	RW	0x0	win0_afbcd_video_top_crop video top crop. 2'b00: 0 2'b01: 4 2'b10: 8 others: Reserved

VOP2_CLUSTER_WIN1_CTRL0

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19	RW	0x0	win1_yuv_clip 1'b0: Disable, YCbCr no clip 1'b1: Enable, YCbCr clip before YCbCr2RGB *Y clip: 16~235, CbCr clip: 16~239
18	RW	0x0	win1_dither_up_en 1'b0: Disable 1'b1: Enable

VOP2_CLUSTER_WIN1_TRANSFORMED_OFFSET

Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:16	RW	0x0	transformed_yoffset The y_offset between the first acitve pixel and the first pixel of column.
15:4	RO	0x000	reserved
3:0	RW	0x0	transformed_xoffset The x_offset between the first acitve pixel and the first pixel of line.

VOP2_CLUSTER_WIN1_AFBCD_OUTPUT_CTRL

Address: Operational Base + offset (0x00D0)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4	RW	0x1	win1_afbcd_gating_en win1 afbcd gating enable
0	RW	0x0	win1_afbcd_output_mask_en 1'b0: AFBCD output must be aligned to 16 width/height 1'b1: AFBCD output can be random integer yuv420 width/height is even, yuv422 width is even.

VOP2_CLUSTER_WIN1_AFBCD_MODE

Address: Operational Base + offset (0x00D4)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	win1_ymir_en 1'b0: Ymirror disable 1'b1: Ymirror when afbcd output
2	RW	0x0	win1_xmir_en 1'b0: Xmirror disable 1'b1: Xmirror when afbcd output
1	RW	0x0	win1_rot270_en 1'b0: Rotation 270 disable 1'b1: Rotation 270 angle, when afbcd output
0	RW	0x0	win1_rot90_en 1'b0: Rotation 90 disable 1'b1: Enable, rotation 90 angle when afbcd output

VOP2_CLUSTER_WIN1_AFBCD_HDR_PTR

Address: Operational Base + offset (0x00D8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	win1_afbcd_hdr_ptr AFBC encode stream starting address in DDR.

VOP2_CLUSTER_WIN1_AFBCD_VIR_WIDTH

Address: Operational Base + offset (0x00DC)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win1_afbcd_tail_num Header/payload arbiter tail number.
15:0	RW	0x0000	win1_afbcd_pic_vir_width Number of bytes of AFBCD header virtual width. When afbcd mode is x_mirror/rot90/rot270, it must be aligned to 64 pixels, or it must be aligned to 16pixels.

VOP2_CLUSTER_WIN1_AFBCD_SIZE

Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win1_afbcd_pic_height When win1_afbcd_output_mask_en is 1, it can be random, or it must be aligned to 16bit. Real - 1
15:0	RW	0x0000	win1_afbcd_pic_width When win1_afbcd_output_mask_en is 1, it can be random, or it must be aligned to 16bit. Real - 1

VOP2_CLUSTER_WIN1_AFBCD_PIC_OFFSET

Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win1_afbcd_pic_yoffset Display image vertical offset in DDR. When win1_afbcd_output_mask_en is 1, it can be random,or it must be aligned to 16bit.
15:0	RW	0x0000	win1_afbcd_pic_xoffset Display image horizon offset in DDR. When win1_afbcd_output_mask_en is 1, it can be random,or it must be aligned to 16bit.

VOP2_CLUSTER_WIN1_AFBCD_DIS_OFFSET

Address: Operational Base + offset (0x00E8)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win1_afbcd_dis_yoffset Display image vertical offset in panel. it can be random.
15:0	RW	0x0000	win1_afbcd_dis_xoffset Display image horizon offset in panel. it can be random.

VOP2_CLUSTER_WIN1_AFBCD_CTRL

Address: Operational Base + offset (0x00EC)

Bit	Attr	Reset Value	Description

VOP2_CLUSTER_LG_COE0

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cluster_lg_coe0 Coefficient of 3x3 matrix.

VOP2_CLUSTER_LG_COE1

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cluster_lg_coe1 Coefficient of 3x3 matrix.

VOP2_CLUSTER_LG_COE2

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cluster_lg_coe2 Coefficient of 3x3 matrix.

VOP2_CLUSTER_HG_COE0

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cluster_hg_coe0 Coefficient of 3x3 matrix.

VOP2_CLUSTER_HG_COE1

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cluster_hg_coe1 Coefficient of 3x3 matrix.

VOP2_CLUSTER_HG_COE2

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cluster_hg_coe2 Coefficient of 3x3 matrix.

13.4.7 Esmart register description

13.4.7.1 Registers Summary

The base address of esmart0 registers is 0x1800.
The base address of esmart1 registers is 0x1a00.

Name	Offset	Size	Reset Value	Description
VOP2_ESMART_CTRL0	0x0000	W	0x00000000	To enable the color space conversion of esmart.
VOP2_ESMART_CTRL1	0x0004	W	0x0000B0A0	To control the dma of esmart.
VOP2_ESMART_REGION0_MST_CTL	0x0010	W	0x00000000	To enable the region0 of esmart.
VOP2_ESMART_REGION0_MST_YRGB	0x0014	W	0x00000000	To configure the starting address of YRGB in memory.
VOP2_ESMART_REGION0_MST_CBCR	0x0018	W	0x00000000	To configure the starting address of CBCR in memory.
VOP2_ESMART_REGION0_VIR	0x001C	W	0x00000000	To configure the virtual width of data in memory.
VOP2_ESMART_REGION0_ACT_INFO	0x0020	W	0x00000000	To configure the active size of data .
VOP2_ESMART_REGION0_DSP_INFO	0x0024	W	0x00000000	To configure the display size of data .
VOP2_ESMART_REGION0_DSP_OFFSET	0x0028	W	0x00000000	To configure the display offset of data .
VOP2_ESMART_REGION0_SCL_CTRL	0x0030	W	0x00000000	To enable the scaling of esmart.
VOP2_ESMART_REGION0_SCL_FACTOR_YRGB	0x0034	W	0x10001000	To configure the scaling factor of YRGB.
VOP2_ESMART_REGION0_SCL_FACTOR_CBCR	0x0038	W	0x10001000	To configure the scaling factor of CBCR.
VOP2_ESMART_REGION0_SCL_OFFSET	0x003C	W	0x00000000	To configure the scaling offset of esmart.
VOP2_ESMART_REGION1_MST_CTL	0x0040	W	0x00000000	To enable the region1 of esmart.
VOP2_ESMART_REGION1_MST_YRGB	0x0044	W	0x00000000	To configure the starting address of YRGB in memory.
VOP2_ESMART_REGION1_MST_CBCR	0x0048	W	0x00000000	To configure the starting address of CBCR in memory.
VOP2_ESMART_REGION1_VIR	0x004C	W	0x00000000	To configure the virtual width of data in memory.
VOP2_ESMART_REGION1_ACT_INFO	0x0050	W	0x00000000	To configure the active size of data .
VOP2_ESMART_REGION1_DSP_INFO	0x0054	W	0x00000000	To configure the display size of data .
VOP2_ESMART_REGION1_DSP_OFFSET	0x0058	W	0x00000000	To configure the display offset of data .
VOP2_ESMART_REGION1_SCL_CTRL	0x0060	W	0x00000000	To enable the scaling of esmart.
VOP2_ESMART_REGION1_SCL_FACTOR_YRGB	0x0064	W	0x10001000	To configure the scaling factor of YRGB.

Name	Offset	Size	Reset Value	Description
VOP2_ESMART_REGION1_SCL_FACTOR_CBCR	0x0068	W	0x10001000	To configure the scaling factor of CBCR
VOP2_ESMART_REGION1_SCL_OFFSET	0x006C	W	0x00000000	To configure the scaling offset of esmart.
VOP2_ESMART_REGION2_MST_CTL	0x0070	W	0x00000000	To enable the region2 of esmart.
VOP2_ESMART_REGION2_MST_YRGB	0x0074	W	0x00000000	To configure the starting address of YRGB in memory.
VOP2_ESMART_REGION2_MST_CBCR	0x0078	W	0x00000000	To configure the starting address of CBCR in memory.
VOP2_ESMART_REGION2_VIR	0x007C	W	0x00000000	To configure the virtual width of data in memory.
VOP2_ESMART_REGION2_ACT_INFO	0x0080	W	0x00000000	To configure the active size of data .
VOP2_ESMART_REGION2_DSP_INFO	0x0084	W	0x00000000	To configure the dsiplay size of data .
VOP2_ESMART_REGION2_DSP_OFFSET	0x0088	W	0x00000000	To configure the dsiplay offset of data .

VOP2_ESMART_REGION3_SCL_OFFSET	0x00CC	W	0x00000000	To configure the scaling offset of esmart.
VOP2_ESMART_KEY_CTRL	0x00D0	W	0x00000000	To configure the color key of esmart.
VOP2_ESMART_BG_EN	0x00D4	W	0x00000000	To enable the background of esmart.

13.4.7.2 Detail Registers Description

VOP2_ESMART_CTRL0

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	esmart_8bpp_lut_en To enable 8bpp LUT.
3:2	RW	0x0	esmart_csc_mode Color space conversion: 2'b00: BT601_L 2'b01: BT709_L 2'b10: BT601_F 2'b11: BT2020
1	RW	0x0	esmart_rgb2yuv_en 1'b0: Disable 1'b1: Enable
0	RW	0x0	esmart_yuv2rgb_en 1'b0: Disable 1'b1: Enable

VOP2_ESMART_CTRL1

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	esmart_ymir_en 1'b0: Axi addr add vstep 1'b1: Axi addr sub vstep
30:29	RW	0x0	esmart_dma_rreq_thold Esmart dma hurry read request thold. If esmart empty lb number >= esmart_dma_rreq_thold , dma_rreq_hurry is asserted.
28	RW	0x0	esmart_dma_rreq_hurry_en Enable esmart dma hurry read request. 1'b0: Disable 1'b1: Enable
27:24	RW	0x0	esmart_cbcr_gather_num The gather number of CBCR.
23:20	RW	0x0	esmart_yrgb_gather_num The gather number of YRGB.
19:16	RO	0x0	reserved
15:12	RW	0xb	esmart_cbcr_rid AXI read id of esmart cbcr channel.
11:8	RO	0x0	reserved
7:4	RW	0xa	esmart_yrgb_rid AXI read id of esmart yrgb channel.
3	RW	0x0	esmart_cbcr_gather_en To enable CBCR gather transfer.
2	RW	0x0	esmart_yrgb_gather_en To enable YRGB gather transfer.
1:0	RW	0x0	esmart_esmart_axi_rlen 2'b00: Burst16 (burst 15 in rgb888 pack mode) 2'b01: Burst8 (burst 12 in rgb888 pack mode) 2'b10: Burst4 (burst 6 in rgb888 pack mode) 2'b11: Reserved

VOP2_ESMART_REGION0_MST_CTL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x0	region0_yuv_clip 1'b0: Disable, YCbCr no clip 1'b1: Enable, YCbCr clip before YCbCr2RGB *Y clip: 16~235, CbCr clip: 16~239
16	RW	0x0	region0_uv_swap Swap U and V component.
15	RW	0x0	region0_mid_swap 1'b0: Y3Y2Y1Y0 1'b1: Y3Y1Y2Y0
14	RW	0x0	region0_rb_swap 1'b0: RGB 1'b1: BGR
13	RW	0x0	region0_alpha_swap 1'b0: ARGB 1'b1: RGBA
12	RW	0x0	region0_dither_up_en 1'b0: Disable 1'b1: Enable

31	RW	0x0	esmart_key_en 1'b0: Disable 1'b1: Enable
30	RO	0x0	reserved
29:20	RW	0x000	esmart_r_key_value Esmart RED color key.
19:10	RW	0x000	esmart_g_key_value Esmart GREEN color key.
9:0	RW	0x000	esmart_b_key_value Esmart Blue color key.

VOP2_SMART_BG_EN

Address: Operational Base + offset (0x00D4)

Bit	Attr	Reset Value	Description
31	RW	0x0	esmart_bg_en 1'b0: Disable 1'b1: Enable
30	RO	0x0	reserved
29:20	RW	0x000	esmart_r_value Esmart Background Red color.
19:10	RW	0x000	esmart_g_value Esmart Background Green color.
9:0	RW	0x000	esmart_b_value Esmart Background Blue color.

13.4.9 HDR10 register description

13.4.9.1 Registers Summary

The base address of HDR10 registers is 0x2000.

Name	Offset	Size	Reset Value	Description
VOP2_HDR10_LUT_CTRL	0x0000	W	0x00000000	To control the fetching of HDR10 LUT.
VOP2_HDR10_LUT_MST	0x0004	W	0x00000000	To control the fetching of HDR10 LUT.
VOP2_SDR2HDR_CTRL	0x0010	W	0x00000000	To enable the SDR2HDR of HDR10.
VOP2_HDR2SDR_CTRL	0x0020	W	0x00000000	To enable the HDR2SDR of HDR10.
VOP2_HDR2SDR_SRC_RANGE	0x0024	W	0x00000000	To configure the source luminance of HDR10.
VOP2_HDR2SDR_NORFACEETF	0x0028	W	0x00000000	To configure the normalized factor of EETF.
VOP2_HDR2SDR_DST_RANGE	0x002C	W	0x00000000	To configure the destination luminance of HDR10.
VOP2_HDR2SDR_NORMFACCGAMMA	0x0030	W	0x00000000	To configure the normalized factor of GAMMA.
VOP2_EETF_OETF0	0x003C	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF1	0x0040	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF2	0x0044	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF3	0x0048	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF4	0x004C	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF5	0x0050	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF6	0x0054	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF7	0x0058	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF8	0x005C	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF9	0x0060	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF10	0x0064	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF11	0x0068	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF12	0x006C	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF13	0x0070	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF14	0x0074	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF15	0x0078	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF16	0x007C	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.

Name	Offset	Size	Reset Value	Description
VOP2_EETF_OETF17	0x0080	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.
VOP2_EETF_OETF18	0x0084	W	0x00000000	To configure the Y value of BT1886_OETF and EETF curve.

13.4.9.2 Detail Registers Description

VOP2_HDR10_LUT_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	hdr10_lut_mode Configure HDR10 register mode. 1'b0: AXI 1'b1: AHB
0	RW	0x0	hdr10_lut_update_en Update HDR10 configure. 1'b0: disable 1'b1: enable

VOP2_HDR10_LUT_MST

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hdr10_lut_mst HDR10 configure's start address in memory.

VOP2_SDR2HDR_CTRL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RW	0x0	sdr2hdr_gating_en Enable SDR2HDR auto-gating. 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
8	RW	0x0	sdr2hdr_bypass_en Bypass SDR2HDR function. 1'b0: Disable 1'b1: Enable
7:4	RO	0x0	reserved
3	RW	0x0	sdr2hdr_oetf_en Enable OETF curve. 1'b0: Disable 1'b1: Enable
2	RW	0x0	sdr2hdr_r2r_mode Select R2R mode. 1'b0: RGB709TORGB2020 1'b1: RGB2020TORGB709
1	RW	0x0	sdr2hdr_r2r_en Enable R2R convert. 1'b0: Disable 1'b1: Enable
0	RW	0x0	sdr2hdr_eotf_en Enable EOTF curve. 1'b0: Disable 1'b1: Enable

VOP2_HDR2SDR_CTRL

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:10	RO	0x00000000	reserved
9	RW	0x0	hdr2sdr_gating_en 1'b0: Disable 1'b1: Enable
8	RW	0x0	hdr2sdr_bypass_en 1'b0: Disable 1'b1: Enable
7:1	RO	0x0	reserved
0	RW	0x0	hdr2sdr_en 1'b0: Disable 1'b1: Enable

VOP2_HDR2SDR_SRC_RANGE

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	src_max Source max luminance.
15:14	RO	0x0	reserved
13:0	RW	0x0000	src_min Source min luminance.

VOP2_HDR2SDR_NORFACEETF

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x000	normfaceetf Normalization eetf factor.

VOP2_HDR2SDR_DST_RANGE

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dst_max Destination max luminance.
15:0	RW	0x0000	dst_min Destination min luminance.

VOP2_HDR2SDR_NORMFACCGAMMA

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	normfaccgamma Normalization gamma factor.

VOP2_EETF_OETF0

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF1

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF2

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF3

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF4

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF5

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF6

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF7

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF8

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF9

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved

Bit	Attr	Reset Value	Description
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF10

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF11

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

VOP2_EETF_OETF12

Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	bt1886oetf_y bt1886oetf y.
15:14	RO	0x0	reserved
13:0	RW	0x0000	eetf_y eetf y.

13.4.10.2 Detail Registers Description

VOP2_MMU_DTE_ADDR

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dte_addr Current page table address.

VOP2_MMU_STATUS

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:6	RW	0x00	page_fault_bus_id Index of master responsible for last page fault.
5	RW	0x0	page_fault_is_write The direction of access for last page fault: 1'b0: Read 1'b1: Write
4	RW	0x0	replay_buffer_empty The MMU replay buffer is empty.
3	RW	0x0	mmu_idle The MMU is idle when accesses are being translated and there are no unfinished translated accesses.
2	RW	0x0	stail_active MMU stall mode currently enabled. The mode is enabled by command.
1	RW	0x0	page_fault_active MMU page fault mode currently enabled. The mode is enabled by command.
0	RW	0x0	paging_en Paging is enabled. 1'b0: Disable 1'b1: Enable

VOP2_MMU_COMMAND

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
2:0	RW	0x0	mmu_cmd This can be: 3'd0: MMU_ENABLE_PAGING 3'd1: MMU_DISABLE_PAGING 3'd2: MMU_ENABLE_STALL 3'd3: MMU_DISABLE_STALL 3'd4: MMU_ZAP_CACHE 3'd5: MMU_PAGE_FAULT_DONE 3'd6: MMU_FORCE_RESET Others: Reserved

VOP2_MMU_PAGE_FAULT_ADDR

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	page_fault_addr Address of last page fault.

VOP2_MMU_ZAP_ONE_LINE

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	mmu_zap_one_line Address to be invalidated from the page table cache.

VOP2_MMU_INT_RAWSTAT

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	rawst_bus_error Raw interrupt status of read bus error.
0	RW	0x0	rawst_page_fault Raw interrupt status of page fault.

VOP2_MMU_INT_CLEAR

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	clr_bus_error Clear interrupt of bus error.
0	RW	0x0	clr_page_fault Clear interrupt of page fault.

VOP2_MMU_INT_MASK

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	mask_bus_error Mask interrupt of bus error.
0	RW	0x0	mask_page_fault Mask interrupt of page fault.

VOP2_MMU_INT_STATUS

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	st_bus_error Interrupt status of bus error.
0	RW	0x0	st_page_fault Interrupt status of page fault.

VOP2_MMU_AUTO_GATING

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	mmu_cfg_mode 1'b0: Regdone when frame start 1'b1: Regdone immediately
0	RW	0x0	mmu_auto_gating When it is 1'b1, the mmu will auto gating it self.

13.4.11 LUT address summary

The base address of GAMMA LUT is 0x4000, it's size is 0x1000. The base address of BPP LUT is 0x5000, it's size is 0x0400.

13.5 Application Note

13.5.1 Cluster application note

1. The vir_width and vir_height of the afbcd image is a multiple of 16.
2. If rotation_90 or rotation_270 is enable, afbcd_full_mode must be enable and lb_mode must be 2. Rotation_90 and rotation_270 can't be enable at the same time.
3. The height of the rotated image must be less than 2048.
4. If the afbcd image width is greater than 2048, half mode must be 1 and lb_mode must be 0.
5. If cluster is used to display two pictures, lb_mode and afbcd_half_block must be 1 and the picture width can't be greater than 2048.
6. The active width of the afbcd image must be a multiple of 4.
7. The scale factor must be less than 4. Otherwise, there is not enough AXI bandwidth to cause some display error.
8. The active width must be a multiple of 4.

13.5.2 Smart application note

1. The active width and display width of the image is a multiple of 2.
2. If YUYV420 is enable, the scale mode can't be 2.
3. If YUV-10 is enable, the active width of the image must be a multiple of 4.
4. The maximum gather number of smart is 4.

13.5.3 HDR10 application note

1. Only one HDR10 image is supported. If hdr2sdr is enable, hdr10_path_en must be 1.
2. If the display panel is HDR and the image is SDR, sdr2hdr and sdr2sdr_path_en must be enable.
3. The delay between the input and the output of HDR2SDR is 37. The delay between the input and the output of SDR2HDR is 10.

13.5.4 CABC application note

1. Post-process1 is support CABC. If CABC is enable, the post_lb_mode must be 1 and the display with is less than 1024.

13.5.5 Interlace application note

1. If interlace is enable, p2i_en must be enable.
2. If the resolution of the display panel is 480i or 576i, dsp_core_dclk_sel must be enable.

13.5.6 Write back application note

1. The maximum resolution of the wrote back image is 1920x1080. If the wrote back image resolution is greater than 1080p, scale down must be enable.
2. The wb_fifo_thold must be greater than the amount of data in row.

13.5.7 The delay number of overlay application note

The delay number used in different application scenarios is shown as below.

Tcases	Win	Delay number	Max delay number
SDR Input and SDR output	CLUSTERx	0	42
	SMARTx	20	
	Vp0_bg	42	
	Vp1_bg	40	
	Vp2_bg	40	
HDR input and SDR output	CLUSTER0(HDR10)	0	69
	CLUSTER1(SDR)	27	
	SMARTx(SDR)	47	
	Vp0_bg	69	
HDR input and SDR output	CLUSTERx(SDR)	27	69
	SMART0(HDR)	20	
	SMARTx(SDR)	47	
	Vp0_bg	69	
SDR input and HDR output	CLUSTERx	0	53
	ESMATx	20	
	Vp0_bg	53	
HDR input and HDR output	CLUSTER0(HDR10)	21	53
	CLUSTER1(SDR)	0	
	SMARTx(SDR)	20	
	Vp0_bg	53	
HDR input and HDR output	CLUSTERx(SDR)	0	53
	SMART0(HDR)	41	
	SMARTx(SDR)	20	
	Vp0_bg	53	

13.5.8 HDR10 application note

If HDR10 is enable, overlay_mode must be RGB.

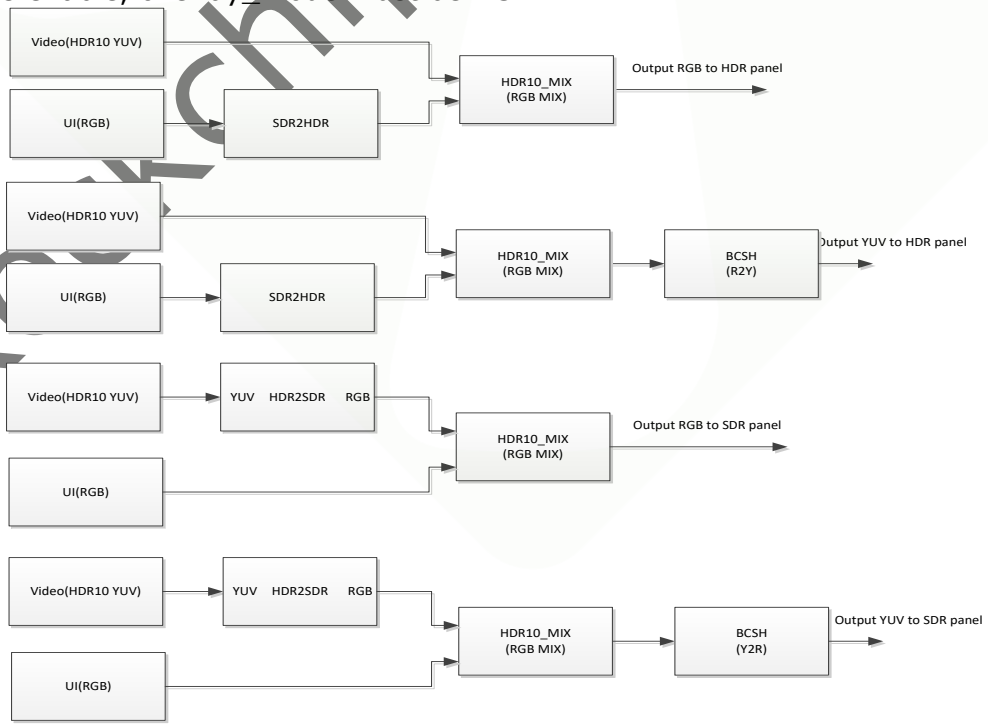

Fig.13-5 HDR10 application

Chapter 14 Raster Graphic Acceleration (RGA2)

14.1 Overview

RGA2 is a separate 2D raster graphic acceleration unit. It accelerates 2D graphics operations, such as point/line drawing, image scaling, rotation, BitBLT, alpha blending.

14.2 Features

- **Data format**
  - Input data:
    - ARGB/RGB888/RGB565/RGB4444/RGB5551
    - YUV420/YUV422/YVYU422/YVYU420/YUV422SP10bit/YUV420SP10bit
  - Output data:
    - ARGB/RGB888/RGB565/RGB4444/RGB5551
    - YUV420/YUV422/YUV400/Y4/YVYU422/YVYU420
  - Pixel Format conversion, BT.601/BT.709
  - Dither operation
  - Max resolution: 8192x8192 source, 4096x4096 destination
- **Scaling**
  - Down-scaling: Average filter
  - Up-scaling: Bi-cubic filter(source>2048 would use Bi-linear)
  - Arbitrary non-integer scaling ratio，from 1/16 to 16
- **Rotation**
  - 0, 90, 180, 270 degree rotation
  - x-mirror, y-mirror & rotation operation
- **BitBLT**
  - Block transfer
  - Color palette/Color fill, support with alpha
  - Transparency mode (color keying/stencil test, specified value/value range)
  - Two source BitBLT:
  - A+B=B only BitBLT, A support rotate&scale when B fixed
  - A+B=C second source (B) has same attribute with (C) plus rotation function
- **Alpha Blending**
  - New comprehensive per-pixel alpha(color/alpha channel separately)
  - Fading
  - Support SRC1(R2Y)+SRC0(YUV) -> DST(YUV)
  - Support DST Full CSC convert for YUV2YUV
- **Others**
  - Support NN quantize (CLIP((source + offset) * scale) for RGB channel)
  - Floyd–Steinberg dither (RGB888 or 565 TO Y4 ; RGB888 or 565 DITHER TO Y4)
- **MMU**
  - 4k/64k page size
  - Four channel: SRC/SRC1/DST/CMD, individual base address and enable control bit
  - TLB pre-fetch

Constrain：

(1) YUV420/422-8bit virtual stride need 8byte align，xoff/yoff need 2byte algin；
(2) YUV420/422-10bit virtual stride need 16byte align，not support xoff/yoff；
(3) Vertical scale down or not && Horizontal bi-cubic scale up src0 width<=2048；
Vertical scale up && Horizontal bi-cubic scale up src0 width<=1928；
(4) Vertical scale down or not && Horizontal bilinear scale up src0 width<=4096；
Vertical scale up && Horizontal bilinear scale up src0 width<=3856；

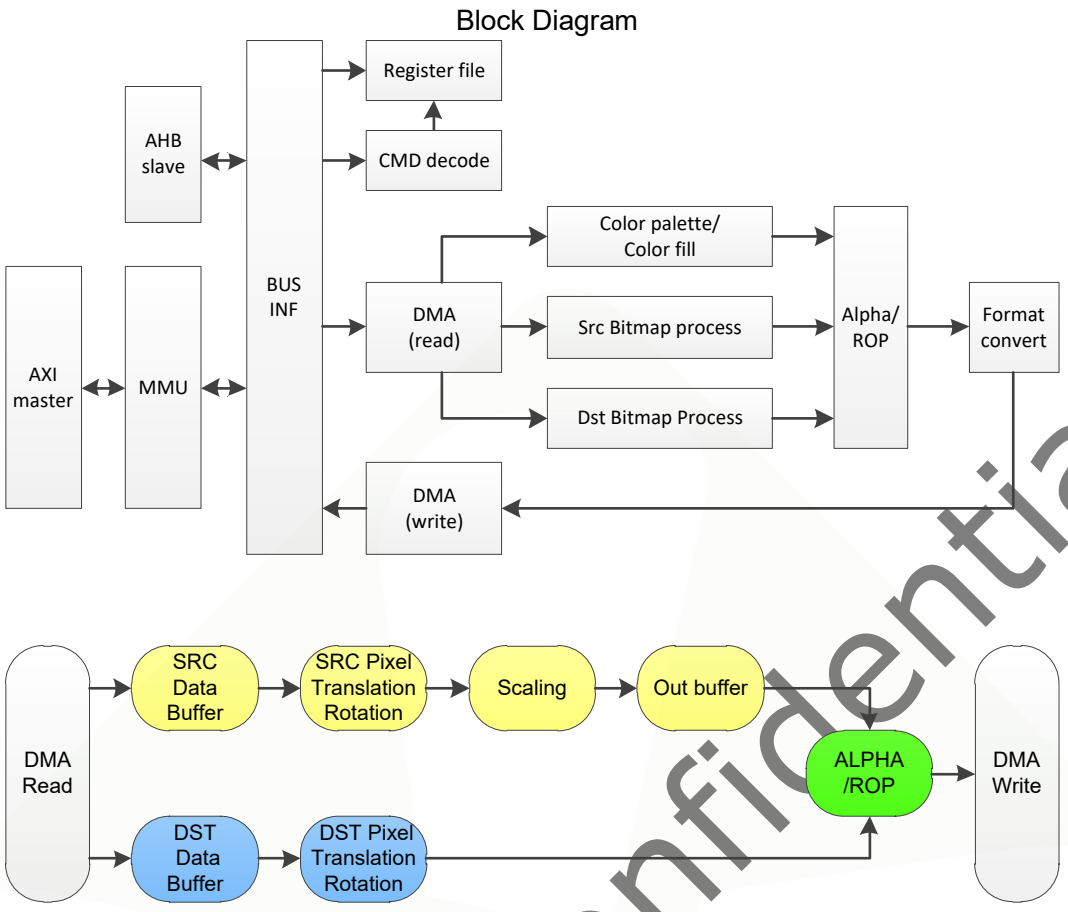

Fig. 14-1 RGA2 Block Diagram

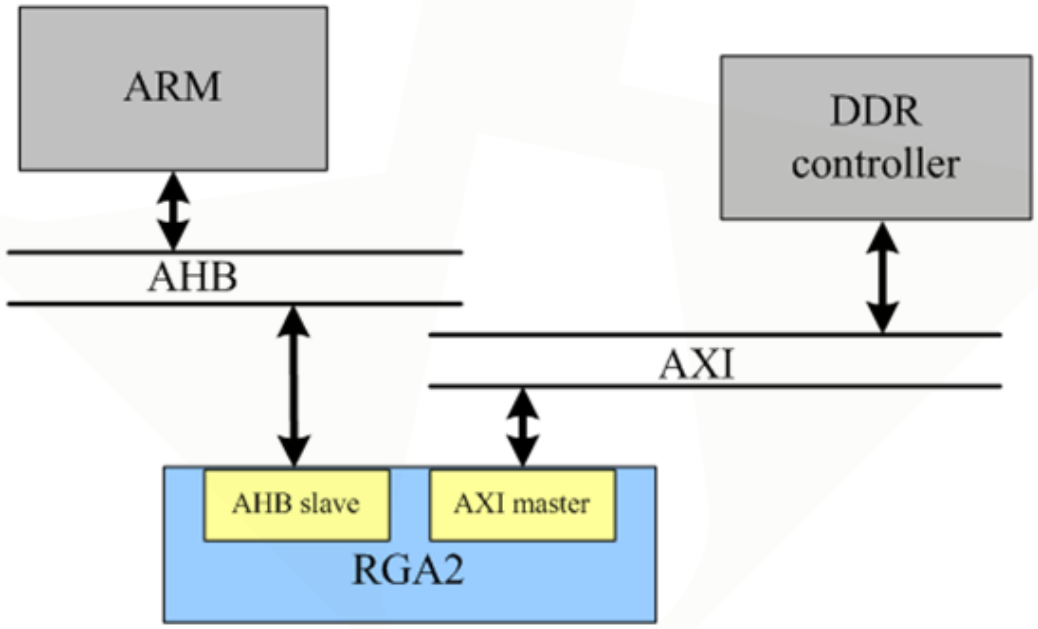

Fig. 14-2 RGA2 in SOC

14.3 Function Description

14.3.1 Data Format

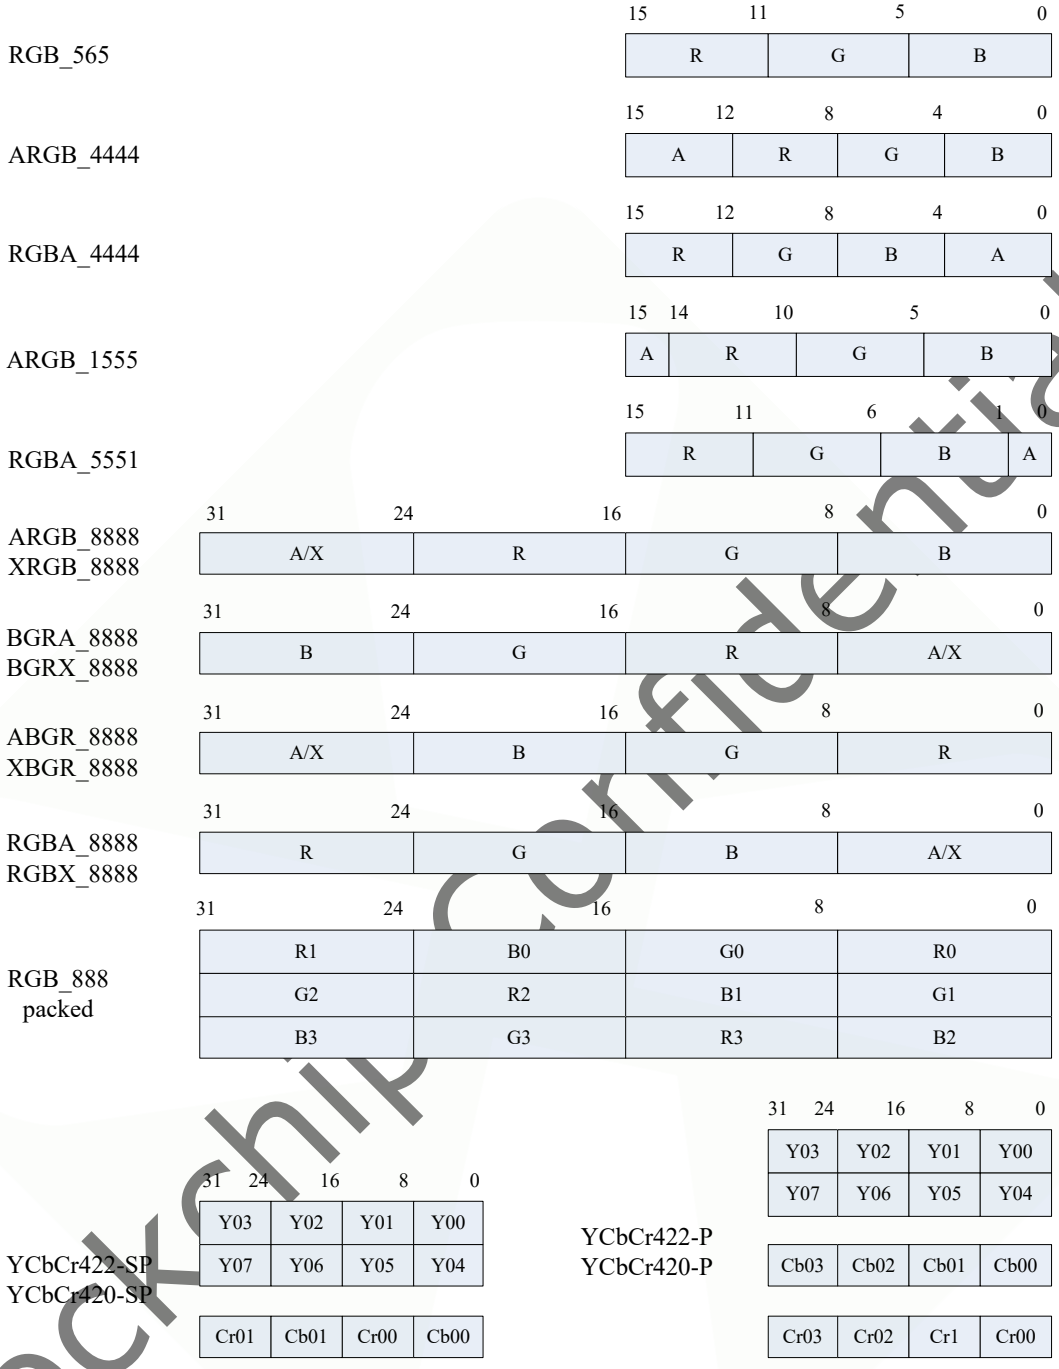

Fig. 14-3 RGA Input Data Format

All input data (defined by SRC_IN_FMT/DST_IN_FMT) are converted to ABGR8888. The results are converted to the output data format (defined by DST_OUT_FMT).

14.3.2 Dithering

There could have dithering operation for source image when the source image format is not RGB565 and the destination format is RGB565.

The down-dithering is done using Dither Allegro.

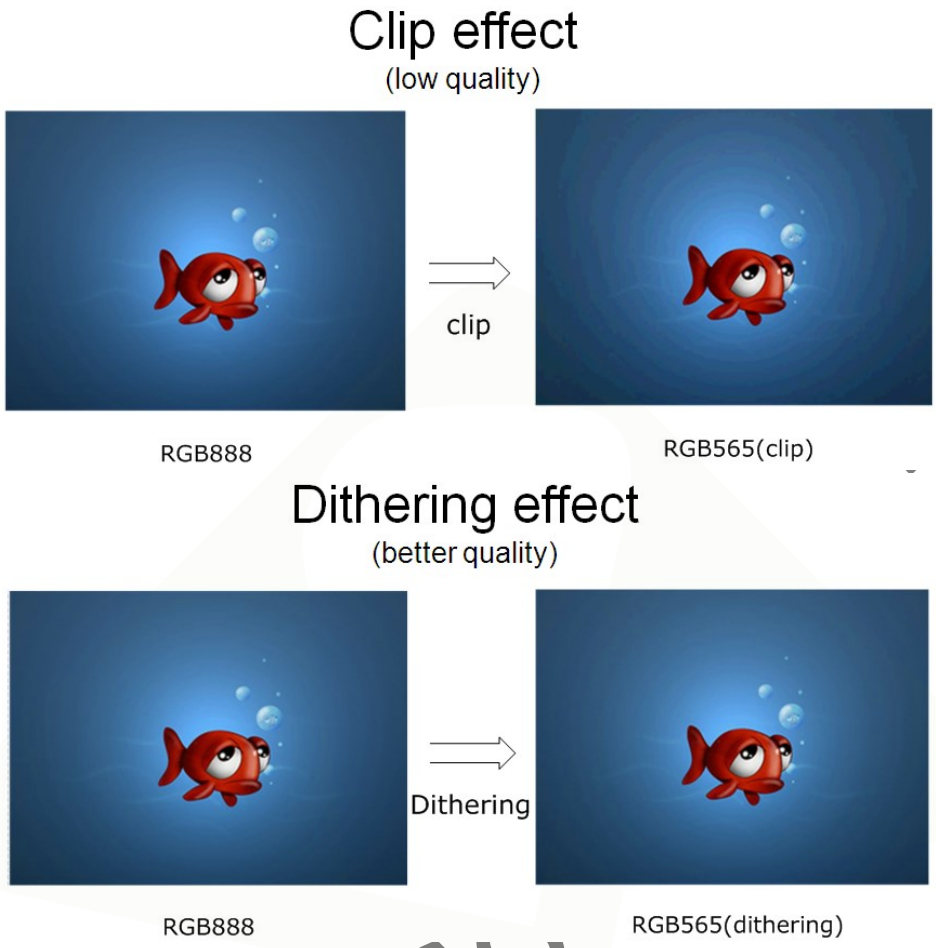

Fig. 14-4 RGA Dither effect

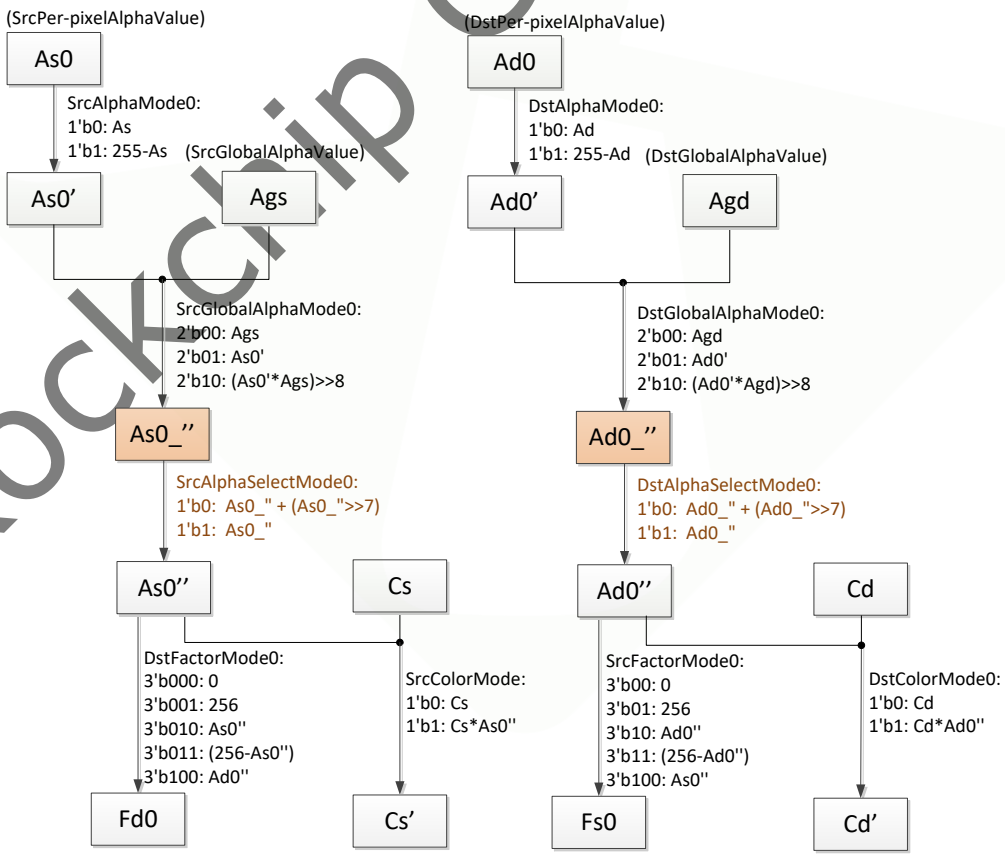
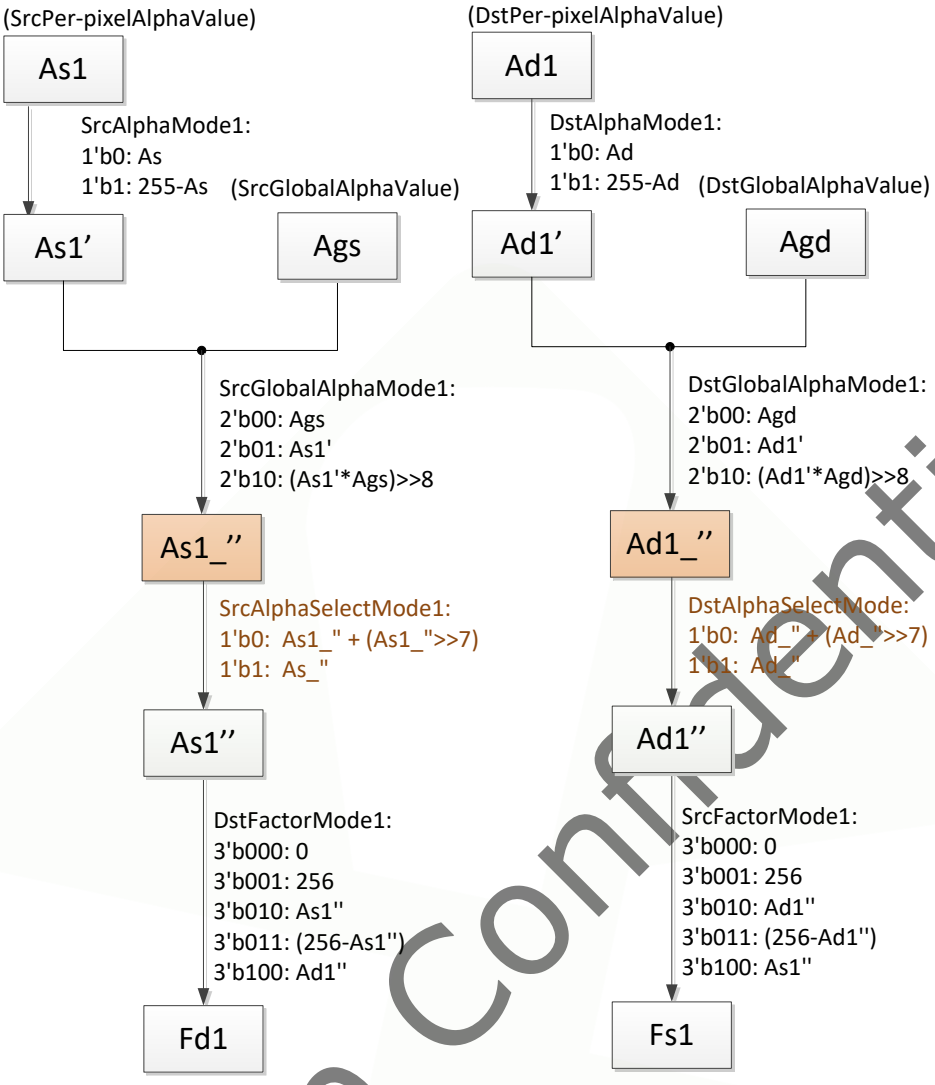
14.3.3 Alpha mode



$$Cd = Fs0 * Cs' + Fd0 * Cd' \quad (1)$$

(Cd – dst color, Fs0 – color src factor0, Cs' – src color', Fd0 – color dst factor0, Cd' – dst color')



$$Ad = Fs1 * As1'' + Fd1 * Ad1'' \quad (2)$$

(Ad – dst alpha, Fs1 – alpha src factor1, As1'' – src alpha'', Fd1 – alpha dst factor1, Ad1' – dst alpha'')

Fig. 14-5 alpha mode configure description

14.3.4 Color fill

Two modes of color fill can be done by RGA: solid fill and gradient fill.

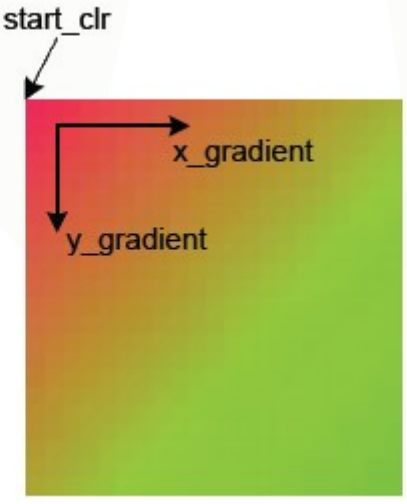


Fig. 14-6 RGA Gradient Fill

Gradient fill using following equations for ARGB calculation of every pixel in different

coordinary.
A_cur = (A_start + x*x_A_gradient) +y*y_A_gradient;
R_cur = (R_start + x*x_R_gradient) +y*y_R_gradient;
G_cur = (G_start + x*x_G_gradient) +y*y_G_gradient;
B_cur = (B_start + x*x_B_gradient) +y*y_B_gradient;
A_start, R_start, G_start, B_start is the ARGB value of start point. There are four pairs of values for horizontal and vertical gradient. Saturation operation could be enabled or disabled if the color overflows 255 or underflows 0.

14.3.5 Scaling

The scaling operation is the imageresizing processing of source image. Scaling is done base on ARGB8888 format.
There are three sampling modes: scale down (Average); scale up(Bi-cubic).

14.3.6 NN quantize

The NN quantize is for NN pre_process using. The function is CLIP((source + offset) * scale) for R G B channel. When use this function, the signal sw_dst_nn_quantize_en and reg NN_QUANTIZE_SCALE, NN_QUANTIZE_OFFSET need be configured.

14.3.7 Y4 output format and Floyd–Steinberg dither

The Y4 output format and Floyd–Steinberg dither is used for Eink panel. RGA supports RGB888 or 565 to Y4 directly. In this mode, signal sw_dst_fmt_y4_en needs set to 1. There is a 16 segments LUT could be used in Y4 output mode (reg is RGA2_DST_Y4MAP_LUT0 and RGA2_DST_Y4MAP_LUT1).

RGA also supports RGB888 or 565 dither to Y4. In this mode, the signals sw_dst_fmt_y4_en, sw_dither_down, sw_dither_mode need be configured.
note: If sw_dither_mode is set Y8 to Y1 mode, the output format is still Y4 format.

14.4 Register description

14.4.1 Register Summary

Slave address can be divided into different length for different usage, which is shown as follows.

Name	Offset	Size	Reset Value	Description
RGA2_SYS_CTRL	0x0000	W	0x00000044	RGA system control register
RGA2_CMD_CTRL	0x0004	W	0x00000000	RGA command control register
RGA2_CMD_BASE	0x0008	W	0x00000000	RGA command codes base address register
RGA2_STATUS1	0x000C	W	0x00000000	RGA status register
RGA2_INT	0x0010	W	0x00000000	RGA interrupt register
RGA2_MMU_CTRL0	0x0014	W	0x00000000	RGA MMU control 0 register
RGA2_MMU_CMD_BASE	0x0018	W	0x00000000	Register0000 Description
RGA2_STATUS2	0x001C	W	0x00000000	RGA status register
RGA2_WORK_CNT	0x0020	W	0x00000000	RGA work counter
RGA2_VERSION_INFO	0x0028	W	0x03256726	RTL version and FPGA version information
RGA2_PERF_LATENCY_CTRL0	0x0040	W	0x00000024	Axi performance latency module control register0
RGA2_PERF_LATENCY_CTRL1	0x0044	W	0x00000021	Axi performance latency module control register1
RGA2_PERF_RD_MAX_LATENCY_NUM0	0x0048	W	0x00000000	Read max latency number

14.4.2 Detail Register Description

RGA2_SYS_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x0	reserved
7	RW	0x0	sw_rst_handsave_p It would save protect-rstn into initial status if long time dead in protect-rstn status(auto clear into '0').
6	RW	0x1	sw_rst_protect_e Protect-rstn mode enable. It would be ensure all axi write/read operation into completion status when sw_cclk_sreset_p or sw_aclk_sreset_p valid.
5	RW	0x0	sw_auto_rst It would auto-resetn after one frame finish. 1'b0: Disable 1'b1: Enable
4	RW	0x0	sw_cclk_sreset_p RGA core clk domain Soft reset, write '1' to this would reset the RGA engine except config registers.
3	WO	0x0	sw_aclk_sreset_p RGA aclk domain Soft reset, write '1' to this would reset the RGA engine except config registers.
2	WO	0x1	sw_auto_ckg RGA auto clock gating enable bit 1'b0: Disable 1'b1: Enable
1	WO	0x0	sw_cmd_mode RGA command mode 1'b0: Slave mode 1'b1: Master mode
0	W1C	0x0	sw_cmd_op_st_p Only used in passive (slave) control mode

RGA2_CMD_CTRL

14.5 Application Notes

14.5.1 Register Partition

There are two types of register in RGA. The first 8 registers (0x0 - 0x1C) are general registers for system configuration including command mode, command parameter, RGA status, general interrupts. The other registers (from 0x100) are command registers for command codes.

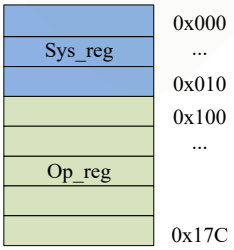

Fig. 14-7 RGA software main register-region

14.5.2 Command Modes

RGA has two command modes: slave mode and master mode. In salve mode (RGA_SYS_CTRL[1] = 1'b0), 2D graphic command only could be run one by one. CPU set all the command registers in RGA and then start RGA running by setting RGA_SYS_CTRL[0] to '1'. In master mode (RGA_SYS_CTRL[1] = 1'b1), 2D graphic commands could be run sequentially. After setting command's number to RGA_CMD_CTRL[12:3], writing '1' to RGA_CMD_CTRL[0] will start the command fetch, then Internal command DMA fetch commands from external command line.

Command line is a collection of several command codes with continuous address. At the first start, the command start address (RGA_CMD_ADDR) and command number (RGA_CMD_CTRL[12:3]) should be set, then write '1' to cmd_line_st (RGA_CMD_CTRL[0]) to start the command line fetch. Incremental command is supported by setting cmd_incr_num (RGA_CMD_CTRL[12:3]) and cmd_incr_valid (RGA_CMD_CTRL[1]=1'b1).

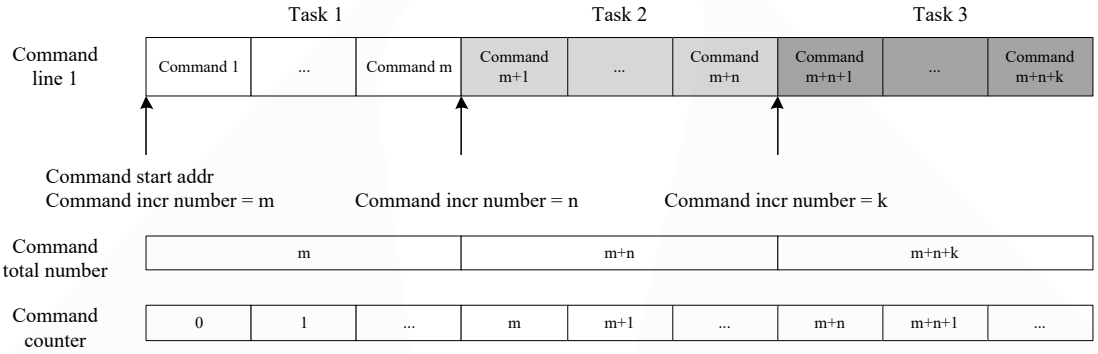

Fig. 14-8 RGA command line and command counter

14.5.3 Command Sync

In slave command mode, command sync is controlled by CPU.

In master command mode, user can enable the current_cmd_int (sw_intr_cf), command by command to generate a interrupt at the end point of target command operation.

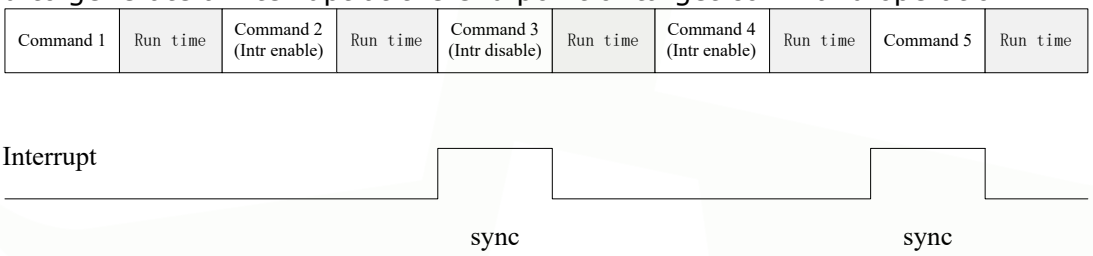

Fig. 14-9 RGA command sync generation

14.5.4 ColorPalette Application Notes

1. Palette/LUT Load into special RAM in ELS_BUF_CTRL.
2. ColorPalette/Pattern interval operations no need to initial LUT/pattern ram if LUT/pattern content no update.

14.5.5 Some special application constraint

1. The algorithm of vertical scale up: must select bicubic algorithm when source picture is smaller or equal to 2k and must select bilinear when bigger than 2k.
2. The effects that The output's definition is near 2k or 4k may not very well when at the scenario that the vertical side is scale up and the horizontal is scale down within range of 2%(such as:2048x32→2008x64).
3. At the scenario A+B->C, the size among the A B C has some constraints:

A's size must be equal to C. C's size must equal to B when A+C is no rotation. C's rotation (90degree)size must equal to B1 when A+C is rotation 90 degree.

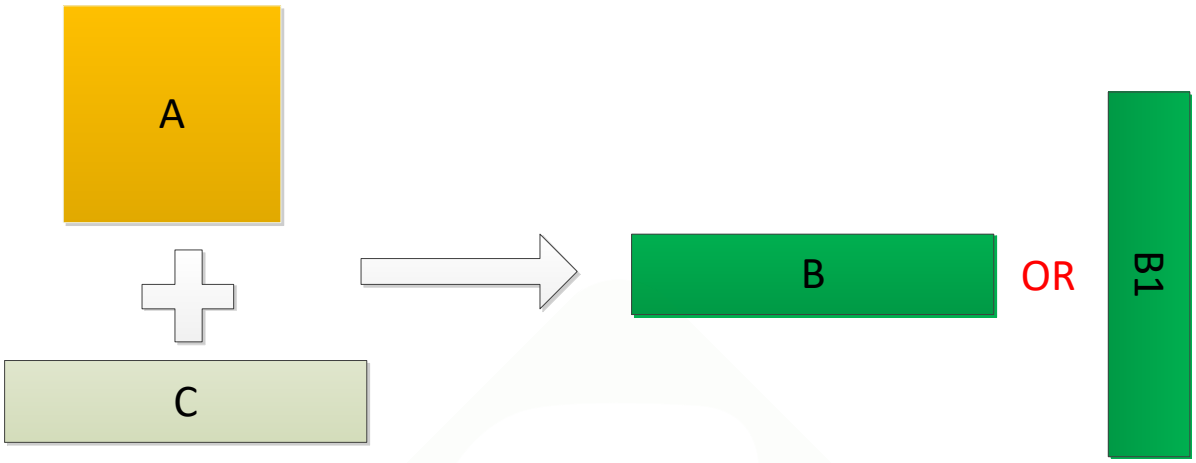

Fig. 14-10 The size constraint among A B C

4. YUV420/422-8bit virtual stride need 8byte align, xoff/yoff need 2byte align.
5. YUV420/422-10bit virtual stride need 16byte align，not support xoff/yoff.
6. Vertical scale down or not && Horizontal bi-cubic scale up src0 width<=2048.
Vertical scale up && Horizontal bi-cubic scale up src0 width<=1928.
7. Vertical scale down or not && Horizontal bilinear scale up src0 width<=4096.
Vertical scale up && Horizontal bilinear scale up src0 width<=3856.

Chapter 15 Image Enhancement Processor（IEP）

15.1 Overview

The Image Enhancement Processor (IEP) receives data from system main memory and transmits data to system main memory by AXI bus.

The features of IEP are as follows:

- **Image format**
  - Input data: YUV420/YUV422; semi-planar/planar; UV swap
  - Output data: YUV420/YUV422; semi-planar; UV swap; Tile mode
  - YUV down sampling conversion from 422 to 420
  - Max resolution for dynamic image up to 1920x1080
- **De-interlace**
  - **I5O2**: Input 5 Fields Output 2 frames mode
  - **I5O1T**: Input 5 Fields Output 1 Top frame mode
  - **I5O1B**: Input 5 Fields Output 1 Bottom frame mode
  - **I2O2**: Input 2 Fields Output 2 frames mode
  - **I1O1T**: Input 1 Field Output 1 Top frame mode
  - **I1O1B**: Input 1 Field Output 1 Bottom frame mode
  - **PULLDOWN_REC**: Pull down Recovery mode
  - **DETECT_ONLY**: Detect Only mode
  - **MVHIST**: De-interlace MV Histogram
  - **MD**: Motion Detection
  - **ME**: Motion Estimate
  - **MC**: Motion Compensation
  - **EEDI**: Enhanced Edge based Interpolation
  - **OSD DETECT**: On-Screen Display Detection
  - **FF DETECT**: Frame Field Detection
  - **FO DETECT**: Field Order Detection
  - **PD DETECT**: Pull down Detection
  - **CC**: Combining Check
- **Interface**
  - 32bit AHB bus slave
  - 128bit AXI bus master
  - Combined interrupt output

15.2 Block Diagram

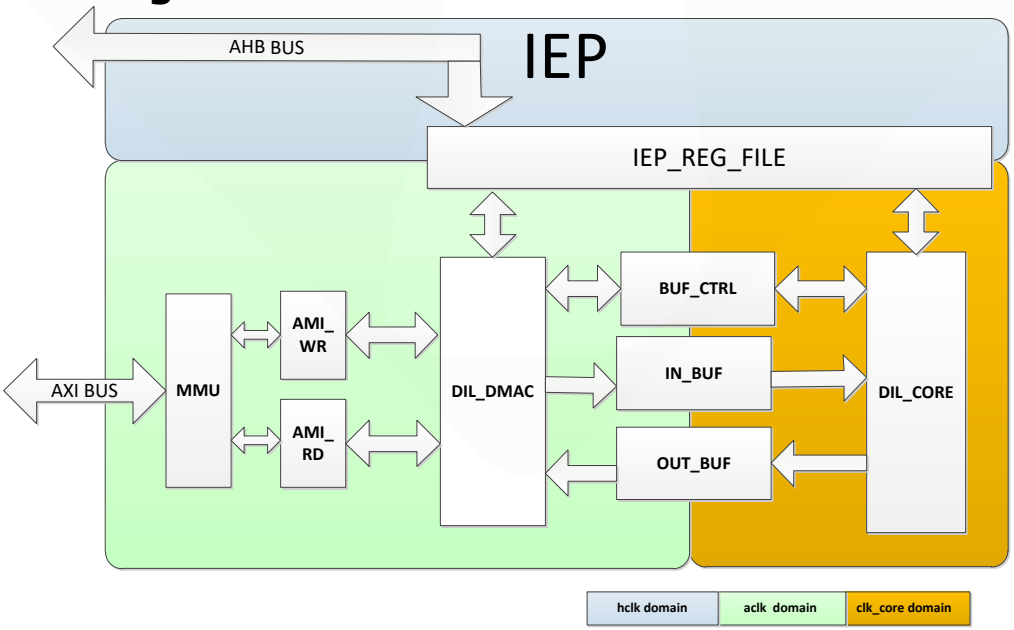

Fig.15-1 IEP block diagram

The data path in IEP is in the previously diagram. The IEP comprises with:

Deinterlace Core Processing

There are eight deinterlace modes (refer to feature description above) in the DIL_CORE block. Some important functions for deinterlace are in this module such as MD, ME, MC, EEDI.

DMA

DMA block responses for reading interlaced video data from DDR and writing frame data to DDR.

REG FILE

All configurable signals will be configured in this block and send to other function modules for using. Detect data and MVHIST data will be read back to user in this module by AHB bus.

15.3 Function Description

Deinterlace

There are eight deinterlace modes including I5O2, I5O1B, I5O1T, I2O2, I1O1B, I1O1T and detect only mode in the deinterlace block.

I5O2 mode

The I5O2 mode represents for 5 fields of input images and 2 frames of output images. This mode is the most frequently used. The input source images are stored as interlaced mode which means top field and bottom field are stored by the method that one top field line follows one bottom field or conversely. So, current, next and preview input frame address (SRC_ADDR_CURY, SRC_ADDR_NXTY and SRC_ADDR_PERY for Y channel) need to be configured. Top frame and bottom frame address (DST_ADDR_TOPY, DST_ADDR_BOTY for Y channel) need to be configured for output 2 frames.

I5O1B/T mode

The I5O1B and I5O1T mode have the same input images as the I4O2 mode, but only one frame output is generated once which means only need configure one output frame address(top frame address for I5O1T mode and bottom frame address for I5O1B mode).

I2O2 mode

The I2O2 mode only need current input source frame, output is the same as I5O2 mode. This mode is the fastest and the most bandwidth saving.

I1O1B/T mode

The I1O1B and I1O1T mode have the same input as I2O2 mode and the same output as I5O1B and I5O1T mode.

Bypass mode

If bypass mode is selected, there are not any deinterlace operations.

Pulldown Recovery mode

If the Pulldown Detection block detects the current source is pulldown interlace video. IEP supports Pulldown Recovery by setting this mode.

Detect Only mode

This mode has no output frames for saving power and bandwidth. All of the detection results will be read back though AHB bus.

15.4 Register Description

15.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
IEP2_FRM_START	0x0000	W	0x00000000	Frame start and frame state register

15.4.2 Detail Register Description

IEP2_FRM_START

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	sw_iep_frm_en Frame start, Write 1, frame work enable, frame end self clear

IEP2_IEP_CONFIG0

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22	RW	0x0	sw_iep_init_dis 1'b1: Frame start not init 1'b0: Frame start initial
21	W1C	0x0	sw_iep_sreset_p Write 1 to global reset iep, auto clear
20	RW	0x0	sw_iep_rst_protect_dis Dma bus error, default protect soft reset,1'b0:Protect reset;1'b1: Direct reset;
19:17	RO	0x0	reserved
16	RW	0x0	sw_iep_debug_data_en If assert this bit, the debug signals will have data(just for power saving).
15:14	RO	0x0	reserved
13:12	RW	0x0	sw_iep_dst_yuv_swap 2'b00: SP UV 2'b01: SP VU 2'b10,2'b11: Reserved
11:10	RO	0x0	reserved
9:8	RW	0x3	sw_iep_dst_fmt 2'b00,2'b01: Reserved 2'b10: YUV422 2'b11: YUV420
7:6	RO	0x0	reserved
5:4	RW	0x0	sw_iep_src_yuv_swap 2'b00: SP UV 2'b01: SP VU 2'b10, 2'b11: P
3:2	RO	0x0	reserved
1:0	RW	0x3	sw_iep_src_fmt 2'b00,2'b01: Reserved 2'b10: YUV422 2'b11: YUV420

IEP2_GATING_CTRL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RW	0x1	sw_reg_clk_on Reg clk is auto gating,if write 1, clk always on, not gating, also control by sw_iep_clk_on.
10	RW	0x0	sw_dma_clk_on Aclk is auto gating,if write 1, clk always on, not gating, also control by sw_iep_clk_on.
9	RW	0x0	sw_ram_clk_on All ram clk always on 1'b0: Clk gating 1'b1: Clk always on
8	RW	0x0	sw_ctrl_clk_on CTRL clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
7	RW	0x0	sw_out_clk_on OUT clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.

Bit	Attr	Reset Value	Description
6	RW	0x0	sw_ble_clk_on BLE clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
5	RW	0x0	sw_eedi_clk_on EEDI clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
4	RW	0x0	sw_mc_clk_on MC clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
3	RW	0x0	sw_me_clk_on ME clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
2	RW	0x0	sw_dect_clk_on DECT clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
1	RW	0x0	sw_md_clk_on MD clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
0	RW	0x0	sw_iep_clk_on IEP clk is auto gating, if write 1, clk always on, not gating.

IEP2_STATUS

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	W1C	0x0	ro_arst_finish_done IEP protect safety reset success status, write 1 clear or frame start clear.

IEP2_INT_EN

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	sw_iep_timeout_int_en Timeout int enable
4	RW	0x1	sw_iep_bus_error_en Bus error int enable
3:2	RO	0x0	reserved
1	RW	0x0	sw_iep_osd_max_en Frame process OSD dect done interrupt 1'b0: Inactive 1'b1: Active
0	RW	0x1	sw_iep_frm_done_en Frame process done interrupt 1'b0: Inactive 1'b1: Active

IEP2_INT_CLR

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	W1C	0x0	sw_iep_timeout_int_clr Time out interruption clear
4	W1C	0x0	sw_iep_bus_error_clr Bus error interruption clear

Bit	Attr	Reset Value	Description
3:2	RO	0x0	reserved
1	W1C	0x0	sw_iep_osd_max_clr OSD max interruption clear
0	W1C	0x0	sw_iep_frm_done_clr Frame process done interrupt clear

IEP2_INT_STS

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RO	0x0	ro_timeout_sts Timeout error int status
4	RO	0x0	ro_bus_error_sts Bus error interruption status
3:2	RO	0x0	reserved
1	RO	0x0	ro_osd_max_sts Frame process OSD dect done interrupt status
0	RO	0x0	ro_frm_done_sts Frame process done interrupt status

IEP2_INT_RAW_STS

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RO	0x0	ro_timeout_raw Timeout int raw status
4	RO	0x0	ro_bus_error_raw Bus error int raw status
3:2	RO	0x0	reserved
1	RO	0x0	ro_osd_max_raw OSD max int raw status
0	RO	0x0	ro_frm_done_raw Frame done int raw status

IEP2_VIR_SRC_IMG_WIDTH

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	sw_iep_src_vir_uv_stride Source uv virtual image width(word align)
15:0	RW	0x0000	sw_iep_src_vir_y_stride Source y virtual image width(word align)

IEP2_VIR_DST_IMG_WIDTH

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	sw_iep_dst_vir_stride Destination virtual image width(word align)

IEP2_SRC_IMG_SIZE

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved

Bit	Attr	Reset Value	Description
26:16	RW	0x000	sw_iep_src_pic_height Source and destination image height(pixel align and need minus 1, for example 1080 need config 1079)
15:11	RO	0x00	reserved
10:0	RW	0x000	sw_iep_src_pic_width Source and destination image width(pixel align and need minus 1, for example 1920 need config 1919)

IEP2_DIL_CONFIG0

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x1	sw_dil_mv_hist_en Deinterlace MV histogram enable. 1'b1: Deinterlace need MV histogram 1'b0: MV histogram not work

Address: Operational Base + offset (0x0818)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	read_bus_error_clear Read bus error interrupt clear. Write 1 to this register can clear read bus error interrupt.
0	RW	0x0	page_fault_clear Page fault interrupt clear. Write 1 to this register can clear page fault interrupt.

IEP2_MMU_INT_MASK

Address: Operational Base + offset (0x081C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	read_bus_error_int_en MMU read bus error int enable
0	RW	0x0	page_fault_int_en PAGE fault int enable

IEP2_MMU_INT_STATUS

Address: Operational Base + offset (0x0820)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	read_bus_error MMU read bus error
0	RW	0x0	page_fault Page fault

IEP2_MMU_AUTO_GATING

Address: Operational Base + offset (0x0824)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	mmu_auto_gating When it is 1, the MMU will auto gating itself

IEP2_MMU_ID

Address: Operational Base + offset (0x0828)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x0	mmu_axi_id
3:1	RO	0x0	reserved
0	RW	0x0	reg_load_mmu_en

15.5 Application Notes

Input source definition constant

The input source definition must be 16x4 aligned, which means the image width 16 aligned and image height 4 aligned.

Normal configuration flow

- Set IEP2 related signals based on current video source information and deinterlace mode (must open frame done interruption by asserting the sw_iep_frm_done_en signal)
- Set frame start by letting sw_iep_frm_en = 1
- Wait for IEP frame done interruption
- Read back many kinds of Detection data and MVHIST, analyze these data, get the global MV, OSD information etc
- Configure the MV, OSD information back
- Set frame start for deinterlace loop

Chapter 16 USB2.0 Host

16.1 Overview

There are two USB2.0 host controller, each USB2.0 host controller supports fully USB2.0 functions with one EHCI host controller and one OHCI host controller, and each host controller has one USB port. OHCI host controller only supports full-speed and low-speed mode and is used for full-speed devices and low-speed devices. EHCI only supports high-speed mode and is used for high-speed devices. OHCI host controller and EHCI host controller shares the same USB port, EHCI host controller will auto select the owner (OHCI or EHCI) of this USB port depending on the speed mode of attached devices, when selecting OHCI as owner, OHCI host controller will serve for the attached device; when selecting EHCI as owner, EHCI host controller will serve for the attached device.

USB2.0 Host Controller supports the following features:

- Compatible Specifications
  - Universal Serial Bus Specification, Revision 2.0
  - Enhanced Host Controller Interface Specification (EHCI), Revision 1.0
  - Open Host Controller Interface Specification (OHCI), Revision 1.0a

Support High-speed (480Mbps), Full-speed (12Mbps) and Low-speed (1.5Mbps)

16.2 Block Diagram

USB2.0 Host Controller comprises with:

- EHCI Host Controller: Perform High-speed transactions
- OHCI Host Controller: Perform full/low-speed transactions
- Port Routing Control: Select EHCI Host Controller or OHCI Host Controller

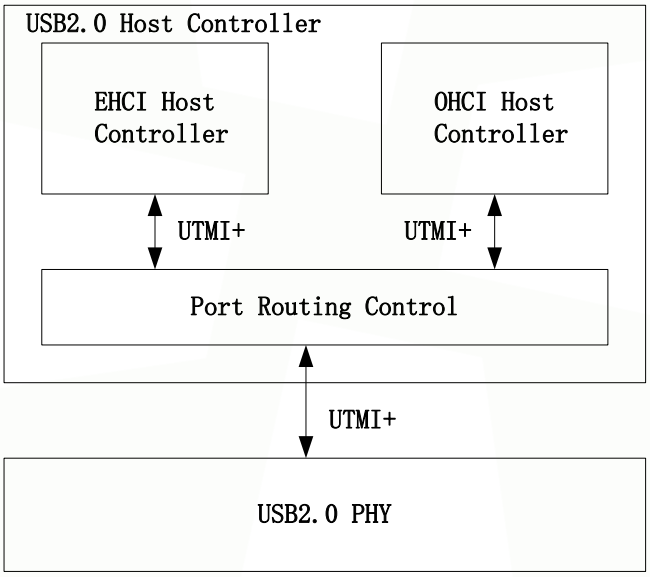

Fig. 16-1 USB2.0 Host Controller Block Diagram

16.3 Function Description

16.3.1 EHCI Host Controller

It performs descriptors and data read or write from or to system memory and packs or unpack USB transactions from or to UTMI+ interface defined in EHCI specification for high-speed data transmission.

16.3.2 OHCI Host Controller

It performs descriptors and data read/write from/to system memory and packs or un-pack USB transactions from or to UTMI+ interface defined in OHCI specification for full-speed or low-speed data transmission.

16.3.3 Port Routing Control

As part of logic in the EHCI host controller, it is used to auto-select EHCI or OHCI host controller to serve the attached device depending on the speed of the attached device.

16.4 Register Description

16.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 16-1 USB2.0 Host Controller Address Mapping

Base Address[16]	Device	Address Length	Offset Address Range
1'b0	EHCI	64K BYTE	0x00000 ~ 0x0ffff
1'b1	OHCI	64K BYTE	0x10000 ~ 0x1ffff

EHCI and OHCI register definitions, please refer to Enhanced Host Controller Interface Specification (EHCI), Revision 1.0 and Open Host Controller Interface Specification (OHCI), Revision 1.0a.

16.5 Interface Description

Table 16-2 USB2.0 PHY Interface Description

Module Pin	Direction	Pin Name	Descriptions
DP0	I/O	HOST0_DP	USB differential signal IO, positive end
DM0	I/O	HOST0_DM	USB differential signal IO, negative end
DP1	I/O	HOST1_DP	USB differential signal IO, positive end
DM1	I/O	HOST1_DM	USB differential signal IO, negative end
VCCA18	I/O	HOST_AVDD_1V8	1.8V power supply
RREF	I/O	HOST_EXTR	External 200ohm Bias Resistance, this is the 200ohm external resistance pin for termination.
AGND	I/O	VSS	Ground IO for both 3.3V, 1.8V and 0.8V
ACCA33	I/O	USB_AVDD3V3	3.3 V power supply(only Full speed driver)
VDDA	I/O	USB_AVDD_0V8	0.8 V power supply

16.6 Application Notes

16.6.1 Some Settings and Description About USB PHY

Here list some usbhost phy configure register of TOP_GRF in detail.

- GRF_USBPHY_CON2

Table 16-3 GRF_USBPHY_CON2 Description

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_enable Write enable for lower 16bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15	RW	0x0	usbhost_id_pull_up Software configure for HOSTPHY id_pull_up Enable ID pin sample. Signal that enables the sampling of the analog ID line. 1'b0: Sampling of ID pin is disabled (IDDIG force to low). 1'b1: Sampling of ID pin is enabled.

Bit	Attr	Reset Value	Description
14	RW	0x0	usbhost_dischrgvbus Software configure for HOSTPHY dischrgvbus Discharge VBUS18. The signal enables discharging VBUS18. 1'b0: do not discharge VBUS18 through a resistor 1'b1: discharge VBUS18 through a resistor (this has to be active for at least 50ms)
13	RW	0x0	usbhost_chrgvbus Software configure for HOSTPHY chrgvbus Charge VBUS18. The signal enables charging VBUS18. 1'b0: do not charge VBUS18 through a resistor 1'b1: charge VBUS18 through a resistor (this has to be active for at least 30ms)
12	RW	0x0	usbhost_txbitstuff_enable Software configure for HOSTPHY txbitstuff_enable TX BITSTUFF ENABLE. Indicates if the data on the DATA_OUT[15:0]lines need to be bit stuffed or not. 1'b0: Bit stuffing is disabled 1'b1: Bit stuffing is enabled This signal is only used when OP_MODE[1:0] is set to 11b.
11	RW	0x1	usbhost_otg_suspendm Software configure for HOSTPHY suspend This signal is used for VBUS negotiation in OTG application and HOST disconnect in HOST application, in DEVICE mode this signal should be tie to 0. In OTG/HOST application this signal should be connected to 1. In HOST application, IDDIG is not valid, OTG_SUSPENDM must be set to 1 and OTG_SUSPENDM_BYPS must set to 1. In DEVICE application, IDDIG is not valid, OTG_SUSPENDM must be set to 0 and OTG_SUSPENDM_BYPS must set to 1.
10	RW	0x1	usbhost_data_bus16_8 Software configure for HOSTPHY data_bus16_8 Selects between 8 and 16-bit data transfer. 1'b1: 16-bit data path operation enabled, CLK60_30 = 30 MHz. 1'b0: 8-bit data path operation enabled, CLK60_30 = 60 MHz. This signal is sampled by USB PHY IP macro cell only when RESET becomes low. Default is 16-bit model and not suggest to configure this bit.
9	RW	0x0	usbhost_pll_en Software configure for HOSTPHY pll_en PLL enable signal, internal PLL start to work when this signal is set to high, otherwise PLL is disabled and PHY IP stop working. This bit must be set to high before usb function.

Bit	Attr	Reset Value	Description
8	RW	0x1	usbhost_chg_rst Software configure for HOSTPHY chg_rst Charge detector reset signal, active high, asynchronous. 1'b0: charge detector is normal operation 1'b1: charge detector is reset to initial
7	RW	0x0	usbhost_chg_en Software configure for HOSTPHY chg_en Charge detector enable signal. 1'b0: charging detect is off, IP is configured as SDP in HOST application or is configured as standard device in DEVICE application 1'b1: charging detect is on, IP is configured as CDP in HOST application or is configured as portable device in DEVICE application
6	RW	0x1	usbhost_termselect Software configure for HOSTPHY termselect Termination Select. This signal selects between the FS and HS terminations: 1'b0: HS termination enabled 1'b1: FS termination enabled In default this is controlled by hardware.
5:4	RW	0x1	usbhost_xcvrselect Software configure for HOSTPHY xcvrselect Transceiver Select. 2'b00: HS Transceiver enabled 2'b01: FS Transceiver enabled 2'b10: LS Transceiver enabled 2'b11: Reserved In default this is controlled by hardware.
3:2	RW	0x0	usbhost_opmode Software configure for HOSTPHY opmode Operational Mode. These signals select between various operational modes: 2'b00: Normal operation 2'b01: Non-driving. Transmitter buffer is in high impedance and pull-up/down resistors are disconnected 2'b10: Disable bit stuffing and NRZI encoding 2'b11: Reserved In default this is controlled by hardware.

Bit	Attr	Reset Value	Description
1	RW	0x0	usbhost_suspend_n Software configure for HOSTPHY suspend_n Active low, asynchronous. When enabled, drive IP into suspend mode and consume minimal current from power supply. 1'b0: IP in suspend mode, only those circuit that serve for resume function is still active 1'b1: IP in normal operation In default this is controlled by hardware.
0	RW	0x0	hostphy_input_sel HOSTPHY input selection. 1'b0: Hardware input 1'b1: Software input

16.6.2 USB Host Reset Sequence

In USB function mode, the recommended reset sequence is in figure1-2. 'RST' is the reset signal of USB controller and 'CLK' is the main clock of USB controller. At first, 'RST' is set to 1 and USB controller starts to work; secondly, USB controller outputs 'SUSPENDM'. 'RESET' is the reset of the usb phy. Both 'RST' and 'RESET' are controlled by CRU model.
'SUSPENDM' is set to 1 firstly to enable PLL, PLL starts to work and frequency starts locking, 'RESET' is set to 0 to enable clock lock detector, and 'CLK60_30' is valid when frequency is stable. PLL lock time(Tlock) is about 500us including the time of bandgap building, PLL locking and so on, Tlock also includes the PVT range.
'CLK_480' is controlled by 'PLL_EN', and 'CLK_480' is not valid when 'PLL_EN' is 0. Because 'PLL_EN' is the reset signal of delay control cell, so there must be a rise edge of 'PLL_EN' to make delay control cell to work correctly. Tdelay is the time of 'PLL_EN' rise edge to 'CLK_480' transmitting 480MHz clock, the value is greater than 200us and less than 500us.

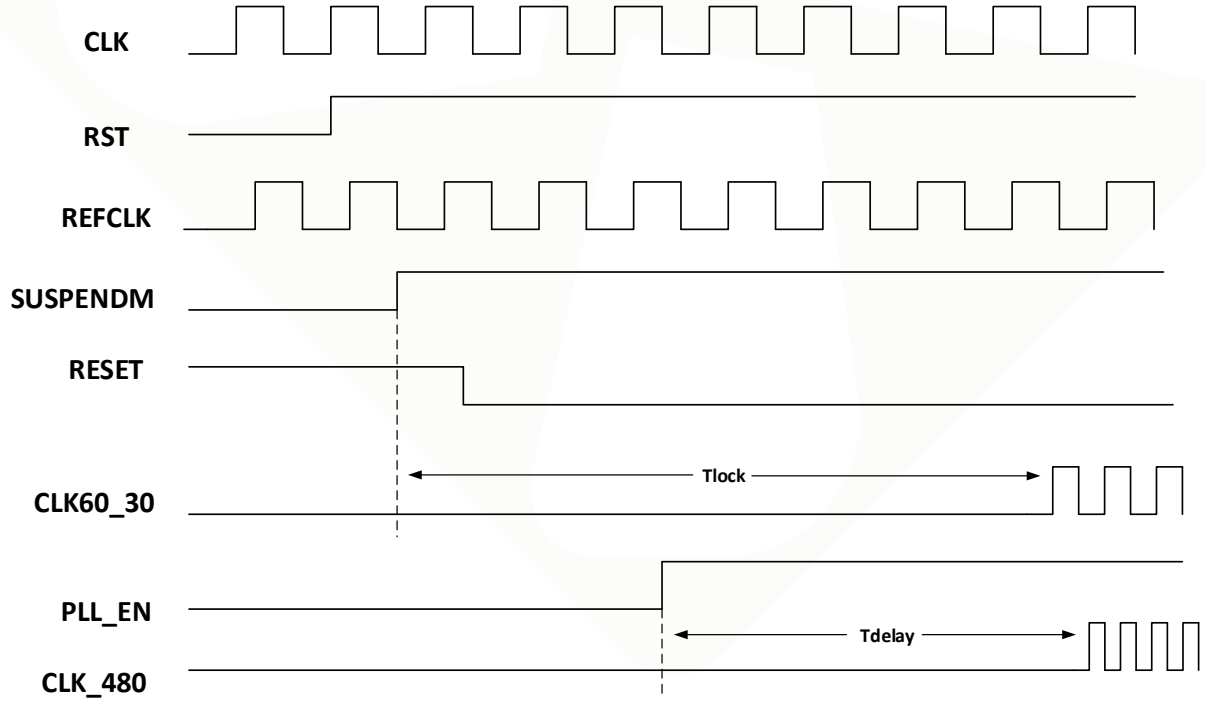

Fig. 16-2 USB2.0 Host reset sequence

16.6.3 Host Charge Detect Sequence

There are three steps in charge detector sequence including data contact detection, primary

detection and secondary detection. Data contact detection is judging DEVICE are connected or not, primary detection is judging whether the charger is connected or not, secondary detection is judging whether the charger is DCP or CDP.
When 'CHG_EN' is set to 1, 'CHG_RST' is set to 0 to start charge detection. This two signal can be control by GRF_USBPHY_CON2. During the detection, 'RESET' must be set to 1, the PHY function is disable before 'PHY_CONNECT' changes to 1. Tdelay is greater than 1ms.

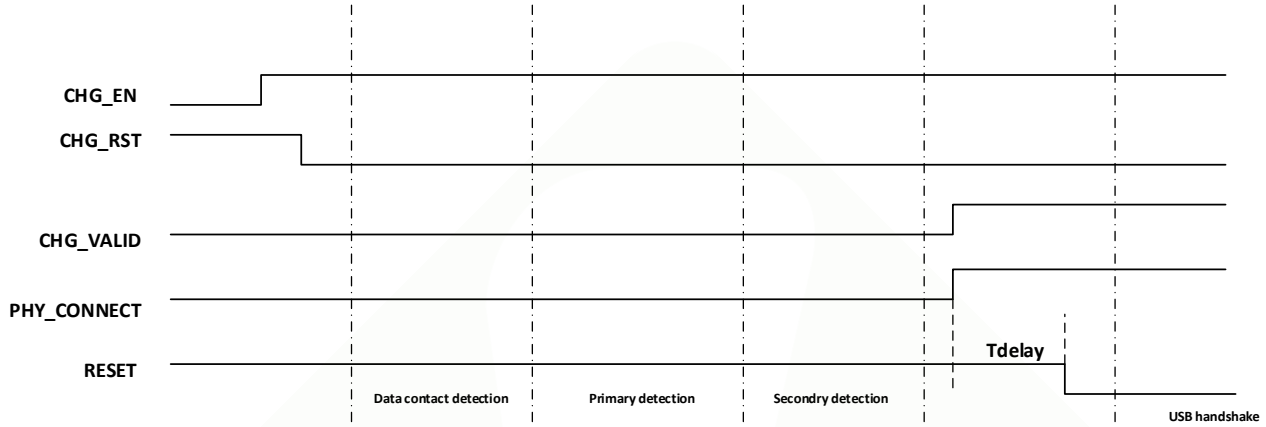

Fig. 16-3 USB2.0 Host charge sequence

Table 1-4 and the description about charge model. Host can be configured as DCP, CDP and SDP.

Table 16-4 Charge Description in host model

Host Port	Device Port	CHG_VALID	PHY_CONNECT
DCP	support charge	1	0
DCP	not support charge	0	0
CDP	support charge	1	1
CDP	not support charge	0	1
SDP	-	0	1

16.6.4 Program Flow

Please refer to Enhanced Host Controller Interface Specification (EHCI), Revision 1.0 and Open Host Controller Interface Specification (OHCI), Revision 1.0a.

Chapter 17 USB3.0 Controller

17.1 Overview

There are two USB3.0 Controllers, one can use as USB3.0 OTG Controller, another one can use as USB3.0 Host Controller only. USB3.0 OTG Controller can act as static host, static device, USB2.0/3.0 OTG A device or B device basing on the status of input ID from USB2.0 PHY. It can perform data transmission between host and device as host or device for Super-Speed / High-Speed / Full-Speed / Low-Speed.

USB3.0 OTG controller supports the following features:

- General Features
  1. Compatible Specification
     - Universal Serial Bus 3.0 Specification, Revision 1.0
     - Universal Serial Bus Specification, Revision 2.0
     - eXtensible Host Controller Interface for Universal Serial Bus (xHCI), Revision 1.1
  2. Support Control/Bulk (including stream)/Interrupt/Isochronous Transfer
  3. Simultaneous IN and OUT transfer for USB3.0, up to 8Gbps bandwidth
  4. Descriptor caching and data pre-fetching used to improve system performance in high-latency systems
  5. LPM protocol in USB 2.0 and U0, U1, U2, and U3 states for USB 3.0
  6. Dynamic FIFO memory allocation for endpoints
  7. Keep-Alive feature in LS mode and (micro-)SOFs in HS/FS modes
  8. Low MIPS requirement
     - Driver involved only in setting up transfers and high-level error recovery
     - Hardware handles data packing and routing to a specific pipe
- Application Interface Features
  1. AHB Slave interface
  2. AXI Master interface
     - Programmable burst lengths up to 16
     - Handle fixed burst address alignment
     - Programmable number of outstanding read/write requests up to 16
     - Concurrent read/write to get best performance of USB3.0 duplex operation
- USB3.0 Device Features
  1. Up to 10 IN endpoints, including control endpoint 0
  2. Up to 6 OUT endpoints, including control endpoint 0
  3. Up to 16 endpoint transfer resources, each one for each endpoint
  4. Flexible endpoint configuration for multiple applications/USB set-configuration modes
  5. Hardware handles ERDY and burst
  6. Stream-based bulk endpoints with controller automatically initiating data movement
  7. Isochronous endpoints with isochronous data in data buffers
  8. Flexible Descriptor with rich set of features to support buffer interrupt moderation, multiple transfers, isochronous, control, and scattered buffering support
- USB Class-Specific Device Features
  1. Stream support for UASP application
  2. Gathering of scattered packet to support Ethernet Over USB
  3. Scheduling of multiple Ethernet packets without interrupt
  4. Variable FIFO buffer allocation for each endpoint
  5. For isochronous applications, scheduling of variable-length payloads for each microframe
  6. Microframe precise scheduling for isochronous applications
  7. Configurable endpoint type selection and dynamic FIFO allocation to facilitate multi-function/composite device implementation. During set-config or alternate-setting, device resources are reconfigured to meet the configuration or alternate setting requirements.
- USB 3.0 xHCI Host Features
  1. Support up to 64 devices
  2. Support 1 interrupter

3. Support 1 USB2.0 port and 1 Super-Speed port
4. Concurrent USB3.0/USB2.0 traffic, up to 8.48Gbps bandwidth
5. Support standard or open-source xHCI and class driver

- USB 3.0 Dual-Role Device (DRD) Features
  1. Static Device Operation
  2. Static Host Operation
  3. USB3.0/USB2.0 OTG A device and B device basing on ID
  4. Not support USB3.0/USB2.0 OTG session request protocol(SRP), host negotiation protocol(HNP) and Role Swap Protocol(RSP)

17.2 Block Diagram

USB3.0 OTG Controller comprises with:

- Bus Interface/List Management: Register Interface/Data and Descriptors DMA management
- HS/FS/LS MAC : USB2.0 part logic
- SS MAC : SS part logic
- USB2.0 PHY: UTMI+ interface USB2.0 PHY
- SS PHY: Pipe Interface Super-Speed PHY

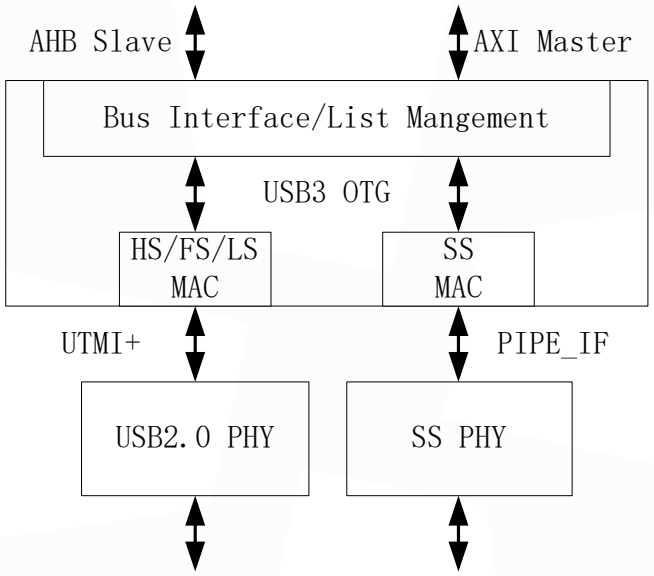

Fig.17-1USB3.0 OTG Block Diagram

17.3 Function Description

As a USB3.0 OTG controller, it can act as static xHCI host controller, static device controller, USB3.0/2.0 OTG A device or B device basing on ID of USB2.0 PHY.

As device controller, it can work on either USB2.0 speed or Super-Speed basing on speed of host attached to, and process USB tractions described in the descriptors (read back from external memory by AXI master) to/from UTMI+ interface and Pipe Interface of PCIE&SS PHY.

As host controller, it can work on USB2.0 speed, Super-Speed or both basing on speed or type of attached device, and process USB tractions described in the descriptors (read back from external memory by AXI master) to/from UTMI+ interface and Pipe Interface of SS PHY.

17.4 Register Description

17.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 17-1USB3 Address Mapping

Offset Address Range	Register Type

0x00000 ~ 0x07FFF	xHCI Registers, see xHCI spec.
0x0C100 ~ 0x0C6FF	Global Registers
0x0C700 ~ 0x0CBFF	Device Controller Registers
0x0CC00 ~ 0x0CFFF	Unused/Reserved
0x40000 ~ 0x7FFFF	Internal RAM0 – Debug Access (256KB)
0x80000 ~ 0xBFFFF	Internal RAM1 – Debug Access (256KB)
0xC0000 ~ 0xFFFFF	Internal RAM2 – Debug Access (256KB)

17.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
usb3otg_GSBUSCFG0	0xC100	W	0x00000001	Global SoC Bus Configuration Register 0
usb3otg_GSBUSCFG1	0xC104	W	0x00000300	Global SoC Bus Configuration Register 1

17.4.3 Detail Registers Description

usb3otg_GSBUSCFG0

Address: Operational Base + offset (0xC100)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	datrdreqinfo AXI-cache for Data Read (DatRdReqInfo).
27:24	RW	0x0	desrdreqinfo AXI-cache for Descriptor Read (DesRdReqInfo).
23:20	RW	0x0	datwrreqinfo AXI-cache for Data Write (DatWrReqInfo).
19:16	RW	0x0	deswrreqinfo AXI-cache for Descriptor Write (DesWrReqInfo).
15:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11	RW	0x0	datbigend This bit controls the endian mode for data accesses. 1'b0: Little-endian (default) 1'b1: Big-endian
10	RW	0x0	desbigend This bit controls the endian mode for descriptor accesses. 1'b0: Little-endian (default) 1'b1: Big-endian
9:8	RO	0x0	reserved
7	RW	0x0	incr256brstena If software set this bit to 1, the AXI master uses INCR to do the 256-beat burst.
6	RW	0x0	incr128brstena If software set this bit to 1, the AXI master uses INCR to do the 128-beat burst.
5	RW	0x0	incr64brstena If software set this bit to 1, AXI master uses INCR to do the 64-beat burst.
4	RW	0x0	incr32brstena If software set this bit to 1, the AXI master uses INCR to do the 32-beat burst.
3	RW	0x0	incr16brstena If software set this bit to 1, the AXI master uses INCR to do the 16-beat burst.
2	RW	0x0	incr8brstena If software set this bit to 1, the AXI master uses INCR to do the 8-beat burst.
1	RW	0x0	incr4brstena When this bit is enabled the controller is allowed to do bursts of beat length 1, 2, 3, and 4. It is highly recommended that this bit is enabled to prevent descriptor reads and writes from being broken up into separate transfers.

Bit	Attr	Reset Value	Description
0	RW	0x1	incrbrstena This bit determines the set of burst lengths the master interface uses. It works in conjunction with the GSBUSCFG0[7:1] enables(INCR256/128/64/32/16/8/4). 0: INCRX burst mode ARLEN/AWLEN do not use INCR. They use only the following burst lengths: 1; 4 (if GSBUSCFG0.INCR4BrstEna = 1); 8 (if GSBUSCFG0.INCR8BrstEna = 1); 16 (if GSBUSCFG0.INCR16BrstEna = 1); 32 (if GSBUSCFG0.INCR32BrstEna = 1); 64 (if GSBUSCFG0.INCR64BrstEna = 1); 128 (if GSBUSCFG0.INCR128BrstEna = 1); 256 (if GSBUSCFG0.INCR256BrstEna = 1); 1: INCR (undefined length) burst mode; ARLEN/AWLEN uses any length less than or equal to the largest-enabled burst length of INCR4/8/16/32/64/128/256. For cache line-aligned applications, this bit is typically set to 0 to ensure that the master interface uses only power-of-2 burst lengths (as enabled via GSBUSCFG0[7:0]).

usb3otg_GSBUSCFG1

Address: Operational Base + offset (0xC104)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	en1kpage 1K Page Boundary Enable. By default (this bit is disabled) the AXI breaks transfers at the 4k page boundary. When this bit is enabled, the AXI master (DMA data) breaks transfers at the 1k page boundary.
11:8	RW	0x3	pipe_trans_limit AXI Pipelined Transfers Burst Request Limit. The field controls the number of outstanding pipelined transfer requests the AXI master pushes to the AXI slave. When the AXI master reaches this limit, it does not make any more requests on the AXI ARADDR and AWADDR buses until the associated data phases complete. This field is encoded as follows: 0: 1 request 1: 2 requests 2: 3 requests 3: 4 requests ... F: 16 requests

Bit	Attr	Reset Value	Description
7:0	RO	0x00	reserved

usb3otg_GTXTHRCFG

Address: Operational Base + offset (0xC108)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RO	0x0	USBTxPktCntSel This field enables/disables the USB transmission multi-packet thresholding: 0: USB transmission multi-packet thresholding is disabled; the core can only start transmission on the USB after the entire packet has been fetched into the corresponding TXFIFO. 1: USB transmission multi-packet thresholding is enabled. The core can only start transmission on the USB after USB Transmit Packet Count amount of packets for the USB transaction (burst) are already in the corresponding TXFIFO. This mode is only valid in the host mode. It is only used for SuperSpeed.
28	RO	0x0	reserved
27:24	RW	0x0	USBTxPktCnt This field specifies the number of packets that must be in the TXFIFO before the core can start transmission for the corresponding USB transaction (burst). This field is only valid when the USB Transmit Packet Count Enable field is set to one. Valid values are from 1 to 15. Note: This field must be less than or equal to the USB Maximum TX Burst Size field.
23:16	RW	0x00	USBMaxTxBurstSize
15:0	RO	0x0000	reserved reserved

usb3otg_GRXTHRCFG

Address: Operational Base + offset (0xC10C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	usb_rx_pkt_cntsel USB ReceivePacket Count Enable. This field enables/disables the USB reception multi-packet thresholding: 1'b0: The core can only start reception on the USB when the RX FIFO has space for at least one packet. 1'b1: Not applied. If you are using external buffer control (EBC) feature, disable this mode by setting USBRxPktCntSel to 0.
28:13	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
12:0	RW	0x0000	resvl_socout_spc Space reserved in rx fifo for ISOC OUT. In host mode, this field is not applicable and must be programmed to 0. In device mode, this value represents the amount of space to be reserved for ISOC OUT packets. The value to be programmed should be chosen so as to ensure that non ISOC packets are not completely dropped, If no space needs to be reserved for ISOC OUT packets, program this field to 0. This field is valid only in device mode. The maximum configurable depth of rx fifo is 8192. Therefore, this field is 13 bits wide. For HS/FS, the space reservation is the actual value.

usb3otg_GCTL

Address: Operational Base + offset (0xC110)

Bit	Attr	Reset Value	Description
31:19	RW	0x026a	pwrdnscale Not applied.
18	RW	0x0	masterfiltbypass Master Filter Bypass When this bit is set to 1'b1, all the filters are bypassed. The double synchronizers to mac_clk preceding the filters are also bypassed. For enabling the filters, this bit must be 1'b0.
17	RW	0x0	bypassetaddr Bypass SetAddress in Device Mode. When BYPSSETADDR bit is set, the device core uses the value in the DCFG[DevAddr] bits directly for comparing the device address in the tokens. For simulation, you can use this feature to avoid sending an actual SET ADDRESS control transfer on the USB, and make the device core respond to a new address. Note: You can set this bit for simulation purposes only. In the actual hardware, this bit must be set to 1'b0.
16	RW	0x1	u2rstecn Device controller on USB 2.0 reset checks for receiver termination eight times per attempt if this bit is set to zero, or only once per attempt if the bit is set to one. Note: This bit is applicable only in device mode.

Bit	Attr	Reset Value	Description
15:14	RW	0x0	frmscldwn This field scales down device view of a SOF/USOF duration. For HS mode: Value of 2'h3 implements interval to be 15.625 us Value of 2'h2 implements interval to be 31.25 us Value of 2'h1 implements interval to be 62.5 us Value of 2'h0 implements interval to be 125us For FS mode, the scale-down value is multiplied by 8. This field also scales down the MaxPacketSize of the IN and OUT bulk endpoint to allow more traffic during simulation. It can only be changed from a non-zero value during simulation. 2'h0: 1024 bytes 2'h1: 512 bytes 2'h2: 256 bytes 2'h3: 128 bytes
13:12	RW	0x2	prtcapdir PRTCAPDIR: Port Capability Direction (PrtCapDir) 2'b01: for Host configurations 2'b10: for Device configurations SW should base on IDDIG input to set usb controller as an OTG 2.0 device with A-device or B-device.
11	RW	0x0	coresoftreset Core Soft Reset (CoreSoftReset) 1'b0: No soft reset; 1'b1: Soft reset to core Clears the interrupts and all the CSRs except the following registers: GCTL; GUCTL; GSTS; GSNPSID; GGPIO; GUID; GUSB2PHYCFGn registers; GUSB3PIPECTLn registers; DCFG; DCTL; DEVTEN; DSTS.
10	RW	0x0	sofitpsync Not applied.
9	RW	0x0	u1u2_timescale Not applied.
8	RW	0x0	debugattach Debug Attach. Not applied.

Bit	Attr	Reset Value	Description
7:6	RW	0x0	ramclksel RAM Clock Select (RAMClkSel) 2'b00: bus clock 2'b01: pipe clock (Only used in device mode) 2'b10: In device mode, pipe/2 clock. In Host mode, controller switches ram_clk between pipe/2 clock, mac2_clk and bus_clk based on the status of the U2 ports 2'b11: In device mode, selects mac2_clk as ram_clk (when 8-bit UTMI or ULPI used. Not supported in 16-bit UTMI mode); In Host mode, controller switches ram_clk between pipe_clk, mac2_clk and bus_clk based on the status of the U2 ports. In device mode, upon a USB reset and USB disconnect, the hardware clears these bits to 2'b00.
5:4	RW	0x0	scaledown Scale-Down Mode (ScaleDown) When Scale-Down mode is enabled for simulation, the core uses scaled-down timing values, resulting in faster simulations. When Scale-Down mode is disabled, actual timing values are used. This is required for hardware operation. HS/FS/LS Modes: 2'b00: Disables all scale-downs. Actual timing values are used. 2'b01: Enables scale-down of all timing values except Device mode suspend and resume. These include Speed enumeration, HNP/SRP, and Host mode suspend and resume 2'b10: Enables scale-down of Device mode suspend and resume timing values only. 2'b11: Enables bit 0 and bit 1 scale-down timing values.
3	RW	0x0	disscramble Disable Scrambling (DisScramble) Transmit request to Link Partner on next transition to Recovery or Polling.
2	RW	0x1	u2exit_lfps If this bit is: 1'b0: the link treats 248ns LFPS as a valid U2 exit. 1'b1: the link waits for 8us of LFPS before it detects a valid U2 exit. This bit is added to improve interoperability with a third party host controller. This host controller in U2 state while performing receiver detection generates an LFPS glitch of about 4ms duration. This causes the device to exit from U2 state because the LFPS filter value is 248ns. With the new functionality enabled, the device can stay in U2 while ignoring this glitch from the host controller.

Bit	Attr	Reset Value	Description
1	RO	0x0	gbl_hibernation_en This bit enables hibernation at the global level. If hibernation is not enabled through this bit, the PMU immediately accepts the D0->D3 and D3->D0 power state change requests, but does not save or restore any core state. In addition, the PMUs never drive the PHY interfaces and let the core continue to drive the PHY interfaces.
0	RW	0x0	dsblclkgtng Disable Clock Gating. This bit is set to 1 and the core is in Low Power mode, internal clock gating is disabled. You can set this bit to 1'b1 after Power On Reset.

usb3otg_GSTS

Address: Operational Base + offset (0xC118)

Bit	Attr	Reset Value	Description
31:20	RO	0x7e8	cbelt Current BELT Value. In Host mode, this field indicates the minimum value of all received device BELT values and the BELT value that is set by the Set Latency Tolerance Value command.
19:12	RO	0x00	reserved
11	RO	0x0	SSIC_IP Not applied.
10	RO	0x0	OTG_IP OTG Interrupt Pending. This field indicates that there is a pending interrupt pertaining to OTG in OEVT register.
9	RO	0x0	bc_ip Battery Charger Interrupt Pending This field indicates that there is a pending interrupt pertaining to BC in BCEVT register.
8	RO	0x0	adp_ip ADP Interrupt Pending. This field indicates that there is a pending interrupt pertaining to ADP in ADPEVT register.
7	RO	0x0	host_ip Host Interrupt Pending. This field indicates that there is a pending interrupt pertaining to xHC in the Host event queue.
6	RO	0x0	device_ip Device Interrupt Pending This field indicates that there is a pending interrupt pertaining to peripheral (device) operation in the Device event queue.

Bit	Attr	Reset Value	Description
5	W1C	0x0	csr_timeout When this bit is 1'b1, it indicates that the software performed a write or read to a core register that could not be completed within DWC_USB3_CSR_ACCESS_TIMEOUT bus clock cycles (default: h1FFFF).
4	W1C	0x0	buserraddrvld us Error Address Valid Indicates that the GBUSERRADDR register is valid and reports the first bus address that encounters a bus error.
3:2	RO	0x0	reserved
1:0	RO	0x0	curmod Current Mode of Operation.

usb3otg_GUCTL1

Address: Operational Base + offset (0xC11C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	filter_se0_fsls_eop 1'b0: Default behaviour, no change in Linestate check for SE0 detection in FS/LS. 1'b1: Feature enabled, FS/LS SE0 is filtered for 2 clocks for detecting EOP. This bit is applicable for FS/LS operation. If this feature is enabled, then SE0 on the linestate is validated for 2 consecutive utmi/ulpi clock edges for EOP detection. This feature is applicable only in FS in device mode and FS/LS mode of operation in host mode. Device mode: FS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then for device LPM hanshake, the core will ignore single SE0 glitch on the linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS. Host mode: FS/LS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then the core will ignore single SE0 glitch on the linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS/LS port. Enable this feature if the LineState has SE0 glitches during transmission. This bit is quasi-static, i.e., should not be changed during device operation.

Bit	Attr	Reset Value	Description
28	RW	0x0	tx_ipgap_linecheck_dis 1'b0: Default behaviour, no change in Linestate check. 1'b1: Feature enabled, 2.0 MAC disables Linestate check during HS transmit. This bit is applicable for HS operation of u2mac. If this feature is enabled, then the 2.0 mac operating in HS ignores the UTMI/ULPI Linestate during the transmit of a token (during token-to-token and token-to-data IPGAP). When enabled, the controller implements a fixed 40-bit TxEndDelay after the packet is given on UTMI and ignores the Linestate during this time. This feature is applicable only in HS mode of operation. Device mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then for device LPM handshake, the core will ignore the linestate after TX and wait for a fixed clocks (40 bit times equivalent) after transmitting ACK on utmi. Host mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then the ipgap between (tkn to tkn/data) is added by 40 bit times of TXENDDELAY, and linestate is ignored during this 40 bit times delay. Enable this bit if the LineState will not reflect the expected line state (J) during transmission. This bit is quasi-static, i.e., should not be changed during device operation.
27	RW	0x0	dev_trb_out_spr_ind 1'b0: Default behaviour, no change in TRB status dword. 1'b1: Feature enabled, OUT TRB status indicates Short Packet. This bit is applicable for device mode only (and ignored in host mode). If the device application (SW/HW) wants to know if a short packet was received for an OUT in the TRB status itself, then this feature can be enabled, so that a bit is set in the TRB writeback in the buf_size dword. Bit[26] - SPR of the trbstatus, RSVD, SPR,PCM1, bufsize dword will be set during an OUT transfer TRB write back if this is the last TRB used for that transfer descriptor. This bit is quasi-static, i.e., should not be changed during device operation.
26	RW	0x0	dve_force_20clk_for_30clk Not applied.
25	RW	0x0	p3_in_u2 Not applied.

Bit	Attr	Reset Value	Description
24	RW	0x0	dev_l1_exit_by_hw 1'b0: Default behaviour, disables device L1 hardware exit logic. 1'b1: feature enabled This bit is applicable for device mode (2.0) only. This field enables device controller sending remote wakeup for L1 if the device becomes ready for sending/accepting data when in L1 state. If the host expects the device to send remote wkp signalling to resume after going into L1 in flow controlled state, then this bit can be set to send the remote wake signal automatically when the device controller becomes ready. This HW remote wake feature is applicable only to bulk and interrupt transfers, and not for Isoch/Control When control transfers are in progress, the LPM will be rejected (NYET response). Only after control transfers are completed (either with ACK/STALL), LPM will be accepted For Isoch transfers, the host needs to do the wake-up and start the transfer. Device controller will not do remote-wakeup when Isoch endpoints get ready. The device SW needs to keep the GUSB2PHYCFG[EnblSlpM] reset in order to keep the PHY clock to be running for keeping track of SOF intervals. When L1 hibernation is enabled, the controller will not do automatic exit for hibernation requests thru L1. This bit is quasi-static, i.e., should not be changed during device operation.
23:21	RW	0x0	ip_gap_add_on This register field is used to add on to the default inter packet gap setting in the USB 2.0 MAC.
20	RW	0x0	dev_lsp_tail_lock_dis 1'b0: Default behaviour, enables device lsp lock logic for tail TRB update. 1'b1: Fix disabled This is a bug fix for STAR 9000716195 that affects the CSP mode for OUT endpoints in device mode. The issue is that tail TRB index is not synchronized with the cache Scratchpad bytecount update. If the fast-forward request comes in-between the bytecount update on a newly fetched TRB and the tail-index write update in TPF, the RDP works on an incorrect tail index and misses the byte count decrement for the newly fetched TRB in the fast-forwarding process. This fix needs to be present all the times.

Bit	Attr	Reset Value	Description
19	RW	0x0	nak_per_enh_fs 1'b1: Enables performance enhancement for FS async endpoints in the presence of NAKs. 1'b0: Enhancement not applied. If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other Full Speed bulk endpoint which is ACked by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your FullSpeed application. Setting this bit will only control, and is only required for Full Speed transfers.
18	RW	0x1	nak_per_enh_hs 1'b1: Enables performance enhancement for HS async endpoints in the presence of NAKs. 1'b0: Enhancement not applied. If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other High Speed bulk endpoint which is ACked by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your HighSpeed application. Setting this bit will only control, and is only required for High Speed transfers.
17	RW	0x0	parkmode_disbale_ss Not applied.

Bit	Attr	Reset Value	Description
16	RW	0x0	parkmode_disable_hs This bit is used only in host mode. When this bit is set to 1 all HS bus instances park mode are disabled. To improve performance in park mode, the xHCI scheduler queues in three requests of 4 packets each for High Speed asynchronous endpoints in a micro-frame. But if a device is slow and if it NAKs more than 3 times, then it is rescheduled only in the next micro-frame. This could decrease the performance of a slow device even further. In a few high speed devices (such as Sandisk Cruzer Blade 4GB VID: 1921, PID: 21863 and Flex Drive VID: 3744, PID: 8552) when an IN request is sent within 900ns of the ACK of the previous packet, these devices send a NAK. When connected to these devices, if required, the software can disable the park mode if you see performance drop in your system. When park mode is disabled, pipelining of multiple packet is disabled and instead one packet at a time is requested by the scheduler. This allows up to 12 NAKs in a micro-frame and improves performance of these slow devices.
15	RW	0x0	parkmod_disavale_fsls This bit is used only in host mode, and is for debug purpose only. When this bit is set to 1 all FS/LS bus instances in park mode disabled.
14:9	RO	0x00	reserved
8	RW	0x1	l1_susp_thrld_en_for_host This bit is used only in host mode. The host controller asserts the utmi_l1_suspend_n and utmi_sleep_n output signals (see LPM Interface Signals table in the Databook) as follows: The controller asserts the utmi_l1_suspend_n signal to put the PHY into deep low-power mode in L1 when both of the following are true: The HIRD/BESL value used is greater than or equal to the value in L1_SUSP_THRLD_FOR_HOST field. The L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1'b1. The controller asserts utmi_sleep_n on L1 when one of the following is true: The HIRD/BESL value used is less than the value in L1_SUSP_THRLD_FOR_HOST field. The L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1'b0.

Bit	Attr	Reset Value	Description
7:4	RW	0x8	l1_susp_thrld_for_host This field is effective only when the L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1. For more details, refer to the description of the L1_SUSP_THRLD_EN_FOR_HOST bit.
3	RW	0x1	hc_errata_enable Not applied.
2	RW	0x0	hc_parchk_disable Host Parameter Check Disable. When this bit is set to 0 (by default), the xHC checks that the input slot/EP context fields comply to the xHCI Specification. Upon detection of a parameter error during command execution, the xHC generates an event TRB with completion code indicating PARAMETER ERROR. When the bit is set to 1, the xHC does not perform parameter checks and does not generate PARAMETER ERROR completion code.
1	RW	0x1	ovrld_l1_susp_com If this bit is set, the utmi_l1_suspend_com_n is overloaded with the utmi_sleep_n signal. This bit is usually set if the PHY stops the port clock during L1 sleep condition.
0	RW	0x0	loa_filter_en If this bit is set, the USB 2.0 port babble is checked at least three consecutive times before the port is disabled. This prevents false triggering of the babble condition when using low quality cables. Note: This bit is valid only in host mode.

usb3otg_GSNPSID

Address: Operational Base + offset (0xC120)

Bit	Attr	Reset Value	Description
31:0	RO	0x5533300a	snpsid SNPSID[31:16] indicates Core Identification Number. 0x5533 is ASCII for U3 (DWC_usb3). SNPSID[15:0] indicates the release number. Current Release is 3.00a. Software uses this register to configure release-specific features in the driver.

usb3otg_GGPIO

Address: Operational Base + offset (0xC124)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	gpo General Purpose Output This field's value is driven out on the gp_out[15:0] core output port.

Bit	Attr	Reset Value	Description
15:0	RO	0x0000	gpi General Purpose Input This field's read value reflects the gp_in[15:0] core input value.

usb3otg_GUID

Address: Operational Base + offset (0xC128)

Bit	Attr	Reset Value	Description
31:0	RW	0x20190520	userid Application-programmable ID field.

usb3otg_GUCTL

Address: Operational Base + offset (0xC12C)

Bit	Attr	Reset Value	Description
31:22	RW	0x008	refclkper This field indicates in terms of nano seconds the period of ref_clk. The default value of this register is set to 'h8 (8ns/125 MHz). This field needs to be updated during power-on initialization, if GCTL.SOFITPSYNC or GFLADJ.GFLADJ_REFCLK_LPM_SEL is set to 1. The programmable maximum value is 62ns, and the minimum value is 8ns. You must use a reference clock with a period that is an integer multiple, so that ITP can meet the jitter margin of 32ns. The allowable ref_clk frequencies whose period is not integer multiples are 16/17/19.2/24/39.7MHz. This field must not be set to 0 at any time. If you never plan to use this feature, then set this field to 'h8, the default value.
21	RW	0x0	no_extr_di No Extra Delay Between SOF and the First. Some HS devices misbehave when the host sends a packet immediately after a SOF. However, adding an extra delay between a SOF and the first packet can reduce the USB data rate and performance. This bit is used to control whether the host must wait for 2 microseconds before it sends the first packet after a SOF, or not. User can set this bit to one to improve the performance if those problematic devices are not a concern in the user's host environment. 1'b0: Host waits for 2 microseconds after a SOF before it sends the first USB packet. 1'b1: Host doesn't wait after a SOF before it sends the first USB packet.
20:18	RO	0x0	reserved

Bit	Attr	Reset Value	Description
17	RW	0x0	sprs_ctrl_trans_en Sparse Control Transaction Enable. Some devices are slow in responding to Control transfers. Scheduling multiple transactions in one microframe/frame can cause these devices to misbehave. If this bit is set to 1'b1, the host controller schedules transactions for a Control transfer in different microframes/frames.
16	RW	0x0	res_bw_hs_esp Reserving 85% Bandwidth for HS Periodic EPs. By default, HC reserves 80% of the bandwidth for periodic EPs. If this bit is set, the bandwidth is relaxed to 85% to accommodate two high speed, high bandwidth ISOC EPs. USB 2.0 required 80% bandwidth allocated for ISOC traffic. If two High-bandwidth ISOC devices (HD Webcams) are connected, and if each requires 1024-bytes X 3 packets per Micro-Frame, then the bandwidth required is around 82%. If this bit is set, then it is possible to connect two Webcams of 1024bytes X 3 payload per Micro-Frame each. Otherwise, you may have to reduce the resolution of the Webcams. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode.
15	RW	0x1	cm_dev_addr Compliance Mode for Device Address. When this bit is 1'b1, Slot ID may have different value than Device Address if max_slot_enabled < 128. 1'b1: Increment Device Address on each Address Device command. 1'b0: Device Address is equal to Slot ID. The xHCI compliance requires this bit to be set to 1. The 0 mode is for debug purpose only. This allows you to easily identify a device connected to a port in the Lecroy or Eliisys trace during hardware debug. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode.
14	RW	0x0	usb_host_in_auto_retry_en Host IN Auto Retry. 1'b0: Auto Retry Disabled 1'b1: Auto Retry Enabled Note: This bit is also applicable to the device mode.
13	RW	0x0	en_overlap_chk Not applied.

Bit	Attr	Reset Value	Description
12	RW	0x0	ext_cap_suppt_en External Extended Capability Support Enable When set, this field enables extended capabilities to be implemented outside the core. When the ExtCapSupEN is set and the Debug Capability is enabled, the Next Capability pointer in Debug Capability returns 16. A read to the first DWORD of the last internal extended capability (the "xHCI Supported Protocol Capability for USB 3.0" when the Debug Capability is not enabled) returns a value of 4 in the Next Capability Pointer field. This indicates to software that there is another capability four DWORDs after this capability (for example, at address N+16 where N is the address of this DWORD). If enabled, an external address decoder that snoops the xHC slave interface must be implemented. If it sees an access to N+16 or greater, the slave access is re-routed to a piece of hardware which returns the external capability pointer register of the new capability and also handles reads/writes to this new capability and the side effects. If disabled, a read to the first DWORD of the last internal extended capability returns 0 in the 'Next Capability Pointer' field. This indicates there are no more capabilities.
11	RW	0x0	insrt_extr_fsbodi Insert Extra Delay Between FS Bulk OUT. Some FS devices are slow to receive Bulk OUT data and can get stuck when there are consecutive Bulk OUT transactions with short inter-transaction delays. This bit is used to control whether the host inserts extra delay between consecutive Bulk OUT transactions to a FS Endpoint. 1'b0: Host doesn't insert extra delay between consecutive Bulk OUT transactions to a FS Endpoint. 1'b1: Host inserts about 12us extra delay between consecutive Bulk OUT transactions to a FS Endpoint to work around the device issue. Note: Setting this bit to one will reduce the Bulk OUT transfer performance for most of the FS devices.

Bit	Attr	Reset Value	Description
10:9	RW	0x0	dtct Device Timeout Coarse Tuning. This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. The core first checks the DTCT value. If it is 0, then the timeout value is defined by the DTFT. If it is non-zero, then it uses the following timeout values: 2'b00: 0 usec -> use DTFT value instead 2'b01: 500 usec 2'b10: 1.5 msec 2'b11: 6.5 msec
8:0	RW	0x010	ctft Device Timeout Fine Tuning. This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. For the DTFT field to take effect, DTCT must be set to 2'b00. The DTFT value is the number of 125 MHz clocks * 256 to count before considering a device timeout. The minimum value of DTFT is 2. For example, if the mac3_clk is 125 MHz clk (8 ns period), this is calculated as follows: (DTFT value) * 256 * (8 ns) Quick Reference: if DTFT = 0x2, 2*256*8 = 4usec timeout if DTFT = 0x5, 5*256*8 = 10usec timeout if DTFT = 0xA, 10*256*8 = 20usec timeout if DTFT = 0x10, 16*256*8 = 32usec timeout if DTFT = 0x19, 25*256*8 = 51usec timeout if DTFT = 0x31, 49*256*8 = 100usec timeout if DTFT = 0x62, 98*256*8 = 200usec timeout

usb3otg_GBUSERRADDRLO

Address: Operational Base + offset (0xC130)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	buserraddr Bus Address - Low. This register contains the lower 32 bits of the first bus address that encountered a SoC bus error. It is valid when the GSTS.BusErrAddrVld field is 1. It can only be cleared by resetting the core. Note: Only supported in AHB and AXI configurations.

Address: Operational Base + offset (0xC200)

Bit	Attr	Reset Value	Description
31	RW	0x0	physoftrst UTMI PHY Soft Reset. Causes the usb2phy_reset signal to be asserted to reset a UTMI PHY. Not applicable to ULPI because ULPI PHYs are reset via their FunctionControl. Reset register, and the core automatically writes to this register when the core is reset (vcc_reset_n, USBCMD.HCRST, DCTL.SoftReset, or GCTL.SoftReset).

Bit	Attr	Reset Value	Description
30	RW	0x1	u2_freeclk_exists Specifies whether your USB 2.0 PHY provides a free-running PHY clock, which is active when the clock control input is active. If your USB 2.0 PHY provides a free-running PHY clock, it must be connected to the utmi_clk[0] input. The remaining utmi_clk[n] must be connected to the respective port clocks. The core uses the Port-0 clock for generating the internal mac2 clock. 1'b0: USB 2.0 free clock does not exist 1'b1: USB 2.0 free clock exists Note: When the core is configured as device-only, do not set this bit to 1.
29:25	RO	0x00	reserved
24:22	RW	0x0	lstrd LS Turnaround Time. This field indicates the value of the Rx-to-Tx packet gap for LS devices. The encoding is as follows: 3'h0: 2 bit times 3'h1: 2.5 bit times 3'h2: 3 bit times 3'h3: 3.5 bit times 3'h4: 4 bit times 3'h5: 4.5 bit times 3'h6: 5 bit times 3'h7: 5.5 bit times Note: This field is applicable only in Host mode. For normal operation (to work with most LS devices), set the default value of this field to 3'h0 (2 bit times). The programmable LS device inter-packet gap and turnaround delays are provided to support some legacy LS devices that might require different delays than the default/fixed ones. For instance, the Open LS mouse requires 3 bit times of inter-packet gap to work correctly.

Bit	Attr	Reset Value	Description
21:19	RW	0x2	lsipd LS Inter-Packet Time. This field indicates the value of Tx-to-Tx packet gap for LS devices. The encoding is as follows: 3'h0: 2 bit times 3'h1: 2.5 bit times 3'h2: 3 bit times 3'h3: 3.5 bit times 3'h4: 4 bit times 3'h5: 4.5 bit times 3'h6: 5 bit times 3'h7: 5.5 bit times Note: This field is applicable only in Host mode. For normal operation (to work with most LS devices), set the default value of this field to 3'h2 (3 bit times). The programmable LS device inter-packet gap and turnaround delays are provided to support some legacy LS devices that might require different delays than the default/fixed ones. For instance, the AOpen LS mouse requires 3 bit times of inter-packet gap to work correctly.
18:14	RO	0x00	reserved
13:10	RW	0x9	usbtrdim USB 2.0 Turnaround Time. Sets the turnaround time in PHY clocks. Specifies the response time for a MAC request to the Packet FIFO Controller (PFC) to fetch data from the DFIFO (SPRAM). The following are the required values for the minimum SoC bus frequency of 60 MHz. USB turnaround time is a critical certification criteria when using long cables and five hub levels. The required values for this field: 4'h5: When the MAC interface is 16-bit UTMI+. 4'h9: When the MAC interface is 8-bit UTMI+/ULPI. If SoC bus clock is less than 60 MHz, and USB turnaround time is not critical, this field can be set to a larger value. Note: This field is valid only in device mode.

Bit	Attr	Reset Value	Description
9	RW	0x0	xcvrdly Transceiver Delay. Enables a delay between the assertion of the UTMI/ULPI Transceiver Select signal (for HS) and the assertion of the TxValid signal during a HS Chirp. When this bit is set to 1, a delay (of approximately 2.5 us) is introduced from the time when the Transceiver Select is set to 2'b00 (HS) to the time the TxValid is driven to 0 for sending the chirp-K. This delay is required for some UTMI/ULPI PHYs. Note: If you enable the hibernation feature when the device core comes out of power-off, you must re-initialize this bit with the appropriate value because the core does not save and restore this bit value during hibernation. This bit is valid only in device mode.
8	RW	0x0	enblslpm Enable utmi_sleep_n and utmi_l1_suspend_n. The application uses this bit to control utmi_sleep_n and utmi_l1_suspend_n assertion to the PHY in the L1 state. 1'b0: utmi_sleep_n and utmi_l1_suspend_n assertion from the core is not transferred to the external PHY. 1'b1: utmi_sleep_n and utmi_l1_suspend_n assertion from the core is transferred to the external PHY. Note: This bit must be set high for Port0 if SNPS PHY is used. In Device mode - Before issuing any device endpoint command when operating in 2.0 speeds, disable this bit and enable it after the command completes. Without disabling this bit, if a command is issued when the device is in L1 state and if mac2_clk (utmi_clk/ulpi_clk) is gated off, the command will not get completed.
7	RO	0x0	physel USB 2.0 High-Speed PHY or USB 1.1 Full-Speed. 1'b0: USB 2.0 high-speed UTMI+ or ULPI PHY. 1'b1: USB 1.1 full-speed serial transceiver.

Bit	Attr	Reset Value	Description
6	RW	0x0	suspendusb20 Suspend USB2.0 HS/FS/LS PHY. When set, USB2.0 PHY enters Suspend mode if Suspend conditions are valid. For DRD/OTG configurations, it is recommended that this bit is set to 0 during coreConsultant configuration. If it is set to 1, then the application must clear this bit after power-on reset. Application needs to set it to 1 after the core initialization completes. For all other configurations, this bit can be set to 1 during core configuration. Note: In host mode, on reset, this bit is set to 1. Software can override this bit after reset. In device mode, before issuing any device endpoint command when operating in 2.0 speeds, disable this bit and enable it after the command completes. If you issue a command without disabling this bit when the device is in L2 state and if mac2_clk (utmi_clk/ulpi_clk) is gated off, the command will not get completed.
5	RO	0x0	reserved
4	RO	0x0	ulpi_utmi_sel ULPI or UTMI+ Select. 1'b0: UTMI+ Interface 1'b1: ULPI Interface
3	RW	0x0	phyif If UTMI+ is selected, the application uses this bit to configure the core to support a UTMI+ PHY with an 8- or 16-bit interface. 1'b0: 8 bits 1'b1: 16 bits

Bit	Attr	Reset Value	Description
2:0	RW	0x0	tout_cal HS/FS Timeout Calibration. The number of PHY clocks, as indicated by the application in this field, is multiplied by a bit-time factor; this factor is added to the high-speed/full-speed interpacket timeout duration in the core to account for additional delays introduced by the PHY. This may be required, since the delay introduced by the PHY in generating the linestate condition may vary among PHYs. The USB standard timeout value for high-speed operation is 736 to 816 (inclusive) bit times. The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of connection. The number of bit times added per PHY clock are: High-speed operation: One 30-MHz PHY clock = 16 bit times One 60-MHz PHY clock = 8 bit times Full-speed operation: One 30-MHz PHY clock = 0.4 bit times One 60-MHz PHY clock = 0.2 bit times

usb3otg_GUSB3PIPECTL0

Address: Operational Base + offset (0xC2C0)

Bit	Attr	Reset Value	Description
31	RW	0x0	PHYSoftRst USB3 PHY Soft Reset After setting this bit to 1, the software needs to clear this bit.
30	RW	0x0	HstPrtCmpl
29	RW	0x0	U2SSInactP3ok
28	RW	0x0	DisRxDetP3 Disabled receiver detection in P3 0: If PHY is in P3 and Core needs to perform receiver detection, The core performs receiver detection in P3. (Default) 1: If PHY is in P3 and Core needs to perform receiver detection, The core changes the PHY power state to P2 and then performs receiver detection. After receiver detection, the cores changes PHY power state to P3.
27	RW	0x0	Ux_exit_in_Px

Bit	Attr	Reset Value	Description
26	RW	0x0	ping_enhancement_en Ping Enhancement Enable When set, the Downstream port U1 ping receive timeout becomes 500 ms instead of 300 ms. Minimum Ping.LFPS receive duration is 8 ns (one mac3_clk). This field is valid for the downstream port only. Note: This bit is used by third-party SS PHY. It must be set to 0 for SNPS PHY.
25	RW	0x0	u1u2exitfail_to_recov U1U2exitfail to Recovery When set, and U1/U2 LFPS handshake fails, the LTSSM transitions from U1/U2 to Recovery instead of SS Inactive. If Recovery fails, then the LTSSM can enter SS.Inactive. This is an enhancement only. It prevents interoperability issue if the remote link does not do proper handshake.
24	RW	0x0	request_p1p2p3 Always Request P1/P2/P3 for U1/U2/U3 When set, the core always requests PHY power change from P0 to P1/P2/P3 during U0 to U1/U2/U3 transition. If this bit is 0, and immediate Ux exit (remotely initiated, or locally initiated) happens, the core does not request P1/P2/P3 power state change. Note: This bit must be set to 1 for SNPS PHY. For third-party SS PHY, check with your PHY vendor.
23	RW	0x0	StartRxDetU3RxDet
22	RW	0x0	DisRxDetU3RxDet Disable Receiver Detection in U3/Rx.Det When set, the core does not handle receiver detection in either U3 or Rx.Detect states. DWC_USB3_GUSB3PIPECTL_INIT[23] must be used to start receiver detection manually. This bit can only be used for the downstream port. This bit must be set to 0 for Upstream ports. This feature must not be enabled for normal operation. If you have to use this feature, contact SNPS.
21:19	RW	0x0	DelayP1P2P3 Delay P1P2P3 Delay P0 to P1/P2/P3 request when entering U1/U2/U3 until (DWC_USB3_GUSB3PIPECTL_INIT[21:19]*8) 8B10B error occurs, or Pipe3_RxValid drops to 0. DWC_USB3_GUSB3PIPECTL_INIT[18] must be 1 to enable this functionality.

Bit	Attr	Reset Value	Description
18	RW	0x0	DELAYP1TRANS DELAYP1TRANS Delay PHY power change from P0 to P1/P2/P3 when link state changing from U0 to U1/U2/U3 respectively. 1'b1: When entering U1/U2/U3, delay the transition to P1/P2/P3 until the pipe3 signals, Pipe3_RxElecIlde is 1 and pipe3_RxValid is 0 1'b0: When entering U1/U2/U3, transition to P1/P2/P3 without checking for Pipe3_RxElecIlde and pipe3_RxValid. Note: This bit must be set to '1' for SNPS PHY. It is also used by third-party SS PHY.
17	RW	0x0	SUSPENDENABLE
16:15	RW	0x0	DATWIDTH
14	RW	0x0	AbortRxDetInU2
13	RW	0x0	SkipRxDet
12	RW	0x0	LFPSP0Algn LFPS P0 Align When set: 1. The core deasserts LFPS transmission on the clock edge that it requests Phy power state 0 when exiting U1, U2, or U3 low power states. Otherwise, LFPS transmission is asserted one clock earlier. 2. The core requests symbol transmission two pipe3_rx_pclks periods after the PHY asserts PhyStatus as a result of the PHY switching from P1 or P2 state to P0 state. Currently, this bit is only used in USB 3.0 HUB with SNPS PHY. For other USB 3.0 Host, Device, and DRD cores, this bit is not required.
11	RW	0x0	P3P2TranOK
10	RW	0x0	P3ExSigP2 P3 Exit Signal in P2 When this bit is set, the core always changes the PHY power state to P2, before attempting a U3 exit handshake. This bit is used only for some non-SNPS PHYs that cannot do LFPS in P3. Note: This bit is used by third-party SS PHY. It must be set to '0' for SNPS PHY.

Bit	Attr	Reset Value	Description
9	RW	0x0	LFPSFILTER LFPS Filter When set, filter LFPS reception with pipe3_RxValid in PHY power state P0, that is, ignore LFPS reception from the PHY unless both pipe3_Rxelecidle and pipe3_RxValid are deasserted.
8	RW	0x0	RX_DETECT_to_Polling_L RX_DETECT to Polling.LFPS Control 1'b0 (Default): Enables a 400us delay to start Polling LFPS after RX_DETECT. This allows VCM offset to settle to a proper level. 1'b1: Disables the 400us delay to start Polling LFPS after RX_DETECT. During controller certification with third party PHY it is observed that the PHY is not able to meet the Tx AC common mode voltage active (VTX-CM-ACPP_ACTIVE <100mv) if the link starts polling within 80us from the time rx.detect is performed. To meet this VTX-CM-ACPP_ACTIVE specification, the polling must be delayed further. If the PHY does not have issue then they can set this bit to 1 which allows polling to start within 80us.

usb3otg_GTXFIFOPRIDEV

Address: Operational Base + offset (0xC610)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	gtxfifopridev Device TxFIFO priority. This register specifies the relative DMA priority level among the Device TXFIFOs (one per IN endpoint). Each register bit[n] controls the priority (1: high, 0: low) of each TXFIFO[n]. When multiple TXFIFOs compete for DMA service at a given time (that is, multiple TXQs contain TX DMA requests and their corresponding TXFIFOs have space available), the TX DMA arbiter grants access on a packet-basis in the following manner: 1. High-priority TXFIFOs are granted access using round-robin arbitration 2. Low-priority TXFIFOs are granted access using round-robin arbitration only after the high-priority TXFIFOs have no further processing to do (that is, either the TXQs are empty or the corresponding TXFIFOs are full). For scatter-gather packets, the arbiter grants successive DMA requests to the same FIFO until the entire packet is completed. When configuring periodic IN endpoints, software must set register bit[n]=1, where n is the TXFIFO assignment. This ensures that the DMA for isochronous or interrupt IN endpoints are prioritized over bulk or control IN endpoints. This register is present only when the core is configured to operate in the device mode. The register size corresponds to the number of Device IN endpoints.

usb3otg_GTXFIFOPRIHST

Address: Operational Base + offset (0xC618)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	gtxfifoprihst Host TxFIFO priority. This register specifies the relative DMA priority level among the Host TXFIFOs (one per USB bus instance) within the associated speed group (HS/FSLS). Each register bit[n] controls the priority (1: high, 0: low) of TXFIFO[n] within a speed group. When multiple TXFIFOs compete for DMA service at a given time (i.e., multiple TXQs contain TX DMA requests and their corresponding TXFIFOs have space available), the TX DMA arbiter grants access on a packet-basis in the following manner: 1. Among the FIFOs in the same speed group (HS/FSLS): a. High-priority TXFIFOs are granted access using round-robin arbitration b. Low-priority TXFIFOs are granted access using round-robin arbitration only after the high-priority TXFIFOs have no further processing to do (that is, either the TXQs are empty or the corresponding TXFIFOs are full). 2. The TX DMA arbiter prioritizes the HS/FSLS speed group according to the ratio programmed in the GDMAHLRATIO register. For scatter-gather packets, the arbiter grants successive DMA requests to the same FIFO until the entire packet is completed. This register is present only when the core is configured to operate in the host mode (includes DRD and OTG modes). The register size corresponds to the number of configured USB bus instances; for example, in the default configuration, there are 2 USB bus instances (1 HS, and 1 FSLS).

usb3otg_GRXFIFOPRIHST

usb3otg_GFLADJ

Address: Operational Base + offset (0xC630)

Bit	Attr	Reset Value	Description
31	RW	0x0	gfladj_refclk_240mhzdecr_pls1 This field indicates that the decrement value that the controller applies for each ref_clk must be GFLADJ_REFCLK_240MHZ_DECR and GFLADJ_REFCLK_240MHZ_DECR +1 alternatively on each ref_clk. Set this bit to a 1 only if GFLADJ_REFCLK_LPM_SEL is set to 1 and the fractional component of 240/ref_frequency is greater than or equal to 0.5. Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = (240/24) = 10 3. GFLADJ.GFLADJ_REFCLK_240MHZDECR_PLS1 = 0
30:24	RW	0x00	gfladj_refclk_240mhz_decr This field indicates the decrement value that the controller applies for each ref_clk in order to derive a frame timer in terms of a 240-MHz clock. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to 1. The value is derived as follows: GFLADJ_REFCLK_240MHZ_DECR = 240/ref_clk_frequency Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = 240/24 = 10
23	RW	0x0	gfladj_refclk_lpm_sel This bit enables the functionality of running SOF counters on the ref_clk. This bit must not be set to 1 if GCTL.SOFITPSYNC bit is set to 1. Similarly, if GFLADJ_REFCLK_LPM_SEL set to 1, GCTL.SOFITPSYNC must not be set to 1. Note that the ref_clk frequencies supported in this mode are 16/17/19.2/20/24/39.7/40 MHz. The utmi_clk[0] signal of the core must be connected to the FREECLK of the PHY. Note: If you set this bit to 1, the GUSB2PHYCFG.U2_FREECLK_EXISTS bit must be set to 0.
22	RO	0x0	reserved

Bit	Attr	Reset Value	Description
21:8	RW	0x0000	gfladj_refclk_fladj This field indicates the frame length adjustment to be applied when SOF counter is running on the ref_clk. SOF interval when GLADJ.GFLADJ_REFCLK_LPM_SEL is set to 1. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to 1 or GCTL.SOFITPSYNC is set to 1. The value is derived as follows: FLADJ_REF_CLK_FLADJ=((125000/ref_clk_period_integer)-(125000/ref_clk_period)) * ref_clk_period where: 1. The ref_clk_period_integer is the integer value of the ref_clk period got by truncating the decimal (fractional) value that is programmed in the GUCTL.REF_CLK_PERIOD field. 2. The ref_clk_period is the ref_clk period including the fractional value. Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GLADJ_REFCLK_FLADJ = ((125000/41)-(125000/41.6666))*41.6666 = 2032 (ignoring the fractional value).
7	RW	0x0	gfladj_30mhz_sdbnd_sel This field selects whether to use the input signal fladj_30mhz_reg or the GFLADJ.GFLADJ_30MHZ to adjust the frame length for the SOF. When this bit is set to: 1'b1: the controller uses the register field GFLADJ.GFLADJ_30MHZ value 1'b0: the controller uses the input signal fladj_30mhz_reg value.
6	RO	0x0	reserved
5:0	RW	0x00	gfadj_30mhz This field indicates the value that is used for frame length adjustment instead of considering from the sideband input signal fladj_30mhz_reg. This enables post-silicon frame length adjustment in case the input signal fladj_30mhz_reg is connected to a wrong value or is not valid. For details on how to set this value, refer to section 5.2.4, "Frame Length Adjustment Register (FLADJ)," of the xHCI Specification.

usb3otg_DCFG

Address: Operational Base + offset (0xC700)

Bit	Attr	Reset Value	Description

21:17	RW	0x04	nump Number of Receive Buffers. Not applied.
16:12	RW	0x00	intrnum Interrupt number. Indicates interrupt/EventQ number on which non-endpoint-specific device-related interrupts (see DEVT) are generated.
11:10	RO	0x0	reserved
9:3	RW	0x00	devaddr Device Address. The application must perform the following: 1. Program this field after every SetAddress request. 2. Reset this field to zero after USB reset.
2:0	RW	0x0	devspd Device Speed. Indicates the speed at which the application requires the core to connect, or the maximum speed the application can support. However, the actual bus speed is determined only after the chirp sequence is completed, and is based on the speed of the USB host to which the core is connected. 3'b000: High-speed (USB 2.0 PHY clock is 30 MHz or 60 MHz) 3'b001: Full-speed (USB 2.0 PHY clock is 30 MHz or 60 MHz)

usb3otg_DCTL

Address: Operational Base + offset (0xC704)

Bit	Attr	Reset Value	Description
31	RW	0x0	run_stop The software writes 1 to this bit to start the device controller operation. To stop the device controller operation, the software must remove any active transfers and write 0 to this bit. When the controller is stopped, it sets the DSTS.DevCtrlHlt bit when the core is idle and the lower layer finishes the disconnect process. The Run/Stop bit must be used in following cases as specified: 1. After power-on reset and CSR initialization, the software must write 1 to this bit to start the device controller. The controller does not signal connect to the host until this bit is set. 2. The software uses this bit to control the device controller to perform a soft disconnect. When the software writes 0 to this bit, the host does not see that the device is connected. The device controller stays in the disconnected state until the software writes 1 to this bit. The minimum duration of keeping this bit cleared is specified in the Note below. If the software attempts a connect after the soft disconnect or detects a disconnect event, it must set DCTL[8:5] to 5 before reasserting the Run/Stop bit. 3. When the USB is in a lower power state and the Two Power Rails configuration is selected, software writes 0 to this bit to indicate that it is going to turn off the Core Power Rail. After the software turns on the Core Power Rail again and re-initializes the device controller, it must set this bit to start the device controller. Note: The following is the minimum duration under various conditions for which the soft disconnect (SftDiscon) bit must be set for the USB host to detect a device disconnect: 10ms: For high-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions); For full-speed/low-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions). To accommodate clock jitter, it is recommended that the application add extra delay to the specified minimum duration.

Bit	Attr	Reset Value	Description
30	R/WSC	0x0	csftrst Core Soft Reset. Reset all clock domains as follows: 1. This bit clears the interrupts and all the CSRs except GSTS, GSNPSID, GGPIO, GUID, GUSB2PHYCFGn registers, GUSB3PIPECTLn registers, DCFG, DCTL, DEVTEN, and DSTS registers. 2. All module state machines (except the SoC Bus Slave Unit) are reset to the IDLE state, and all the TxFIFOs and the RxFIFO are flushed. 3. Any transactions on the SoC bus Master are terminated as soon as possible, after gracefully completing the last data phase of a SoC bus transfer. Any transactions on the USB are terminated immediately. The application can write this bit at any time to reset the core. This is a self-clearing bit; the core clears this bit after all necessary logic is reset in the core, which may take several clocks depending on the core's current state. Once this bit is cleared, the software must wait at least 3 PHY clocks before accessing the PHY domain (synchronization delay). Typically, software reset is used during software development and also when you dynamically change the PHY selection bits in the USB configuration registers listed above. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain must be reset for proper operation.
29	RO	0x0	reserved
28:24	RW	0x00	hirdthres HIRD Threshold. The core asserts output signals utmi_l1_suspend_n and utmi_sleep_n on the basis of this signal: The core asserts utmi_l1_suspend_n to put the PHY into Deep Low-Power mode in L1 when both of the following are true: 1. HIRD value is greater than or equal to the value in DCTL.HIRD_Thres[3:0] 2. HIRD_Thres[4] is set to 1'b1. The core asserts utmi_sleep_n on L1 when one of the following is true: 1. If the HIRD value is less than HIRD_Thres[3:0] or 2. HIRD_Thres[4] is set to 1'b0. Note: This field must be set to '0' during SuperSpeed mode of operation.

Bit	Attr	Reset Value	Description
23:20	RW	0xf	lpm_nyet_thres LPM NYET Threshold Handshake response to LPM token specified by device application. Response depends on DCFG.LPMCap. DCFG.LPMCap is 1'b0 - The core always responds with Timeout (that is, no response). DCFG.LPMCap is 1'b1 - The core responds with an ACK on successful LPM transaction, which requires that all of the following are satisfied: 1. There are no PID or CRC5 errors in both the EXT token and the LPM token (if not true, inactivity results in a timeout ERROR). 2. No data is pending in the Transmit FIFO and OUT endpoints not in flow controlled state (else NYET). 3. The BESL value in the LPM token is less than or equal to LPM_NYET_thres[3:0].
19	RW	0x0	keep_connect When 1, this bit enables the save and restore programming model by preventing the core from disconnecting from the host when DCTL.RunStop is set to 0. The device core disconnects from the host when DCTL.RunStop is set to 0. This bit indicates whether to preserve this behavior (0), or if the core must not disconnect when RunStop is set to 0 (1).
18	RW	0x0	l1_hibernation_en When this bit is set along with KeepConnect, the device core generates a Hibernation Request Event if L1 is enabled and the HIRD value in the LPM token is larger than the threshold programmed in DCTL.HIRD_Thres. The core does not exit the LPM L1 state until software writes Recovery into the DCTL.ULStChngReq field. This prevents corner cases where the device is entering hibernation at the same time the host is attempting to exit L1.
17	RW	0x0	crs Controller Restore State. This command is similar to the USBCMD.CRS bit in host mode and initiates the restore process. When software sets this bit to 1, the controller immediately sets DSTS.RSS to 1. When the controller has finished the restore process, it sets DSTS.RSS to 0. Note: When read, this field always returns 0.

Bit	Attr	Reset Value	Description
16	RW	0x0	css Controller Save State. This command is similar to the USBCMD.CSS bit in host mode and initiates the save process. When software sets this bit to 1, the controller immediately sets DSTS.SSS to 1. When the controller has finished the save process, it sets DSTS.SSS to 0. Note: When read, this field always returns 0.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the device command parameter. This must be programmed before or along with the device command. The available device commands are listed in DGCMD register.

usb3otg_DGCMD

Address: Operational Base + offset (0xC714)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:12	RO	0x0	cmdstatus Command Status: 1'b1: CmdErr: Indicates that the device controller encountered an error while processing the command. 1'b0: Indicates command success
11:10	RO	0x0	reserved
9	R/WSC	0x0	cmdact Command Active. The software sets this bit to 1 to enable the device controller to execute the generic command. The device controller sets this bit to 0 after executing the command.
8	RW	0x0	cmdioc Command Interrupt on Complete. When this bit is set, the device controller issues a Generic Command Completion event after executing the command. Note that this interrupt is mapped to DCFG.IntrNum. Note: This field must not set to 1 if the DCTL.RunStop field is 0.
7:0	RW	0x00	cmdtyp Command Type. Specifies the type of command the software driver is requesting the core to perform. 8'h0: Reserved 8'h1: Set Endpoint Configuration - 64 or 96-bit Parameter 8'h2: Set Endpoint Transfer Resource Configuration - 32-bit Parameter 8'h3: Get Endpoint State - No Parameter Needed 8'h4: Clear Stall (see Set Stall) - No Parameter Needed 8'h5: Start Transfer - 64-bit Parameter 8'h6: Update Transfer - No Parameter Needed 8'h7: End Transfer - No Parameter Needed 8'h8 Start New Configuration - No Parameter Needed

usb3otg_DALEPENA

Address: Operational Base + offset (0xC720)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	usbactep USB Active Endpoints. This field indicates if a USB endpoint is active in the current configuration and interface. It applies to USB IN endpoints 0~15 and OUT endpoints 0~15, with one bit for each of the 32 possible endpoints. Even numbers are for USB OUT endpoints, and odd numbers are for USB IN endpoints, as follows: Bit[0]: USB EP0-OUT Bit[1]: USB EP0-IN Bit[2]: USB EP1-OUT Bit[3]: USB EP1-IN ... The entity programming this register must set bits 0 and 1 because they enable control endpoints that map to physical endpoints (resources) after USBReset. Hardware clears these bits for all endpoints (other than EP0-OUT and EP0-IN) after detecting a USB reset event. After receiving SetConfiguration and SetInterface requests, the application must program endpoint registers accordingly and set these bits.

usb3otg_DEPnCMDPAR2

Address: Operational Base + offset (0xC800)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the physical endpoint command Parameter 2. It must be programmed before issuing the command.

usb3otg_DEPnCMDPAR1

Address: Operational Base + offset (0xC804)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the physical endpoint command Parameter 1. It must be programmed before issuing the command.

usb3otg_DEPnCMDPAR0

Address: Operational Base + offset (0xC808)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the physical endpoint command Parameter 0. It must be programmed before issuing the command.

usb3otg_DEPnCMD

Address: Operational Base + offset (0xC80C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	commandparam Command Parameters or Event Parameters when this register is written: For Start Transfer command: The 16-bit StreamID assigned to this transfer For Start Transfer command applied to an isochronous endpoint: StartMicroFramNum, Indicates the (micro) frame number to which the first TRB applies. For Update Transfer, End Transfer, and Start New Configuration commands: [22:16]: Transfer Resource Index (XferRscIdx). The hardware-assigned transfer resource index for the transfer, which was returned in response to the Start Transfer command. The application software-assigned transfer resource index for a Start New Configuration command. Event Parameters (EventParam), when this register is read.
15:12	RW	0x0	cmdstatus Command Completion Status. The information is in the same format as bits 15:12 of the Endpoint Command Complete event.
11	RW	0x0	hipri_forcerm HighPriority: Only valid for Start Transfer command. ForceRM: Only valid for End Transfer command. ClearPendIN: Only valid for Clear Stall command. Software sets this bit to clear any pending IN transaction (on that endpoint) stuck at the lower layers when a Clear Stall command is issued.
10	RW	0x0	cmdact Command Active. Software sets this bit to 1 to enable the device endpoint controller to execute the generic command. The device controller sets this bit to 0 when the CmdStatus field is valid and the endpoint is ready to accept another command. This does not imply that all the effects of the previously-issued command have taken place.
9	RO	0x0	reserved
8	RW	0x0	cmdioc Command Interrupt on Complete. When this bit is set, the device controller issues a generic Endpoint Command Complete event after executing the command. Note that this interrupt is mapped to DEPCFG.IntrNum. When the DEPCFG command is executed, the command interrupt on completion goes to the interrupt pointed by the DEPCFG.IntrNum in the current command. Note: This field must not set to 1 if the DCTL.RunStop field is 0.
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	cmdtyp Command Type. Specifies the type of command the software driver is requesting the core to perform. 4'h0: Reserved 4'h1: Set Endpoint Configuration - -64 or 96-bit Parameter 4'h2: Set Endpoint Transfer Resource Configuration - 32-bitparameter 4'h3: Get Endpoint State - No Parameter Needed 4'h4: Set Stall - No Parameter Needed 4'h5: Clear Stall (see Set Stall) - No Parameter Needed 4'h6: Start Transfer - 64-bit Parameter 4'h7: Update Transfer - No Parameter Needed 4'h8: End Transfer - No Parameter Needed 4'h9: Start New Configuration - No Parameter Needed

17.5 Interface Description

Table 17-1 USB2.0 PHY and SS PHY Interface Description

Module Pin	Dir.	Pin Name	Descriptions
USB0ID	I/O	USB3OTG_ID	USB3 OTG usb2 part pad
USB0PN	I/O	USB3OTG_DM	USB3 OTG usb2 part pad
USB0PP	I/O	USB3OTG_DP	USB3 OTG usb2 part pad
VBUS	I/O	USB3OTG_VBUS	USB3 OTG usb2 part pad
PIPE0TXP	I/O	USB3OTG_TXP	USB3 OTG usb3 part pad
PIPE0TXN	I/O	USB3OTG_TXN	USB3 OTG usb3 part pad

PIPE1RXN	I/O	USB3HOST_RXN	USB3 Host usb3 part pad

17.6 Application Notes

17.6.1 Some Special Settings before Initialization

Set USB3.0 OTG controller AXI master secure setting.
Set PHYIF to 1 to use 16-bit UTMI+ interface (see register GUSB2PHYCFG0)
Clear ENBLSLPM to 0 to disable sleep and l1 suspend (see register GUSB2PHYCFG0)
Clear U2_FREECLK_EXITSTS to 0 (see register GUSB2PHYCFG0)
Clear DEV_FORCE_20_CLK_FOR_30_CLK to 0 (see register GUCTL1)
Clear DELAYP1TRANS to 0 (see register GUSB3PIPECTL0)
Hold USB3.0 controller in resetting during USB3PHY initialization

17.6.2 OTG Programming Model

When detect ID change event (see USBPHY_GRF) or VBUS change event (see USBPHY_GRF) after disconnect, it means a USB3/2 OTG A device or B device may connect, then check status of ID(see USBPHY_GRF). If ID==0, it will work as A device, then follow host programming flow; if ID==1, it will work as B device, then it follows device programming flow.
Note: USB3.0 OTG doesn’t support host/device mode swapping through HNP and RSP.
Note: SS PHY is combo PHY, it may share with other protocol PHY, when other protocol PHY is on, USB3.0 OTG can only work on usb2.0 mode.

Chapter 18 PCIe Controller

18.1 Overview

The PCI Express (PCIe) is a high performance, general purpose I/O interconnect defined for a wide variety of future computing and communication platforms. The PCIe designed to be used as a general-purpose serial I/O interconnect in multiple market segments, including desktop, mobile, server, storage, and embedded communications. It is compliant with PCI Express Specifications 1.1, 2.1. The PCIe subsystem is consist of three Controllers, one 2-lane Gen3 PHY with bifurcation, and one 1-lane Gen2 PHY combo with SATA/PCS.
PCIe subsystem supports the following features:

- Compatible with PCI Express Base Specification Revision 3.0
- Support 1 DM (Dual-Mode) 2-lane PCIe 3.0 Gen3 controller: Root Complex (RC) and Endpoint (EP)
- Support 1 RC only mode 1-lane PCIe 3.0 Gen3 controller: Root Complex (RC)
- Support 1 RC only mode 1-lane PCIe 3.0 Gen2 controller: Root Complex (RC)
- Maximum link width is 2, single bi-directional Link interface
- Maximum Payload Size of 256 bytes
- Maximum 32 Non-Posted outstanding transactions
- Support 2.5GT/s, 5.0 GT/s, 8.0GT/s serial data transmission rate per lane per direction
- Support 100MHz differential clock output (optional with SSC) for system application
- Embedded DMA with Hardware Flow Control in DM controller
- Support Latency Tolerance Reporting (LTR)
- Support Optimized Buffer Flush and Fill (OBFF)
- Support Resizable BAR Capability
- Support Single Physical PCI Function in Endpoint Mode
- Support Legacy Interrupt
- Support MSI with Per-Vector Masking (PVM) and 32 multiple MSI
- Support MSI-X with Per-Vector Masking (PVM) and 64 MSI-X table size
- Support ECRC Generation and Checking
- Support Outbound and Inbound address translation
- Support Dynamic Power Allocation Capability (DPA)
- Support PCI Express Active State Power Management (ASPM) state L0s and L1
- Support L1 Power Management Substate
- Support PCI Function power states D0, D1 and D3, and the corresponding link power states L0, L1 and L2
- Support RAS DES (Debug, Error Injection, and Statistics)
- Support Automatic Lane Reversal
- Support PCI Express Advanced Error Reporting (AER) with Header Logging

18.2 Block Diagram

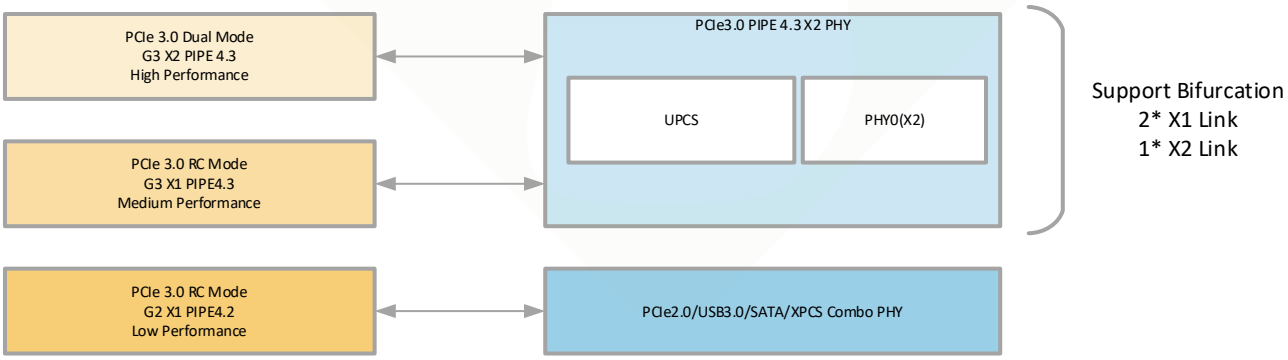

Fig. 18-1 PCIe Block Diagram

18.3 Function Description

18.3.1 Application Interface and AXI Bridge

Application Interface comprises with four standard interfaces: one AXI master interface, two AXI slave interface and one APB interface. These interface bridging capability for directly adding a PCI Express link to an AXI system fabric.

The AXI bridge module acts as a bridge between the standard AXI interfaces and the PCIe controller native interfaces. The bridge interconnects the AXI interfaces within an AXI-embedded system with a remote PCIe link, as either a root complex port or as an endpoint port.

The AXI master interfaces enable a remote PCIe device to read and write to an AXI slave connected to the AXI bridge. The AXI link slave interface enables an AXI master to read and write through the AXI bridge to a remote PCIe device. The DBI slave enables an AXI master to access the controller's registers. The APB enables Application to access the client registers.

18.3.2 Client Logic

Client Logic Consists of some additional logic used for application to interact with PCIe Controller. For example, applications can access client registers to send/receive PCIe Message, request to enter/exit PM state, deal with interrupts, configure some basic operation mode, read some basic debug information, and so on. For more details, please refer to client registers description and application notes for more information.

18.3.3 Embedded DMA

The RC system CPU, or the EP application CPU, can offload the transferring of large blocks of data to the embedded DMA controller, leaving the CPU free to perform other tasks. The embedded DMA have one read channel and one write channel. It can simultaneously perform the two types of memory transactions:

DMA write: Transfer (copy) of a block of data from local (application) memory to remote (link partner) memory.

DMA read: Transfer (copy) of a block of data from remote (link partner) memory to local (application) memory.

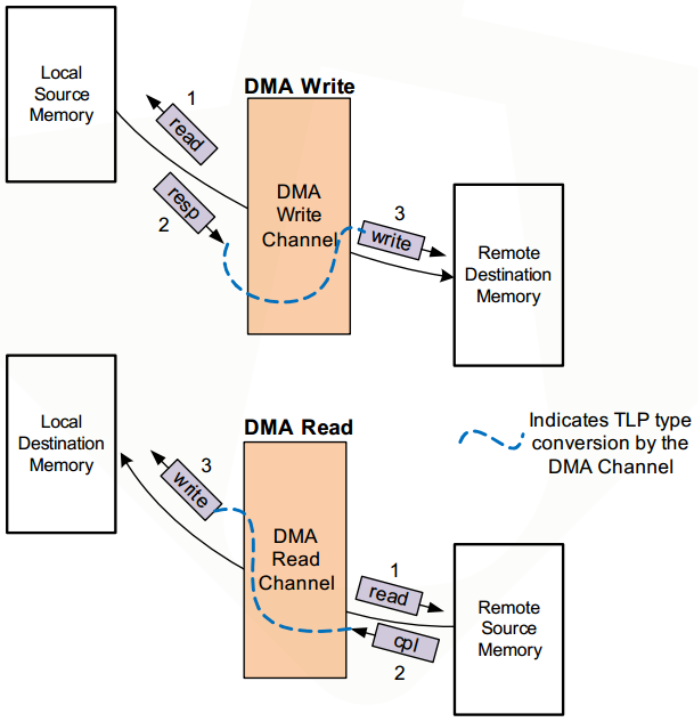

Fig. 18-2 System Level View of PCIe EDMA

Therefore, the EDMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (Memory Write) to the remote CPU. The DMA is highly configurable and can be programed

by using the local DBI AXI Slave interface.
The EDMA provides a linked list (LL) mode to efficiently move data from source to destination with minimal intervention from the local CPU. For details, please refer to DMA Registers Description and Application notes for more information.

18.3.4 PCIe Core

PCIe Core deal with the PCIe protocol, and consists of three main modules:

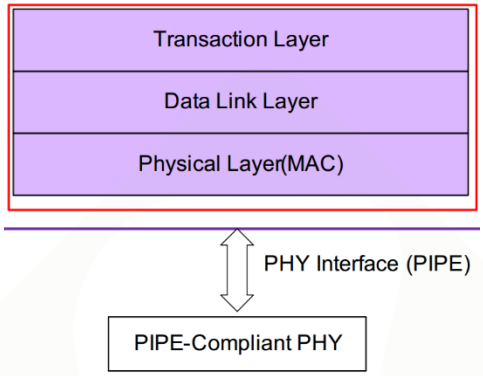

Fig. 18-3 PCIe Core Architecture Overview

The PCIe Core implements the basic functionality for the PCI Express physical, link, and transaction layers. This module implements a large part of the transaction layer logic, all of the data link layer logic, and the MAC portion of the physical layer, including the link training and status state machine (LTSSM). The Core connects to the external PHY through the standard PIPE interface.

18.3.5 Power Management

PCIe Controller support PCIe ASPM, L1 Substate and PCI PM. For proper understanding of PCIe Power Management, you should be familiar with Chapter 5, Power Management of the PCI Express Base Specification, and PCI-SIG Engineering Change Notice ECN L1 Substates with CLKREQ#. For application details, please refer to Application Notes for more information.

18.3.6 PCIe 2.0 PHY

PCIe Controller shares a combo PHY with USB 3.0 Controller. The PCIe PHY, which consists of Physical Coding Sub-layer(PCS) and Physical Media Attachment Layer(PMA), includes all circuitry for interface operation, including 8/10 encoding/decoding, driver and input buffers, parallel-to-serial and serial-to-parallel conversion, PLL(s), and impedance matching circuitry. The PHY provides standard PIPE interface with the Media Access Layer for exchanging information. This PHY is responsible for converting information received from the PCIe Core into an appropriate serialized format and transmitting it across the PCIe Link at a frequency and width compatible with the device connected to the other side of the Link.

18.4 Register Description

PCIe Registers can be accessed by either local CPU through AXI Dbi bus or remote RC device through PCIe link or both. The way through local CPU will be mentioned as 'Dbi' and the way through PCIe link will be mentioned as 'wire' in this section.
Some read-only registers can be made temporarily R/W when you write 1 to the DBI_RO_WR_EN bit of the MISC_CONTROL_1_OFF register. These registers will be specifically mentioned in their description if they have this feature.

18.4.1 Internal Address Mapping

PCIe local address mapping is discussed in this section.

Table 18-1 PCIe X2 DM G3 Client and Core Register Address Mapping

Base Address	Device	Address Length	Offset Address Range
0xF6000000	Core Register	4M BYTE	0x00000 ~ 0x3fffff
0xF0000000	PCIe Outbound	32M BYTE	0x0000000~0x1ffffff

	Memory		
0xFE280000	Client Register	64K BYTE	0x0000~0xffff
0xFDC50000	PD PIPE GRF	64K BYTE	0x0000~0xffff
0xFDCB8000	PHY GRF	32K BYTE	0x0000~0x7fff
0xFE8C0000	PHY Register	128K BYTE	0x0000~0x1ffff

Table 18-2 PCIe X1 RC G3 Client and Core Register Address Mapping

Base Address	Device	Address Length	Offset Address Range
0xF6400000	Core Register	4M BYTE	0x00000 ~ 0x3fffff
0xF2000000	PCIe Outbound Memory	32M BYTE	0x0000000~0x1ffffff
0xFE270000	Client Register	64K BYTE	0x0000~0xffff
0xFDC50000	PD PIPE GRF	64K BYTE	0x0000~0xffff
0xFDCB8000	PHY GRF	32K BYTE	0x0000~0x7fff
0xFE8C0000	PHY Register	128K BYTE	0x0000~0x1ffff

Table 18-3 PCIe X1 RC G2 Client and Core Register Address Mapping

Base Address	Device	Address Length	Offset Address Range
0xF6800000	Core Register	4M BYTE	0x00000 ~ 0x3fffff
0xF4000000	PCIe Outbound Memory	32M BYTE	0x0000000~0x1ffffff
0xFE260000	Client Register	64K BYTE	0x0000~0xffff
0xFDC50000	PD PIPE GRF	64K BYTE	0x0000~0xffff
0xFDC90000	PHY GRF	64K BYTE	0x0000~0xffff
0xFE840000	PHY Register	64K BYTE	0x0000~0xffff

Core Register map is as follows:
RC mode:

Table 18-4 PCIe Core Register Map in RC mode

Offset Address Range	Register Block	Description
0x0000~0x003c	TYPE1_HDR	PCI-Compatible Configuration Space Header Type1
0x0040~0x0044	PM_CAP	PCI Power Management Capability Structure
0x0050~0x0064	MSI_CAP	MSI Capability Structure
0x0070~0x00a0	PCIE_CAP	PCI Express Capability Structure

18.4.3 PCIe Client Detail Registers Description

PCIE_CLIENT_GENERAL_CON

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:14	RO	0x0	reserved
13	RW	0x0	link_req_rst_grt_sel Link down reset request grant control select: 1'b1: From client grf GENERAL_CON bit 3 1'b0: From pcie grf PCIE_CON0 bit 2
12	WO	0x0	app_err_repot Set 1 to repor application error to controller. It is a self-clear bit to generate a pulse to controller. Application should provide error information in VEN_ERR_INFOx registers before setting this bit.
11	RW	0x0	app_sris_mode SRIS operating mode 1'b0: non-SRIS mode 1'b1: SRIS mode
10	RW	0x0	app_dbi_ro_wr_disable 1'b0: MISC_CONTROL_1_OFF.DBI_RO_WR_EN register field is read-write. 1'b1: MISC_CONTROL_1_OFF.DBI_RO_WR_EN register field is forced to 0 and is read-only
9	RW	0x0	tx_lane_flip_en Performs manual lane reversal for transmit lanes. Used when automatic lane reversal does not occur. 1'b1: enable 1'b1: disable
8	RW	0x0	rx_lane_flip_en Performs manual lane reversal for receive lanes. Used when automatic lane reversal does not occur. 1'b1: enable 1'b1: disable

Bit	Attr	Reset Value	Description
7:4	RW	0x0	device_type Device/port type. Indicates the specific type of this PCI Express function. It is also used to set the 'Device/Port Type' field of the 'PCI Express Capabilities Register'. The controller uses this input to determine the operating mode of the controller at run time. Defined encodings are: 4'b0000: PCI Express endpoint 4'b0001: Legacy PCI Express endpoint 4'b0100: Root port of PCI Express root complex
3	RW	0x0	link_req_rst_grt Link down reset request grant control. 1'b1: enable link down reset request grant 1'b0: disable link down reset request grant
2	RW	0x0	ltssm_enable Driven low by your application after cold, warm, or hot reset to hold the LTSSM in the Detect state until your application is ready for the link training to begin. When your application has finished reprogramming the controller configuration registers using the DBI, it asserts app_ltssm_enable to allow the LTSSM to continue link establishment. Can also be used to delay hot resetting of the controller until you have read out any register status.
1	RW	0x0	app_req_retry_en Provides a capability to defer incoming configuration requests until initialization is complete. When app_req_retry_en is asserted, the controller completes incoming configuration requests with a configuration request retry status. Other incoming requests complete normally.
0	RW	0x0	app_init_rst Set "1" to send a hot reset to link partner. It is a self-clear bit to generate a hot reset pulse to controller. Only used in RC mode.

PCIE_CLIENT_INTR_STATUS_MSG_RX

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	W1C	0x0	obff_cpu_active_int Interrupt indicates that the controller received an 'CPU Active' OBFF message. 1'b0: no interrupt 1'b1: interrupt EP only.
13	W1C	0x0	obff_obff_int Interrupt indicates that the controller received an 'OBFF' OBFF message. 1'b0: no interrupt 1'b1: interrupt EP only.
12	W1C	0x0	obff_idle_int Interrupt indicates that the controller received an 'IDLE' OBFF message. 1'b0: no interrupt 1'b1: interrupt EP only.
11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10	W1C	0x0	pm_turnoff_int Interrupt indicates that the controller received a PME Turnoff message. 1'b0: no interrupt 1'b1: interrupt EP mode only.
9	W1C	0x0	pm_to_ack_int Interrupt indicates that the controller received a PME_TO_Ack message. 1'b0: no interrupt 1'b1: interrupt RC mode only.
8	W1C	0x0	pm_pme_int Interrupt indicates that the controller received a PM_PME message. 1'b0: no interrupt 1'b1: interrupt RC mode only.
7:6	RO	0x0	reserved
5	W1C	0x0	pme_msi Asserted when all of the following conditions are true: 1. MSI or MSI-X is enabled. 2. The PME Interrupt Enable bit in Root Control register is set to 1. 3. The PME Status bit in Root Status register is set to 1. Note the difference between pme_msi and pme_int is that aer_rc_err_int is read only and rc_err_msi can be wroten 1 to clear.
4	RO	0x0	pme_int Asserted when all of the following conditions are true: The INTx Assertion Disable bit in the Command register is 0. The PME Interrupt Enable bit in the Root Control register is set to 1. The PME Status bit in the Root Status register is set to 1. This signal is used when MSI/MSI-X is NOT enabled; otherwise see cfg_aer_rc_err_msi.
3	RO	0x0	reserved
2	W1C	0x0	ltr_msg_int Interrupt that indicates the controller received a LTR message. The LTR message information is available in PL_LTR_LATENCY_OFF registers. 1'b0: no interrupt 1'b1: interrupt
1	W1C	0x0	unlock_int Interrupt indicates that the controller received an Unlock message. 1'b0: no interrupt 1'b1: interrupt
0	W1C	0x0	ven_msg_int Interrupt that indicates the controller received a vendor-defined message. The message header is available in VEN_MSG_RX_INFO registers. 1'b0: no interrupt 1'b1: interrupt

PCIE_CLIENT_INTR_STATUS_LEGACY

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RO	0x0	tx_intd_int Emulation of sending the legacy PCI Interrupts. 1'b0 to 1'b1: The controller has sent an Assert_INTD Message to the upstream device. 1'b1 to 1'b0: The controller has sent an Deassert_INTD Message to the upstream device. EP mode only.
6	RO	0x0	tx_intc_int Emulation of sending the legacy PCI Interrupts. 1'b0 to 1'b1: The controller has sent an Assert_INTC Message to the upstream device. 1'b1 to 1'b0: The controller has sent an Deassert_INTC Message to the upstream device. EP mode only.
5	RO	0x0	tx_intb_int Emulation of sending the legacy PCI Interrupts. 1'b0 to 1'b1: The controller has sent an Assert_INTB Message to the upstream device. 1'b1 to 1'b0: The controller has sent an Deassert_INTB Message to the upstream device. EP mode only.
4	RO	0x0	tx_inta_int Emulation of sending the legacy PCI Interrupts. 1'b0 to 1'b1: The controller has sent an Assert_INTA Message to the upstream device. 1'b1 to 1'b0: The controller has sent an Deassert_INTA Message to the upstream device. EP mode only.
3	RO	0x0	rx_intd_int Emulation of reception of the legacy PCI Interrupts. RC mode only. 1'b0 to 1'b1: The controller received an Assert_INTD Message from the downstream device. 1'b1 to 1'b0: The controller received an Deassert_INTD Message from the downstream device. RC mode only.
2	RO	0x0	rx_intc_int Emulation of reception of the legacy PCI Interrupts. RC mode only. 1'b0 to 1'b1: The controller received an Assert_INTC Message from the downstream device. 1'b1 to 1'b0: The controller received an Deassert_INTC Message from the downstream device. RC mode only.
1	RO	0x0	rx_intb_int Emulation of reception of the legacy PCI Interrupts. RC mode only. 1'b0 to 1'b1: The controller received an Assert_INTB Message from the downstream device. 1'b1 to 1'b0: The controller received an Deassert_INTB Message from the downstream device. RC mode only.

Bit	Attr	Reset Value	Description
0	RO	0x0	rx_inta_int Emulation of reception of the legacy PCI Interrupts. RC mode only. 1'b0 to 1'b1: The controller received an Assert_INTA Message from the downstream device. 1'b1 to 1'b0: The controller received an Deassert_INTA Message from the downstream device. RC mode only.

PCIE_CLIENT_INTR_STATUS_ERR

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	W1C	0x0	radm_qoverflow_int Interrupt indicates that one or more of the P/NP/CPL receive queues have overflowed. 1'b0: no interrupt 1'b1: interrupt
11	RO	0x0	reserved
10	W1C	0x0	f_err_rx_int Interrupt indicates that the controller received an ERR_FATAL message. 1'b0: no interrupt 1'b1: interrupt EP mode only.
9	W1C	0x0	nf_err_rx_int Interrupt indicates that the controller received an ERR_NONFATAL message. 1'b0: no interrupt 1'b1: interrupt EP mode only.
8	W1C	0x0	cor_err_rx_int Interrupt indicates that the controller received an ERR_COR message. 1'b0: no interrupt 1'b1: interrupt EP mode only.
7	RO	0x0	reserved
6	W1C	0x0	f_err_sent_int EP has sent a message towards the Root Complex indicating that the EP has received a TLP that contained a fatal error. 1'b0: no interrupt 1'b1: interrupt EP mode only.
5	W1C	0x0	nf_err_sent_int EP has sent a message towards the Root Complex indicating that the EP has received a TLP that contained a non-fatal error. 1'b0: no interrupt 1'b1: interrupt
4	W1C	0x0	cor_err_sent_int EP has sent a message towards the Root Complex indicating that the EP has received a TLP that contained a correctable error. 1'b0: no interrupt 1'b1: interrupt

Bit	Attr	Reset Value	Description
3	W1C	0x0	tx_cpl_timeout_int Interrupt indicates that the application has not generated a completion for an incoming request within the required time interval. The default completion timeout value is approximately 10 ms.
2	W1C	0x0	rx_cpl_timeout_int Interrupt indicates that the completion TLP for a request has not been received within the expected time window. 1'b0: no interrupt 1'b1: interrupt You can find the timed out completion information in RX_CPL_TIME_OUT_INFO register.
1	W1C	0x0	aer_rc_err_msi Interrupt asserted cfg_aer_rc_err_msi for one clock cycle when all of the following conditions are true: 1. MSI or MSI-X is enabled. 2. A reported error condition causes a bit to be set in the Root Error Status register. 3. The associated error message reporting enable bit is set in the Root Error Command register. The controller does not check if the associated MSI vector is unmasked. Note the difference between aer_rc_err_msi and aer_rc_err_int is that aer_rc_err_int is read only and rc_err_msi can be wroten 1 to clear. RC mode only.
0	RO	0x0	aer_rc_err_int Interrupt sserted when a reported error condition causes a bit to be set in the Root Error Status register and the associated error message reporting enable bit is set in the Root Error Command register. aer_rc_err_int is set when the RC internally generates an error or when an error message is received by the RC. This signal is used when MSI/MSI-X is NOT enabled; otherwise see cfg_aer_rc_err_msi. RC mode only.

PCIE_CLIENT_INTR_STATUS_MISC

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	ep_elbi_app_int Interrupt generated by ELBI app. 1'b1: interrupt 1'b0: no interrupt
14	RO	0x0	link_eq_req_int Interrupt indicating to your application that the Link Equalization Request bit in the Link Status 2 Register has been set and the Link Equalization Request Interrupt Enable (Link Control 3 Register bit 1) is set. 1'b1: interrupt 1'b0: no interrupt

Bit	Attr	Reset Value	Description
13	W1C	0x0	rbar_updata_int Interrupt indicates that a resizable BAR control register has been updated. 1'b1: interrupt 1'b0: no interrupt
12	W1C	0x0	dpa_sub_upd_int Interrupt asserted when the Substate Control field of the DPA Control Register has been updated with a new value. The controller asserts it when the updated value of the Substate Control field does not match the Substate Status field of the Status Register when the Substate Control Enable bit field of the Status Register is set to "1".
11	RO	0x0	edma_rd_int DMA read channel interrupt. Indicates that the DMA read transfer has completed or that an error has occurred. 1'b0: no interrupt 1'b1: interrupt
10	RO	0x0	edma_wr_int DMA write channel interrupt. Indicates that the DMA write transfer has completed or that an error has occurred. 1'b0: no interrupt 1'b1: interrupt
9	W1C	0x0	bw_mgt_msi Interrupt asserted when following conditions are true: 1. MSI or MSI-X is enabled. 2. The Link Bandwidth Management Status register (Link Control Status register bit 14) is updated 3. The Link Bandwidth Management Interrupt Enable (Link Control register bit 10) is set. RC mode only.
8	RO	0x0	bw_mgt_int Interrupt asserted when all the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0 2. The Bandwidth Management Interrupt Enable bit in the Link Control register is set to 1 3. The Bandwidth Management Interrupt Status bit in the Link Status register is set to 1. RC mode only.
7	W1C	0x0	link_auto_bw_msi The controller sets this pin when following conditions are true: 1. MSI or MSI-X is enabled. 2. The Link Autonomous Bandwidth Status register (Link Status register bit 15) is updated. 3. The Link Autonomous Bandwidth Interrupt Enable (Link Control register bit 11) is set. RC mode only.

Bit	Attr	Reset Value	Description
6	RO	0x0	link_auto_bw_int Interrupt asserted when all the following conditions are true: 1. The INTx assertion disable bit in the Command register is 0, and 2. The Link Autonomous Bandwidth Interrupt Enable bit in the Link Control register is set to 1, and 3. The Link Autonomous Bandwidth Interrupt Status bit in the Link Status register is set to 1. RC mode only.
5	W1C	0x0	hp_msi Interrupt asserted when following conditions are true: 1. MSI or MSI-X is enabled. 2. Hot-Plug interrupts are enabled in the Slot Control register. 3. Any bit in the Slot Status register transitions from 0 to 1 and the associated event notification is enabled in the Slot Control register. RC mode only.
4	RO	0x0	hp_int Interrupt asserted when all the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0. 2. Hot-Plug interrupts are enabled in the Slot Control register. 3. Any bit in the Slot Status register is equal to 1, and the associated event notification is enabled in the Slot Control register. hp_int stays asserted if the status bit is set. RC mode only.
3	W1C	0x0	hp_pme_int Interrupt asserted when all the following conditions are true: 1. The PME Enable bit in the Power Management Control and Status register is set to 1. 2. Any bit in the Slot Status register transitions from 0 to 1 and the associated event notification is enabled in the Slot Control register. The controller does not check if the PM state is D1, D2, or D3hot. It is up to your application to check the value pm_dstate to make sure the device is in D1, D2, or D3hot. In addition, it asserts hp_pme only if PME is enabled, but it does not matter if hot-plug interrupts are enabled. RC mode only.
2	W1C	0x0	link_req_rst_not_int Interrupt for reset request because the link has gone down, or the controller received a hot-reset request. 1'b1: interrupt 1'b0: no interrupt
1	W1C	0x0	dll_link_up_int Data link layer up/down status interrupt: 1'b1: Data link layer is up 1'b0: Data link layer is down
0	W1C	0x0	phy_link_up_int PHY Link up/down status interrupt: 1'b1: Link is up 1'b0: Link is down

PCIE_CLIENT_INTR_STATUS_PMC

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	W1C	0x0	pm_dstate_update_int Interrupt indicates that the current power management D-state have changed. 1'b1: interrupt 1'b0: no interrupt
7	W1C	0x0	linkst_out_l0s_int Interrupt that indicates link has left L0s state (falling edge detected of pm_linkst_in_l0s in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
6	W1C	0x0	linkst_out_l2_int Interrupt that indicates link has left L2 state (falling edge detected of pm_linkst_in_l2 in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
5	W1C	0x0	linkst_out_l1_int Interrupt that indicates link has left L1 state (falling edge detected of pm_linkst_in_l1 in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
4	W1C	0x0	linkst_out_l1sub_int Interrupt that indicates link has left L1 substate (falling edge detected of pm_linkst_in_l1sub in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
3	W1C	0x0	linkst_in_l0s_int Interrupt that indicates link has entered L0s state (rising edge detected of pm_linkst_in_l0s in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
2	W1C	0x0	linkst_in_l2_int Interrupt that indicates link has entered L2 state (rising edge detected of pm_linkst_in_l2 in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
1	W1C	0x0	linkst_in_l1_int Interrupt that indicates link has entered L1 state (rising edge detected of pm_linkst_in_l1 in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt
0	W1C	0x0	linkst_in_l1sub_int Interrupt that indicates link has entered L1 substate (rising edge detected of pm_linkst_in_l1sub in POWER_STATUS register). 1'b0: no interrupt 1'b1: interrupt

PCIE_CLIENT_INTR_MASK_MSG_RX

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15	RO	0x0	reserved

Bit	Attr	Reset Value	Description
14	RW	0x1	obff_cpu_active_int_mask Mask bit of the CPU Active OBFF message reception interrupt. 1'b0: interrupt unmask 1'b1: interrupt mask
13	RW	0x1	obff_obff_int_mask Mask bit of the OBFF OBFF message reception interrupt. 1'b0: interrupt unmask 1'b1: interrupt mask
12	RW	0x1	obff_idle_int_mask Mask bit of the OBFF IDLE message reception interrupt. 1'b0: interrupt unmask 1'b1: interrupt mask
11	RO	0x0	reserved
10	RW	0x1	pm_turnoff_int_mask Mask bit of the pm_turnoff_int interrupt. 1'b0: interrupt unmask 1'b1: interrupt mask
9	RW	0x1	pm_to_ack_int_mask Mask bit of the pm_to_ack_int interrupt. 1'b0: interrupt unmask 1'b1: interrupt mask
8	RW	0x1	pm_pme_int_mask Mask bit of the pm_pme_int interrupt. 1'b0: interrupt unmask 1'b1: interrupt mask

PCIE_CLIENT_POWER_CON

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:14	RO	0x0	reserved
13	RW	0x0	clk_req_n_con Valid when clk_req_n_bypass set to 1. 1'b1: tristate CLKREQ# 1'b0: pull down CLKREQ#
12	RW	0x0	clk_req_n_bypass 1'b1: clk_req_n bypass, CLKREQ# driven by bit 13 of POWER_CON 1'b0: clk_req_n does not bypass, CLKREQ# driven by controller
11:10	RW	0x0	p2_cpm_disable 2'b00: when phy in P2 power state, enable clock PM for both L1 and L2. 2'b01: when phy in P2 power state, enable clock PM for L2 but disable for L1. 2'b10: when phy in P2 power state, disable clock PM for L2 but enable for L1. 2'b11: when phy in P2 power state, disable clock PM for both L1 and L2.
9	RW	0x0	app_clk_pm_en Clock PM feature enabled by application. Used to inhibit the programming of the Clock PM in Link Control Register.
8	RW	0x0	sys_aux_pwr_det Indicates if auxiliary power is present. 1'b1: Auxiliary power is present 1'b0: Auxiliary power is not present
7	RO	0x0	reserved
6	RW	0x0	app_l1sub_disable The application can set this input to 1'b1 to prevent entry to L1 Sub-states. This pin is used to gate the L1 sub-state enable bits from the L1 PM Substates Control 1 Register
5	RW	0x0	app_xfer_pending Indicates that your application has transfers pending. 1'b1: There are transactions outside the controller that the controller needs to transmit. For EP mode, prevents generation of requests to enter L1. Triggers exit if already in L1. For RC mode, triggers exit if already in L1. 1'b0: There are no transactions outside the controller.
4	RW	0x0	app_req_exit_l1 1'b1: Application request to Exit L1. 1'b0: Self clear to generate a pulse to controller. Request from your application to exit L1. It is only effective when L1 is enabled.

Bit	Attr	Reset Value	Description
3	RW	0x1	app_ready_entr_l23 1'b1: Application ready to enter L23. 1'b0: Application not ready to enter L23. Indication application that it is ready to enter the L23 state. The controller delays sending PM_Enter_L23 (in response to PM_Turn_Off) until this signal becomes active. When this signal has been asserted by the application, it must be kept asserted until L2 entry has completed. EP mode only.
2	RW	0x0	app_req_entr_l1 Application request to Enter L1 ASPM state. 1'b1: Application request to enter L1 state 1'b0: Self clear to generate a pulse to controller This bit is used by applications that need to control L1 entry instead of using the L1 entry timer as defined in the PCI Express Specification. It is only effective when L1 is enabled. The controller latches this request when in L0 or L0s; to be acted upon later. EP mode only.
1	RW	0x0	app_pm_xmt_pme Request controller to send PME message. Self clear to generate a pulse to controller. If PME is enabled and PME support is configured for current PMCSR D-state asserting this signal will cause the controller to wake from either L1 or L2 state. When the controller has transitioned back to the L0 state it will transmit a PME message and set the PME_Status. Upon receiving the PME message the root complex should clear the PME_Status and change the D-state back to D0. This bit de-asserted when D-state back to D0. EP mode only.
0	RW	0x0	app_clk_req_n Indicates that the application is ready to have reference clock removed. 1'b0: Application does not want to remove reference clock 1'b1: Application is ready to have reference clock removed

PCIE_CLIENT_POWER_STATUS

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RW	0x0	pm_clkreq_in Status of wire CLKREQ#
27	RW	0x0	pm_clkreq_out Status of CLKREQ# drive signal
26	RO	0x0	pm_wake_in Status of wire WAKE#
25	RO	0x0	pm_wake_out 1'b1: Controller assert WAKE# signal to request to make link back to L0 1'b0: Controller is not in wake process or Link already back to L0 EP only.
24	RO	0x0	pm_linkst_in_l0s 1'b1: Power management is in L0s. 1'b0: Power management is not in L0s.

Bit	Attr	Reset Value	Description
23	RO	0x0	pm_linkst_in_l2 1'b1: Power management is in L2. 1'b0: Power management is not in L2.
22	RO	0x0	pm_linkst_in_l1 1'b1: Power management is in L1. 1'b0: Power management is not in L1.
21	RO	0x0	pm_linkst_in_l1sub 1'b1: Power management is in L1 substate. 1'b0: Power management is not in L1 substate.
20	RO	0x0	reserved
19:17	RO	0x0	pm_l1sub_state Power management L1 sub-states FSM state. For debugging purposes, not for system operation.
16:15	RO	0x0	reserved
14:10	RO	0x00	pm_slave_state Power management slave FSM state. For debugging purposes, not for system operation.
9	RO	0x0	reserved
8:4	RO	0x00	pm_master_state Power management master FSM state. For debugging purposes, not for system operation.
3	RO	0x0	reserved
2:0	RO	0x0	pm_curnt_state Indicates the current power state. For debugging purposes, not for system operation.

PCIE_CLIENT_MSG_GEN_CON

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15	RO	0x0	reserved
14	RW	0x0	obff_cpu_active_msg_req Request controller to generate a "CPU Active" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
13	RW	0x0	obff_obff_msg_req Request controller to generate a "OBFF" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
12	RW	0x0	obff_idle_msg_req Request controller to generate a "IDLE" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
11:9	RO	0x0	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	ltr_msg_req Set to request controller to send a LTR Message. This bit clears automatically when request is granted by controller. Application should put LTR message information ready in LTR_MSG_TX_INFO register before setting this bit.
7:6	RO	0x0	reserved
5	RW	0x0	xmt_unlock_req Request controller to generate an Unlock message. This bit clears automatically when request has been sent.
4	RW	0x0	xmt_turnoff_req Request controller to generate a PM_Turn_Off message. This bit clears automatically when request has been sent.
3:2	RO	0x0	reserved
1	RW	0x0	legacy_int_req This bit is intended to request controller to generate messages that emulates the legacy PCI Interrupts. When this bit goes from low to high, the controller generates an Assert_INTx Message. When this bit goes from high to low, the controller generates a Deassert_INTx Message. The Interrupt Pin register for the corresponding function determines which INTx Message the controller generates (INTA, INTB, INTC, or INTD).
0	RW	0x0	ven_msg_req Set to request controller to send a vendor-defined Message. This bit clears automatically when request is granted by controller. Application should put vendor message information ready in VEN_MSG_TX_CFGx registers before setting this bit.

PCIE_CLIENT_MSI_GEN_CON

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	msi_gen_req 32 bits write only MSI generation request signals. MSB has the highest priority and LSB has the lowest priority. Write 1 to a certain bit request the controller send a MSI interrupt. Software should use MSI capability register to access MSI mask or pending status.

PCIE_CLIENT_MSI_GEN_FNUM_TC

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x0	msi_tc Traffic Class of the MSI request. Reserved for future use.
3	RO	0x0	reserved
2:0	RW	0x0	msi_func_num The function number of the MSI request. Reserved for future use.

PCIE_CLIENT_RBAR_SIZE_INFO0

DMA_WRITE_CH01_IMWR_DATA_OFF	0x0070	W	0x00000000	DMA Write Channel 1 and 0 IMWr Data Register.
DMA_WRITE_CH23_IMWR_DATA_OFF	0x0074	W	0x00000000	DMA Write Channel 3 and 2 IMWr Data Register.
DMA_WRITE_CH45_IMWR_DATA_OFF	0x0078	W	0x00000000	DMA Write Channel 5 and 4 IMWr Data Register.
DMA_WRITE_CH67_IMWR_DATA_OFF	0x007C	W	0x00000000	DMA Write Channel 7 and 6 IMWr Data Register.
DMA_WRITE_LINKED_LIST_ERR_EN_OFF	0x0090	W	0x00000000	DMA Write Linked List Error Enable Register.
DMA_READ_INT_STATUS_OFF	0x00A0	W	0x00000000	DMA Read Interrupt Status Register.
DMA_READ_INT_MASK_OFF	0x00A8	W	0x00010001	DMA Read Interrupt Mask Register.
DMA_READ_INT_CLEAR_OFF	0x00AC	W	0x00000000	DMA Read Interrupt Clear Register.
DMA_READ_ERR_STATUS_LOW_OFF	0x00B4	W	0x00000000	DMA Read Error Status Low Register.
DMA_READ_ERR_STATUS_HIGH_OFF	0x00B8	W	0x00000000	DMA Read Error Status High Register.

Name	Offset	Size	Reset Value	Description
DMA_READ_LINKED_LIST_ERR_EN_OFF	0x00C4	W	0x00000000	DMA Read Linked List Error Enable Register.
DMA_READ_DONE_IMWR_LOW_OFF	0x00CC	W	0x00000000	DMA Read Done IMWr Address Low Register.
DMA_READ_DONE_IMWR_HIGH_OFF	0x00D0	W	0x00000000	DMA Read Done IMWr Address High Register.
DMA_READ_ABORT_IMWR_LOW_OFF	0x00D4	W	0x00000000	DMA Read Abort IMWr Address Low Register.
DMA_READ_ABORT_IMWR_HIGH_OFF	0x00D8	W	0x00000000	DMA Read Abort IMWr Address High Register.
DMA_READ_CH01_IMWR_DATA_OFF	0x00DC	W	0x00000000	DMA Read Channel 1 and 0 IMWr Data Register.
DMA_READ_CH23_IMWR_DATA_OFF	0x00E0	W	0x00000000	DMA Read Channel 3 and 2 IMWr Data Register.
DMA_READ_CH45_IMWR_DATA_OFF	0x00E4	W	0x00000000	DMA Read Channel 5 and 4 IMWr Data Register.
DMA_READ_CH67_IMWR_DATA_OFF	0x00E8	W	0x00000000	DMA Read Channel 7 and 6 IMWr Data Register.
DMA_WRITE_ENGINE_HSHAKE_CNT_LOW_OFF	0x0108	W	0x00000000	DMA Write Engine Handshake Counter Channel 0/1/2/3 Register.
DMA_WRITE_ENGINE_HSHAKE_CNT_HIGH_OFF	0x010C	W	0x00000000	DMA Write Engine Handshake Counter Channel 4/5/6/7 Register.
DMA_READ_ENGINE_HSHAKE_CNT_LOW_OFF	0x0118	W	0x00000000	DMA Read Engine Handshake Counter Channel 0/1/2/3 Register.
DMA_READ_ENGINE_HSHAKE_CNT_HIGH_OFF	0x011C	W	0x00000000	DMA Read Engine Handshake Counter Channel 4/5/6/7 Register.
DMA_CH_CONTROL1_OFF_WRCH_0	0x0200	W	0x00000000	DMA Write Channel Control 1 Register.
DMA_TRANSFER_SIZE_OFF_WRCH_0	0x0208	W	0x00000000	DMA Write Transfer Size Register.
DMA_SAR_LOW_OFF_WRCH_0	0x020C	W	0x00000000	DMA Write SAR Low Register.
DMA_SAR_HIGH_OFF_WRCH_0	0x0210	W	0x00000000	DMA Write SAR High Register.
DMA_DAR_LOW_OFF_WRCH_0	0x0214	W	0x00000000	DMA Write DAR Low Register.
DMA_DAR_HIGH_OFF_WRCH_0	0x0218	W	0x00000000	DMA Write DAR High Register.
DMA_LLP_LOW_OFF_WRCH_0	0x021C	W	0x00000000	DMA Write Linked List Pointer Low Register.
DMA_LLP_HIGH_OFF_WRCH_0	0x0220	W	0x00000000	DMA Write Linked List Pointer High Register.
DMA_CH_CONTROL1_OFF_RDCH_0	0x0300	W	0x00000000	DMA Read Channel Control 1 Register.
DMA_TRANSFER_SIZE_OFF_RDCH_0	0x0308	W	0x00000000	DMA Read Transfer Size Register.
DMA_SAR_LOW_OFF_RDCH_0	0x030C	W	0x00000000	DMA Read SAR Low Register.
DMA_SAR_HIGH_OFF_RDCH_0	0x0310	W	0x00000000	DMA Read SAR High Register.
DMA_DAR_LOW_OFF_RDCH_0	0x0314	W	0x00000000	DMA Read DAR Low Register.

Name	Offset	Size	Reset Value	Description
DMA_DAR_HIGH_OFF_RDCH_0	0x0318	W	0x00000000	DMA Read DAR High Register.
DMA_LLP_LOW_OFF_RDCH_0	0x031C	W	0x00000000	DMA Read Linked List Pointer Low Register.
DMA_LLP_HIGH_OFF_RDCH_0	0x0320	W	0x00000000	DMA Read Linked List Pointer High Register.

18.4.5 DMA Detail Registers Description

DMA_CTRL_DATA_ARB_PRIOR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:9	RW	0x3	RDBUFF_TRGT_WEIGHT DMA Read Channel MWr Requests. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
8:6	RW	0x2	RD_CTRL_TRGT_WEIGHT DMA Read Channel MRd Requests. For LL element/descriptor access. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
5:3	RW	0x1	WR_CTRL_TRGT_WEIGHT DMA Write Channel MRd Requests. For DMA data requests and LL element/descriptor access. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
2:0	RW	0x0	RTRGT1_WEIGHT Non-DMA Rx Requests. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_CTRL_OFF

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	DIS_C2W_CACHE_RD Disable DMA Read Channels "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
24	RW	0x0	DIS_C2W_CACHE_WR Disable DMA Write Channels "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
23:20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19:16	RO	0x1	NUM_DMA_RD_CHAN Number of Read Channels. You can read this register to determine the number of read channels the DMA controller has been configured to support.
15:4	RO	0x000	reserved
3:0	RO	0x1	NUM_DMA_WR_CHAN Number of Write Channels. You can read this register to determine the number of write channels the DMA controller has been configured to support.

DMA_WRITE_ENGINE_EN_OFF

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH7 Enable Handshake for DMA Write Engine Channel 7. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
22	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH6 Enable Handshake for DMA Write Engine Channel 6. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
21	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH5 Enable Handshake for DMA Write Engine Channel 5. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
20	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH4 Enable Handshake for DMA Write Engine Channel 4. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
19	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH3 Enable Handshake for DMA Write Engine Channel 3. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
18	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH2 Enable Handshake for DMA Write Engine Channel 2. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
17	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH1 Enable Handshake for DMA Write Engine Channel 1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
16	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH0 Enable Handshake for DMA Write Engine Channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	DMA_WRITE_ENGINE DMA Write Engine Enable. 1: Enable 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this bit to "0" when you want to "Soft Reset" the DMA controller write logic. There are three possible reasons for resetting the DMA controller write logic: The "Abort Interrupt Status" bit is set (in the "DMA Write Interrupt Status Register" DMA_WRITE_INT_STATUS_OFF), and any of the bits is in the "DMA Write Error Status Register" (DMA_WRITE_ERR_STATUS_OFF) are set. Resetting the DMA controller write logic re-initializes the control logic, ensuring that the next DMA write transfer is executed successfully. You have executed the procedure outlined in "Stop Bit" , after which, the "Abort Interrupt Status" bit is set and the Channel Status field (CS) of the DMA write "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) is set to "Stopped." Resetting the DMA controller write logic re-initializes the control logic ensuring that the next DMA write transfer is executed successfully. During software development, when you incorrectly program the DMA write engine. To "Soft Reset" the DMA controller write logic, you must: De-assert the DMA write engine enable bit. Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA write engine enable bit returns a "0". Assert the DMA write engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA write transfer does not start until you write to the "DMA Write Doorbell Register" (DMA_WRITE_DOORBELL_OFF). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_DOORBELL_OFF

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	WR_STOP Stop. Set in conjunction with the Doorbell Number field. The DMA write channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) to ensure that the write channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)." Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
30:3	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
2:0	RW	0x0	WR_DOORBELL_NUM Doorbell Number. You must write the channel number to this register to start the DMA write transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. You do not need to toggle or write any other value to this register to start a new transfer. The range of this field is 0x0 to 0x7, and 0x0 corresponds to channel 0. Also note that a write to this field triggers the controller to exit L1 substates. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:15	RW	0x01	WRITE_CHANNEL3_WEIGHT Channel 3 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
14:10	RW	0x01	WRITE_CHANNEL2_WEIGHT Channel 2 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
9:5	RW	0x01	WRITE_CHANNEL1_WEIGHT Channel 1 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
4:0	RW	0x01	WRITE_CHANNEL0_WEIGHT Channel 0 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_CHANNEL_ARB_WEIGHT_HIGH_OFF

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:15	RW	0x00	WRITE_CHANNEL7_WEIGHT Channel 7 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
14:10	RW	0x00	WRITE_CHANNEL6_WEIGHT Channel 6 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
9:5	RW	0x00	WRITE_CHANNEL5_WEIGHT Channel 5 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
4:0	RW	0x00	WRITE_CHANNEL4_WEIGHT Channel 4 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_ENGINE_EN_OFF

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH7 Enable Handshake for DMA Read Engine Channel 7. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
22	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH6 Enable Handshake for DMA Read Engine Channel 6. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
21	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH5 Enable Handshake for DMA Read Engine Channel 5. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
20	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH4 Enable Handshake for DMA Read Engine Channel 4. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
19	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH3 Enable Handshake for DMA Read Engine Channel 3. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
18	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH2 Enable Handshake for DMA Read Engine Channel 2. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
17	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH1 Enable Handshake for DMA Read Engine Channel 1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
16	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH0 Enable Handshake for DMA Read Engine Channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	DMA_READ_ENGINE DMA Read Engine Enable. 1: Enable 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this field to "0" when you want to "Soft Reset" the DMA controller read logic. There are three possible reasons for resetting the DMA controller read logic: The "Abort Interrupt Status" bit is set (in the "DMA Read Interrupt Status Register" (DMA_READ_INT_STATUS_OFF), and any of the bits in the "DMA Read Error Status Low Register" (DMA_READ_ERR_STATUS_LOW_OFF) is set. Resetting the DMA controller read logic re-initializes the control logic, ensuring that the next DMA read transfer is executed successfully. You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the channel Status field (CS) of the DMA read "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) is set to "Stopped". Resetting the DMA controller read logic re-initializes the control logic ensuring that the next DMA read transfer is executed successfully. During software development, when you incorrectly program the DMA read engine. To "Soft Reset" the DMA controller read logic, you must: De-assert the DMA read engine enable bit. Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA read engine enable bit returns a "0". Assert the DMA read engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA read transfer does not start until you write to the "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_DOORBELL_OFF

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31	RW	0x0	RD_STOP Stop. Set in conjunction with the Doorbell Number field. The DMA read channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_RDCH_0) to ensure that the read channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
30:3	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
2:0	RW	0x0	RD_DOORBELL_NUM Doorbell Number. You must write 0x0 to this register to start the DMA read transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. The range of this field is 0x0 to 0x7, and 0x0 corresponds to channel 0. Also note that a write to this field triggers the controller to exit L1 substates. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_CHANNEL_ARB_WEIGHT_LOW_OFF

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:15	RW	0x01	READ_CHANNEL3_WEIGHT Channel 3 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
14:10	RW	0x01	READ_CHANNEL2_WEIGHT Channel 2 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
9:5	RW	0x01	READ_CHANNEL1_WEIGHT Channel 1 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
4:0	RW	0x01	READ_CHANNEL0_WEIGHT Channel 0 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_CHANNEL_ARB_WEIGHT_HIGH_OFF

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:15	RW	0x01	READ_CHANNEL7_WEIGHT Channel 7 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
14:10	RW	0x01	READ_CHANNEL6_WEIGHT Channel 6 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
9:5	RW	0x01	READ_CHANNEL5_WEIGHT Channel 5 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
4:0	RW	0x01	READ_CHANNEL4_WEIGHT Channel 4 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_INT_STATUS_OFF

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	WR_ABORT_INT_STATUS Abort Interrupt Status. The DMA write channel has detected an error, or you manually stopped the transfer as described in "Error Handling Assistance by Remote Software". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA write interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA write interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:8	RO	0x00	reserved

Bit	Attr	Reset Value	Description
7:0	RW	0x00	WR_DONE_INT_STATUS Done Interrupt Status. The DMA write channel has successfully completed the DMA transfer. For more details, see "Interrupts and Error Handling". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA write interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA write interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_INT_MASK_OFF

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x1	WR_ABORT_INT_MASK Abort Interrupt Mask. Prevents the Abort interrupt status field in the DMA write interrupt status register from asserting the edma_int output. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:1	RO	0x0000	reserved
0	RW	0x1	WR_DONE_INT_MASK Done Interrupt Mask. Prevents the Done interrupt status field in the DMA write interrupt status register from asserting the edma_int output. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_INT_CLEAR_OFF

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	WO	0x0	WR_ABORT_INT_CLEAR Abort Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Abort interrupt status field of the DMA write interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	WO	0x0	WR_DONE_INT_CLEAR Done Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Done interrupt status field of the DMA write interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".

DMA_WRITE_ERR_STATUS_OFF

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	LINKLIST_ELEMENT_FETCH_ERR_DETECT Linked List Element Fetch Error Detected. The DMA write channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA write interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Write Interrupt Clear Register" (DMA_WRITE_INT_CLEAR_OFF) to clear this error bit. Value After Reset: 0x0
15:8	RO	0x00	reserved
7:0	RO	0x00	APP_READ_ERR_DETECT Application Read Error Detected. The DMA write channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while reading data from it. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA write interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Write Interrupt Clear Register" (DMA_WRITE_INT_CLEAR_OFF) to clear this error bit.

DMA_WRITE_DONE_IMWR_LOW_OFF

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_WRITE_DONE_LOW_REG The DMA uses this field to generate bits [31:0] of the address field for the Done IMWr TLP. Bits [1:0] must be "00" as this address must be dword aligned. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_DONE_IMWR_HIGH_OFF

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_WRITE_DONE_HIGH_REG The DMA uses this field to generate bits [63:32] of the address field for the Done IMWr TLP. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_ABORT_IMWR_LOW_OFF

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_WRITE_ABORT_LOW_REG The DMA uses this field to generate bits [31:0] of the address field for the Abort IMWr TLP it generates. Bits [1:0] must be "00" as this address must be dword aligned. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_ABORT_IMWR_HIGH_OFF

Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	DMA_WRITE_ABORT_HIGH_REG The DMA uses this field to generate bits [63:32] of the address field for the Abort IMWr TLP. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_CH01_IMWR_DATA_OFF

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	WR_CHANNEL_1_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:0	RW	0x0000	WR_CHANNEL_0_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_CH23_IMWR_DATA_OFF

Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	WR_CHANNEL_3_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 3. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	WR_CHANNEL_2_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 2. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_CH45_IMWR_DATA_OFF

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	WR_CHANNEL_5_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 5. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:0	RW	0x0000	WR_CHANNEL_4_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 4. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_CH67_IMWR_DATA_OFF

Address: Operational Base + offset (0x007C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	WR_CHANNEL_7_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 7. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:0	RW	0x0000	WR_CHANNEL_6_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 6. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_WRITE_LINKED_LIST_ERR_EN_OFF

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	WR_CHANNEL_LLLAIE Write Channel LL Local Abort Interrupt Enable (LLLAIE). You enable the write channel local abort interrupt through this bit. The LIE and RIE bits in the LL element enable the write channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	WR_CHANNEL_LLRAIE Write Channel LL Remote Abort Interrupt Enable (LLRAIE). You enable the write channel remote abort interrupt through this bit. The LIE and RIE bits in the LL element enable the write channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_INT_STATUS_OFF

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	RD_ABORT_INT_STATUS Abort Interrupt Status. The DMA read channel has detected an error, or you manually stopped the transfer as described in "Stopping the DMA Transfer (Software Stop)". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. You can read the "DMA Read Error Status Low Register" (DMA_READ_ERR_STATUS_LOW_OFF) and "DMA Read Error Status High Register" (DMA_READ_ERR_STATUS_HIGH_OFF) to determine the source of the error. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:8	RO	0x00	reserved
7:0	RW	0x00	RD_DONE_INT_STATUS Done Interrupt Status. The DMA read channel has successfully completed the DMA read transfer. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_INT_MASK_OFF

Address: Operational Base + offset (0x00A8)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x1	RD_ABORT_INT_MASK Abort Interrupt Mask. Prevents the Abort interrupt status field in the DMA read interrupt status register from asserting the edma_int output. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
15:1	RO	0x0000	reserved
0	RW	0x1	RD_DONE_INT_MASK Done Interrupt Mask. Prevents the Done interrupt status field in the DMA read interrupt status register from asserting the edma_int output. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_READ_INT_CLEAR_OFF

Address: Operational Base + offset (0x00AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	WO	0x00	RD_ABORT_INT_CLEAR Abort Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Abort interrupt status field of the DMA read interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".
15:8	RO	0x00	reserved
7:0	WO	0x00	RD_DONE_INT_CLEAR Done Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Done interrupt status field of the DMA read interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".

DMA_READ_ERR_STATUS_LOW_OFF

Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RO	0x00	LINK_LIST_ELEMENT_FETCH_ERR_DETECT Linked List Element Fetch Error Detected. The DMA read channel has received an error response from the AXI bus while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this clears all bits in this register, and also the DMA Read Error Status High register (DMA_READ_ERR_STATUS_HIGH_OFF).
15:8	RO	0x00	reserved
7:0	RO	0x00	APP_WR_ERR_DETECT Application Write Error Detected. The DMA read channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while writing data to it. This error is fatal. You must restart the transfer from the beginning, as the channel context is corrupted, and the transfer is not rolled back. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this clears all bits in this register, and also the DMA Read Error Status High register (DMA_READ_ERR_STATUS_HIGH_OFF).

DMA_READ_ERR_STATUS_HIGH_OFF

Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	DATA_POISIONING Data Poisoning. The DMA read channel has detected data poisoning in the completion from the remote device (in response to the MRd request). The DMA read channel will drop the completion and then be halted. The CX_FLT_MASK_UR_POIS filter rule does not affect this behavior. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.

Bit	Attr	Reset Value	Description
23:16	RO	0x00	CPL_TIMEOUT Completion Time Out. The DMA read channel has timed-out while waiting for the remote device to respond to the MRd request, or a malformed CplD has been received. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling" . Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.
15:8	RO	0x00	CPL_ABORT Completer Abort. The DMA read channel has received a PCIe completer abort completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.
7:0	RO	0x00	UNSUPPORTED_REQ Unsupported Request. The DMA read channel has received a PCIe unsupported request completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.

DMA_CH_CONTROL1_OFF_WRCH_0

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	DMA_AT Address Translation TLP Header Bit (AT) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
29:27	RW	0x0	DMA_TC Traffic Class TLP Header Bit (TC) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
26	RO	0x0	reserved
25	RW	0x0	DMA_RO Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
24	RW	0x0	DMA_NS_SRC Source No Snoop TLP Header Bit (DMA_NS_SRC). The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
23	RW	0x0	DMA_NS_DST Destination No Snoop TLP Header Bit (DMA_NS_DST). The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
22:17	RO	0x00	reserved
16:12	RW	0x00	DMA_FUNC_NUM Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the "DMA Write Channel Control 2 Register" (DMA_CH_CONTROL2_OFF_WRCH_0). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
11:10	RO	0x0	reserved
9	RW	0x0	LLE Linked List Enable (LLE). 0: Disable linked list operation 1: Enable linked list operation Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
8	RW	0x0	CCS Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
7	RO	0x0	reserved
6:5	RO	0x0	CS Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: 00: Reserved 01: Running. This channel is active and transferring data. 10: Halted. An error condition has been detected, and the DMA has stopped this channel. 11: Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the "DMA Write Doorbell Register" (DMA_WRITE_DOORBELL_OFF) or "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF).
4	RW	0x0	RIE Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
3	RW	0x0	LIE Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
2	RW	0x0	LLP Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
1	RW	0x0	TCB Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
0	RW	0x0	CB Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_TRANSFER_SIZE_OFF_WRCH_0

Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_TRANSFER_SIZE DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA write channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_SAR_LOW_OFF_WRCH_0

Address: Operational Base + offset (0x020C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_LOW Source Address Register (Lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The SAR is the address of the remote memory. DMA Write: The SAR is the address of the local memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_SAR_HIGH_OFF_WRCH_0

Address: Operational Base + offset (0x0210)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_HIGH Source Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_DAR_LOW_OFF_WRCH_0

Address: Operational Base + offset (0x0214)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_LOW Destination Address Register (Lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The DAR is the address of the local memory. DMA Write: The DAR is the address of the remote memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_DAR_HIGH_OFF_WRCH_0

Address: Operational Base + offset (0x0218)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_HIGH Destination Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_LLP_LOW_OFF_WRCH_0

Address: Operational Base + offset (0x021C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_LOW Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. When the current element is a data element; this field is incremented by 6 DWORDS. When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_LLP_HIGH_OFF_WRCH_0

Address: Operational Base + offset (0x0220)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_HIGH Upper 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_CH_CONTROL1_OFF_RDCH_0

Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	DMA_AT Address Translation TLP Header Bit (AT) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
29:27	RW	0x0	DMA_TC Traffic Class TLP Header Bit (TC) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
26	RO	0x0	reserved
25	RW	0x0	DMA_RO Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
24	RW	0x0	DMA_NS_SRC Source No Snoop TLP Header Bit (DMA_NS_SRC). The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
23	RW	0x0	DMA_NS_DST Destination No Snoop TLP Header Bit (DMA_NS_DST). The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
22:17	RO	0x00	reserved
16:12	RW	0x00	DMA_FUNC_NUM Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the "DMA Read Channel Control 2 Register" (DMA_CH_CONTROL2_OFF_RDCH_0). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
11:10	RO	0x0	reserved
9	RW	0x0	LLE Linked List Enable (LLE). 0: Disable linked list operation 1: Enable linked list operation Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
8	RW	0x0	CCS Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:5	RO	0x0	CS Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: 00: Reserved 01: Running. This channel is active and transferring data. 10: Halted. An error condition has been detected, and the DMA has stopped this channel. 11: Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the "DMA Read Doorbell Register" (DMA_WRITE_DOORBELL_OFF) or "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF).
4	RW	0x0	RIE Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
3	RW	0x0	LIE Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
2	RW	0x0	LLP Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W
1	RW	0x0	TCB Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
0	RW	0x0	CB Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_TRANSFER_SIZE_OFF_RDCH_0

Address: Operational Base + offset (0x0308)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_TRANSFER_SIZE DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA read channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_SAR_LOW_OFF_RDCH_0

Address: Operational Base + offset (0x030C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_LOW Source Address Register (Lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The SAR is the address of the remote memory. DMA Read: The SAR is the address of the local memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_SAR_HIGH_OFF_RDCH_0

Address: Operational Base + offset (0x0310)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_HIGH Source Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_DAR_LOW_OFF_RDCH_0

Address: Operational Base + offset (0x0314)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_LOW Destination Address Register (Lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The DAR is the address of the local memory. DMA Read: The DAR is the address of the remote memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_DAR_HIGH_OFF_RDCH_0

Address: Operational Base + offset (0x0318)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_HIGH Destination Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_LLP_LOW_OFF_RDCH_0

Address: Operational Base + offset (0x031C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_LOW Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. When the current element is a data element; this field is incremented by 6 DWORDS. When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DMA_LLP_HIGH_OFF_RDCH_0

Address: Operational Base + offset (0x0320)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_HIGH Upper 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

18.4.6 ATU Registers Summary

Name	Offset	Size	Reset Value	Description
IATU_REGION_CTRL_1_OFF_OUTBOUND_i	0x0000	W	0x00000000	iATU Region Control 1 Register. (for i = 0; i <= 15)
IATU_REGION_CTRL_2_OFF_OUTBOUND_i	0x0004	W	0x00000000	iATU Region Control 2 Register. (for i = 0; i <= 15)
IATU_LWR_BASE_ADDR_OFF_OUTBOUND_i	0x0008	W	0x00000000	iATU Lower Base Address Register. (for i = 0; i <= 15)
IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_i	0x000C	W	0x00000000	iATU Upper Base Address Register. (for i = 0; i <= 15)
IATU_LIMIT_ADDR_OFF_OUTBOUND_i	0x0010	W	0x0000FFFF	iATU Limit Address Register. (for i = 0; i <= 15)
IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i	0x0014	W	0x00000000	iATU Lower Target Address Register. (for i = 0; i <= 15)
IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_i	0x0018	W	0x00000000	iATU Upper Target Address Register. (for i = 0; i <= 15)
IATU_REGION_CTRL_1_OFF_INBOUND_i	0x0100	W	0x00000000	iATU Region Control 1 Register. (for i = 0; i <= 15)
IATU_REGION_CTRL_2_OFF_INBOUND_i	0x0104	W	0x00000000	iATU Region Control 2 Register. (for i = 0; i <= 15)
IATU_LWR_BASE_ADDR_OFF_INBOUND_i	0x0108	W	0x00000000	iATU Lower Base Address Register. (for i = 0; i <= 15)
IATU_UPPER_BASE_ADDR_OFF_INBOUND_i	0x010C	W	0x00000000	iATU Upper Base Address Register. (for i = 0; i <= 15)
IATU_LIMIT_ADDR_OFF_INBOUND_i	0x0110	W	0x0000FFFF	iATU Limit Address Register. (for i = 0; i <= 15)
IATU_LWR_TARGET_ADDR_OFF_INBOUND_i	0x0114	W	0x00000000	iATU Lower Target Address Register. (for i = 0; i <= 15)

18.4.7 ATU Detail Registers Description

IATU_REGION_CTRL_1_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22:20	RW	0x0	CTRL_1_FUNC_NUM Function Number. Note: This register field is sticky.
19:14	RO	0x00	reserved
13	RW	0x0	INCREASE_REGION_SIZE Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12:11	RO	0x0	reserved
10:9	RW	0x0	ATTR When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register. Note: This register field is sticky.
8	RW	0x0	TD This is a reserved field. Do not use.

Bit	Attr	Reset Value	Description
7:5	RW	0x0	TC When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register. Note: This register field is sticky.
4:0	RW	0x00	TYPE When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register. Note: This register field is sticky.

IATU_REGION_CTRL_2_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	REGION_EN Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30	RO	0x0	reserved
29	RW	0x0	INVERT_MODE Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28	RW	0x0	CFG_SHIFT_MODE CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky.
27	RW	0x0	DMA_BYPASS DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This register field is sticky.
26:24	RO	0x0	reserved

Bit	Attr	Reset Value	Description
23	RW	0x0	HEADER_SUBSTITUTE_EN Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. 1: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. 0: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Note: This register field is sticky.
22	RW	0x0	INHIBIT_PAYLOAD Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. 1: Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. 0: Fmt[1] =0/1 so that TLPs with or without data can be sent. Note: This register field is sticky.
21	RO	0x0	reserved
20	RW	0x0	SNP Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. Note: This register field is sticky.
19	RW	0x0	FUNC_BYPASS Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky.
18:17	RO	0x0	reserved
16	RW	0x0	TAG_SUBSTITUTE_EN TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note: This register field is sticky.
15:8	RW	0x00	TAG TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	MSG_CODE MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Note: This register field is sticky.

IATU_LWR_BASE_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_BASE_RW Forms bits [31:n] of the start address of the address region to be translated. n is log2(CX_ATU_MIN_REGION_SIZE) Note: This register field is sticky.
15:0	RO	0x0000	LWR_BASE_HW Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(CX_ATU_MIN_REGION_SIZE)

IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_BASE_RW Forms bits [63:32] of the start (and end) address of the address region to be translated. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect. Note: This register field is sticky.

IATU_LIMIT_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	LIMIT_ADDR_RW Forms upper bits of the end address of the address region to be translated. Note: This register field is sticky.
15:0	RW	0xffff	LIMIT_ADDR_HW Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always all ones. A write to this location is ignored by the PCIe controller.

IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LWR_TARGET_RW_OUTBOUND When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_ is '0' (normal operation): LWR_TARGET_RW[31:n] forms MSB's of the Lower Target part of the new address of the translated region; LWR_TARGET_RW[n-1:0] are not used. (The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so the lower bits of the start address of the new address of the translated region (bits n-1:0) are always '0'). n is log2(CX_ATU_MIN_REGION_SIZE). When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_i is '1': LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 dword header) or bytes 12-15 (for 4 dword header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header. Note: This register field is sticky.

IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_TARGET_RW Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. Note: This register field is sticky.

IATU_REGION_CTRL_1_OFF_INBOUND_i

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22:20	RW	0x0	CTRL_1_FUNC_NUM Function Number. Note: This register field is sticky.
19:14	RO	0x00	reserved
13	RW	0x0	INCREASE_REGION_SIZE Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12:11	RO	0x0	reserved
10:9	RW	0x0	ATTR When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
8	RW	0x0	TD When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7:5	RW	0x0	TC When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
4:0	RW	0x00	TYPE When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky.

IATU_REGION_CTRL_2_OFF_INBOUND_i

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31	RW	0x0	REGION_EN Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30	RW	0x0	MATCH_MODE Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. 1:BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. 1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header.

Bit	Attr	Reset Value	Description
29	RW	0x0	INVERT_MODE Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28	RW	0x0	CFG_SHIFT_MODE CFG Shift Mode. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky.
27	RW	0x0	FUZZY_TYPE_MATCH_CODE Fuzzy Type Match Mode. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. MWr, MRd and MRdLk TLPs are seen as identical The Routing field of Msg/MsgD TLPs is ignored FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0 or CfgWr1 TLP. Note: This register field is sticky.
26	RO	0x0	reserved
25:24	RW	0x0	RESPONSE_CODE Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. 00 - Normal RADM filter response is used. 01 - Unsupported request (UR) 10 - Completer abort (CA) 11 - Not used / undefined / reserved. Note: This register field is sticky.
23	RW	0x0	SINGLE_ADDR_LOC_TRANS_EN Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky.
22	RO	0x0	reserved

Bit	Attr	Reset Value	Description
21	RW	0x0	MSG_CODE_MATCH_EN Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is 1 Note: This register field is sticky.
20	RO	0x0	reserved
19	RW	0x0	FUNC_NUM_MATCH_EN Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky.
18:17	RO	0x0	reserved
16	RW	0x0	ATTR_MATCH_EN ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
15	RW	0x0	TD_MATCH_EN TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
14	RW	0x0	TC_MATCH_EN TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
13	RW	0x0	MSG_TYPE_MATCH_MODE Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the iatu_region_ctrl_1_OFF_inbound register (=>TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky.
12:11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10:8	RW	0x0	BAR_NUM BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Control 2 Register" is set. 000b - BAR0 001b - BAR1 010b - BAR2 011b - BAR3 100b - BAR4 101b - BAR5 110b - ROM 111b - reserved IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky.
7:0	RW	0x00	MSG_CODE MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.

IATU_LWR_BASE_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_BASE_RW Forms bits [31:n] of the start address of the address region to be translated. n is log2(CX_ATU_MIN_REGION_SIZE) Note: This register field is sticky.
15:0	RO	0x0000	LWR_BASE_HW Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(CX_ATU_MIN_REGION_SIZE)

IATU_UPPER_BASE_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_BASE_RW Forms bits [63:32] of the start (and end) address of the address region to be translated. Note: This register field is sticky.

IATU_LIMIT_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LIMIT_ADDR_RW Forms upper bits of the end address of the address region to be translated. Note: This register field is sticky.
15:0	RO	0xffff	LIMIT_ADDR_HW Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always all ones. A write to this location is ignored by the PCIe controller.

IATU_LWR_TARGET_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_TARGET_RW Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. Field size depends on log2(CX_ATU_MIN_REGION_SIZE) in address match mode. Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky.
15:0	RO	0x0000	LWR_TARGET_HW Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. Field size depends on log2(CX_ATU_MIN_REGION_SIZE) in address match mode. Field size depends on log2(BAR_MASK+1) in BAR match mode.

18.4.8 Port Logic Registers Summary

Name	Offset	Size	Reset Value	Description
PL_ACK_LATENCY_TIMER_OFF	0x0700	W	0x18460817	Ack Latency Timer and Replay Timer Register.
PL_VENDOR_SPEC_DLLP_OFF	0x0704	W	0xFFFFFFFF	Vendor Specific DLLP Register.
PL_PORT_FORCE_OFF	0x0708	W	0x00000004	PORT_FORCE_OFF
PL_ACK_F_ASPM_CTRL_OFF	0x070C	W	0x1BFFFF00	Ack Frequency and L0-L1 ASPM Control Register.
PL_PORT_LINK_CTRL_OFF	0x0710	W	0x00030120	Port Link Control Register.
PL_LANE_SKEW_OFF	0x0714	W	0x08000000	Lane Skew Register.
PL_TIMER_CTRL_MAX_FUNC_NUM_OFF	0x0718	W	0x00000000	Timer Control and Max Function Number Register.
PL_SYMBOL_TIMER_FILTER_1_OFF	0x071C	W	0x00000280	Symbol Timer Register and Filter Mask 1 Register. The Filter Mask 1 Register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section.

Name	Offset	Size	Reset Value	Description
PL_FILTER_MASK_2_OFF	0x0720	W	0x00000000	Filter Mask 2 Register. This register modifies the RADM filtering and error handling rules.
PL_AMBA_MUL_OB_DECOMP_NP_SUB_REQ_CTRL_OFF	0x0724	W	0x00000001	AMBA Multiple Outbound Decomposed NP SubRequests Control Register.
PL_PL_DEBUG0_OFF	0x0728	W	0x00000000	Debug Register 0
PL_PL_DEBUG1_OFF	0x072C	W	0x00000000	Debug Register 1
PL_TX_P_FC_CREDIT_STATUS_OFF	0x0730	W	0x00000000	Transmit Posted FC Credit Status
PL_TX_NP_FC_CREDIT_STATUS_OFF	0x0734	W	0x00000000	TX_NP_FC_CREDIT_STATUS_OFF
PL_TX_CPL_FC_CREDIT_STATUS_OFF	0x0738	W	0x00000000	Transmit Completion FC Credit Status
PL_QUEUE_STATUS_OFF	0x073C	W	0x00000000	Queue Status
PL_VC_TX_ARBI_1_OFF	0x0740	W	0x0000000F	VC Transmit Arbitration Register 1
PL_VC_TX_ARBI_2_OFF	0x0744	W	0x00000000	VC Transmit Arbitration Register 2
PL_VC0_P_RX_Q_CTRL_OFF	0x0748	W	0x45027048	Segmented-Buffer VC0 Posted Receive Queue Control.
PL_VC0_NP_RX_Q_CTRL_OFF	0x074C	W	0x05027009	Segmented-Buffer VC0 Non-Posted Receive Queue Control.
PL_VC0_CPL_RX_Q_CTRL_OFF	0x0750	W	0x05000000	Segmented-Buffer VC0 Completion Receive Queue Control.
PL_GEN2_CTRL_OFF	0x080C	W	0x000102FF	Link Width and Speed Change Control Register.
PL_PHY_STATUS_OFF	0x0810	W	0x00000000	PHY Status Register. Memory mapped register from phy_cfg_status GPIO input pins.
PL_PHY_CONTROL_OFF	0x0814	W	0x00000000	PHY Control Register. Memory mapped register to cfg_phy_control GPIO output pins.
PL_TRGT_MAP_CTRL_OFF	0x081C	W	0x00000047	Programmable Target Map Control Register.
PL_CLOCK_GATING_CTRL_OFF	0x088C	W	0x00000001	RADM clock gating enable control register.
PL_GEN3_RELATED_OFF	0x0890	W	0x00000000	Gen3 Control Register. This register is reserved for future use.
PL_GEN3_EQ_CONTROL_OFF	0x08A8	W	0x04059F61	Gen3 EQ Control Register.
PL_GEN3_EQ_FB_MODE_DIR_CHANGE_OFF	0x08AC	W	0x00000040	Gen3 EQ Direction Change Feedback Mode Control Register.
PL_ORDER_RULE_CTRL_OFF	0x08B4	W	0x00000000	Order Rule Control Register.
PL_PIPE_LOOPBACK_CONTROL_OFF	0x08B8	W	0x00000003	PIPE Loopback Control Register.
PL_MISC_CONTROL_1_OFF	0x08BC	W	0x00000000	DBI Read-Only Write Enable Register.
PL_MULTI_LANE_CONTROL_OFF	0x08C0	W	0x00000080	UpConfigure Multi-lane Control Register.
PL_PHY_INTEROP_CTRL_OFF	0x08C4	W	0x0000003F	PHY Interoperability Control Register.

Name	Offset	Size	Reset Value	Description
PL_TRGT_CPL_LUT_DELETE_ENTRY_OFF	0x08C8	W	0x00000000	TRGT_CPL_LUT Delete Entry Control register.
PL_LINK_FLUSH_CONTROL_OFF	0x08CC	W	0x00000000	Link Reset Request Flush Control Register.
PL_AMBA_ERROR_RESPONSE_DEFAULT_OFF	0x08D0	W	0x00009C00	AXI Bridge Slave Error Response Register.
PL_AMBA_LINK_TIMEOUT_OFF	0x08D4	W	0x00000032	Link Down AXI Bridge Slave Timeout Register.
PL_AMBA_ORDERING_CTRL_OFF	0x08D8	W	0x00000000	AMBA Ordering Control.
PL_COHERENCY_CONTROL_1_OFF	0x08E0	W	0x00000000	ACE Cache Coherency Control Register 1
PL_COHERENCY_CONTROL_2_OFF	0x08E4	W	0x00000000	ACE Cache Coherency Control Register 2
PL_COHERENCY_CONTROL_3_OFF	0x08E8	W	0x00000000	ACE Cache Coherency Control Register 3
PL_AXI_MSTR_MSG_ADDR_LOW_OFF	0x08F0	W	0x00000000	Lower 20 bits of the programmable AXI address where Messages coming from wire are mapped to.
PL_AXI_MSTR_MSG_ADDR_HIGH_OFF	0x08F4	W	0x00000000	Register0000 Description
PL_PCIE_VERSION_NUMBER_OFF	0x08F8	W	0x3531302A	PCIe Controller IIP Release Version Number.
PL_PCIE_VERSION_TYPE_OFF	0x08FC	W	0x67612A2A	PCIe Controller IIP Release Version Type.
PL_MSIX_ADDRESS_MATCH_LOW_OFF	0x0940	W	0x00000000	MSI-X Address Match Low Register.
PL_MSIX_ADDRESS_MATCH_HIGH_OFF	0x0944	W	0x00000000	MSI-X Address Match High Register.
PL_MSIX_DOORBELL_OFF	0x0948	W	0x00000000	MSI-X Doorbell Register.
PL_MSIX_RAM_CTRL_OFF	0x094C	W	0x00000000	MSI-X RAM power mode and debug control register.
PL_LTR_LATENCY_OFF	0x0B30	W	0x00000000	LTR Latency Register.
PL_AUX_CLK_FREQ_OFF	0x0B40	W	0x00000018	Auxiliary Clock Frequency Control Register.
PL_L1_SUBSTATES_OFF	0x0B44	W	0x000000D2	L1 Substates Timing Register.
PL_PIPE_RELATED_OFF	0x0B90	W	0x00000000	PIPE Related Register.

18.4.9 Port Logic Detail Registers Description

PL_ACK_LATENCY_TIMER_OFF

Address: Operational Base + offset (0x0700)

Bit	Attr	Reset Value	Description
31:16	RW	0x1846	REPLAY_TIME_LIMIT Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires. For more details, see "Transmit Replay". You can modify the effective timer limit with the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-4, 3-5, and 3-6 of the PCIe 3.0 specification. If there is a change in the payload size or link speed, the controller will override any value that you have written to this register field, and reset the field back to the specification-defined value. It will not change the value in the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register.
15:0	RW	0x0817	ROUND_TRIP_LATENCY_TIME_LIMIT Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. For more details, see "Ack Scheduling". You can modify the effective timer limit with the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-7, 3-8, and 3-9 of the PCIe 3.0 specification. The limit must reflect the round trip latency from requester to completer. If there is a change in the payload size or link width, the controller will override any value that you have written to this register field, and reset the field back to the specification-defined value. It will not change the value in the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register.

PL_VENDOR_SPEC_DLLP_OFF

Address: Operational Base + offset (0x0704)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	VENDOR_SPEC_DLLP Vendor Specific DLLP Register. Used to send a specific PCI Express DLLP. Your application writes the 8-bit DLLP Type and 24-bits of Payload data into this register, then sets the field VENDOR_SPECIFIC_DLLP_REQ of PORT_LINK_CTRL_OFF to send the DLLP. [7:0] = Type [31:8] = Payload (24 bits) The dllp type is in bits [7:0] while the remainder is the vendor defined payload. Note: This register field is sticky.

PL_PORT_FORCE_OFF

Address: Operational Base + offset (0x0708)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23	RW	0x0	DO_DESKEW_FOR_SRIS Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew for SRIS instead of using received SKP OS if DO_DESKEW_FOR_SRIS is set to 1. Note: This register field is sticky.
22	RO	0x0	reserved
21:16	RW	0x00	LINK_STATE Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link). LTSSM state encoding is defined by the lts_state variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky.
15	WO	0x0	FORCE_EN Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: Forces the LTSSM to the state specified by the Forced LTSSM State field. Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a "0".
14:12	RO	0x0	reserved
11:8	RW	0x0	FORCED_LTSSM Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link). Link command encoding is defined by the ltssm_cmd variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky.
7:0	RW	0x04	LINK_NUM Link Number. Not used for endpoint. Note: This register field is sticky.

PL_ACK_F_ASPM_CTRL_OFF

Address: Operational Base + offset (0x070C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	ENTER_ASPM ASPM L1 Entry Control. 1: Core enters ASPM L1 after a period in which it has been idle. 0: Core enters ASPM L1 only after idle period during which both receive and transmit are in L0s. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
29:27	RW	0x3	L1_ENTRANCE_LATENCY L1 Entrance Latency. Value range is: 000: 1 us 001: 2 us 010: 4 us 011: 8 us 100: 16 us 101: 32 us 110 or 111: 64 us Note: Programming this timer with a value greater that 32us has no effect unless extended sync is used, or all of the credits are infinite. Note: This register field is sticky.
26:24	RW	0x3	L0S_ENTRANCE_LATENCY L0s Entrance Latency. Values correspond to: 000: 1 us 001: 2 us 010: 3 us 011: 4 us 100: 5 us 101: 6 us 110 or 111: 7 us Note: This register field is sticky.
23:16	RO	0xff	COMMON_CLK_N_FTS Common Clock N_FTS. This is the N_FTS when common clock is used. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255. This field is only writable (sticky) when all of the following configuration parameter equations are true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. Note: The access attributes of this field are as follows: Wire: R Dbi: R
15:8	RW	0xff	ACK_N_FTS N_FTS. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255. The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	ACK_FREQ Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before scheduling an ACK DLLP. 0: Indicates that this Ack Frequency Counter feature is turned off. The controller generates a low-priority ACK request for every TLP that it receives. The controller waits until the ACK Latency Timer expires, then converts the current low-priority ACK request to a high-priority ACK request and schedules the DLLP for transmission to the remote link partner. 1-255: Indicates that the controller will schedule a high-priority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs if the ACK Latency Timer expires, but never later. For a typical system, you do not have to modify the default setting. For more details, see "ACK/NAK Scheduling". Note: This register field is sticky.

PL_PORT_LINK_CTRL_OFF

Address: Operational Base + offset (0x0710)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	TRANSMIT_LANE_REVERSALE_ENABLE TRANSMIT_LANE_REVERSALE_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky.
26	RW	0x0	EXTENDED_SYNCH EXTENDED_SYNCH is an internally reserved field. Do not use. Note: This register field is sticky.
25	RW	0x0	CORRUPT_LCRC_ENABLE CORRUPT_LCRC_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky.
24	RW	0x0	BEACON_ENABLE BEACON_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky.
23:22	RO	0x0	reserved
21:16	RW	0x03	LINK_CAPABLE Link Mode Enable. Sets the number of lanes in the link that you want to connect to the link partner. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Predetermined Number of Lanes" field of the "Link Width and Speed Change Control Register". For more information, see "How to Tie Off Unused Lanes". For information on upsizing and downsizing the link width, see "Link Establishment". 000001: x1 000011: x2 000111: x4 Note: This register field is sticky.
15:12	RO	0x0	reserved
11:8	RW	0x1	LINK_RATE LINK_RATE is an internally reserved field. Do not use. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7	RW	0x0	FAST_LINK_MODE Fast Link Mode. Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation. Forces the LTSSM training (link initialization) to use shorter time-outs and to link up faster. The default scaling factor can be changed using the DEFAULT_FAST_LINK_SCALING_FACTOR parameter or through the FAST_LINK_SCALING_FACTOR field in the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Fast Link Mode can also be activated by setting the diag_ctrl_bus[2] pin to '1'. For more details, see the "Fast Link Simulation Mode" section in the "Integrating the Core with the PHY or Application RTL or Verification IP" chapter of the User Guide. For M-PCIe, this field also affects Remain Hibern8 Time, Minimum Activate Time, and RRAP timeout. If this bit is set to '1', tRRAPInitiatorResponse is set to 1.88 ms(60 ms/32). Note: This register field is sticky.
6	RW	0x0	LINK_DISABLE LINK_DISABLE is an internally reserved field. Do not use. Note: This register field is sticky.
5	RW	0x1	DLL_LINK_EN DLL Link Enable. Enables link initialization. When DLL Link Enable =0, the controller does not transmit InitFC DLLPs and does not establish a link. Note: This register field is sticky.
4	RO	0x0	reserved
3	RW	0x0	RESET_ASSERT Reset Assert. Triggers a recovery and forces the LTSSM to the hot reset state (downstream port only). Note: This register field is sticky.
2	RW	0x0	LOOPBACK_ENABLE Loopback Enable. Turns on loopback. For more details, see "Loopback". For M-PCIe, to force the master to enter Digital Loopback mode, you must set this field to "1" during Configuration.start state(initial discovery/configuration). M-PCIe doesn't support loopback mode from L0 state - only from Configuration.start. Note: This register field is sticky.
1	RW	0x0	SCRAMBLE_DISABLE Scramble Disable. Turns off data scrambling. Note: This register field is sticky.
0	RW	0x0	VENDOR_SPECIFIC_DLLP_REQ Vendor Specific DLLP Request. When software writes a '1' to this bit, the controller transmits the DLLP contained in the VENDOR_SPEC_DLLP field of VENDOR_SPEC_DLLP_OFF. Reading from this self-clearing register field always returns a '0'.

PL_LANE_SKEW_OFF

Address: Operational Base + offset (0x0714)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved

Bit	Attr	Reset Value	Description
30:27	RW	0x1	IMPLEMENT_NUM_LANES Implementation-specific Number of Lanes. Set the implementation-specific number of lanes. Allowed values are: 4'b0000: 1 lane 4'b0001: 2 lanes 4'b0011: 4 lanes 4'b0111: 8 lanes 4'b1111: 16 lanes The number of lanes to be used when in Loopback Master. The number of lanes programmed must be equal to or less than the valid number of lanes set in LINK_CAPABLE field. You must configure this field before initiating Loopback by writing in the LOOPBACK_ENABLE field. The controller will transition from Loopback.Entry to Loopback.Active after receiving two consecutive TS1 Ordered Sets with the Loopback bit asserted on the implementation specific number of lanes configured in this field. Note: This register field is sticky.
26	RW	0x0	ELASTIC_BUFFER_MODE Selects Elasticity Buffer operating mode: 0: Nominal Half Full Buffer mode 1: Nominal Empty Buffer Mode Note: This register field is sticky.
25	RW	0x0	ACK_NAK_DISABLE Ack/Nak Disable. Prevents the controller from sending ACK and NAK DLLPs. Note: This register field is sticky.
24	RW	0x0	FLOW_CTRL_DISABLE Flow Control Disable. Prevents the controller from sending FC DLLPs. Note: This register field is sticky.
23:0	RW	0x000000	INSERT_LANE_SKEW INSERT_LANE_SKEW is an internally reserved field. Do not use. Note: This register field is sticky.

PL_TIMER_CTRL_MAX_FUNC_NUM_OFF

Address: Operational Base + offset (0x0718)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:29	RW	0x0	FAST_LINK_SCALING_FACTOR Fast Link Timer Scaling Factor. Sets the scaling factor of LTSSM timer when FAST_LINK_MODE field in PORT_LINK_CTRL_OFF is set to '1'. 0: Scaling Factor is 1024 (1ms is 1us *a) 1: Scaling Factor is 256 (1ms is 4us) 2: Scaling Factor is 64 (1ms is 16us) 3: Scaling Factor is 16 (1ms is 64us) Note: This register field is sticky.
28:24	RW	0x00	UPDATE_FREQ_TIMER UPDATE_FREQ_TIMER is an internally reserved field. Do not use. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
23:19	RW	0x00	TIMER_MOD_ACK_NAK Ack Latency Timer Modifier. Increases the timer value for the Ack latency timer in increments of 64 clock cycles. A value of "0" represents no modification to the timer value. For more details, see the ROUND_TRIP_LATENCY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. Note: This register field is sticky.
18:14	RW	0x00	TIMER_MOD_REPLAY_TIMER Replay Timer Limit Modifier. Increases the time-out value for the replay timer in increments of 64 clock cycles at Gen1 or Gen2 speed, and in increments of 256 clock cycles at Gen3 speed. A value of "0" represents no modification to the timer limit. For more details, see the REPLAY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. At Gen3 speed, the controller automatically changes the value of this field to DEFAULT_GEN3_REPLAY_ADJ. For M-PCIe, this field increases the time-out value for the replay timer in increments of 64 clock cycles at HS-Gear1, HS-Gear2, or HS-Gear3 speed. Note: This register field is sticky.
13:8	RO	0x00	reserved
7:0	RW	0x00	MAX_FUNC_NUM Maximum function number that can be used in a request. Configuration requests targeted at function numbers above this value are returned with UR (unsupported request). Note: This register field is sticky.

PL_SYMBOL_TIMER_FILTER_1_OFF

Address: Operational Base + offset (0x071C)

Bit	Attr	Reset Value	Description
31	RW	0x0	CX_FLT_MASK_RC_CFG_DISCARD 0: For RADM RC filter to not allow CFG transaction being received 1: For RADM RC filter to allow CFG transaction being received
30	RW	0x0	CX_FLT_MASK_RC_IO_DISCARD 0: For RADM RC filter to not allow IO transaction being received 1: For RADM RC filter to allow IO transaction being received
29	RW	0x0	CX_FLT_MASK_MSG_DROP 0: Drop MSG TLP (except for Vendor MSG). Send decoded message on the SII. 1: Do not Drop MSG (except for Vendor MSG). Send message TLPs to your application on TRGT1 and send decoded message on the SII. The default for this bit is the inverse of FLT_DROP_MSG. That is, if FLT_DROP_MSG =1, then the default of this bit is "0" (drop message TLPs). This bit only controls message TLPs other than Vendor MSGs. Vendor MSGs are controlled by Filter Mask Register 2, bits [1:0]. The controller never passes ATS Invalidate messages to the SII interface regardless of this filter rule setting. The controller passes all ATS Invalidate messages to TRGT1 (or AXI bridge master), as they are too big for the SII.

Bit	Attr	Reset Value	Description
28	RW	0x0	CX_FLT_MASK_CPL_ECRC_DISCARD Only used when completion queue is advertised with infinite credits and is in store-and-forward mode. 0: Discard completions with ECRC errors 1: Allow completions with ECRC errors to be passed up Reserved field for SW.
27	RW	0x0	CX_FLT_MASK_ECRC_DISCARD 0: Discard TLPs with ECRC errors 1: Allow TLPs with ECRC errors to be passed up
26	RW	0x0	CX_FLT_MASK_CPL_LEN_MATCH 0: Enforce length match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err 1: MASK length match for completions
25	RW	0x0	CX_FLT_MASK_CPL_ATTR_MATCH 0: Enforce attribute match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask attribute match for completions
24	RW	0x0	CX_FLT_MASK_CPL_TC_MATCH 0: Enforce Traffic Class match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Traffic Class match for completions
23	RW	0x0	CX_FLT_MASK_CPL_FUNC_MATCH 0: Enforce function match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask function match for completions
22	RW	0x0	CX_FLT_MASK_CPL_REQID_MATCH 0: Enforce Req. Id match for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Req. Id match for completions
21	RW	0x0	CX_FLT_MASK_CPL_TAGERR_MATCH 0: Enforce Tag Error Rules for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Tag Error Rules for completions
20	RW	0x0	CX_FLT_MASK_LOCKED_RD_AS_UR 0: Treat locked Read TLPs as UR for EP; Supported for RC 1: Treat locked Read TLPs as Supported for EP; UR for RC
19	RW	0x0	CX_FLT_MASK_CFG_TYPE1_REQ_AS_UR 0: Treat CFG type1 TLPs as UR for EP; Supported for RC 1: Treat CFG type1 TLPs as Supported for EP; UR for RC When CX_SRIOV_ENABLE is set then this bit is set to allow the filter to process Type 1 Config requests if the EP consumes more than one bus number.
18	RW	0x0	CX_FLT_MASK_UR_OUTSIDE_BAR 0: Treat out-of-bar TLPs as UR 1: Do not treat out-of-bar TLPs as UR
17	RW	0x0	CX_FLT_MASK_UR_POIS 0: Treat poisoned request TLPs as UR 1: Do not treat poisoned request TLPs as UR The native controller always passes poisoned completions to your application except when you are using the DMA read channel.

Bit	Attr	Reset Value	Description
16	RW	0x0	CX_FLT_MASK_UR_FUNC_MISMATCH 0: Treat Function MisMatched TLPs as UR 1: Do not treat Function MisMatched TLPs as UR
15	RW	0x0	DISABLE_FC_WD_TIMER Disable FC Watchdog Timer. Note: This register field is sticky.
14:11	RW	0x0	EIDLE_TIMER EIDLE_TIMER is an internally reserved field. Do not use. Note: This register field is sticky.
10:0	RW	0x280	SKP_INT_VAL SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. Note that the controller actually waits the number of symbol times in this register plus 1 between transmitting SKP ordered sets. Your application must program this register accordingly. For example, if 1536 were programmed into this register (in a 250 MHz controller), then the controller actually transmits SKP ordered sets once every 1537 symbol times. The value programmed to this register is actually clock ticks and not symbol times. In a 125 MHz controller, programming the value programmed to this register should be scaled down by a factor of 2 (because one clock tick = two symbol times in this case). Note: This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. For M-PCIe configurations, if the 2K_PPM_DISABLED field in the M-PCIe Configuration Attribute is changed, then this field is changed automatically as follows. 2K_PPM_DISABLED=1: 1280 / CX_NB 2K_PPM_DISABLED=0: 228/CX_NB You need to set this field again if necessary when 2K_PPM_DISABLED is changed. Note: This register field is sticky.

PL_FILTER_MASK_2_OFF

Address: Operational Base + offset (0x0720)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	CX_FLT_MASK_POIS_ERROR_REPORTING 0: Disable masking of error reporting for Poisoned TLPs 1: Enable masking of error reporting for Poisoned TLPs
7	RW	0x0	CX_FLT_MASK_PRS_DROP 0: Allow PRS message to pass through 1: Drop PRS Messages silently This bit is ignored when the CX_FLT_MASK_MSG_DROP bit in the MASK_RADM_1 field of the SYMBOL_TIMER_FILTER_1_OFF register is set to '1'.
6	RW	0x0	CX_FLT_UNMASK_TD 0: Disable unmask TD bit if CX_STRIP_ECRC_ENABLE 1: Enable unmask TD bit if CX_STRIP_ECRC_ENABLE
5	RW	0x0	CX_FLT_UNMASK_UR_POIS_TRGT0 0: Disable unmask CX_FLT_MASK_UR_POIS with TRGT0 destination 1: Enable unmask CX_FLT_MASK_UR_POIS with TRGT0 destination

Bit	Attr	Reset Value	Description
4	RW	0x0	CX_FLT_MASK_LN_VENMSG1_DROP 0: Allow LN message to pass through 1: Drop LN Messages silently
3	RW	0x0	CX_FLT_MASK_HANDLE_FLUSH 0: Disable controller Filter to handle flush request 1: Enable controller Filter to handle flush request
2	RW	0x0	CX_FLT_MASK_DABORT_4UCPL 0: Enable DLLP abort for unexpected completion 1: Do not enable DLLP abort for unexpected completion
1	RW	0x0	CX_FLT_MASK_VENMSG1_DROP 0: Vendor MSG Type 1 dropped silently 1: Vendor MSG Type 1 not dropped
0	RW	0x0	CX_FLT_MASK_VENMSG0_DROP 0: Vendor MSG Type 0 dropped with UR error reporting 1: Vendor MSG Type 0 not dropped

PL_AMBA_MUL_OB_DECOMP_NP_SUB_REQ_CTRL_OFF

Address: Operational Base + offset (0x0724)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	OB_RD_SPLIT_BURST_EN Enable AMBA Multiple Outbound Decomposed NP SubRequests. This bit when set to "0" disables the possibility of having multiple outstanding non-posted requests that were derived from decomposition of an outbound AMBA request. For more details, see "AXI Bridge Ordering" in the AXI chapter of the Databook. You should not clear this register unless your application master is requesting an amount of read data greater than Max_Read_Request_Size, and the remote device (or switch) is reordering completions that have different tags. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky.

PL_PL_DEBUG0_OFF

Address: Operational Base + offset (0x0728)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DEB_REG_0 The value on cxpl_debug_info[31:0].

Bit	Attr	Reset Value	Description
11:0	RO	0x000	TX_CPL_DATA_FC_CREDIT Transmit Completion Data FC Credits. The Completion Data credits advertised by the receiver at the other end of the link, updated with each UpdateFC DLLP. Default value depends on the number of advertised credits for header and data [12'b0, xtlh_xadm_cplh_cdts, xtlh_xadm_cpld_cdts]; When the number of advertised completion credits (both header and data) are infinite, then the default would be [12'b0, 8'hFF, 12'hFFF].

PL_QUEUE_STATUS_OFF

Address: Operational Base + offset (0x073C)

Bit	Attr	Reset Value	Description
31	RW	0x0	TIMER_MOD_FLOW_CONTROL_EN FC Latency Timer Override Enable. When this bit is set, the value from the "FC Latency Timer Override Value" field in this register will override the FC latency timer value that the controller calculates according to the PCIe specification. Note: This register field is sticky.
30:29	RO	0x0	reserved
28:16	RW	0x0000	TIMER_MOD_FLOW_CONTROL FC Latency Timer Override Value. When you set the "FC Latency Timer Override Enable" in this register, the value in this field will override the FC latency timer value that the controller calculates according to the PCIe specification. For more details, see "Flow Control". Note: This register field is sticky.
15:14	RO	0x0	reserved
13	RO	0x0	RX_SERIALIZATION_Q_NON_EMPTY Receive Serialization Queue Not Empty. Indicates there is data in the serialization queue.
12:4	RO	0x000	reserved
3	RW	0x0	RX_QUEUE_OVERFLOW Receive Credit Queue Overflow. Indicates insufficient buffer space available to write to the P/NP/CPL credit queue.
2	RO	0x0	RX_QUEUE_NON_EMPTY Receive Credit Queue Not Empty. Indicates there is data in one or more of the receive buffers.
1	RO	0x0	TX_RETRY_BUFFER_NE Transmit Retry Buffer Not Empty. Indicates that there is data in the transmit retry buffer.
0	RO	0x0	RX_TLP_FC_CREDIT_NON_RETURN Received TLP FC Credits Not Returned. Indicates that the controller has received a TLP but has not yet sent an UpdateFC DLLP indicating that the credits for that TLP have been restored by the receiver at the other end of the link.

PL_VC_TX_ARBI_1_OFF

Address: Operational Base + offset (0x0740)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	WRR_WEIGHT_VC_3 WRR Weight for VC3.

11:0	RO	0x000	VC0_CPL_DATA_CREDIT VC0 Completion Data Credits. The number of initial Completion data credits for VC0, used only in the segmented-buffer configuration. Note: This register field is sticky.

PL_GEN2_CTRL_OFF

Address: Operational Base + offset (0x080C)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved

Bit	Attr	Reset Value	Description
21	RW	0x0	Field0008 Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery.Speed or Loopback.Active (as slave) state at Gen1 speed by looking for a "1" value on RxElecIdle instead of looking for a "0" on RxValid. If the PHY fails to deassert the RxValid signal in Recovery.Speed or Loopback.Active (because of corrupted EIOS for example), then EI cannot be inferred successfully in the controller by just detecting the condition RxValid=0. 0: Use RxElecIdle signal to infer Electrical Idle 1: Use RxValid signal to infer Electrical Idle Note: This register field is sticky.
20	RW	0x0	SEL_DEEMPHASIS Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. 0: -6 dB 1: -3.5 dB Note: This register field is sticky.
19	RW	0x0	CONFIG_TX_COMP_RX Config Tx Compliance Receive Bit. When set to 1, signals LTSSM to transmit TS ordered sets with the compliance receive bit assert (equal to "1"). Note: This register field is sticky.
18	RW	0x0	CONFIG_PHY_TX_CHANGE Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. 0: Full Swing 1: Low Swing Note: This register field is sticky.
17	RW	0x0	DIRECT_SPEED_CHANGE Directed Speed Change. Writing "1" to this field instructs the LTSSM to initiate a speed change to Gen2 or Gen3 after the link is initialized at Gen1 speed. When the speed change occurs, the controller will clear the contents of this field; and a read to this field by your software will return a "0". To manually initiate the speed change: Write to LINK_CONTROL2_LINK_STATUS2_REG . PCIE_CAP_TARGET_LINK_SPEED in the local device Deassert this field Assert this field
16	RW	0x1	AUTO_LANE_FLIP_CTRL_EN Enable Auto flipping of the lanes. You must set the CX_AUTO_LANE_FLIP_CTRL_EN configuration parameter to include the hardware for this feature in the controller. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
15:13	RW	0x0	PRE_DET_LANE Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. Allowed values are: 3'b000: Connect logical Lane0 to physical lane 0 or CX_NL-1 or CX_NL/2-1 or CX_NL/4-1 or CX_NL/8-1, depending on which lane is detected 3'b001: Connect logical Lane0 to physical lane 1 3'b010: Connect logical Lane0 to physical lane 3 3'b011: Connect logical Lane0 to physical lane 7 3'b100: Connect logical Lane0 to physical lane 15 This field is used to restrict the receiver detect procedure to a particular lane when the default detect and polling procedure performed on all lanes cannot be successful. A notable example of when it is useful to program this field to a value different from the default, is when a lane is asymmetrically broken, that is, it is detected in Detect LTSSM state but it cannot exit Electrical Idle in Polling LTSSM state.
12:8	RW	0x02	NUM_OF_LANES Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. Used to limit the effective link width to ignore 'broken" or "unused" lanes that detect a receiver. Indicates the number of lanes to check for exit from Electrical Idle in Polling.Active and L2.Idle. It is possible that the LTSSM might detect a receiver on a bad or broken lane during the Detect Substate. However, it is also possible that such a lane might also fail to exit Electrical Idle and therefore prevent a valid link from being configured. This value is referred to as the "Predetermined Number of Lanes" in section 4.2.6.2.1 of the PCI Express Base 3.0 Specification, revision 1.0. Encoding is as follows: 0x01: 1 lane 0x02: 2 lanes 0x03: 3 lanes .. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Link Mode Enable" field of PORT_LINK_CTRL_OFF. The value in this register is normally the same as the encoded value in PORT_LINK_CTRL_OFF. If you find that one of your used lanes is bad then you must reduce the value in this register. For more information, see "How to Tie Off Unused Lanes." For information on upsizing and downsizing the link width, see "Link Establishment." Note: This register field is sticky.
7:0	RW	0xff	FAST_TRAINING_SEQ Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training. This value is used to inform the link partner about the PHY's ability to recover synchronization after a low power state. The number should be provided by the PHY vendor. Do not set N_FTS to zero; doing so can cause the LTSSM to go into the recovery state when exiting from L0s. This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: Note: This register field is sticky.

PL_PHY_STATUS_OFF

Address: Operational Base + offset (0x0810)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PHY_STATUS PHY Status. Data received directly from the phy_cfg_status bus. These is a GPIO register reflecting the values on the static phy_cfg_status input signals. The usage is left completely to the user and does not in any way influence controller functionality. You can use it for any static sideband status signalling requirements that you have for your PHY. Note: This register field is sticky.

PL_PHY_CONTROL_OFF

Address: Operational Base + offset (0x0814)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	PHY_CONTROL PHY Control. Data sent directly to the cfg_phy_control bus. These is a GPIO register driving the values on the static cfg_phy_control output signals. The usage is left completely to the user and does not in any way influence controller functionality. You can use it for any static sideband control signalling requirements that you have for your PHY.

PL_TRGT_MAP_CTRL_OFF

Address: Operational Base + offset (0x081C)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:16	RW	0x00	TARGET_MAP_INDEX The number of the PF Function on which the Target Values are set. This register does not respect the Byte Enable setting. any write will affect all register bits.
15:7	RO	0x000	reserved
6	RW	0x1	TARGET_MAP_ROM Target Value for the ROM page of the PF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits.
5:0	RW	0x07	TARGET_MAP_PF Target Values for each BAR on the PF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits.

PL_CLOCK_GATING_CTRL_OFF

Address: Operational Base + offset (0x088C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	RADM_CLK_GATING_EN Enable Radm clock gating feature. 0: Disable 1: Enable

PL_GEN3_RELATED_OFF

Address: Operational Base + offset (0x0890)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23	RW	0x0	GEN3_EQ_INVREQ_EVAL_DIFF_DISABLE Eq InvalidRequest and RxEqEval Different Time Assertion Disable. Disable the assertion of Eq InvalidRequest and RxEqEval at different time.
22:19	RO	0x0	reserved
18	RW	0x0	GEN3_DC_BALANCE_DISABLE DC Balance Disable. Disable DC Balance feature.
17	RW	0x0	GEN3_DLLP_XMT_DELAY_DISABLE DLLP Transmission Delay Disable. Disable delay transmission of DLLPs before equalization.
16	RW	0x0	GEN3_EQUALIZATION_DISABLE Equalization Disable. Disable equalization feature. This bit cannot be changed once the LTSSM starts link training.
15:14	RO	0x0	reserved
13	RW	0x0	RXEQ_RGRDLESS_RXTS When set to '1', the controller as Gen3 EQ master asserts RxEqEval to instruct the PHY to do Rx adaptation and evaluation after a 500ns timeout from a new preset request. 0: mac_phy_rxeqeval asserts after 1us and 2 TS1 received from remote partner. 1: mac_phy_rxeqeval asserts after 500ns regardless of TS's received or not.
12	RW	0x0	RXEQ_PH01_EN Rx Equalization Phase 0/Phase 1 Hold Enable. When this bit is set the upstream port holds phase 0 (the downstream port holds phase 1) for 10ms. Holding phase 0 or phase 1 can be used to allow sufficient time for Rx Equalization to be performed by the PHY. This bit is used during Virtex-7 Gen3 equalization. The programmable bits [RXEQ_PH01_EN, EQ_PHASE_2_3] can be used to obtain the following variations of the equalization procedure: 00: Tx equalization only in phase 2/3 01: No Tx equalization, no Rx equalization 10: Tx equalization in phase 2/3, Rx equalization in phase 0/1 11: No Tx equalization, Rx equalization in phase 0/1
11	RW	0x0	EQ_REDO Equalization Redo Disable. Disable autonomous mechanism for requesting to redo the equalization process. Note: This register field is sticky.
10	RW	0x0	EQ_EIEOS_CNT Equalization EIEOS Count Reset Disable. Disable requesting reset of EIEOS count during equalization. Note: This register field is sticky.
9	RW	0x0	EQ_PHASE_2_3 Equalization Phase 2 and Phase 3 Disable. This applies to downstream ports only.
8	RW	0x0	DISABLE_SCRAMBLER_GEN_3 Disable Scrambler for Gen3 and Gen4 Data Rate.
7:1	RO	0x00	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	GEN3_ZRXDC_NONCOMPL Gen3 Receiver Impedance ZRX-DC Not Compliant. Receivers that operate at 8.0 GT/s with an impedance other than the range defined by the ZRX-DC parameter for 2.5 GT/s (40-60 Ohms) must meet additional behavior requirements in the following LTSSM states: Polling, Rx_L0s, L1, L2, and Disabled. 0: The receiver complies with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. 1: The receiver does not comply with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. Note: This register field is sticky.

PL_GEN3_EQ_CONTROL_OFF

Address: Operational Base + offset (0x08A8)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26	RW	0x1	GEN3_REQ_SEND_CONSEC_EIEOS_FOR_PSET_MAP Request controller to send back-to-back EIEOS in Recovery.RcvrLock state until presets to coefficients mapping is complete. 0: Do not request 1: request
25	RW	0x0	GEN3_EQ_PSET_REQ_AS_COEF GEN3_EQ_PSET_REQ_AS_COEF is an internally reserved field. Do not use.
24	RW	0x0	GEN3_EQ_FOM_INC_INITIAL_EVAL Include Initial FOM. Include or not the FOM feedback from the initial preset evaluation performed in the EQ Master, when finding the highest FOM among all preset evaluations. 0: Do not include 1: Include

Bit	Attr	Reset Value	Description
23:8	RW	0x059f	GEN3_EQ_PSET_REQ_VEC Preset Request Vector. Requesting of Presets during the initial part of the EQ Master Phase. Encoding scheme is as follows: Bit [15:0] =0x0: No preset is requested and evaluated in EQ Master Phase. Bit [i] =1: "Preset=i" is requested and evaluated in EQ Master Phase. 0000000000000000: No preset be requested and evaluated in EQ Master Phase 000000xxxxxxxxx1: Preset 0 is requested and evaluated in EQ Master Phase 000000xxxxxxxx1x: Preset 1 is requested and evaluated in EQ Master Phase 000000xxxxxxx1xx: Preset 2 is requested and evaluated in EQ Master Phase 000000xxxxxx1xxx: Preset 3 is requested and evaluated in EQ Master Phase 000000xxxxx1xxxx: Preset 4 is requested and evaluated in EQ Master Phase 000000xxxx1xxxxx: Preset 5 is requested and evaluated in EQ Master Phase 000000xxx1xxxxxx: Preset 6 is requested and evaluated in EQ Master Phase 000000xx1xxxxxxx: Preset 7 is requested and evaluated in EQ Master Phase 000000x1xxxxxxxx: Preset 8 is requested and evaluated in EQ Master Phase 00000x1xxxxxxxxx: Preset 9 is requested and evaluated in EQ Master Phase 000001xxxxxxxxxx: Preset 10 is requested and evaluated in EQ Master Phase All other encodings: Reserved
7	RO	0x0	reserved
6	RW	0x1	GEN3_LOWER_RATE_EQ_REDO_ENABLE Support EQ redo and lower rate change: 0: not support 1: support
5	RW	0x1	GEN3_EQ_EVAL_2MS_DISABLE Phase2_3 2 ms Timeout Disable. Determine behavior in Phase2 for USP (Phase3 if DSP) when the PHY does not respond within 2ms to the assertion of RxEqEval: 0: abort the current evaluation, stop any attempt to modify the remote transmitter settings, Phase2 is terminated by the 24ms timeout 1: ignore the 2ms timeout and continue as normal. This is used to support PHYs that require more than 2ms to respond to the assertion of RxEqEval.

Bit	Attr	Reset Value	Description
4	RW	0x0	GEN3_EQ_PHASE23_EXIT_MODE Behavior After 24 ms Timeout (when optimal settings are not found). For a USP: Determine next LTSSM state from Phase2 after 24ms Timeout 0: Recovery.Speed 1: Recovery.Equalization.Phase3 When optimal settings are not found then: Equalization Phase 2 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 Equalization Phase 2 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 Equalization Phase 2 Complete status bit is set in the "Link Status Register 2" For a DSP: Determine next LTSSM state from Phase3 after 24ms Timeout 0: Recovery.Speed 1: Recovery.Equalization.RcvrLock When optimal settings are not found then: Equalization Phase 3 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 Equalization Phase 3 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 Equalization Phase 3 Complete status bit is set in the "Link Status Register 2"
3:0	RW	0x1	GEN3_EQ_FB_MODE Feedback Mode. 0000b: Direction Change 0001b: Figure Of Merit 0010b: Reserved .....: Reserved 1111b: Reserved

PL_GEN3_EQ_FB_MODE_DIR_CHANGE_OFF

Address: Operational Base + offset (0x08AC)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:14	RW	0x0	GEN3_EQ_FMDC_MAX_POST_CUSROR_DELTA Convergence Window Aperture for C+1. Post-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15.
13:10	RW	0x0	GEN3_EQ_FMDC_MAX_PRE_CUSROR_DELTA Convergence Window Aperture for C-1. Pre-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15.
9:5	RW	0x02	GEN3_EQ_FMDC_N_EVALS Convergence Window Depth. Number of consecutive evaluations considered in Phase 2/3 when determining if optimal coefficients have been found. Allowed range: 0,1,2,..16 up to a maximum of CX_GEN3_EQ_COEFQ_DEPTH. When set to 0, EQ Master is performed without sending any requests to the remote partner in Phase 2 for USP and Phase 3 for DSP. Therefore, the remote partner will not change its transmitter coefficients and will move to the next state.

Bit	Attr	Reset Value	Description
4:0	RW	0x00	GEN3_EQ_FMDC_T_MIN_PHASE23 Minimum Time (in ms) To Remain in EQ Master Phase. The LTSSM stays in EQ Master phase for at least this amount of time, before starting to check for convergence of the coefficients. Allowed values 0,1,...,24.

PL_ORDER_RULE_CTRL_OFF

15:0	RW	0x0003	LPBK_RXVALID LPBK_RXVALID is an internally reserved field. Do not use. Note: This register field is sticky.

PL_MISC_CONTROL_1_OFF

Address: Operational Base + offset (0x08BC)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	ARI_DEVICE_NUMBER When ARI is enabled, this field enables use of the device ID. Note: This register field is sticky.
4	RW	0x0	DISABLE_AUTO_LTR_CLR_MSG Disable the autonomous generation of LTR clear message in upstream port. 0: Allow the autonomous generation of LTR clear message. 1: Disable the autonomous generation of LTR clear message. Default value is 0. For more details, see "Latency Tolerance Reporting (LTR) Message Generation [EP Mode]" in "Message Generation" section of the "Controller Operations" chapter of the Databook. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
3	RW	0x0	SIMPLIFIED_REPLAY_TIMER Enables Simplified Replay Timer (Gen4). For more details, see "Transmit Replay" in the Controller Operations chapter of the Databook. Simplified Replay Timer Values are: A value from 24,000 to 31,000 Symbol Times when Extended Synch is 0b. A value from 80,000 to 100,000 Symbol Times when Extended Synch is 1b. Must not be changed while link is in use. Note: This register field is sticky.
2	RW	0x0	UR_CA_MASK_4_TRGT1 This field only applies to request TLPs (with UR filtering status) that you have chosen to forward to the application (when you set DEFAULT_TARGET in this register). When you set this field to '1', the core suppresses error logging, Error Message generation, and CPL generation (for non-posted requests). For more details, refer to the "Advanced Error Handling For Received TLPs" chapter of the Databook. You should set this if you have set the Default Target port logic register to '1'. Note: This register field is sticky.
1	RW	0x0	DEFAULT_TARGET Default target a received IO or MEM request with UR/CA/CRS is sent to by the controller. 0: The controller drops all incoming I/O or MEM requests (after corresponding error reporting). A completion with UR status will be generated for non-posted requests. 1: The controller forwards all incoming I/O or MEM requests with UR/CA/CRS status to your application For more details, see "ECRC Handling" and "Request TLP Routing Rules" in "Receive Routing" section of the "Controller Operations" chapter of the Databook. Default value is DEFAULT_TARGET configuration parameter. Note: This register field is sticky.
0	RW	0x0	DBI_RO_WR_EN Write to RO Registers Using DBI. When you set this field to "1", then some RO and HwInit bits are writable from the local application through the DBI. For more details, see "Writing to Read-Only Registers." Note: This register field is sticky.

PL_MULTI_LANE_CONTROL_OFF

Address: Operational Base + offset (0x08C0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	UPCONFIGURE_SUPPORT Upconfigure Support. The controller sends this value as the Link Upconfigure Capability in TS2 Ordered Sets in Configuration.Complete state.

Bit	Attr	Reset Value	Description
6	RW	0x0	DIRECT_LINK_WIDTH_CHANGE Directed Link Width Change. The controller always moves to Configuration state through Recovery state when this bit is set to '1'. If the upconfigure_capable variable is '1' and the PCIE_CAP_HW_AUTO_WIDTH_DISABLE bit in LINK_CONTROL_LINK_STATUS_REG is '0', the controller starts upconfigure or autonomous width downsizing (to the TARGET_LINK_WIDTH value) in the Configuration state. If TARGET_LINK_WIDTH value is 0x0, the controller does not start upconfigure or autonomous width downsizing in the Configuration state. The controller self-clears this field when the controller accepts this request.
5:0	RW	0x00	TARGET_LINK_WIDTH Target Link Width. Values correspond to: 6'b000000: Core does not start upconfigure or autonomous width downsizing in the Configuration state. 6'b000001: x1 6'b000010: x2 6'b000100: x4 6'b001000: x8 6'b010000: x16 6'b100000: x32

PL_PHY_INTEROP_CTRL_OFF

Address: Operational Base + offset (0x08C4)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10	RW	0x0	L1_CLK_SEL L1 Clock control bit. 1: Controller does not request aux_clk switch and core_clk gating in L1. 0: Controller requests aux_clk switch and core_clk gating in L1. Note: This register field is sticky.
9	RW	0x0	L1_NOWAIT_P1 L1 entry control bit. 1: Core does not wait for PHY to acknowledge transition to P1 before entering L1. 0: Core waits for the PHY to acknowledge transition to P1 before entering L1. Note: This register field is sticky.
8	RW	0x0	L1SUB_EXIT_MODE L1 Exit Control Using phy_mac_pclkack_n. 1: Core exits L1 without waiting for the PHY to assert phy_mac_pclkack_n. 0: Core waits for the PHY to assert phy_mac_pclkack_n before exiting L1. Note: This register field is sticky.
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:0	RW	0x3f	RXSTANDBY_CONTROL Rxstandby Control. Bits 0..5 determine if the controller asserts the RxStandby signal (mac_phy_rxstandby) in the indicated condition. Bit 6 enables the controller to perform the RxStandby/RxStandbyStatus handshake. [0]: Rx EIOS and subsequent T TX-IDLE-MIN [1]: Rate Change [2]: Inactive lane for upconfigure/downconfigure [3]: PowerDown=P1orP2 [4]: RxL0s.Idle [5]: EI Infer in L0 [6]: Execute RxStandby/RxStandbyStatus Handshake Note: This register field is sticky.

PL_TRGT_CPL_LUT_DELETE_ENTRY_OFF

Address: Operational Base + offset (0x08C8)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	RW	0x00000000	LOOK_UP_ID This number selects one entry to delete of the TRGT_CPL_LUT.

PL_LINK_FLUSH_CONTROL_OFF

Address: Operational Base + offset (0x08CC)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	AUTO_FLUSH_EN Enables automatic flushing of pending requests before sending the reset request to the application logic to reset the PCIe controller and the AXI Bridge. The flushing process is initiated if any of the following events occur: Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. Warm (Soft) reset request. Generated when exiting from D3 to D0 and cfg_pm_no_soft_rst=0. Link down reset request. A high to low transition on smlh_req_rst_not indicates the link has gone down and the controller is requesting a reset. If you disable automatic flushing, your application is responsible for resetting the PCIe controller and the AXI Bridge. Note: This register field is sticky.

PL_AMBA_ERROR_RESPONSE_DEFAULT_OFF

Address: Operational Base + offset (0x08D0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:10	RW	0x27	AMBA_ERROR_RESPONSE_MAP AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for non-posted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. bit 0: 0: UR (unsupported request) -> DECERR 1: UR (unsupported request) -> SLVERR bit 1: 0: CRS (configuration retry status) -> DECERR 1: CRS (configuration retry status) -> SLVERR bit 2 0: CA (completer abort) -> DECERR 1: CA (completer abort) -> SLVERR bit 3: Reserved bit 4: Reserved bit 5: 0: Completion Timeout -> DECERR 1: Completion Timeout -> SLVERR
9:5	RO	0x00	reserved
4:3	RW	0x0	AMBA_ERROR_RESPONSE_CRS CRS Slave Error Response Mapping. Determines the AXI slave response for CRS completions. 00: OKAY 01: OKAY with all FFFF_FFFF data for all CRS completions 10: OKAY with FFFF_0001 data for CRS completions to vendor ID read requests, OKAY with FFFF_FFFF data for all other CRS completions 11: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Note: This register field is sticky.
2	RW	0x0	AMBA_ERROR_RESPONSE_VENDORID Vendor ID Non-existent Slave Error Response Mapping. Determines the AXI slave response for errors on reads to non-existent Vendor ID register. 0: OKAY (with FFFF data). 1: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Note: This register field is sticky.
1	RO	0x0	reserved
0	RW	0x0	AMBA_ERROR_RESPONSE_GLOBAL Global Slave Error Response Mapping. Determines the AXI slave response for all error scenarios on non-posted requests. 0: OKAY (with FFFF data for non-posted requests) 1: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) The error response mapping is not applicable to Non-existent Vendor ID register reads. Note: This register field is sticky.

PL_AMBA_LINK_TIMEOUT_OFF

Address: Operational Base + offset (0x08D4)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	LINK_TIMEOUT_ENABLE_DEFAULT Disable Flush. You can disable the flush feature by setting this field to "1". Note: This register field is sticky.
7:0	RW	0x32	LINK_TIMEOUT_PERIOD_DEFAULT Timeout Value (ms). The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface requests and the PCIe TX link is not transmitting any of these requests. The timer is clocked by core_clk. For an M-PCIe configuration: Time unit of this field is 4 ms. Margin of error for RateA clock is < 1%. Margin of error for RateB clock is between 16% and 17%. Note: This register field is sticky.

PL_AMBA_ORDERING_CTRL_OFF

Address: Operational Base + offset (0x08D8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	AX_MSTR_ZEROLREAD_FW AXI Master Zero Length Read Forward to the application. The DW PCIe controller AXI bridge is able to terminate in order with the Posted transactions the zero length read, implementing the PCIe express flush semantics of the Posted transactions. 0x0: The zero length Read is terminated at the DW PCIe AXI bridge master 0x1: The zero length Read is forward to the application.
6:5	RO	0x0	reserved
4:3	RW	0x0	AX_MSTR_ORDR_P_EVENT_SEL AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels,you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. 00: B'last event: wait for the all of the write responses on the B channel thereby ensuring that the complete Posted transaction has effectively reached the application slave (default). 01: AW'last event: wait until the complete Posted transaction has left the AXI address channel at the bridge master. 10: W'last event: wait until the complete Posted transaction has left the AXI data channel at the bridge master. 11: Reserved
2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	AX_SNP_EN AXI Serialize Non-Posted Requests Enable. This field enables the AXI Bridge to serialize same ID Non-Posted Read/Write Requests on the wire. Serialization implies one outstanding same ID NP Read or Write on the wire and used to avoid AXI RAR and WAW hazards at the remote link partner.
0	RO	0x0	reserved

PL_COHERENCY_CONTROL_1_OFF

Address: Operational Base + offset (0x08E0)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	CFG_MEMTYPE_BOUNDARY_LOW_ADDR Boundary Lower Address For Memory Type. Bits [31:0] of dword-aligned address of the boundary for Memory type. The two lower address LSBs are "00". Addresses up to but not including this value are in the lower address space region; addresses equal or greater than this value are in the upper address space region. Note: This register field is sticky.
1	RO	0x0	reserved
0	RW	0x0	CFG_MEMTYPE_VALUE Sets the memory type for the lower and upper parts of the address space: 0: lower = Peripheral; upper = Memory 1: lower = Memory type; upper = Peripheral Note: This register field is sticky.

PL_COHERENCY_CONTROL_2_OFF

Address: Operational Base + offset (0x08E4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	CFG_MEMTYPE_BOUNDARY_HIGH_ADDR Boundary Upper Address For Memory Type. Bits [63:32] of the 64-bit dword-aligned address of the boundary for Memory type. Note: This register field is sticky.

PL_COHERENCY_CONTROL_3_OFF

Address: Operational Base + offset (0x08E8)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:27	RW	0x0	CFG_MSTR_AWCACHE_VALUE Master Write CACHE Signal Value. Value of the individual bits in mstr_awcache when CFG_MSTR_AWCACHE_MODE is '1'. Note: not applicable to message requests; for message requests the value of mstr_awcache is always "0000" Note: This register field is sticky.
26:23	RO	0x0	reserved
22:19	RW	0x0	CFG_MSTR_ARCACHE_VALUE Master Read CACHE Signal Value. Value of the individual bits in mstr_arcache when CFG_MSTR_ARCACHE_MODE is '1'. Note: This register field is sticky.
18:15	RO	0x0	reserved

Bit	Attr	Reset Value	Description
14:11	RW	0x0	CFG_MSTR_AWCACHE_MODE Master Write CACHE Signal Behavior. Defines how the individual bits in mstr_awcache are controlled: 0: set automatically by the AXI master 1: set by the value of the corresponding bit of the CFG_MSTR_AWCACHE_VALUE field Note: for message requests the value of mstr_awcache is always "0000" regardless of the value of this bit Note: This register field is sticky.
10:7	RO	0x0	reserved
6:3	RW	0x0	CFG_MSTR_ARCACHE_MODE Master Read CACHE Signal Behavior. Defines how the individual bits in mstr_arcache are controlled: 0: set automatically by the AXI master 1: set by the value of the corresponding bit of the CFG_MSTR_ARCACHE_VALUE field Note: This register field is sticky.
2:0	RO	0x0	reserved

PL_AXI_MSTR_MSG_ADDR_LOW_OFF

Address: Operational Base + offset (0x08F0)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	CFG_AXIMSTR_MSG_ADDR_LOW Lower 20 bits of the programmable AXI address for Messages. Note: This register field is sticky.
11:0	RO	0x000	CFG_AXIMSTR_MSG_ADDR_LOW_RESERVED Reserved for future use. Note: This register field is sticky.

PL_AXI_MSTR_MSG_ADDR_HIGH_OFF

Address: Operational Base + offset (0x08F4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	CFG_AXIMSTR_MSG_ADDR_HIGH Upper 32 bits of the programmable AXI address for Messages. Note: This register field is sticky.

PL_PCIE_VERSION_NUMBER_OFF

Address: Operational Base + offset (0x08F8)

Bit	Attr	Reset Value	Description
31:0	RO	0x3531302a	VERSION_NUMBER Version Number.

PL_PCIE_VERSION_TYPE_OFF

Address: Operational Base + offset (0x08FC)

Bit	Attr	Reset Value	Description
31:0	RO	0x67612a2a	VERSION_TYPE Version Type.

PL_MSIX_ADDRESS_MATCH_LOW_OFF

Address: Operational Base + offset (0x0940)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	MSIX_ADDRESS_MATCH_LOW MSI-X Address Match Low Address. Note: This register field is sticky.
1	RO	0x0	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	MSIX_ADDRESS_MATCH_EN MSI-X Match Enable. Enable the MSI-X Address Match feature when the AXI bridge is present. Note: This register field is sticky.

PL_MSIX_ADDRESS_MATCH_HIGH_OFF

Address: Operational Base + offset (0x0944)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	MSIX_ADDRESS_MATCH_HIGH MSI-X Address Match High Address. Note: This register field is sticky.

PL_MSIX_DOORBELL_OFF

Address: Operational Base + offset (0x0948)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	WO	0x00	MSIX_DOORBELL_PF MSIX Doorbell Physical Function. This register determines the Physical Function for the MSI-X transaction.
23:16	WO	0x00	MSIX_DOORBELL_VF MSIX Doorbell Virtual Function. This register determines the Virtual Function for the MSI-X transaction.
15	WO	0x0	MSIX_DOORBELL_VF_ACTIVE MSIX Doorbell Virtual Function Active. This register determines whether a Virtual Function is used to generate the MSI-X transaction.
14:12	WO	0x0	MSIX_DOORBELL_TC MSIX Doorbell Traffic Class. This register determines which traffic class to generate the MSI-X transaction with.
11	RO	0x0	reserved
10:0	WO	0x000	MSIX_DOORBELL_VECTOR MSI-X Doorbell Vector. This register determines which vector to generate the MSI-X transaction for.

PL_MSIX_RAM_CTRL_OFF

Address: Operational Base + offset (0x094C)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	MSIX_RAM_CTRL_DBG_PBA MSIX PBA RAM Debug Mode. Use this bit to activate the debug mode and allow direct read/write access to the PBA. Use can also use the dbg_pba input to activate debug mode. Debug mode turns off the PF/VF/Offset-based addressing into the RAM and maps the entire table linearly from the base address of the BAR (indicated by the BIR) in function 0. Note: This register field is sticky.
24	RW	0x0	MSIX_RAM_CTRL_DBG_TABLE MSIX Table RAM Debug Mode. Use this bit to activate the debug mode and allow direct read/write access to the Table. Use can also use the dbg_table input to activate debug mode. Debug mode turns off the PF/VF/Offset-based addressing into the RAM and maps the entire table linearly from the base address of the BAR (indicated by the BIR) in function 0. Note: This register field is sticky.
23:17	RO	0x00	reserved

Bit	Attr	Reset Value	Description
16	RW	0x0	MSIX_RAM_CTRL_BYPASS MSIX RAM Control Bypass. The bypass field, when set, disables the internal generation of low power signals for both RAMs. It is up to the application to ensure the RAMs are in the proper power state before trying to access them. Moreover, the application needs to observe all timing requirements of the RAM low power signals before trying to use the MSIX functionality. Note: This register field is sticky.
15:10	RO	0x00	reserved
9	RW	0x0	MSIX_RAM_CTRL_PBA_SD MSIX PBA RAM Shut Down. Set this bit to drive the cfg_msix_pba_sd output to signal your external logic to place the MSIX PBA RAM in Shut Down low-power mode. Note: This register field is sticky.
8	RW	0x0	MSIX_RAM_CTRL_PBA_DS MSIX PBA RAM Deep Sleep. Set this bit to drive the cfg_msix_pba_ds output to signal your external logic to place the MSIX PBA RAM in Deep Sleep low-power mode. Note: This register field is sticky.
7:2	RO	0x00	reserved
1	RW	0x0	MSIX_RAM_CTRL_TABLE_SD MSIX Table RAM Shut Down. Set this bit to drive the cfg_msix_table_sd output to signal your external logic to place the MSIX Table RAM in Shut Down low-power mode. Note: This register field is sticky.
0	RW	0x0	MSIX_RAM_CTRL_TABLE_DS MSIX Table RAM Deep Sleep. Set this bit to drive the cfg_msix_table_ds output to signal your external logic to place the MSIX Table RAM in Deep Sleep low-power mode. Note: This register field is sticky.

PL_LTR_LATENCY_OFF

Address: Operational Base + offset (0x0B30)

Bit	Attr	Reset Value	Description

PL_AUX_CLK_FREQ_OFF

Address: Operational Base + offset (0x0B40)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:0	RW	0x018	AUX_CLK_FREQ The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: err% = (f_prog/f-1)*100. For example if f=2.5 MHz and f_prog=3 MHz, then err% =(3/2.5-1)*100 =20%, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON). Note: This register field is sticky.

PL_L1_SUBSTATES_OFF

Address: Operational Base + offset (0x0B44)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:6	RW	0x3	L1SUB_T_PCLKACK Max delay (in 1us units) between a MAC request to remove the clock on mac_phy_pclkreq_n and a PHY response on phy_mac_pclkack_n. If the PHY does not respond within this time the request is aborted. Range is 0..3 Note: This register field is sticky.
5:2	RW	0x4	L1SUB_T_L1_2 Duration (in 1us units) of L1.2. Range is 0.15. Note: The timeout value can vary by 50%. Note: This register field is sticky.
1:0	RW	0x2	L1SUB_T_POWER_OFF Duration (in 1us units) of L1.2.Entry. Range is 0.3. Note: The timeout value can vary by 50%. Note: This register field is sticky.

PL_PIPE_RELATED_OFF

Address: Operational Base + offset (0x0B90)

18.6 Application Notes

18.6.1 Clock and Reset

18.6.1.1 Clock Overview

The PCIe module uses multiple clock domains, it consists of system bus clocks (APB and AXI), Core function clock, PIPE interface clock, Power management clock, and PCIe PHY reference clock.

The system bus clock is generated from SOC main PLL internally, please refer to the relative chapter for details. System bus clock gating is handled automatically by PCIe controller, and the clock gating can be disable by software through PCIE_CLIENT_LOCAL_CRU_CTRL Register.

Core function clock is derived from the PIPE interface clock output from the PCIe PHY. In specific low power state, core function clock is gated and switch to Power management clock automatically.

The PHY TX PLL generates PIPE interface clock from the platform reference clock. The PCIe link Training and transaction is completely dependent upon availability of this clock. Application should not initiate transactions before ensuring that the PHY PLL is locked.

The Power management clock which should be fixed with 24MHz driven by crystal input clock. The PCIe controller uses this clock for counting time during L1 substates. You must program the frequency of this clock into the L1_SUBSTATES_OFF register with a value of 24MHz to count real time.

Many PCIe connections, especially backplane connections, require a synchronous reference clock between the two link partners. To achieve this a common clock source, referred to as REFCLK in the PCI Express Card Electromechanical Specification, should be used by both ends of the PCIe link. the PCIe PHY provides 100MHz differential clock output (optional with SSC) in RC mode for system application. If Spread Spectrum Clocking (SSC) is used it is required that a common reference clock be used by the link partners. Most commercially available platforms with PCIe backplanes use Spread Spectrum Clocking to reduce EMI. If common clock architecture is used, the user driver should configure the PHY internal configuration bits to enable the feature of 100MHz differential clock output.

18.6.1.2 PCIe PHY Reference Clock

In RC mode, PCIe PHY can use internal single-ended clock which can be configured to 24Mhz, 25Mhz, 50Mhz or 100Mhz. Meanwhile, PCIe PHY can provide differential clock output for system application. The source of differential clock output can be select from internal single-ended clock or PHY TX PLL.

In EP mode, PCIe PHY can use internal single-ended clock or external differential clock input as its reference clock. The Reference clock structure and related configuration is shown below.

For more detail information, please refer to section PCIe2/USB3 PHY Detail Register Description for PHY register description.

18.6.1.3 Reset Overview

18.6.1.3.1 Power-On Reset

The power-on reset is used as cold reset of the PCIe. The entire module is reset when power-on reset is asserted. After de-assertion of the power-on reset, the PCIe PHY and PCIe Core function reset keep until the software release them. Application should finish PCIe PHY configuration and wait for TX PLL lock before release reset.

18.6.1.3.2 System reset

The PCIe Controller has the following distinct resets, all of these are configurable through software driver. This section describes the function of each of the reset inputs.

- button_rst_n: Button reset from board if related IO has been used. Please refer to Interface Description section for more information. This reset has an equal functionality with power-on reset.
- perst_n: This reset works as Warm Reset of PCIe if related IO has been used. Please refer to Interface Description section for more information.
- core_rst: This is the main reset for the PCIe Controller. It resets all the logic in the core

running in the CORE_CLK domain, except for the PMC module. It keeps reset with power-up reset by default. It also should be asserted when Hot Reset or link down reset occurs, but Application software can delay core_rst_n been asserted until system is ready to do core reset. This delayed reset operation will be discussed in next section.

- AXI Reset: All three AXI interface has its own reset input: mstr_aresetn, slv_aresetn, dbi_resetn. Each resets all logic in the specific AXI_CLK domain. Typically, these resets are be asserted whenever core_reset is asserted. Application software shall have the knowledge of choosing an appropriate time to drive this reset in order to avoid times when a transaction is in flight.
- non_sticky_rst_n: Resets all non-sticky bit registers in the configuration register space.
- sticky_rst_n : Resets all sticky bit registers in the configuration register space.
- pwr_rst_n: Resets the PMC module and resets all registers in the PM clock domain, including sticky bits.
- phy_rst_n: output reset signal to reset the PCIe PHY. This reset asserted along with Power-On Reset and Hot Reset.

PMC of PCIe Controller may request some system reset such as core_rst_n, sticky_rst_n, non_sticky_rst_n and pwr_rst_n. Application can use PCIE_CLIENT_LOCAL_CRU_CTRL register in client register group to disable these requests. Refer to PCIe Client Detail Register Description for more details.

18.6.1.3.3 Hot Reset and Link-Down Reset

A downstream port (DSP) can hot reset an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. Eventually, the DSP and USP assert link_req_rst_not to request external logic to reset them. Alternatively, during normal operation, the link might fail and go down. After this link-down event, the controller requests the reset module to hot-reset the controller. There is no difference in the handling of a link-down reset or a hot reset; the controller core asserts the link_req_rst_not output requesting the reset module to reset the controller.

Hot Reset or Link-down reset cannot be activated before no transaction is appending on system bus. Application software must confirm that system bus is in IDLE state then let the reset operation go on.

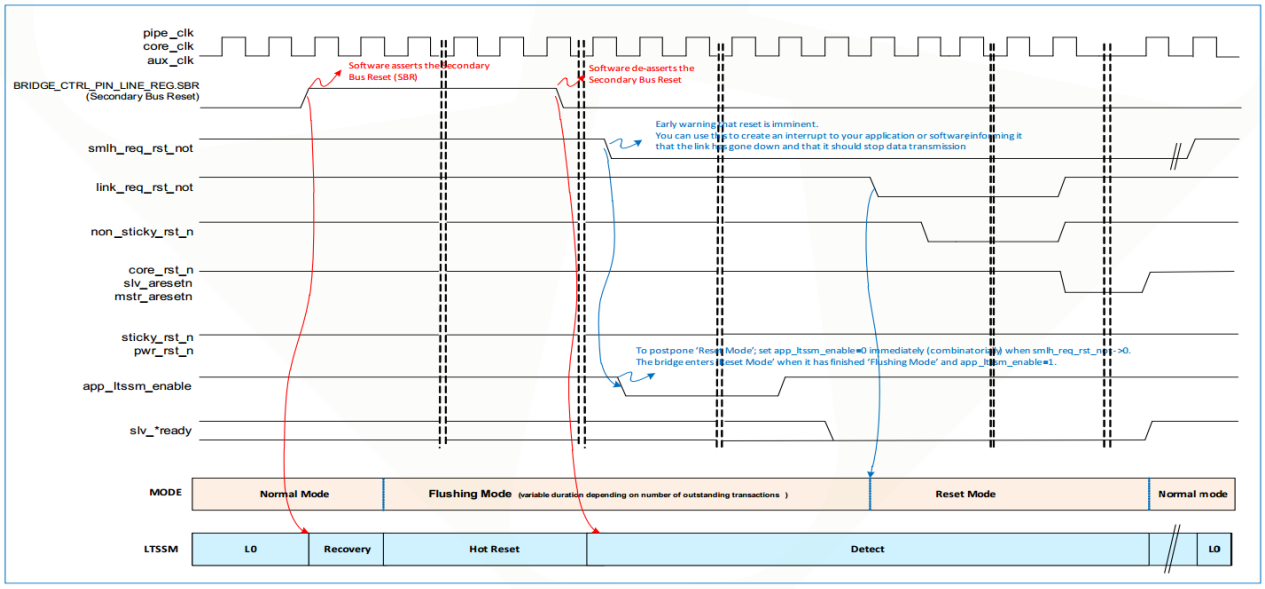

Fig. 18-4 Delaying the PCIe Hot Reset

Figure above illustrate the timing of handling Hot Reset. When Hot Reset or Link-down reset occurs, controller will assert smlh_req_rst_not as an early warning. This warning is an interrupt bit in Client Register group. app_ltssm_enable should be deasserted immediately to disable the LTSSM. Then the Hot Reset process is holding on. Software then should set the PCIe NIU in IDLE state by using PCIE GRF registers. After that, software can assert app_ltssm_enable to let the controller to finish the reset.

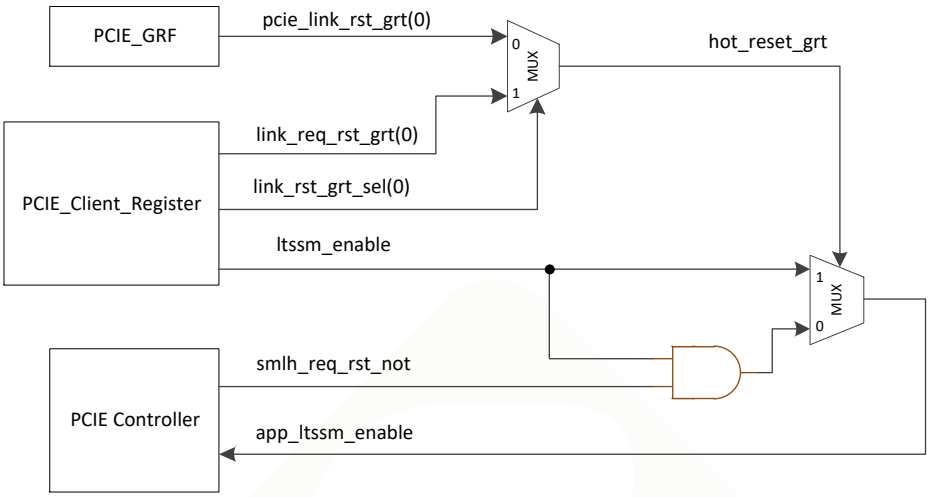

Fig. 18-5 PCIe Hot Reset Control Structure

Figure above illustrate the Hot Reset control structure, when application deassert link_rst_grt, the app_ltssm_enable will be gated if smlh_req_rst_not is asserted. Configure hot_reset_grt by PCIE_GRF register is recommend and the client register control path is reserved for future use.

The link down or hot reset flow is as follows:

1. When link is up, set pcie_link_rst_grt (bit 2 in PCIe_USB_GRF_PCIe_CON0 register) to 0. Then smlh_req_rst_not will gate ltssm_enable and delay the reset when link down.
2. When link down or hot reset occurs, interrupt bit in PCIE_CLIENT_INTR_STATUS_MISC will be set.
3. Set ltssm_enable to 0.
4. Set bit 1 in PCIe_USB_GRF_PCIe_CON0 register to 1 to IDLE PCIe NIU.
5. Wait bit 1 in PCIe_USB_GRF_PCIe_STATUS0 set to 1 which indicates PCIe NIU idle status.
6. Software stop all transactions or other operations to prepare for reset.
7. Let reset operation start and retrain the link: set pcie_link_rst_grt (bit 2 in PCIe_USB_GRF_PCIe_CON0 register) to 1 and set ltssm_enable to 1.
8. Wait for link up and then set pcie_link_rst_grt to 0 to prepare for the next link down reset.

18.6.2 Initialization

18.6.2.1 Initialization Sequence for RC Mode

The initialization sequence for RC mode is as follows:

1. Configure the IO for CLKREQ# and WAKE# signals. Configure the optional signals button_rst_n and perst_n if they are used. Please refer to section Interface Description for details.
2. Configure the CRU registers to provide reference clock to PCIe PHY. Please refer to CRU Chapter for more information.
3. Configure USB3PHY General Register File to set PIPE signals which are unused for PCIe to appropriate values.
4. Configure PHY registers to set PCIe PHY work in PCIe RC Mode. Configure Client Registers to set the PCIe Controller device_type to RC mode.
5. Configure PHY registers to set TX PLL parameters to appropriate values. For programming details, please refer to Programming setting for PCIe PHY TX PLL.
6. Wait for PCIe PHY TX PLL lock, then release software reset for PCIe Controller.
7. Assert pcie_link_rst_grt in PCIE_GRF (refer to section Hot Reset and Link-Down Reset) to free ltssm_enable to prepare for link training. This step must be down because smlh_req_rst_not is asserted after power-on reset until first link up.
8. You can program controller registers before Link training start if necessary. Link training can be initialed by setting ltssm_enable bit in register PCIE_CLIENT_GENERAL_CON to 1. Link training success will set phy_link_up_int interrupt status bit in register PCIE_CLIENT_INTR_STATUS_MISC to 1. And if data flow initialization success, dll_link_up_int interrupt status bit will be set to one in same register. To Initially, the controller tries to linkup at maximum Link width, when you have unused

lanes in your system, you must tie them off using the hardware and software procedures outlined in section Tie off Unused Lanes.
Link speed will change to Gen2 automatically if you set direct_speed_change bit to 1 in PL_GEN2_CTRL_OFF register and both device support Gen2 speed.

9. RC finish the device Enumeration. For example: read the configuration space of the downstream devices, program device capabilities, program the BARs of endpoints.
10. Writes to Bus Master Enable (BME), Memory Space Enable (MSE), then application can start application traffic generation.

18.6.2.2 Initialization Sequence for EP Mode

The initialization sequence for RC mode is as follows:

1. Configure the GPIO configure for CLKREQ# and WAKE# signals. Configure the optional signals button_rst_n and perst_n if they are used. Please refer to section Interface Description for details.
2. Configure the CRU registers to provide reference clock to PCIe PHY. Please refer to CRU Chapter for more information. Configure PCIe PHY register if external differential clock is use as reference clock.
3. Configure USB3PHY General Register File to set PIPE signals which are unused for PCIe to appropriate values.
4. Configure PHY registers to set PCIe PHY work in PCIe EP Mode. Configure Client Registers to set the PCIe Controller device_type to EP mode.
5. Configure PHY registers to set TX PLL parameters to appropriate values. For programming details, please refer to Programming setting for PCIe PHY TX PLL.
6. Wait for PCIe PHY TX PLL lock, then release software reset for PCIe Controller.
7. Assert pcie_link_rst_grt in PCIE_GRF (refer to section Hot Reset and Link-Down Reset) to free ltssm_enable to prepare for link training. This step must be down because smlh_req_rst_not is asserted after power-on reset until first link up.
8. You can program controller registers before Link training start if necessary. Link training can be initialed by setting ltssm_enable bit in register PCIE_CLIENT_GENERAL_CON to 1. Link training success will set phy_link_up_int interrupt status bit in register PCIE_CLIENT_INTR_STATUS_MISC to 1. And if data flow initialization success, dll_link_up_int interrupt status bit will be set to one in same register. To
Initially, the controller tries to linkup at maximum Link width, when you have unused lanes in your system, you must tie them off using the hardware and software procedures outlined in section Tie off Unused Lanes.
Link speed will change to Gen2 automatically if you set direct_speed_change bit to 1 in PL_GEN2_CTRL_OFF register and both device support Gen2 speed.
9. The PCIe then can accept configuration setup access, after emulation done, the transactions can be initiated.

18.6.2.3 Tie Off Unused Lanes

When the link width of the PHY is smaller than the link width of the controller, you must tie off the unused lanes of the controller's PIPE interface.
Following PHY input signal pins should be assigned proper values by configuring PCIe PHY GRF:
`pipe_pd_i_l0/1[1:0]'=2'b11
`pipe_txelecidle_i_l0/1'=1'b1
`pipe_txdetectrx_lb_i_l0/1'=1'b0
`pipe_txdata_i_l0/1[31:0]'=32'h0
`pipe_txdatak_i_l0/1[3:0]'=4'h0
`pipe_ebuffmode_i_l0/1'=1'b0
`pipe_rxterm_i_l0/1'=1'b0
`pipe_txcompliance_i_l0/1'=1'b0
`pipe_txoneszeros_i_l0/1'=1'b0
Following registers should be reprogram to proper values:

- LINK_CAPABLE field of the PORT_LINK_CTRL_OFF register to 6h1 from 6h7. This is used by the LTSSM in Detect.
- NUM_OF_LANES[8:0] field of the GEN2_CTRL_OFF register. This indicates to the LTSSM, the number of lanes to check for exiting from L2.Idle or Polling.Active.

- PCIE_CAP_MAX_LINK_WIDTH field of the LINK_CAPABILITIES_REG register

18.6.3 Address Translation

The controller uses the internal Address Translation Unit(iATU) to implement a local address translation scheme that replaces the TLP address and TLP header fields in the current TLP request header.

The iAUT has 16 inbound Address Translation regions and 16 outbound Address Translation regions. The minimum size of an Address Translation Region is 64k and the maximum size of an Address Translation Region is 4G.

18.6.3.1 Outbound Features

Address translation is used for mapping different address ranges to different memory spaces supported by your application. A typical example maps your application memory space to PCI memory space. The ATU also supports type translation. Without address translation, your application address is passed unmodified to the TLPs directly through the Tx application interface. You can program the iATU to implement your own outbound address translation scheme. The outbound features is as follows:

- Address Match mode operation for MEM and I/O, CFG, and MSG TLPs. No translation for completions.
- Supports type translation through TLP type header field replacement for MEM or I/O types to MSG/CFG types.
- Programmable TLP header field replacement. Including TYPE, TC, AT, ATTR, MSG-Code, TH, PH, ST.
- Multiple (up to 16) address regions programmable for location and size.
- Programmable enable/disable per region.
- Automatic FMT field translation between three DWORDs and four DWORDs for 64-bit addresses.
- Invert Address Matching mode to translate accesses outside of a successful address match.
- Configuration Shift mode. Optimizes the memory footprint of CFG accesses destined for the Rx application interface in a multifunction device.
- Response code which defines the completion status to return for accesses matching a region.
- Supports regions from 64 KB to 4 GB in size.
- Payload Inhibit marks all TLPs as having no payload data.
- Header Substitution replaces bytes 8 to 11 (for 3 DWORD header) or bytes 12 to 15 (for 4 DWORD header), inclusive, of the outbound TLP header.
- Tag Substitution of the outbound TLP tag field.
- Function number bypass mode to allow function number information to be supplied from your application transmit interface while translating the address and other attributes of the TLP.
- DMA bypass mode to allow TLPs which are initiated by the embedded DMA engine, to pass through the iATU untranslated.

18.6.3.2 Outbound Basic Operation

The address field of each request MEM and I/O TLP is checked to see if it falls into any of the enabled address regions defined by the Start and End addresses as defined in Figure below. When an address match is found, then the TLP address field is modified as follows:

Translated Address = Original Address - Base Address + Target Address

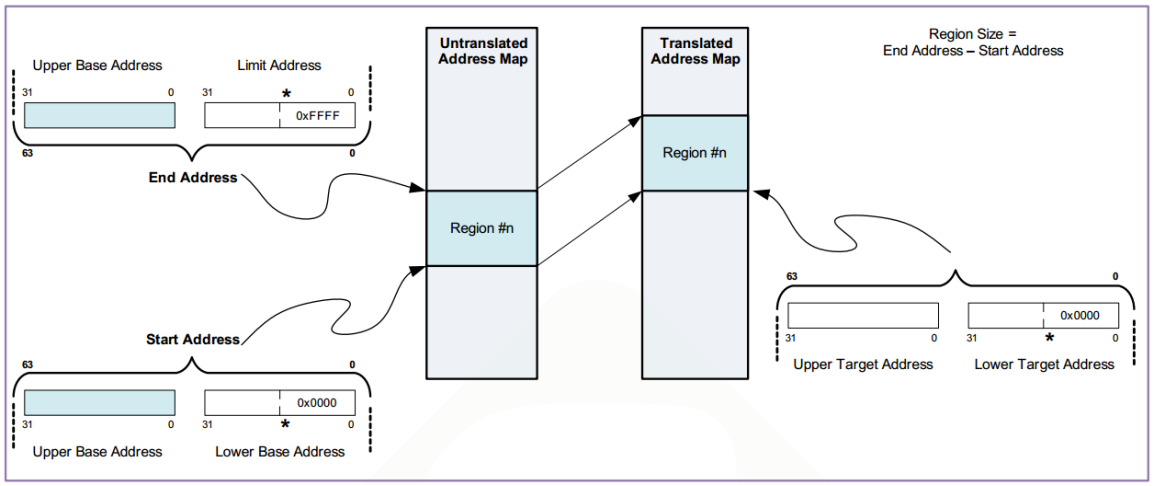

Fig. 18-6 PCIe Hot Reset Control Structure

The TYPE, TC, AT, TH, PH, ST, Function Number, and ATTR header fields are replaced with the corresponding fields in the IATU_REGION_CTRL_1_OFF_OUTBOUND_0 register. When your application address field matches more than one of the CX_ATU_NUM_OUTBOUND_REGIONS address regions, then the first (from lowest number 0) enabled region to be matched is used. For details on what happens when there is no address match, see "No Address Match Result". This operational mode (called Address Match Mode) is always used for outbound translation.

The minimum size of an address translation region is 64KB. So the lower 16 bits of the Base, Limit, and Target registers are zero and all address regions are aligned on 64 KB boundaries.

18.6.3.3 Outbound Detailed Operation

18.6.3.3.1 RID BDF Number Replacement

When there is a successful address match on an outbound TLP, then the function number used in generating the function part of the requester ID field of the TLP is taken from the 3-bit Function Number field of the IATU_REGION_CTRL_1_OFF_OUTBOUND_iregister. The value in this field must be 0x0 unless multifunction operation in the controller is enabled. To override this behavior, use the "Function Number Translation Bypass Feature" described later.

18.6.3.3.2 iATU Outbound MSG Handling

The iATU supports TYPE translation/conversion of MEM and I/O TLPs to Msg/MsgD TLPs. This supports applications that are unable to directly generate Msg/MsgD TLPs. When there is a successful address match on an outbound MEM TLP, and the translated TLP type field is MSG (that is, the type field of the IATU_REGION_CTRL_1_OFF_OUTBOUND_i register is 10xxx), then the message code field of the TLP is set to the value in the Message Code field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_iregister.A Memory Write with an effective length of '0' is converted to Msg and all other MWr TLPs are converted to MsgD.

18.6.3.3.3 MEM-CFG Type Translation

The iATU supports translation of I/O and MEM TLPs to CFG TLPs. This is useful for applications that are unable to generate CFG TLPs. The 16-bit BDF is located at bits [31:16] of the translated address where:

Translated Address = Original Address - Base Address + Target Address

As an example:

Original Address[31:16] = {13h0,function_no[2:0]}

Base Address[31:16] = 16h0

Target Address[31:16] = {bus_no[7:0],device_no[4:0],3h0}

then:

Translated Address[31:16] = BDF ={bus_no[7:0], device_no[4:0], function_no[2:0]}

To handle eight functions (as the previous example indicates), you should use a 19-bit wide region size. For CFG transactions created directly by your application (asopposed to the iATU), you must ensure that the BDF field does not match any programmed iATU address region or else unintentional type translation could occur.

18.6.3.3.4 CFG Shift Feature

This feature is enabled by setting the CFG_SHIFT_MODE field the

IATU_REGION_CTRL_2_OFF_OUTBOUND_0 register. The iATU uses bits [27:12] of the original address to form bits [31:16] (BDF location) of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space.

18.6.3.3.5 FMT Translation

The iATU automatically sets the TLP format field for three DWORDs when it detects all zeros in the upper 32 bits of the translated address. Otherwise, it sets it to four DWORDs when it detects a 64-bit address (that is, when there is a '1' in the upper 32 bits of the translated address). When the original address and the translated address are of different format, the iATU ensures that the TLP header size matches the translated address format.

18.6.3.3.6 Invert Feature

In normal operation an address match on an outbound TLP occurs when the untranslated address is in the region bounded by the base address and limit address. When the invert feature is activated, an address match occurs when the untranslated address is not in the region bounded by the base address and limit address. This feature is activated by setting the Invert field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_iregister.

18.6.3.3.7 DMA Bypass Feature

When you do not want the iATU to translate outbound requests that are generated by the DMA, you must implement one of the following approaches:

■ Ensure that the combination of DMA channel address programming and iATU control register programming causes no translation of DMA traffic to be done in the iATU.

■ Activate the DMA bypass mode to allow request TLPs which are initiated by the embedded DMA controller to pass through the iATU untranslated. You can activate the DMA bypass mode by setting the DMA Bypass field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_i register to 1.

18.6.3.3.8 Function Number Translation Bypass Feature

In this mode the function number of the translated TLP is taken from your application transmit interface and not from the Function Number field of the REGION_CTRL_1_OFF_OUTBOUND_i register. You can activate the function number bypass mode by setting the Function Number Translation Bypass Enable field in the IATU_REGION_CTRL_2_OFF_OUTBOUND_i to '1'.

18.6.3.3.9 General Bypass

Application can program PCIE_CLIENT_AXI_SLV_ATU_BYPASS register to do general ATU bypassing. Note that you should make sure that there is no transfer pending before you program this register.

18.6.3.3.10 Header Substitution (Tx)

When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. The expected usage scenario is for Vendor Defined Msg/MsgD and ATS transactions over the AXI bridge which is normally inefficient requiring a very large iATU region. Enabled using the HEADER_SUBSTITUTE_EN field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i.

18.6.3.3.11 Tag Substitution (Tx)

When enabled and region address is matched, the iATU substitutes the TAGfield of the outbound TLP header with the contents of the TAG field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Enabled using the TAG_SUBSTITUTE_EN field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i.

Your application must not attempt to perform TAG substitution for outgoingnon-posted TLPs.

Note: If the iATU is programmed to allow a TLP to be matched to more than one iATU outbound regions, the Function Number Translation Bypass field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_i register should be same for every region where that TLP can be matched.

18.6.3.3.12 No Address Match Result

When there is no address match then the address is untranslated but the TLP header information (for fields that are programmable) comes from the relevant fields on the

application transmit interface AXI slave.

18.6.3.4 Outbound Programming Example

Define Outbound Region 1 as:
64 KB I/O region from 0x80000000_d000000to 0x80000000_d000ffff, to be mapped to 0x00010000in the PCIe I/O space.

1. Setup the Region Base and Limit Address Registers.
   Write 0xd0000000to Address {0x208} to set the Lower Base Address.
   Write 0x80000000to Address {0x20C} to set the Upper Base Address.
   Write 0xd000ffff to Address {0x210} to set the Limit Address.
2. Setup the Target Address Registers.
   Write 0x00010000to Address {0x214} to set the Lower Target Address.
   Write 0x00000000to Address {0x218} to set the Upper Target Address.
3. Configure the region through the Region Control 1 Register.
   Write 0x00000002to Address {0x200} to define the type of the region to be I/O.
4. Enable the region.
   Write 0x80000000to Address {0x204} to enable the region.

18.6.3.5 Inbound Features

Address translation is used for mapping different address ranges to different memory spaces supported by your application. A typical example maps your application memory space to PCI memory space. The iATU supports type translation. Without address translation, your application address is passed from the TLPs directly through the AXI application interface. You can program the iATU to implement your own inbound address translation scheme without external logic.

- Programmable Match mode operation for MEM, I/O, CFG, and MSG TLPs. No translation for completions.
- Selectable BAR Match mode operation for I/O and MEM TLPs:

TLPs destined for the internal CDM (or ELBI) in an upstream port are not translated.
TLPs that are not error-free (ECRC, malformed and so on) are not translated.

- Programmable TLP header field matching:
  TYPE/TD/TC/AT/ATTR/MSG-Code/TH/PH/ST

❑ Function Number

- Multiple (up to 16) address regions programmable for location and size.
- Programmable enable/disable per region.
- Automatic FMT field translation between three DWORDs and four DWORDs for 64-bit addresses.
- Invert Address Matching mode to translate accesses outside of a successful address match.
- ECAM Configuration Shift mode to allow a 256 MB CFG1 space to be located anywhere in the 64-bit address space.
- Supports regions from 64 KB to 4 GB in size.
- Single Address Location to allow all TLPs to be translated to a single address location.
- Msg Type Match Mode to allow matching of any TLP of type Message.

18.6.3.6 Inbound Basic Operation

18.6.3.6.1 Overview

The following translation rules and limitations apply:

- When there is no match, then the address is untranslated. In addition
- TLPs destined for the internal registers in an upstream port are not translated.
- TLPs that are not error-free (ECRC, malformed and so on) are not translated.
- Address translation of all TLP types (MEM, I/O, CFG, and MSG) except completion is supported in Address Match mode. In BAR Match mode, only translation of I/O and MEM is supported.

The setting of the MATCH_MODE field in IATU_REGION_CTRL_2_OFF_INBOUND_0 determines how iATU inbound matching is done for each TLP type.

Table 18-9 Determination of Match Mode

TLP Type	MATCH_MODE =0	MATCH_MODE =1
MEM or I/O	Address Match Mode	BAR Match Mode
CFG0	Routing ID Match Mode	Accept Mode
MSG/MSGD	Address Match Mode	Vendor ID Match Mode

18.6.3.6.2 I/O and MEM Match Modes

Inbound address translation for I/O and MEM TLPs operates in one of two matching modes as determined by the "Inbound Match Mode" field in the IATU_REGION_CTRL_2_OFF_INBOUND_0 register.

Address Match Mode: The operation is similar to "Outbound Basic Operation (Address Match Mode)". The address field of each request TLP is checked to see if it falls into any of the enabled address regions. When an address match is found then the TLP address field is modified as follows:

Address = Address - Base Address + Target Address

BAR Match Mode:

Looking for an address match is a two-step process.

1. The standard internal PCI Express BAR Matching Mechanism checks if the address field of any MEM and I/O request TLP falls into any address region defined by the enabled BAR addresses and masks.
2. When a matched BAR is found, then the iATU compares the BAR ID to the BAR Number field in the IATU_REGION_CTRL_2_OFF_INBOUND_0 register for all enabled regions. Figure below provides more details on inbound translation in BAR Match Mode.

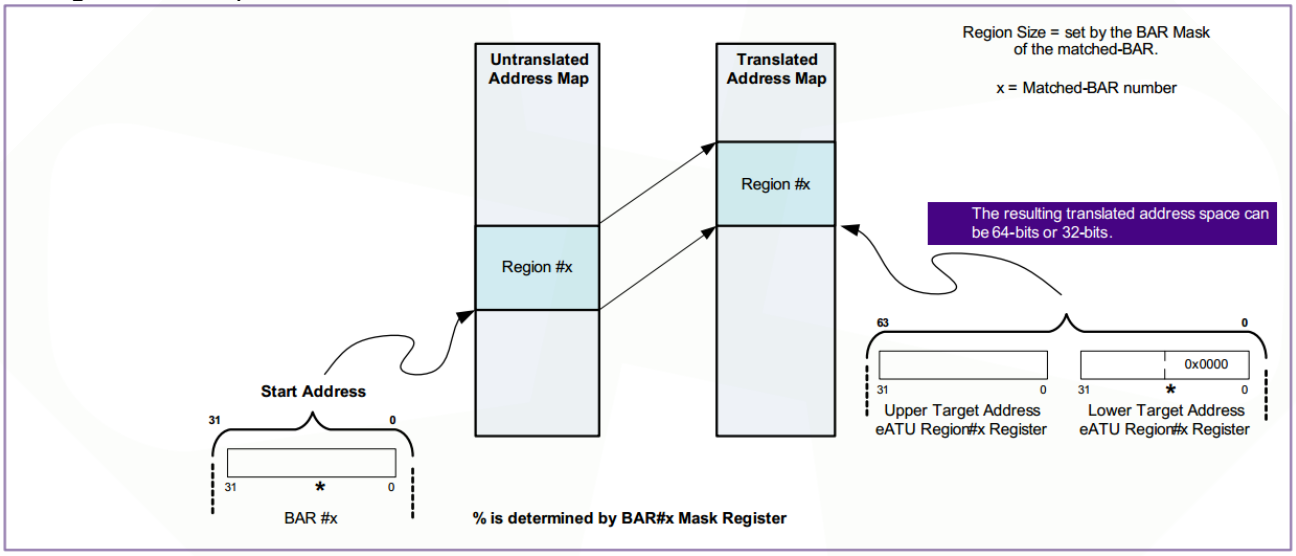

Fig. 18-7 Inbound BAR Match Mode

18.6.3.7 Inbound Detailed Operation

18.6.3.7.1 Single Address Location

When enabled and region address is matched, the TLPs can be translated to a single address location as determined by the target address register of the iATU region. This feature can be enabled using the SINGLE_ADDR_LOC_TRANS_EN field in IATU_REGION_CTRL_2_OFF_INBOUND_i. This feature is useful fortranslating messages on AXI bridge.

18.6.3.7.2 CFG Handling (Upstream Port)

The controller normally routes CFG TLPs (to the internal CDM or ELBI) without translation. The iATU only translates CFG0 TLPs that the controller has routed to the TRGT1. Inbound address translation for CFG0 TLPs operates in one of two matching modes as determined by the Inbound CFG0 Match Mode field in the IATU_REGION_CTRL_2_OFF_INBOUND_i register.

Accept Mode

The controller always accepts CFG0 TLPs even when the CFG bus number does not match the current bus number of the device. This mode follows that behavior. The routing ID of received CFG0 TLPs are ignored when determining a match.

Routing ID Match Mode

The operation is similar to "Outbound Basic Operation (Address Match Mode)". The routing

ID of the inbound CFG0 TLP must fall within the Base and Limit of the defined iATU region for matching to proceed. The iATU interprets the routing ID (Bytes1 8-11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM and I/O transactions.

CFG Shift Feature

Inbound CFG transactions routed to the Rx application interface can exist anywhere in address space, because the PCIe controller filter processes the routing ID (BDF) as bits [31:16] of an address. This BDF changes according on the PCIe bus topology. A compressor feature (CFG Shift Feature) can be enabled by setting the CFG Shift bit in the IATU_REGION_CTRL_2_OFF_INBOUND_i register. Bits [15:12] of the third DWORD1 of CFG TLPs are reserved. The compressor feature uses this fact to reduce the memory requirement. This shifts/maps the BDF (bits [31:16] of the third header DWORD, which would be matched against the Base and Limit addresses) of the incoming CfgRd0/CfgWr0 down to bits [27:12] of the translated address.

18.6.3.7.3 Optional Matching Fields

In address and BAR match modes, a successful address/BAR match can be optionally gated by successful matching of the following programmable TLP header fields (per region):

- TYPE/TD/TC/AT/ATTR/TH/PH/ST
- MSG Code (MSG TLPs only)
- Function number (MEM, I/O, or CFG TLPs only)
- Virtual function number (MEM or I/O TLPs only)

For each of the previous fields in the IATU_REGION_CTRL_1_OFF_INBOUND_i register, there is an associated Match Enable bit in the IATU_REGION_CTRL_2_OFF_INBOUND_i register. Address translation only proceeds when compares on all enabled field are successful.

18.6.3.7.4 Response Code Feature

When the Response Code field of the IATU_REGION_CTRL_REG_2_INBOUND_i register is set to a value other than 00, the controller uses it to determine the completion status field of completion TLPs sent in response to successfully matched non-posted TLPs. This can be set to unsupported request (UR) or completer abort (CA). When the error response field is set to 2b00, then the normal receive filter response for this TLP is used.

18.6.3.7.5 Inbound MSG Handling

Inbound message (Msg/MsgD) transactions can use one of two matching modes:

Address Match Mode

The third and fourth header DWORDs are treated as an address and are compared against the iATU Region Base and Limit Address registers. For vendor defined messages this allows specific messages to be filtered into memory at the target address. The Upper Base address should be set to BDF and Vendor ID. The Lower Base address can be used as a filter for specific messages.

Vendor ID Match Mode

This mode is relevant for ID-routed vendor defined messages. The iATU ignores the routing ID (BDF) in bits [31:16] of the third DWORD of the TLP header1, but compares it against the vendor ID in bits [15:0] of the third DWORD of the TLP header (bytes1 10 and 11). This allows vendor defined messages to be filtered against specific vendor IDs without needing to know the BDF number which might vary depending on the PCI topology. Bits [15:0] of the Region Upper Base register should be programmed with the required vendor ID as follows:

Region Upper Base [15:8] =byte 10

Region Upper Base [7:0] =byte 11

The lower base and limit register should be programmed to translate TLPs based on vendor-specific information in the fourth DWORD of the TLP header.

18.6.3.7.6 Msg Type Match Mode

Inbound message (Msg/MsgD) transactions can also use Msg Type Matching mode. When this mode is enabled and Single Address Location is enabled, the iATU matches Msg TLP Type field with TYPE field of IATU_REGION_CTRL_1_OFF_INBOUND_i register.

If Fuzzy Type Match Mode is also enabled, then any Msg received will be matched (that is, Msg Type's sub-field r[2:0], which specifies the Message routing mechanism, is ignored). The Message should be consumed by your application before the next message arrives as all messages go to the same address.

If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN is set for any region, then you must ensure that the same TLP cannot be matched in any other region where SINGLE_ADDRESS_LOCATION_TRANSLATE_EN is not set. If this happens radm_trgt1_hdr_uppr_bytes could have incorrect data.

18.6.3.7.7 Fuzzy Type Match Mode

When enabled, the iATU relaxes the matching of the TLP type field against the expected type field so that:

- CfgRd0 and CfgRd1 TLPs are seen as identical. Similar with CfgWr0 and CfgWr1.
- MWr, MRd and MRdLk TLPs are seen as identical.
- The routing field of MsgD TLPs is ignored.
- Atomic Ops TLPs-FetchAdd, Swap, and CAS are seen as identical.

For example, CFG0 in the type field in the IATU_REGION_CTRL_1_OFF_INBOUND_i register matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. To enable this feature, set the Fuzzy Type Match Mode bit of the IATU_REGION_CTRL_OFF_2_INBOUND_i register.

18.6.3.7.8 FMT Translation

The iATU automatically sets the TLP format field for three DWORDs when it detects all zeroed in the upper 32 bits of the translated address. Otherwise it sets it to four DWORDs when it detects a 64-bit address (when there is a 1 in the upper 32 bits of the translated address). When the original address and the translated address are of a different format then the iATU ensures that the TLP header size matches the translated address format.

18.6.3.7.9 Invert Feature

Normally an address match on an inbound TLP occurs when the untranslated address is in the region bounded by the Base address and Limit address. When the Invert feature is activated, an address match occurs when the untranslated address is not in the region bounded by the Base address and Limit address. This feature is activated by setting the Invert field of the IATU_REGION_CTRL_OFF_2_INBOUND_i register.

18.6.3.8 Inbound Programming Example

You must not update the iATU registers while operations are in progress on the AXI bridge slave interface.

Example 1:

Define Inbound Region 2 as: MEM region matching BAR4 (BAR match mode) mapping to 0x8000_0000_2000_0000 in your application memory space

1. Setup the Target Address Registers.
   Write 0x20000000 to Address {0x508} to set the Lower Target Address.
   Write 0x80000000 to Address {0x50C} to set the Upper Target Address.
2. Configure the region through the Region Control 1 Register.
   Write 0x00000000 to Address {0x500} to define the type of the region to be MEM.
3. Enable the region for BAR Match Mode.
   Write 0xC0000400 to Address {0x504} to enable the region for BAR match mode for BAR#4.

Example 2:

MEM region matching TLPs with addresses in the range 0x00010000 to 0x0005ffff mapped to 0x2000_0000 - 0x2004_ffff in your application memory space.

1. Setup the Region Base and Limit Address Registers.
   Write 0x00010000 to Address {0x108} to set the Lower Base Address.
   Write 0x00000000 to Address {0x10C} to set the Upper Base Address.
   Write 0x0005ffff to Address {0x110} to set the Limit Address
2. Setup the Target Address Registers.
   Write 0x20000000 to Address {0x114} to set the Lower Target Address.
   Write 0x10000000 to Address {0x118} to set the Upper Target Address.
3. Configure the region through the Region Control 1 Register.
   Write 0x00000000 to Address {0x100} to define the type of the region to be MEM.
4. Enable the region.
   Write 0x80000000 to Address {0x104} to enable the region in address match mode

18.6.4 PCIe Embedded DMA

18.6.4.1 PCIe DMA Overview

The RC system CPU, or the EP application CPU, can off load the transfer ring of large blocks

of data to the embedded DMA controller, leaving the CPU free to perform other tasks. You can configure the DMA to have one to eight read channels and one to eight write channels. It can simultaneously perform the following types of memory transactions:

DMA write

Transfer (copy) of a block of data from local memory to remote memory.

DMA read

Transfer (copy) of a block of data from remote memory to local memory.

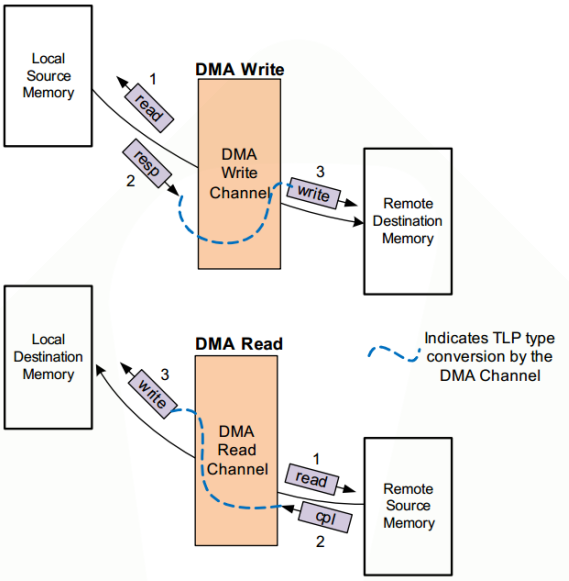

Fig. 18-8 System Level View of PCIe Embedded DMA

Therefore the DMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (IMWr) to the remote CPU. The DMA is highly configurable and you can program it using the local DBI or over the PCIe wire.

In linked list mode, the DMA fetches the transfer control information (called channel context) for each transfer (block), from a list of DMA elements that have constructed in local memory.

18.6.4.2 Interrupts and Error Handling

The DMA generates two interrupts, read channel interrupt and write channel interrupt. Each of them can be caused by one of the two reasons:

Done: The DMA successfully completes the transfer.

Abort: The DMA fails to complete the transfer, or an error occurs during the transfer.

The interrupts are signaled to the software on your CPU, using one or both of the following mechanisms:

- Locally through the edma_rd_int or edma_wr_int field of PCIE_CLIENT_INTR_STATUS_MISC register.
- Remotely using a posted memory write (IMWr), which can be interpreted as an MSI or MSIX when directed toward the RC.

For remote interrupt, there are two programmable IMWr addresses per channel, one each for the done and abort interrupts. For MSI, you must program all IMWRr address registers with the same MSI address, as PCIe only supports a single MSI address per function.

A single IMWr data register is used for both types of interrupts, so you must read DMA_READ_INT_STATUS_OFF(or DMA_WRITE_INT_STATUS_OFF) to identify the interrupt type.

The interrupt handling mechanism is different for linked list (LL) mode (than non LL mode), and there are also some differences between the read and write channels.

18.6.4.2.1 Non Linked List Mode Interrupt Handling

You enable the local and remote interrupts through the local and remote interrupt enable (LIE and RIE) bits: DMA_CH_CONTROL1_OFF_WRCH_0.lie and DMA_CH_CONTROL1_OFF_WRCH_0.rie.

In the write channel, there is only one error condition that results in an abort interrupt. For

more details, see “Linked List Mode” on next section. You mask, clear, and read the status of each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below:

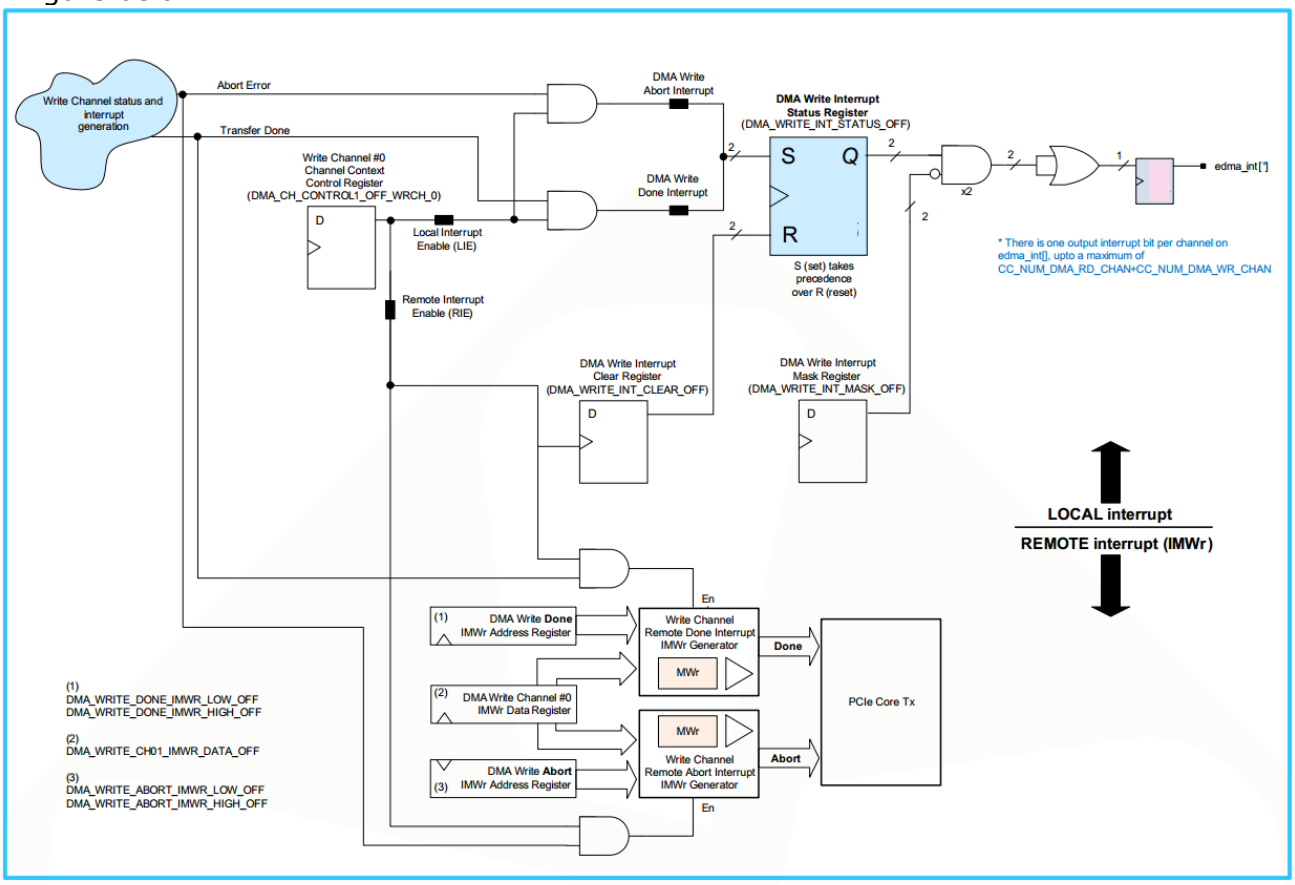

Fig. 18-9 Write Interrupt Generation - Non Linked List Mode

In the read channel, there are five error conditions that results in an abort interrupt. For more details, see “Linked List Mode” on next section. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below. However, you can read the status of each of the five abort errors (that contribute to the abort interrupt) through DMA_READ_ERR_STATUS_LOW_OFF and DMA_READ_ERR_STATUS_HIGH_OFF.

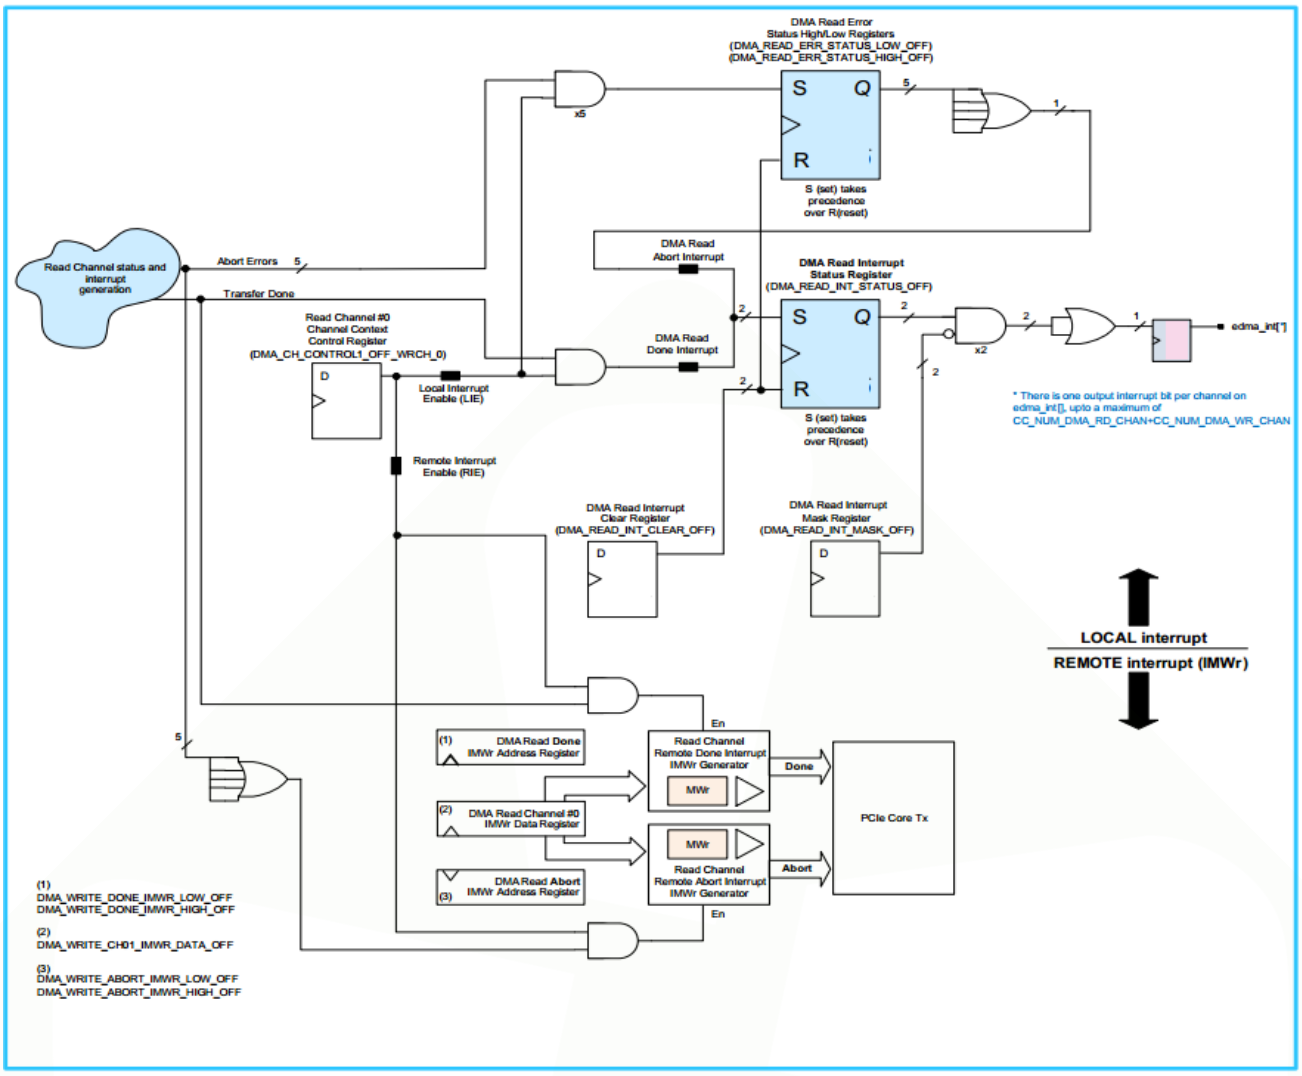

Fig. 18-10 Read Interrupt Generation - Non Linked List Mode

18.6.4.2.2 Linked List Mode Interrupt Handling

The LIE and RIE bits in the LL element enable the channel done interrupts (local and remote). The LLLAIE and LLRAIE bits of the DMA_WRITE_LINKED_LIST_ERR_EN_OFF and DMA_READ_LINKED_LIST_ERR_EN_OFF registers enable the channel abort interrupts (local and remote). In the write channel, there are two error conditions that results in an abort interrupt. For more details, see "Linked List Mode" on next section. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below. You can read the status of each of the two abort errors (that contribute to the abort interrupt) through the DMA_WRITE_ERR_STATUS_OFF register.

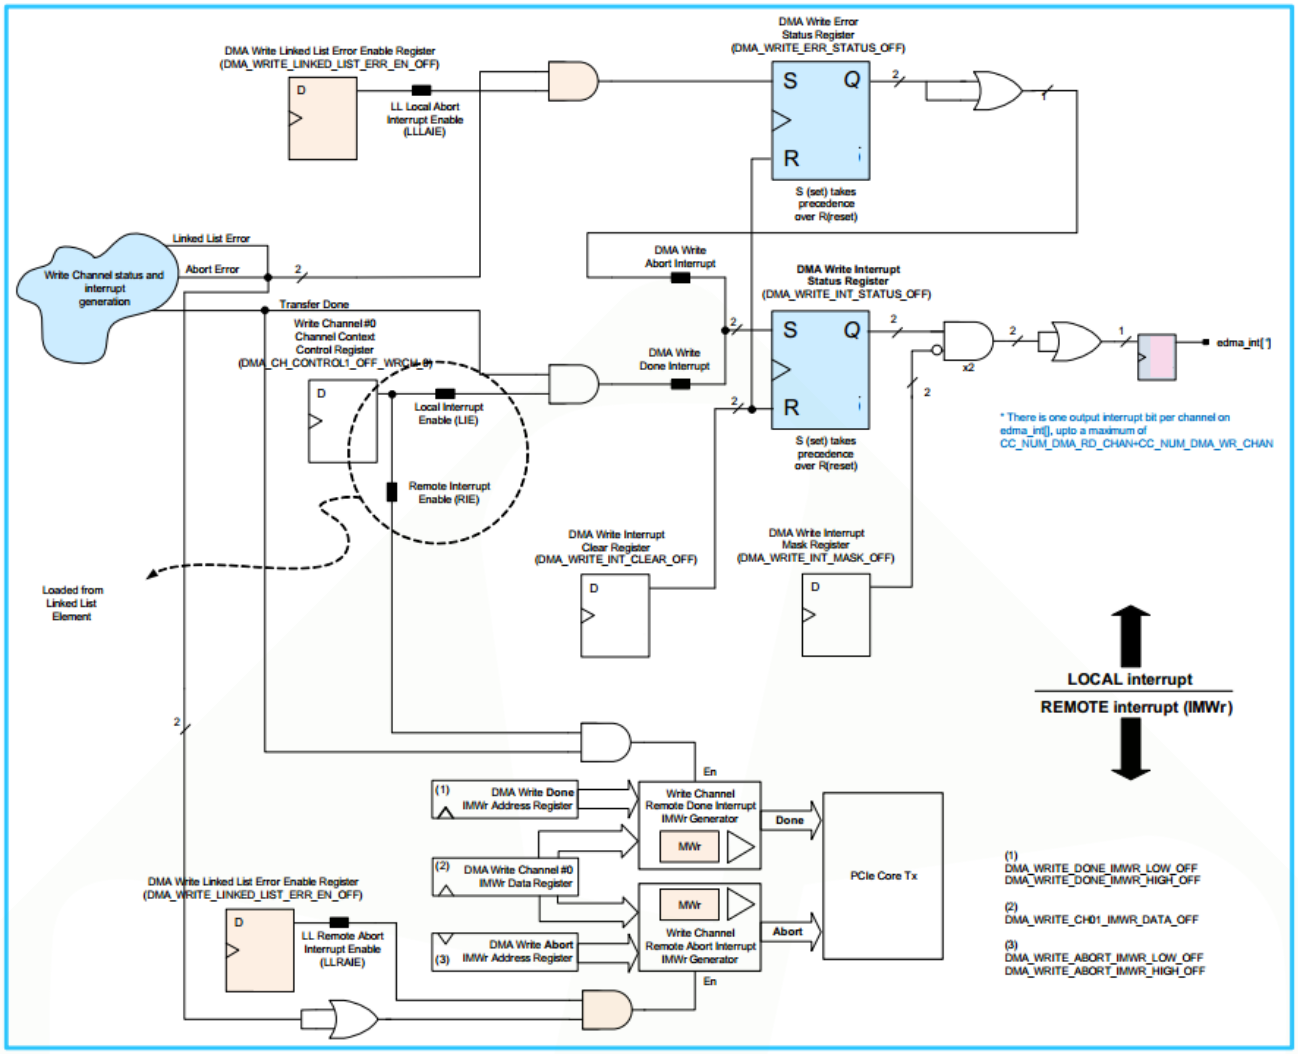

Fig. 18-11 Write Interrupt Generation - Linked List Mode

In the read channel, there are six error conditions that results in an abort interrupt. For more details, see “Linked List Mode” on next section. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below. You can read the status of each of the six abort errors (that contribute to the abort interrupt) through the DMA_READ_ERR_STATUS_LOW_OFF and DMA_READ_ERR_STATUS_HIGH_OFF registers.

In non-linked list mode, LIE acts as a global switch. However when in linked list mode, LIE is just local to the current linked list element and the global switch is LLLAIE.

If the DMA driver is running on the host and the interrupt service routine is reading local interrupts to determine if the transfer is successful, then you must set LIE and RIE in the same element and you should mask or ignore the local interrupt pin. Setting RIE and LIE in element A followed by RIE (only) in element B is not a verified usage scenario.

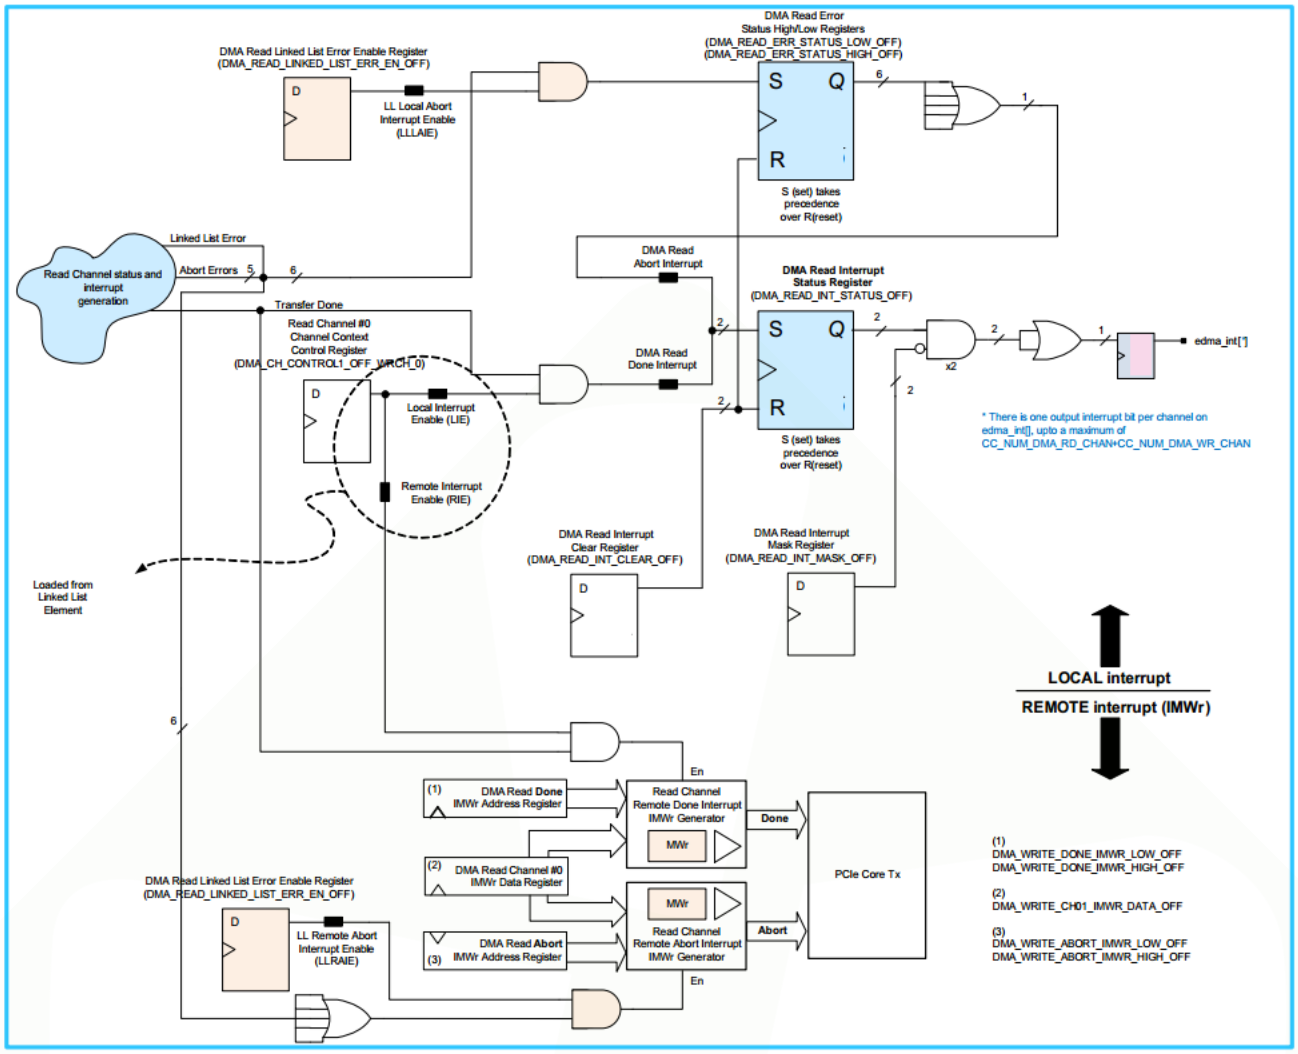

Fig. 18-12 Read Interrupt Generation - Linked List Mode

18.6.4.3 Linked List Mode

The DMA provides a linked list (LL) mode to efficiently move data from source to destination with minimal intervention from the local CPU. This mode provides an alternative to programming the DMA multiple times to transfer multiple blocks of data. The programming information (address, size, and so on) for each block of memory is pre-programmed by your software into a LL element (also known as a descriptor) in local memory. Each element (called a data element) in the LL structure (called a transfer list) can transfer up to 4 GB of data.

You enable LL operation for a channel, by setting the LLE field of the DMA_CH_CONTROL1_OFF_[WRCH|RDCH]_0 register to 1. Your application must produce the LL element structure in local memory as shown in figure below. Normally, all of the elements are contiguous (one after the other) in memory, and each element has six DWORDs containing the information about the block of data to be transferred. You program the channel context registers (DMA_LLP_LOW_OFF_WRCH_0 and DMA_LLP_HIGH_OFF_WRCH_0) with the location of where you have placed the LL element structure in local memory.

When you start the DMA transfer (by writing to the DMA Write Doorbell Register DMA_WRITE_DOORBELL_OFF or DMA Read Doorbell Register DMA_READ_DOORBELL_OFF), the DMA reads (consumes) each element from local memory, and loads the information (SAR, DAR, size, and so on) from that element into the channel context registers in the DMA. These channel context registers determine the operation of the channel that the DMA controller is currently servicing. The DMA then proceeds to transfer the block of data (as defined by the element), and when it is finished, reads the next element from local memory. Normally, all of the elements are contiguous (one after the other) in memory, with the starting address defined in the channel context DMA Linked List Pointer Low Register

DMA_LLP_LOW_OFF_WRCH_0.
When you want to jump in local memory to another element list (or recycle the consumed elements), then you set the LLP bit in the element (for example, link element #N-1 in figure below), specify the location of the next element structure using the LL Element Pointer DWORDs, and, set TCB to 1 (for recycling) or to 0 (to jump to another list).

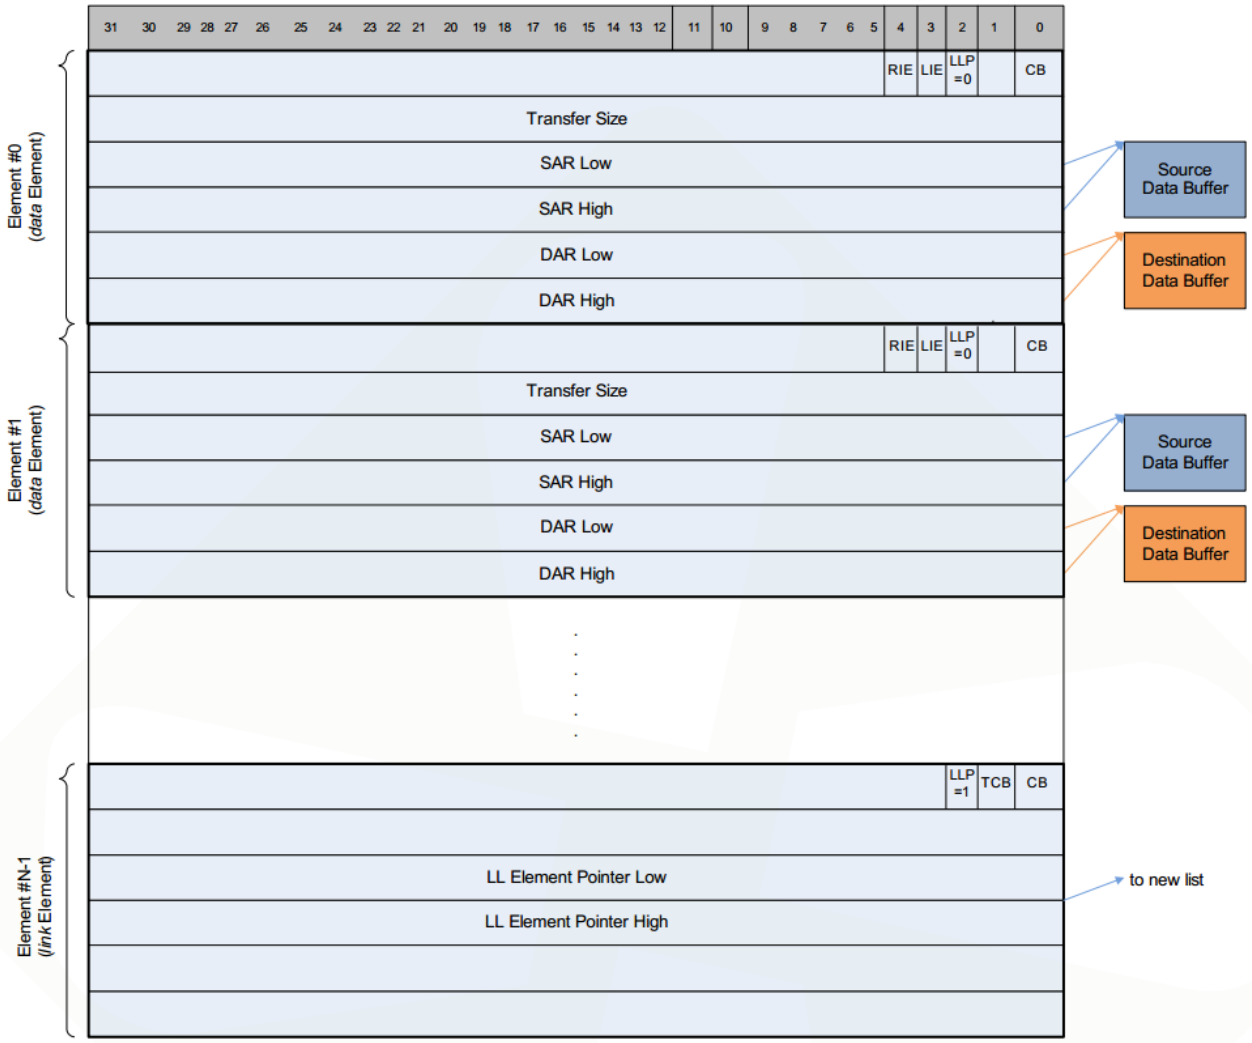

Fig. 18-13 Linked List Element/Descriptor Structure in Local Memory

18.6.4.3.1 LL Element and Channel Context Registers

Notice the similarity between a data element and the DMA Channel Context registers for each channel. Each element has six DWORDs as in Figure 9-6. There are eight channel context registers (DWORDs) for a channel. The DMA loads the six element DWORDs into the following channel context:

- CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register
- DMA Transfer Size
- DMA SAR Low and DMA SAR High
- DMA DAR Low and DMA DAR High

The definitions of the element DWORD bit fields are the same as the DMA Channel Context registers described in the "DMA Detail Register Description" section, with the exception of the LIE and RIE bits. The LIE and RIE bits in a LL element, only enable the done interrupt. In non-LL mode, the RIE and LIE bits (in the channel context registers) enable the done and abort interrupts.

18.6.4.4 Flow Control

18.6.4.4.1 Overview

This optional feature is available only for those channels which are configured to operate in linked list (LL) mode. It enables your application to flow control the DMA controller by using PCIE_CLIENT_DMA_HSHAKE_TOGG register, that is, your application determines when data block transfer starts.

In normal mode, as soon as the DMA is doorbelled, the DMA reads the LL descriptor, and starts the data block transfer. When this feature is enabled, the DMA reads the descriptor, but starts the data transfer only when your application logic toggles the [w|r]dxfer_go_togg field in PCIE_CLIENT_DMA_HSHAKE_TOGG register.
The DMA handshake mechanism can be turned on or off per channel using DMA_[WRITE/READ]_ENGINE_EN_OFF register. The handshake mechanism cannot be enabled/disabled when the channel status isactive, that is, when DMA_CH_CONTROL1_OFF_[WR|RD]CH_i.CS =01.

18.6.4.4.2 DMA Handshake Operation

The handshake between the DMA and your application is done using [w|r]dxfer_go_togg and [w|r]dxfer_done_togg. In case of a DMA Write, your application should toggle the wdxfer_go_togg signal to indicate data block availability. In case of a DMA Read, your application should toggle the rdxfer_go_togg signal to indicate that your application hardware is ready to receive a data block.
To keep a track of [w|r]dxfer_go_togg signal toggles, the DMA implements a 5-bit handshake counter for each write/read channel. When your application toggles [w|r]dxfer_go_togg signal, the handshake counter is incremented. The handshake counter value is taken into account by the DMA before performing the data transfer for each descriptor. The data transfer happens only when the handshake counter value is non-zero. When the data transfer is complete, the DMA decrements the handshake counter, and toggles [w|r]dxfer_done_togg signal to indicate completion of data transfer to your application.
The handshake counter is 5-bit wide, so only 32 outstanding [w|r]dxfer_go_toggrequests can be handled by the DMA for each channel. The DMA does not implement an overflow protection or overflow error indication mechanism for the handshake counter. It is the responsibility of your application to keep the number of [w|r]dxfer_go_togg toggles under check.
One example of the DMA operation when the handshake feature is enabled for a write channel is as follows:

1. The CPU doorbells channel 0.
2. The DMA resets the handshake counter for channel 0.
3. The DMA reads LL element 0 descriptor. After the DMA receives descriptor read completions, the DMA checks the value of the handshake counter.

If handshake counter =0, DMA waits until handshake counter >0 before transferring the data block.
If handshake counter >0, DMA transfers the data block immediately.

4. After the data transfer is complete, the DMA Decrements the handshake counter, and Toggles wdxfer_done_togg.
5. Steps 3-4 are repeated for all the remaining elements of the linked list.

18.6.4.5 Using the DMA

18.6.4.5.1 Source and Destination Address Registers

The DMA channel context SAR and DAR registers (DMA_SAR_LOW_OFF_WRCH_0, DMA_SAR_HIGH_OFF_WRCH_0 etc.) provide support for remote-to-local, and local-to-remote PCIe address mapping. You program the start of the local and remote data buffers using these registers, and the DMA increments the SAR and DAR as the DMA transfer progresses. For a write transfer, the SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in figure below.

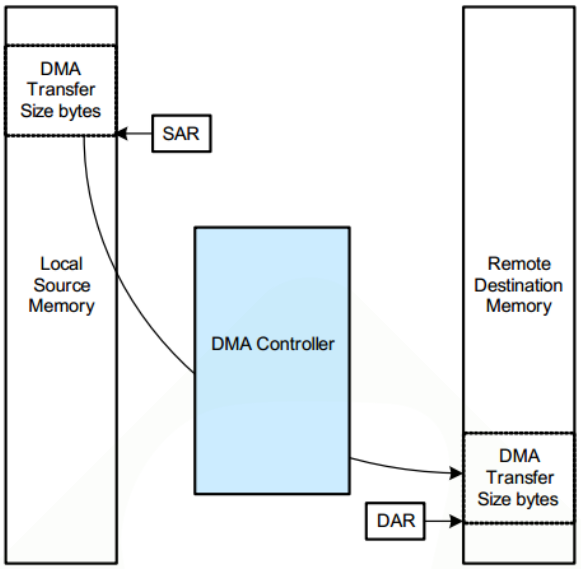

Fig. 18-14 Write Transfer: SAR and DAR for Write Channel

For a read transfer, the SAR is the address of the remote memory, and the DAR is the address of the local memory, as shown in Figure below.

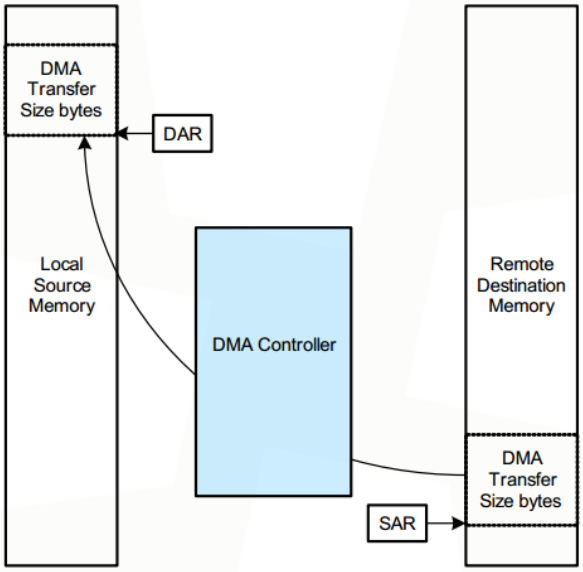

Fig. 18-15 Read Transfer: SAR and DAR for Write Channel

18.6.4.5.2 DMA Transfer Size Registers

You program the DMA transfer size using the DMA Transfer Size Register (DMA_TRANSFER_SIZE_OFF_WRCH_0 or DMA_TRANSFER_SIZE_OFF_RDCH_0). The maximum DMA transfer size is 4GB, and the minimum transfer size is one byte (0x1). The DMA decrements the value in this register as the DMA transfer progresses. When all bytes are successfully transferred, the value in this register is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element.

You can read this register to monitor the transfer progress. However, in some scenarios there is a delay before the controller updates this register. For example, when less than three channels are door belled, this register is only updated after a descriptor finishes (LL mode), or the transfer ends (non-LL mode).

18.6.4.5.3 Starting The DMA Transfer

After you program the DMA controller registers (including writing to the DMA Read Engine Enable or DMA Write Engine Enable register), you start a DMA transfer by writing zero to the Doorbell Number field of the DMA_WRITE_DOORBELL_OFF or DMA_READ_DOORBELL_OFF. You can program and start both a read and a write transfer at the same time. The DMA supports full duplex operation, processing read and write transfers at the same time and in parallel with normal (non-DMA) traffic.

18.6.4.5.4 Detecting the End of The DMA Transfer

Detecting End of Transfer without Errors

The normal end of a DMA transfer is detected by any of the following methods:
■ Local interrupt asserted.
■ Remote interrupt (IMWr) received.
■ Channel status field of the Channel Control 1 register is Stopped, and the DMA Transfer Size register is 0x0.
■ Polling of the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF).

Detecting End of Transfer with Errors

The abnormal end of a DMA transfer is detected by any of the following methods:
■ Local interrupt (pin) asserted.
■ Remote interrupt (IMWr) received.
■ Polling of the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF).
■ Channel Status field of the Channel Control 1 register is Halted. When the DMA controller detects an error, it forces the DMA to stop issuing requests for the channel. It also sets the channel status field of the Channel Control 1 register to Halted, generates an abort interrupt (if enabled), and sends an abort IMWr (if enabled). The DMA Transfer Size register indicates the remaining number bytes to be transferred, except when there is an AXI write error during a DMA read transfer.
■ Channel Status field of the Channel Control 1 register is Stopped, and the DMA Transfer Size register is not 0x0. You have prematurely stopped this channel as described in "Stopping the DMA Transfer (Software Stop)"on next section

18.6.4.5.5 Stopping the DMA Transfer (Software Stop)

You can manually abort (stop) the DMA transfer by writing the channel number to the Doorbell Number field and writing 1 to the Stop field in DMA_[WRITE|READ]_DOORBELL_OFF. This causes the DMA to:

- Place the channel in a Stopped state. The channel Status field in DMA_CH_CONTROL1_OFF_WRCH_0 is Stopped and the value in DMA_TRANSFER_SIZE_OFF_WRCH_0 will not be 0x0.
- Wait for all outstanding pending transactions.
- Assert the abort interrupt (if it is enabled) in DMA_WRITE_INT_STATUS_OFF.

You might also do this as part of a function level reset (FLR). FLR does not directly affect the DMA transfer so you must manually stop the DMA transfer before initiating an FLR.

18.6.4.6 Programming Examples

This section provides two programming and operation example flows.

18.6.4.6.1 Non-LL Write Transfer

In this example, the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the pcie_sys_int interrupt. The SAR is the address of the local memory, and the DAR is the address of the remote memory. Write DMA Transfer is from 0xBEEF_BEE0 to 0xCAFE_CAF0. Table below provides the programming details for this example transfer. The transfer size is 1MB.

Table 18-10 Write DMA Transfer Example

Address 0x380000+	NAME	Value
0x00C	DMA Write Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic.	0x1
0x054	DMA Write Interrupt Mask	0x0
0x200	DMA Channel Control 1 register ■ Local Interrupt Enable (LIE) =1 ■ Remote Interrupt Enable (RIE) =0 ■ AT, RO, NS, TC, Function Number =0	0x04000008
0x208	DMA Transfer Size	0x00100000
0x20C	DMA SAR Low	0xBEEF_BEE0

Address 0x380000+	NAME	Value
0x210	DMA SAR High	0x0000_0000
0x214	DMA DAR Low	0xCAFE_CAF0
0x218	DMA DAR High	0x0000_0000
0x010	DMA Write Doorbell	0x0

18.6.4.6.2 Non-LL Read Transfer

In this example, the local interrupt generation is disabled, as the remote CPU initiates the DMA transfer. The remote CPU is interrupted using an IMWr. The SAR is the address of the remote memory, and the DAR is the address of the local memory. Read DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0. Table below provides the programming details for this example transfer. The transfer size is 1MB.

Table 18-11 Read DMA Transfer Example

Address 0x380000+	NAME	Value
0x02C	DMA Read Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic.	0x1
0x0CC/0x0D0	DMA Read Done IMWr Address Low and high	IMWr Address #1
0x0D4/0x0D8	DMA Read Abort IMWr Address Low and High	IMWr Address #2
0x0DC	DMA Read Channel 0 IMWr Data	IMWr Data
0x200	DMA Channel Control 1 register ■ Local Interrupt Enable (LIE) =0 ■ Remote Interrupt Enable (RIE) =1 ■ AT, RO, NS, TC, Function Number =0	0x04000010
0x208	DMA Transfer Size	0x00100000
0x20C	DMA SAR Low	0xBEEF_BEE0
0x210	DMA SAR High	0x0000_0000
0x214	DMA DAR Low	0xCAFE_CAF0
0x218	DMA DAR High	0x0000_0000
0x030	DMA Read Doorbell	0x0

18.6.5 PCIe Message Handling

This section describes the processing of messages through the controller. For a proper understanding of messages you should be familiar with Section 2.2.8, "Message Request Rules" of the PCI Express Base Specification, Revision 3.0.

18.6.5.1 Message Generation

These are three methods to generate PCIe Messages:

- Specific MSG interface

  You can use PCIE_CLIENT_MSG_GEN_CON register to generate messages such as:
  Vendor-Defined Message
  Legacy PCI Interrupt Message
  PME_Turn_Off message
  Unlock message
  LTR Message
  OBFF Message
  Refer to register description for more details.

- AXI bridge

  In this method, you should program the PCIE_CLIENT_AXI_SLV_AWMISC_HDR PCIE_CLIENT_AXI_SLV_AWMISC_HDR3 and PCIE_CLIENT_AXI_SLV_AWMISC_HDR4 registers to set these parameters:
  slv_awmisc_info [4:0] =MSG

slv_awmisc_info [20:13] = message code
slv_awmisc_tag [5:0] = tag
slv_awmisc_info_hdr_[3|4]dw = 3rd and 4th TLP header DWORD
Then you can send zero length memory write (slv_awstrb=0) to generate the message. You must not program registers mentioned above when there are normal transfers pending on AXI slave interface. And should set these registers in normal value when you want to send MWr TLP. This method is not recommend because of these limitations.

- AXI bridge and iATU

Program related client register fields as follows:
slv_awmisc_info[4:0] =MEM
slv_awmisc_info_hdr_[3|4]dw = 3rd and 4th TLP header DWORD
Then iATU needs to be configured to to translate MWr to Msg TLPs. Refer to "Address Translation" for more details. This method is not recommend because that it needs additional iATU resources.

18.6.5.2 Message Reception

PCIe controller use pcie_msg_int interrupt to indicate the reception of PCIe Message. Application can poll to PCIE_CLIENT_INTR_STATUS_MSG_RX register to check the status of Message reception. Refer to register information for details.

18.6.6 PCIe Power Management

18.6.6.1 Overview

The controller supports two categories of PM operations to control the device state (D-state) and link state. For a proper understanding of PCIe Power management you should be familiar with Section 5, "Power Management" of the PCI Express Base Specification, Revision 3.0.

Software PCI Compatible PM (PCI-PM)

- D-state PM of Function. The host software can direct the function to enter any of the D1, D2, or D3 low-power states. It does this by writing to the Power Management Control and Status Register (PMCSR) in the PCI-PM capability structure.
- D-state PM of Link. Link states are not visible to PCI-PM legacy compatible software, and are derived from the power management D-states of the components connected to that link. The action of changing the D-state in the PMCSR indirectly causes a change in the link power state. The L1 state is entered whenever all functions of a USP on a link are programmed to a non-D0 state. The entry into L2 and L3 states is initiated by the DSP.

PCIe PM Mechanisms

- Active State PM (ASPM).When the USP is in L0 and detects idleness on the link for a specific amount of time, it automatically transitions the link to the L0s or L1 (optional) power state.
- L1 Substates. This is an optional PCIe feature that enables components on a link to further reduce idle power consumption while the link is in L1, including almost complete removal of power for the high speed PHY circuits.

18.6.6.2 L0s Operation

L0s is a low-power state enabled by ASPM. ASPM controls entry into L0s for the transmitter. The remote device controls entry into L0s for the receiver.

18.6.6.2.1 L0s Entry

All of these condition must be met:

■ ASPM L0s is enabled through the ASPM Control field in the Link Control register.

■ L0s entry conditions as defined in Section 5.4.1.1.1, "Entry into the L0s State" of the PCI Express Base Specification, Revision 3.0, exist for a duration of time (determined by the L0S_ENTRANCE_LATENCY field in ACK_F_ASPM_CTRL_OFF).

■ No higher stage of power-down requested.

18.6.6.2.2 L0s Exit

Any of these condition can be met:

■ A DLLP or TLP is pending to be sent.

■ L1 entry conditions as defined in Section 5.4.1.2.1, "Entry into the L1 State" of the PCI Express Base Specification, Revision 3.0, are satisfied.

■ PCIe link partner requests to enter into link recovery.

18.6.6.3 L1 Operation (Non-substates)

The following topic will be discussed in this section: L1 (ASPM/PM) Entry and Exit Conditions

and L1 Clock PM (L1 with REFCLK removal/PLL Off) Entry and Exit Conditions.
18.6.6.3.1 L1 (ASPM/PM) Entry

L1 is a low-power state enabled either by ASPM (L1-ASPM) or by the software changing the D-state (L1-PM). The L1 state is a bi-directional link low-power state and both link partners must negotiate to go to this state.
The L1-ASPM entry negotiation handshake uses PM_Active_State_Request_L1 DLLPs, PM_Request_Ack DLLPs, and PM_Active_State_Nak MSG TLPs. Refer to PCIe Basic Specification for more information.
There are three scenarios that cause the controller to enter L1 under ASPM conditions.
Scenario 1: L1 Idle Timeout In L0s
All of these condition must be met in the USP:
■ ASPM L1 and L0s are enabled through the ASPM Control field in the Link Control register.
■ The ENTER_ASPMfield of ACK_F_ASPM_CTRL_OFFis set to '0' and the link state is L0s for both link partners, or the ENTER_ASPMfield of ACK_F_ASPM_CTRL_OFFis set to '1'.
■ L1 entry conditions as defined in Section 5.4.1.2.1, "Entry into the L1 State" of the PCI Express Base Specification, Revision 3.0, exist for a duration of time (determined by the L1_ENTRANCE_LATENCYfield in ACK_F_ASPM_CTRL_OFF).
■ No higher stage of power-down requested.
■ Your USP application is not asserting the app_xfer_pending field in PCIE_CLIENT_POWER_CON register.
■ There are no in-progress transactions in the controller
■ There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
■ There are no pending DMA transfers.
Scenario 2: L1 Idle Timeout In L0
All of these condition must be met in the USP:
■ ASPM L1 is enabled and L0s is not enabled through the ASPM Control field in the Link Control register.
■ Link state is L0.
■ L1 entry conditions as defined in Section 5.4.1.2.1, "Entry into the L1 State" of the PCI Express Base Specification, Revision 3.0, exist for a duration of time (determined by the L1_ENTRANCE_LATENCYfield in ACK_F_ASPM_CTRL_OFF).
■ No higher stage of power down-requested.
■ Your USP application is not asserting the app_xfer_pending field in PCIE_CLIENT_POWER_CON register.
■ There are no in-progress transactions in the controller.
■ There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
■ There are no pending DMA transfers.
Scenario 3: Application Controlled (USP only)
All of these condition must be met in the USP:
■ ASPM L1 is enabled through the ASPM Control field in the Link Control register.
■ Your application write 1 to the app_req_entr_l1 field in PCIE_CLIENT_POWER_CON register.
■ Your USP application is not asserting the app_xfer_pending field in PCIE_CLIENT_POWER_CON register.
■ There are no in-progress transactions in the controller.
■ There are no pending requests at the AXI slave interface, that is, slv_a*validmust be 0.
■ There are no pending DMA transfers.
L1-PM Entry
The power management state of a link is determined bythe D-state of theUSP.When you change the device state of the USP to D1, D2, or D3hot by writing to the PMCSR, the controller must initiate a link state transition to L1.
An USP application asserting the app_xfer_pending field does not prevent L1-PM entry, but will cause immediate exit from L1-PM.
18.6.6.3.2 L1-PM/L1-ASPM Exit
Any of these condition are met:

■ A DLLP or TLP is pending to be sent.
■ Your application asserts the app_req_exit_l1 field.
■ Link partner is requesting exit from L1.
■ Your application asserts the app_xfer_pending field.
■ Your application asserts the app_pm_xmt_pme field.
When the USP is programmed with capability to support PME; it sends a PME message to the RC which calls the PM software to transition the USP to the D0 state. Therefore, you should only use app_pm_xmt_pme for L1-PM exit.
■ PM software (RC) requests a higher stage of power-down by writing to the PMCSR in the USP.
■ Your application (USP) requests transmission of VDM, MSI/MSIX, or LTR message. Legacy interrupt is not included.
■ Your application (DSP) requests transmission of Unlock message.
■ Your application is requesting to send traffic by asserting or slv_a*valid.
■ Your application doorbells a DMA read or write channel, or DMA controller is requesting data.
■ Your application (DSP) initiates link disable, or link retrain (by setting PCIE_CAP_LINK_DISABLE or PCIE_CAP_RETRAIN_LINK field in LINK_CONTROL_LINK_STATUS_REG to 1).
■ Your application (DSP) initiates hot reset by either:

- ❑ setting RESET_ASSERT field in PORT_LINK_CTRL_OFF to 1, or
- ❑ setting SBR field in BRIDGE_CTRL_INT_PIN_INT_LINE_REG to 1, or
- ❑ toggling app_init_rst field in PCIE_CLIENT_GENERAL_CON.

■ Your application requests a speed change (by setting DIRECT_SPEED_CHANGE field in GEN2_CTRL_OFF to 1).
■ Your application requests link width change (by setting DIRECT_LINK_WIDTH_CHANGE field in MULTI_LANE_CONTROL_OFF is set to 1).

18.6.6.3.3 L1 Clock PM

For an USP, host software uses the Enable Clock Power Management bit in the Link Control register to enable this feature. For a DSP, this register bit is hard coded to '0' and cannot be used to control this behavior. Your application can use the app_clk_pm_en input to dynamically control whether to execute L1 with or without Clock PM.
■ The Support Clock Power Management bit in the Link Capabilities register must be set. For downstream ports it is hardcoded to 0, for upstream ports it can be accessed through the DBI.
■ The Enable Clock Power Management bit in the Link Control register must be set.
■ You must set the app_clk_pm_en field to 1. The controller only samples app_clk_pm_en when L1 is entered.
L1 with Clock PM and L1 substates work orthogonal to each other. L1 with Clock PM uses the mac_phy_pclkreq_n[0]signaling, and L1 substates uses the mac_phy_pclkreq_n[1]signaling. However, L1 substates takes precedence over Clock PM within the cores PM state machine.

18.6.6.4 L1 Substate

The L1 substates are applicable in both the ASPM and PCI-PM L1 link states. L1 substates management utilizes a per-link sideband signal called CLKREQ#.
■ During L1 substates it is assumed that core_clk is turned off and that aux_clk is active. It is required that your application switches aux_clk to a low frequency free running clock on entry into L1.
■ The controller uses aux_clk for counting time during L1 substates. You must program the frequency of this clock into the L1_SUBSTATES_OFF register with a value in the range 1...1000MHz to count real time. Frequencies lower than 1 MHz are possible, but with a loss of accuracy in the time counted.
■ When the electrical idle detection circuitry is disabled it is assumed that the PHY holds the signal phy_mac_rxelecidle to 1.
After the link has entered L1 through the normal L1 negotiation, the USP can initiate the

sequence for entering the target L1 substate (L1.1 or L1.2) by tri-stating its CLKREQ# output buffer. The entry sequence can only proceed if the DSP is also tri-stating its CLKREQ# output buffer, resulting in the bidirectional CLKREQ# signal being pulled up to 1. Otherwise CLKREQ# will remain asserted at 0 and the link state will stay in L1. The exit sequence can be initiated by either ports by asserting CLKREQ# to 0. For each port there are two cases to consider, the first where the exit is initiated locally, the second where the exit is initiated remotely. L1 substates management utilizes a per-link sideband signal called CLKREQ#.

18.6.6.4.1 L1 Substates Software Control

When the controller enters L1, the target L1 substate depends on several programming bits:

- PM Control/Status Register
  - USP: The current D-state
  - DSP: The DLLP type that was used by USP to request L1
- L1 Substates Control 1 Register
  - ASPM PM L1.1 Enabled
  - ASPM PM L1.2 Enabled
  - PCI PM L1.1 Enabled
  - PCI PM L1.2 Enabled

After the USP controller enters L1, it uses the D-state of the device to determine if L1 was entered in ASPM mode or PCI-PM mode.

After the DSP controller enters L1, it uses the USPs DLLPL1 request type to determine if L1 was entered in ASPM mode or PCI-PM mode. The next tables shows the target L1 substate as a function of the relevant programming bits.

Table 18-12 Target L1 Substate as a Function of Software Controls (USP)

D-State	ASPM L1.1 Enabled	ASPM L1.2 Enabled	LTR >= Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
!D0	-	-	-	0	0	L1
!D0	-	-	-	1	0	L1.1
!D0	-	-	-	-	1	L1.2
D0	0	0	-	-	-	L1
D0	1	0	-	-	-	L1.1
D0	0	1	0	-	-	L1
D0	1	1	0	-	-	L1.1
D0	-	1	1	-	-	L1.2

Table 18-13 Target L1 Substate as a Function of Software Controls (DSP)

DLLP Receive	ASPM L1.1 Enabled	ASPM L1.2 Enabled	LTR >= Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
PM_Enter_L1	-	-	-	0	0	L1
	-	-	-	1	0	L1.1
	-	-	-	-	1	L1.2
PM_Active_State_Request_L1	0	0	-	-	-	L1
	1	0	-	-	-	L1.1
	0	1	0	-	-	L1
	1	1	0	-	-	L1.1
	-	1	1	-	-	L1.2

The Reported LTR is the maximum of the snoop/no snoop latency values embedded in LTR messages transmitted by the upstream ports or received by the downstream port. The controller stores these values in the port logic LTR Latency Register (LTR_LATENCY_OFF). When the requirement bit in the message is 0, the latency value is considered infinite (that

is, the check with the threshold always pass).

18.6.6.4.2 L1 Substates Entry and Exit

PCIe link entered L1 substate automatically if related enable bit is set and LTSSM already in L1 state, refer to section L1 Substates Software Control for details.

L1 substates Exit can be triggered locally or Remotely. For locally initiated exit, refer to section L1-PM/L1-ASPM Exit. Remotely initiated exit begin when CLKREQ# is asserted by remote PCIe partner.

18.6.6.5 L2 and L3 Power Down Entry and Exit

L2/L3 entry is initiated after the RC calls power management software to initiate the removal of power and clocks. USPs of devices in D0, D1, D2, and D3hot must respond to the receipt of a PME_Turn_Off MSG TLP by transmitting a PME_TO_Ack MSG TLP. The device must then request a link transition to L2/L3_Ready. L2/L3_Ready is a bi-directional link power down state. If your application is not ready to be shut-down, it must keep the app_ready_entr_l23 field de-asserted.

L2/L3 Entry

All of these condition must be met:

■ PME_Turn_Off/PME_TO_Ack handshake has been completed.

■ Your USP application is ready to be turned off; app_ready_entr_l23=1.

■ After sending the PME_TO_Ack, the USP initiates the L2/L3 Ready transition protocol by sending the PM_Enter_L23 DLLP. The RC responds with the PM_Request_Ack.

L2/L3 Exit

Any of these condition can be met:

■ When the USP is programmed with capability to support PME, your application can assert the apps_pm_xmt_pme field to request the controller to wake up. The USP then sends a PM_PME MSG TLP to the RC which calls the PM software to transition the USP out of the D3 state.

■ Device is programmed with capability to support PME and your application requests the controller to wake up by triggering a native hot-plug event.

■ Link partner is requesting exit from L2/L3.

18.6.6.6 Dynamic Power Allocation (DPA)

The DPA capability enables software to actively manage and optimize function power usage when in the D0 state. DPA is not applicable to power states D1-D3.

For details on how your application interacts with the controller, see the description of the dpa_sub_upd_int field in PCIE_CLIENT_INTR_STATUS_MISC register.

18.6.7 PCIe Interrupt

The PCIe provides six types of interrupt to system interrupt controller. They can be divided into MSI/MSI-X, PCIe Error interrupt, PCIe Message Receive interrupt, PCIe Legacy interrupt, PCIe System interrupt and PCIe Power Management Interrupt. When operating as RC, the PCIe is capable of handling both MSI/MSI-X and legacy interrupts. This is because when operating as RC it should be able to service both PCIe end points as well as legacy endpoints. It is capable of generating MSI or Legacy interrupt if the PCIe is configured as EP. Notes that PCIe EP component can't generate both Legacy and MSI/MSI-X interrupt. It is either one or the other. The interrupt type an EP generates is configured during configuration time.

Interrupt status and mask bits are located in client register group, some interrupts are handle by client register directly, but some interrupts are generated by events deep into controller and software should clear the root cause to serve the interrupt events. For more information, refer to the register description.

Table 18-14 PCIe Interrupt Table

System Interrupt Event ID	Interrupt description (level 1)	Interrupt subset (level 2)	Support mode
118	PCIe System Interrupt	PHY link up interrupt	RC & EP
		DLL link up interrupt	RC & EP
		Link down reset request interrupt	RC & EP
		Slot status change interrupt	RC

System Interrupt Event ID	Interrupt description (level 1)	Interrupt subset (level 2)	Support mode
		Hot plug interrupt	RC
		Link autonomous bandwidth interrupt	RC
		Bandwidth Management Interrupt	RC
		EDMA write channel interrupt	RC & EP
		EDMA read channel interrupt	RC & EP
		DPA update interrupt	EP
		Resizable BAR update interrupt	EP
119	PCIe Legacy interrupt	INTA received interrupt	RC
		INTB received interrupt	RC
		INTC received interrupt	RC
		INTD received interrupt	RC
		INTA sent interrupt	EP
		INTB sent interrupt	EP
		INTC sent interrupt	EP
		INTD sent interrupt	EP
120	PCIe message received interrupt	Vendor message received interrupt	RC & EP
		Unlock message received interrupt	EP
		LTR message received interrupt	RC
		PME status Interrupt	RC
		PM_PME message received interrupt	RC
		PME_TO_Ack message received interrupt	RC
		PME Turnoff message received interrupt	EP
		'IDLE' OBFF message received interrupt	RC
		'OBFF' OBFF message received interrupt	RC
		'CPU Active' OBFF message received interrupt	RC
121	PCIe Error interrupt	Root Error Status interrupt	RC
		Completion TLP Rx timeout interrupt	RC & EP
		Completion TLP Tx timeout interrupt	RC & EP
		ERR_COR message sent interrupt	EP
		ERR_NONFATAL message sent interrupt	EP
		ERR_FATAL message sent interrupt	EP
		ERR_COR message received	RC
		ERR_NONFATAL message received	RC
		ERR_FATAL message received	RC
		Receive FIFO overflowed interrupt	RC & EP
136	PCIe Power Management interrupt	L1 substate entry interrupt	RC & EP
		L1 entry interrupt	RC & EP
		L2 entry interrupt	RC & EP
		L0s entry interrupt	RC & EP
		L1 substate exit interrupt	RC & EP
		L1 exit interrupt	RC & EP
		L2 exit interrupt	RC & EP
		L0s exit interrupt	RC & EP

System Interrupt Event ID	Interrupt description (level 1)	Interrupt subset (level 2)	Support mode
		D-state changed interrupt	EP
XXX	MSI/MSI-X	message signaled interrupt	RC service and EP initiate

Chapter 19 SATA Host

19.1 Overview

Sata Host implements the Serial Advanced Technology Attachment(SATA)storage interface for physical storage devices.

Sata Host supports the following features:

- Include 3 ports, and each port can connect up to 5 devices using PM switching
- SATA 1.5Gb/s,SATA 3.0Gb/s,SATA 6.0Gb/s speeds
- eSATA
- Compliant with Serial ATA 3.3 specifications
- Compliant with AHCI Revision 1.3.1
- OOB signaling detection and generation
- Digital support of Mechanical presence switch and cold presence detect
- Activity LED support
- Digital support of device hot-plugging
- Output port to indicate speed that is negotiated after COMRESET for power optimization
- Memory Data Protection(ECC) and Error Correction(ECC)
- Memory Data Protection Diagnostic Error Injection
- SATA 1.5Gb/s,SATA 3.0Gb/s,and SATA 6.0Gb/s speed negotiation
- Asynchronous signal recovery, including retry polling
- Power management features including automatic partial-to-slumber transition
- BIST loopback modes
- Hardware-assisted Native Command Queuing for up to 32 entries
- Port Multiplier with FIS-based switching
- Disabling RX and TX Data clocks during power down modes
- Any sector size
- AXI interface used for configuration only support single
- AXI interface used to fetch data from memory

19.2 Block Diagram

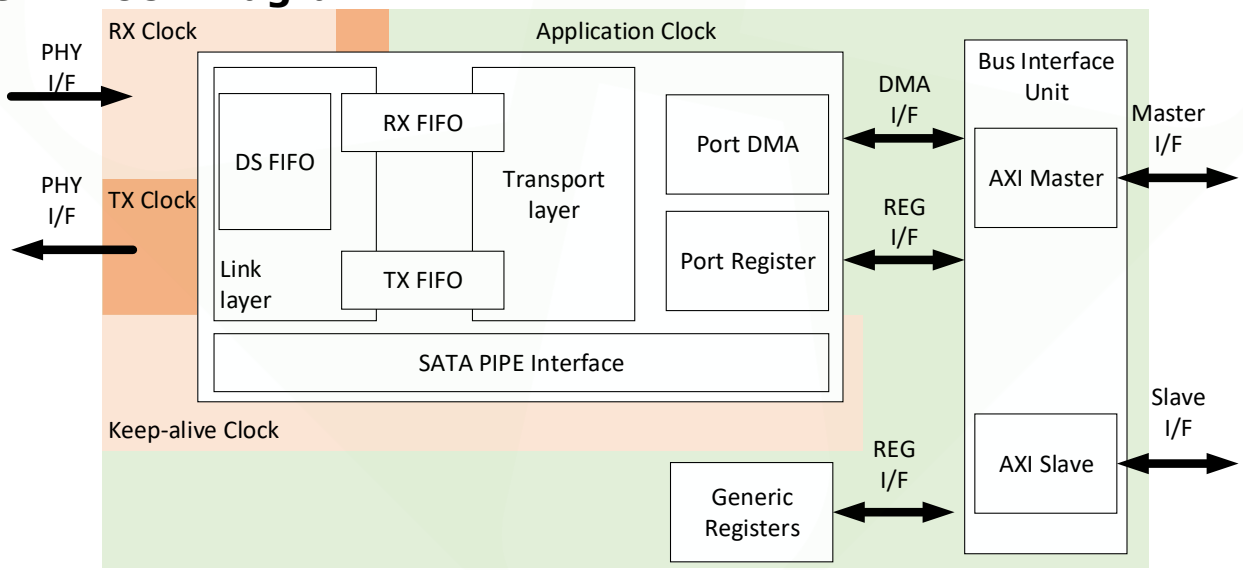

Fig. 19-1 SATA host Architecture

19.3 Function Description

19.3.1 Bus Interface Unit(BIU)

The Bus Interface Unit provides two interfaces:

AXI Master - This interface enables the SATA AHCI DMA engine to read and write to an AXI slave connected to AXI BIU.

AXI Slave - This interface enables an AXI master to read an write through the AXI BIU to the SATA AHCI registers.

19.3.2 Generic Registers(GCSR)

This module implements all global registers and provides the following functions:

- Generic configuration and control
- Global interrupt support
- BIST operation

19.3.3 Port Registers(PCSR)

The port registers module implements all Port-specific registers:

- Command list and FIS Based address
- Interrupt status/ enable
- Port command / status
- Task file data/signature /serial ATA
- DMA status/control

19.3.4 Port DMA(PDMA)

This module performs the following functions:

- Monitors commands posted by system software using the CI register
- Control data transfer between the Transport layer FIFOs and system memory using Physical Region Descriptor Table(PRDT)
- Transfers non-Data FISes received from the device to system memory using Received FIS Structure

Most of the communication between the PDMA and software is done using two system memory descriptors that are constructed by software prior to initiating the transfer: FIS descriptor, which contains FISes received from that device; and the command list, which contains a list of 1 to 32 commands available for Port to execute and the pointers for data transfers. Some additional communication is done by registers located in the GCSR and PCSR modules.

System memory structures are described in the SATA AHCI specification and are not repeated in this document.

The PDMA module operates in the application clock(aclk) domain.

19.3.5 Port Transport layer

The transport layer block provides FIS reception and transmission functions of the SATA transport layer. It operates in two clock domains: transmit and application. During reception, the transport layer receives a new FIS from the link layer through the RX FIFO, decodes the FIS type, and instructs the PDMA to route the FIS payload data to the appropriate location in system memory. During transmission, the transport layer instructs the PDMA to construct the appropriate FIS, and then passes it to the link layer through the TX FIFO. The transport layer block receives all the PHY/Link errors from the link layer, detects transport errors and passes them to the PCSR for setting the corresponding error bits.

The transport layer processes one FIS at time on the transmit side, meaning only one FIS is allowed in the TX FIFO at a time. On the receive side, RX FIFO can potentially contain more than one FIS at a time. For example, when the device transmits several DMA data FISes back-to-back with minimal delay, the RX FIFO still has the previous Data FIS while the next FIS is being received. The transport layer also contains a small internal eight-DWORD RX FIFO1 that is used for non-data FISes and FIS "End Status."

19.3.6 Port Link layer

This module optional OOB signaling, system initialization, speed negotiation, frame negotiation and arbitration, envelope framing/de-framing, CRC calculating, insertion and checking, flow control, frame acknowledgement and status reporting, data scrambling/de-scrambling for EMI reduction, repeat primitive data transmission and reception handling, ALIGN primitive detection, dropping and data alignment and power management.

19.4 Register Description

19.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as

follows.

19.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
SATA_CAP	0x0000	W	0x6737FF85	HBA Capabilities Register
SATA_GHC	0x0004	W	0x80000000	Global HBA Control Register
SATA_GIS	0x0008	W	0x00000000	Interrupt Status Register
SATA_PI	0x000C	W	0x00000000	Ports Implemented Register
SATA_VS	0x0010	W	0x00010300	AHCI Version Register
SATA_CCC_CTL	0x0014	W	0x00010108	Command Completion Coalescing Control
SATA_CCC_PORTS	0x0018	W	0x00000000	Command Completion Coalescing Ports
SATA_CAP2	0x0024	W	0x00000004	HBA Capabilities Extended Register
SATA_BISTAFR	0x00A0	W	0x00000000	BIST Activate FIS Register
SATA_MEMEDRXFERRCNT	0x00A0	W	0x00000000	RX FIFO RAM Address Parity Error Count Register
SATA_BISTCR	0x00A4	W	0x00004700	BIST Control Register
SATA_MEMEDRXFERRDATA	0x00A4	W	0x00000000	RX FIFO RAM Data ECC Error Location and Syndrome Register
SATA_BISTFCTR	0x00A8	W	0x00000000	BIST FIS Count Register
SATA_MEMEDTXFERRCNT	0x00A8	W	0x00000000	ECC TX FIFO RAM Error Count Register
SATA_BISTSR	0x00AC	W	0x00000000	BIST Status Register
SATA_MEMEDTXFERRDATA	0x00AC	W	0x00000000	TX FIFO RAM Data ECC Error Location and Syndrome Register
SATA_BISTDECR	0x00B0	W	0x00000000	BIST DWORD Error Count Register
SATA_MEMEDFBSERRCNT	0x00B0	W	0x00000000	ECC TX FIFO RAM Error Count Register
SATA_MEMEDFBSERRDATA	0x00B4	W	0x00000000	FBS RAM Data ECC Error Location and Syndrome Register
SATA_MEMEDERRINJ	0x00B8	W	0x00000000	ECC Error Detection Status and Error Injection Register
SATA_OOBR	0x00BC	W	0x04070C15	OOB Register
SATA_MEMEDRXFERRDATAU	0x00BC	W	0x00000000	Rx FIFO RAM Data Parity Error Syndrome Upper Bits Register
SATA_MEMEDTXFERRDATAU	0x00C0	W	0x00000000	Tx FIFO RAM Data Parity Error Syndrome Upper Bits Register
SATA_DIAGNR3	0x00C4	W	0x00000000	DIAGNR3
SATA_MEMEDFBSERRDATAU	0x00C4	W	0x00000000	FBS RAM Data Parity Error Syndrome Upper Bits Register
SATA_GPARAM3	0x00DC	W	0x0000004D	Global Parameter 3 Register
SATA_TIMER1MS	0x00E0	W	0x000493E0	Timer 1-ms Register
SATA_MEMDPCR	0x00E4	W	0x00000000	ECC/Parity Global Control Register
SATA_GPARAM1R	0x00E8	W	0x98000C00	Global Parameter 1 Register
SATA_GPARAM2R	0x00EC	W	0x00000832	Global Parameter 2 Register
SATA_TESTR	0x00F4	W	0x00000000	Test Register
SATA_IDR	0x00FC	W	0x00000000	ID Register
SATA_CLB	0x0100	W	0x00000000	Port Command List Base Address Register
SATA_FB	0x0108	W	0x00000000	Port FIS Base Address Register
SATA_PIS	0x0110	W	0x00000000	Port Interrupt Status Register
SATA_PIE	0x0114	W	0x00000000	Port Interrupt Enable Register
SATA_CMD	0x0118	W	0x00000000	Port Command Register

Name	Offset	Size	Reset Value	Description
SATA_TFD	0x0120	W	0x00000000	Port Task File Data Register
SATA_SIG	0x0124	W	0x00000000	Port Signature Register
SATA_SSTS	0x0128	W	0x00000000	Port Serial ATA Status (SStatus) Register
SATA_SCTL	0x012C	W	0x00000000	Port Serial ATA Control Register
SATA_SERR	0x0130	W	0x00000000	Port Serial ATA Error Register
SATA_SACT	0x0134	W	0x00000000	Port Serial ATA Active Register
SATA_CI	0x0138	W	0x00000000	Port Command Issue Register
SATA_SNTF	0x013C	W	0x00000000	Port Serial ATA Notification Register
SATA_FBS	0x0140	W	0x00000000	Port FIS-Based Switching Control Register
SATA_DMACR	0x0170	W	0x00000000	Port DMA Control Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

19.4.3 Detail Registers Description

SATA_CAP

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RO	0x0	s64a Tie 0, do not supports 64-bit addressable data structures.
30	RO	0x1	sncq Supports SATA native command queuing by handing DMA Setup FIS natively.
29	RO	0x1	ssntf Supports PnSNTF(SNotification)register and its associated functionality.
28	RW	0x0	smps This bit is set by the system firmware/BIOS when platform supports mechanical presence for hot plug operation.
27	RW	0x0	sss Support for staggered devices' spin-up.
26	RO	0x1	salp Tie 1, supports auto-generating Link Layer requests to the PARTIAL or SLUMBER power management states when there are no commands to process.
25	RO	0x1	sal Tie 1, supports activity indication using signal Pn_act_led.
24	RO	0x1	sclo Tie1 , supports the PnCMA.CLO bit functionality for Port Multiplier devices' enumeration.
23:20	RO	0x3	iss Supports SATA 1.5Gb/s,SATA 3Gb/s,SATA 6Gb/s interface speeds.
19	RO	0x0	reserved
18	RO	0x1	sam Tie 1, support AHCI mode only and does not supports legacy, task-file based register interface.
17	RO	0x1	spm Tie 1, supports command-based switching Port Multiplier on any of its ports.
16	RO	0x1	fbss FIS-Based Switching supported.

Bit	Attr	Reset Value	Description
15	RO	0x1	pmd Supports multiple DRQ block data transfer for the PIO command protocol.
14	RO	0x1	ssc Supports transitions to the interface SLUMBER power management state.
13	RO	0x1	psc Supports transitions to the interface PARTIAL power management state.
12:8	RO	0x1f	ncs Supports 32 command slots per Port.
7	RO	0x1	cccs Command Completion Coalescing Supported.
6	RO	0x0	ems Does not support enclosure management.
5	RO	0x0	sxs Supports External SATA.
4:0	RO	0x05	np Supports 5 ports.

SATA_GHC

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RO	0x1	ae This bit is always set.
30:2	RO	0x00000000	reserved
1	RW	0x0	ie This global bit enables interrupts. When cleared, all interrupt sources from all the ports are disabled. When set, interrupts are enabled and interrupt event caused intrq assertion.
0	WO	0x0	hr When set by the software, this bit causes an internal Global reset. All state machines that relate to data transfers and queuing return to and idle state, and all the ports are re-initialized by sending COMRESET when staggered spin-up is not supported. When staggered spin-up is supported, then the software must spin-up each port after this reset has complete.

SATA_GIS

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	ips When set, this bit indicates that the corresponding Ports or Command Completion Coalescing logic has an interrupt pending. The software can use this information to determine which ports require service after an interrupt. The bits of this field are set by the ports that have interrupt events pending in the PnIS bits and enabled by the PnIE or CCC interrupt is generated. Set bits are cleared by the software writing 1 to all bits to clear.

SATA_PI

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	pi This register is bit significant. 1: The corresponding Port is available for the software to use. 0: The Port is not available for the software to use.

SATA_VS

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0001	mjr Indicates that the major AHCI version is 1.
15:0	RO	0x0300	mnr Indicates that the monor AHCI version is 30 or 31.

SATA_CCC_CTL

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RO	0x0001	tv This field specifies the CCC time-out value in 1ms intervals. The software loads this value prior to enabling CCC.
15:8	RW	0x01	cc This field specifies the number of command completions that are necessary to cause a CCC interrupt.
7:3	RO	0x01	intr_int This field specifies the interrupt used by the ccc feature, using the number of ports configured for the core.
2:1	RO	0x0	reserved
0	RW	0x0	en The options for this field are: 0: CCC feature is disabled and no CCC interrupts are generated. 1: CCC feature is enabled and CCC interrupts may be generated based on the time-out or command completion conditions.

SATA_CCC_PORTS

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	prt This field is bit significant. Each bit corresponds to a particular Port, where bit 0 corresponds to Port0.The options for this field are: 1: the corresponding Port is part of the CCC feature. 0: the corresponding Port is not part of the CCC feature. Bits set in this register must also have the corresponding bit set in the PI (Ports Implemented Register). This field is reset on Global reset (GHC.HR=1).

SATA_CAP2

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x1	apst Supports automatic Partial to Slumber transaction.
1	RO	0x0	nvmp Does not support NVMHCI.

Bit	Attr	Reset Value	Description
0	RO	0x0	bph Tie0, does not support BOH.

SATA_BISTAFR

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	ncp Least significant byte of the received BIST Activate FIS second DWORD (bits [7:0]). This value defines the required pattern for far-end transmit only mode (BISTAFR.PD=0xC0 or 0xE0): 0xF1: Low transition density pattern (LTDP) 0xB5: High transition density pattern (HTDP) 0xAB: Low frequency spectral component pattern (LFSCP) 0x7F: Simultaneous switching outputs pattern (SSOP) 0x78: Mid frequency test pattern (MFTP) 0x4A: High frequency test pattern (HFTP) 0x7E: Low frequency test pattern (LFTP) When none of these values is decoded, the Lone bit pattern (LBP) is transmitted by default.
7:0	RO	0x00	pd Indicates the pattern definition field of the received BIST Activate FIS - bits [23:16] of the first DWORD. It is used to put the DWC_ahsata in one of the following BIST modes: 0x10: Far-end retimed 0x08: Far-end analog (when PHY supports this mode) 0xC0: Far-end transmit only 0xE0: Far-end transmit only with scrambler bypassed All other values should not be used by the device, otherwise, the FIS is negatively acknowledged with R_ERRp. For far-end transmit only modes BISTAFR.NCP field contains the required data pattern.

SATA_MEMEDRXFERRCNT

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	mem_rxf_corr_err_cnt RX FIFO Corrected RAM Data Error Count.
7:0	RO	0x00	mem_rxf_uncorr_err_cnt RX FIFO Uncorrected RAM Data Error Count.

SATA_BISTCR

Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RO	0x0	old_phy_ready Old phy_ready.

Bit	Attr	Reset Value	Description
24	RO	0x0	late_phy_ready When set, this bit changes monitoring of phy_ready to be the "OR" of phy_ready or phy_rx_data_vld so that a "late arriving", or even "never asserting" phy_ready. This requires that phy_rx_data_vld does not become valid until after the PHY has locked onto post OOB incoming ALIGNs, and the ALIGNs are valid from the PHY. This will not work if phy_rx_data_vld is asserted during OOB data bursts. This behavior is intended for PHYs that assert phy_ready late, but will also work if phy_ready never asserts or is not present.
23:21	RO	0x0	reserved
20	WO	0x0	ferlb When set, this bit is used to put the hardware Link into Far-end Retimed mode, without the BIST Activate FIS, regardless whether the device is connected or disconnected (Link in NOCOMM state). This field is one-shot type and reads returns 0.
19	RO	0x0	reserved
18	WO	0x0	txo This bit is used to initiate transmission of one of the non-compliant patterns defined by the BISTCR.PATTERN value when the device is disconnected.
17	WO	0x0	cntclr This bit clears BIST error count registers. This field is one-shot type and reads returns 0. 1: Clear BISTFCTR, BISTSR, and BISTDECR registers.
16	WO	0x0	nearlb This bit places the Port PHY into near-end analog loopback mode. This field is one-shot type and reads returns 0. 1: Near-end analog loopback request. BISTCR.PATTERN field contains the appropriate pattern. This mode should be initiated either in the PARTIAL or SLUMBER power mode, or with the device disconnected from the Port PHY (Link NOCOMM state). BIST Activate FIS is not sent to the device in this mode.
15	RW	0x0	llb When set, masks out phy_sig_det from the OOB Detector in BIST Loopback Mode, and the only way to exit BIST Loopback mode is to clear the register bit (requires access to the Device AMBA register interface), then issue COMRESET or receive COMINIT as normal. Alternately, a power on reset will automatically clear the BIST Loopback Mode register bit.
14	RO	0x1	qphyinit When set, this bit enables quick PHY initialization feature. The Link does not require any ALIGNs to transition from OOB to normal operation.
13:11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10:8	RW	0x7	llc This field controls the Port Link Layer functions: scrambler, de-scrambler, and repeat primitive drop. Note the different meanings for normal and BIST modes of operation: Bit 8 - SCRAM The options for this field are: 0: Scrambler disabled in normal mode, enabled in BIST mode 1: Scrambler enabled in normal mode, disabled in BIST mode Bit 9 - DESCRAM The options for this field are: 0: Descrambler disabled in normal mode, enabled in BIST mode 1: Descrambler enabled in normal mode, disabled in BIST mode Bit 10 - RPD The options for this field are: 0: Repeat primitive drop function disabled in normal mode, NA in BIST mode. 1: Repeat primitive drop function enabled in normal mode, NA in BIST mode. The SCRAM bit is cleared (enabled) by the Port when the Port enters a responder far-end transmit BIST mode with scrambling enabled (BISTAFR.PD=0xC0). In normal mode, the functions scrambler, descrambler, or RPD can be changed only during Port reset (PnSCTL.DET=0x1).
7	RO	0x0	reserved
6	RW	0x0	erren This bit is used to allow or filter (disable) PHY internal errors outside the FIS boundary to set corresponding PnSERR bits. The options for this field are: 0: Filter errors outside the FIS, allow errors inside the FIS; 1: Allow errors outside or inside the FIS.
5	RW	0x0	flip This bit is used to change disparity of the current test pattern to the opposite every time its state is changed by the software.
4	RW	0x0	pv This bit is used to select either short or long version of the SSOP, HTDP, LTDP, LFSCP, COMP patterns. The options for this field are: 0: Short pattern version, 1: Long pattern version.

Bit	Attr	Reset Value	Description
3:0	RW	0x0	pattern This field defines one of the following SATA-compliant patterns for far-end retimed/far-end analog/near-end analog initiator modes, or non-compliant patterns for transmit-only responder mode when initiated by the software writing to the BISTCR.TXO bit. The options for this field are: 0x0: Simultaneous switching outputs pattern (SSOP) 0x1: High transition density pattern (HTDP) 0x2: Low transition density pattern (LTDP) 0x3: Low frequency spectral component pattern (LFSCP) 0x4: Composite pattern (COMP) 0x5: Lone bit pattern (LBP) 0x6: Mid frequency test pattern (MFTP) 0x7: High frequency test pattern (HFTP) 0x8: Low frequency test pattern (LFTP) All other values are reserved and should not be used. If the value is none of the listed previously, Composite pattern (COMP) is transmitted by default.

SATA_MEMEDRXFERRDATA

Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	mem_rxf_err_synd This field logs the error syndrome of the RAM Data Ecc/Parity error, if the syndrome width excess the range of the filed MEMEDRXFERRDATA.mem_rxf_err_synd, extra bits is logged in another register MEMEDRXFERRDATAU.mem_rxf_err_synd_u.
11:0	RO	0x000	mem_rxf_err_addr RX FIFO RAM Data Ecc/Parity Error Location This filed logs the error location (the address of which the RAM data Ecc/Parity error detected).

SATA_BISTFCTR

Address: Operational Base + offset (0x00A8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	count Received BIST FIS Count.

SATA_MEMEDTXFERRCNT

Address: Operational Base + offset (0x00A8)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	mem_txf_corr_err_cnt TX FIFO Corrected RAM Data Error Count.
7:0	RO	0x00	mem_txf_uncorr_err_cnt TX FIFO Uncorrected RAM Data Error Coun.

SATA_BISTSR

Address: Operational Base + offset (0x00AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RO	0x00	brsterr This field contains the burst error count. It is accumulated each time a burst error condition is detected: DWORD error is detected in the received frame and 1.5 seconds (27,000 frames) passed since the previous burst error was detected. The BRSTERR value does not roll over and freezes at FFh.
15:0	RO	0x0000	framerr This field contains the frame error count. It is accumulated (new value is added to the old value) each time a new BIST frame with a CRC error is received. The FRAMERR value does not roll over and freezes at FFFFh.

SATA_MEMEDTXFERRDATA

Address: Operational Base + offset (0x00AC)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	mem_txf_err_synd This field logs the error syndrome of the RAM Data Ecc error, if the syndrome width excess the range of the filed MEMEDTXFERRDATA.mem_txf_err_synd, extra bits is logged in another register MEMEDTXFERRDATAU.mem_txf_err_synd_u.
11:0	RO	0x000	mem_txf_err_addr This filed logs the error location (the address of which the RAM data Ecc error detected).

SATA_BISTDECR

Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dwerr This field contains the DWORD error count. It is accumulated (new value is added to the old value) each time a new BIST frame is received. The DWERR value does not roll over and freezes when it exceeds 0xFFFF_F000.

SATA_MEMEDFBSERRCNT

Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x00	mem_fbs_corr_err_cnt FBS Corrected RAM Data Error Count.
7:0	RW	0x00	mem_fbs_uncorr_err_cnt FBS Uncorrected RAM Data Error Count.

SATA_MEMEDFBSERRDATA

Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	mem_fbs_err_synd This field logs the error syndrome of the RAM Data Ecc/Parity error, if the syndrome width excess the range of the filed MEMEDFBSERRDATA.mem_fbs_err_synd, extra bits is logged in another register MEMEDFBSERRDATAU.mem_fbs_err_synd_u.
11:0	RO	0x000	mem_fbs_err_addr This filed logs the error location (the address of which the RAM data Ecc/Parity error detected).

SATA_MEMEDERRINJ

Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x0	ued Indicates a single bit uncorrected, or multiple bit error was detected. Cleared by writing '1' to this field.
16	RW	0x0	ced Indicates a single bit error was corrected. Cleared by writing '1' to this field.
15:5	RO	0x000	reserved
4	RW	0x0	oneB_2B Select 'single-bit' or 'two-bit' errors.
3	RW	0x0	cont Selects 'one-shot' (0) or 'continuous' (1) errors.
2:1	RW	0x0	mem_sel 2'b00: All three memory interfaces 2'b01: RX FIFO Memory, 2'b10: TX FIFO Memory, 2'b11: FBS RAM.
0	RW	0x0	err_inj_valid The values in the rest of the fields of this register are valid only when this bit is set to 1.

SATA_OOBR

Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31	RW	0x0	we The options for this field are: 1: OOBR bits [30:0] can be written 0: OOBR bits [30:0] are read-only This bit is cleared when COMRESET is detected.
30:24	RW	0x04	cwMin This field is RW when WE=1 and RO when WE=0.
23:16	RW	0x07	cwMax This field is RW when WE=1 and RO when WE=0.
15:8	RW	0x0c	ciMin This field is RW when WE=1 and RO when WE=0.
7:0	RW	0x15	ciMax This field is RW when WE=1 and RO when WE=0.

SATA_MEMEDRXFERRDATAU

Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mem_rxf_err_synd_u When the Rx FIFO RAM Data parity error syndrome width excess the range of the register MEMEDRXFERRDATA.mem_rx_err_synd, extra bits is logged in this field.

SATA_MEMEDTXFERRDATAU

Address: Operational Base + offset (0x00C0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mem_txf_err_synd_u When the Tx FIFO RAM Data parity error syndrome width excess the range of the register MEMEDTXFERRDATA.mem_tx_err_synd, extra bits is logged in this field.

SATA_DIAGNR3

Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	fbcsw_cnt FIS-based context switching counter.

SATA_MEMEDFBSERRDATAU

Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mem_fbs_err_synd_u When the FBS RAM Data parity error syndrome width excess the range of the register MEMEDFBSERRDATA.mem_fbs_err_synd, extra bits is logged in this field.

SATA_GPARAM3

Address: Operational Base + offset (0x00DC)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RO	0x0	mem_ap_support The options for this field are as follows: 0: No Address Protection Support, 1: Address Protection Support enabled.
7:3	RO	0x09	phy_type PHY Interface Type.
2	RO	0x1	mem_ecc_cor_en The options for this field are as follows: 0: Single-bit error correction not performed, 1: Single-bit correction performed.
1	RO	0x0	mem_dp_type The options for this field are as follows: 0: ECC, 1: Parity.
0	RO	0x1	mem_dp_support The options for this field are as follows: 0: No Data Protection Support, 1: Data Protection Support enabled.

SATA_TIMER1MS

Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:0	RW	0x493e0	timv This field contains the following value for the internal timer to generate 1-ms tick: Famba*1000, where Famba = AMBA clock frequency in MHz.

SATA_MEMDPCR

Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
9	RO	0x0	mem_par_even This value is derived from the MEM_PAR_EVEN parameter. The options for this field are as follows: 0: Generate odd type of parity for data (if parity type protection selected) and address; 1: Generate even type of parity for data (if parity type protection selected) and address.
8	RW	0x0	mem_err_inj_loc The options for this field are as follows: 0: Inject error on data bits; 1: Inject error on data checkbits.
7	RW	0x0	mem_ed_log_clr_en 0: All error detection and correction logging registers are cleared by Global or COMRESET. 1: All error detection and correction logging registers are cleared only when MEMDPCR.EM_ED_LOG_CLR is set.
6	WO	0x0	mem_ed_log_clr This field clears all error detection and correction logging registers when written. This bit clears itself one cycle after written.
5	RW	0x0	mem_ed_log_dis This field disables error detection and correction logging when set.
4	RW	0x0	mem_ed_ce_en This field enables correctable error detection interrupt(INFS). (For diagnostic purposes only).
3	RW	0x0	mem_ed_pdmaf_dis This field disables PDMA from entering a fatal error state when an uncorrectable error is detected. (For diagnostic purposes only).
2	RW	0x0	mem_ed_ifs_dis This field disables setting the IFS interrupt register bit (interface fatal error status interrupt) when an uncorrectable error is detected.
1	RW	0x0	mem_ec_dis When set, disables the single error correcting features everywhere, and all errors are reported as uncorrectable.
0	RW	0x0	mem_ed_dis All ECC/Parity error detection, correction, interrupt generation and Fatal error state transitions are disabled when this bit is set to 1.

SATA_GPARAM1R

Address: Operational Base + offset (0x00E8)

Bit	Attr	Reset Value	Description
31	RO	0x1	align_m The options for this field are: 0: Misaligned, 1: Aligned.
30	RO	0x0	rx_buffer 0: Exclude, 1: Include.

Bit	Attr	Reset Value	Description
29:28	RO	0x1	phy_data The options for this field are: 0x0: 8bit, 0x1: 16bit, 0x2: 32bit.
27	RO	0x1	phy_rst The options for this field are: 0: Low enable, 1: High enable.
26:21	RO	0x00	phy_ctrl PHY Control Width.
20:15	RO	0x00	phy_stat PHY Status Width.
14	RO	0x0	latch_m Do not support latch mode.
13:11	RO	0x1	phy_type Support pipe phy.
10	RO	0x1	return_err Support amba error response.
9:0	RO	0x000	reserved

SATA_GPARAM2R

Address: Operational Base + offset (0x00EC)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19	RO	0x0	bist_m The options for this field are: 0: FIS, 1: DWORD.
18:16	RO	0x0	reserved
15	RO	0x0	fbs_support The options for this field are: 0: Exclude, 1: Include.
14	RO	0x0	reserved
13	RO	0x0	dev_mp The options for this field are: 0: Exclude, 1: Include.
12	RO	0x0	encode_m The options for this field are: 0: Exclude, 1: Include.
11	RO	0x1	rxoob_clk_m The options for this field are: 0: RxClock, 1: Separate.
10	RO	0x0	rx_oob_m The options for this field are: 0: Exclude, 1: Include.
9	RO	0x0	tx_oob_m The options for this field are: 0: Exclude, 1: Include.

Bit	Attr	Reset Value	Description
8:0	RO	0x032	rxoob_clk_lower Rx OOB Clock Frequency (Lower).

SATA_TESTR

Address: Operational Base + offset (0x00F4)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:24	RW	0x0	bsel This field is used to select a bank for BIST or Data Protection operation or Address Protection operation. The options for this field are: 0x0: BIST registers selected 0x1: Data Protection registers selected 0x2: Address Protection registers selected 0x3: Reserved.
23:19	RO	0x00	reserved
18:16	RW	0x0	psel This field is used to select a Port for BIST operation. The options for this field are: 0x0: Port0 is selected 0x1: Port1 is selected 0x2: Port2 is selected 0x3: Port3 is selected 0x4: Port4 is selected 0x5: Port5 is selected 0x6: Port6 is selected 0x7: Port7 is selected.
15:1	RO	0x0000	reserved
0	RW	0x0	test_if This bit is used to put the slave interface into the test mode. The options for this field are: 0: Normal mode: the read back value of some registers is a function of the state and does not match the value written. 1: Test mode: the read back value of the registers matches the value written. Normal operation is disabled.

SATA_IDR

Address: Operational Base + offset (0x00FC)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	id Hard-coded hexadecimal identification value.

SATA_CLB

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	clb Indicates the 32-bit base physical address for the command list for this Port. This base is used when fetching commands to execute. The structure pointed to by this address range is 1 KB in length. This address must be 1-KB-aligned as indicated by bits [9:0] being read only.
9:0	RO	0x000	reserved

SATA_FB

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	fb Indicates the 32-bit base physical address for received FISes. The structure pointed to by this address range is 256 bytes in length. This address must be 256byte-aligned as indicated by bits [7:0] being read only.
7:0	RO	0x00	reserved

SATA_PIS

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31	RW	0x0	cpds This bit is set when the P_cp_det input changes its state due to the insertion or removal of the device.
30	RW	0x0	tfes This bit is set whenever the PTFD.STS register is updated by the device and the error bit [0] is set.
29	RW	0x0	hbfs This bit is set when AXI Master detects an ERROR response from the slave. Port DMA transitions to a fatal state until the software clears PCMD.ST bit or resets the interface by way of Port or Global reset.
28	RW	0x0	hbds This bit is always cleared to 0.
27	RW	0x0	ifs This bit is set when any of the following conditions are detected: SYNC escape is received from the device during non-Data or Data FIS transmission or reception (PSERR.DIAG_S and ERR_P are set); One or more of the following errors are detected during Data FIS transfer: Protocol (PSERR.ERR_P) CRC (PSERR.DIAG_C) Handshake (PSERR.DIAG_H) PHY Not Ready (PSERR.ERR_C) Unknown FIS is received with good CRC, but the length exceeds 64 bytes; PRD table byte count is zero; DMA Setup FIS is received with a TAG corresponding to inactive (PSACT bit is cleared) command slot; RAM address protection error detected (when hardware configuration parameter MEM_AP_SUPPORT is set to Include, and the MEM_AP_ERRFB_EN is set to Include, and the MEMDPCR.MEM_ADDR_ED_IFS_DIS register bit is set to 0); and/or Uncorrected error detected (when hardware configuration parameter MEM_DP_SUPPORT is set to Include, and the MEMDPCR.MEM_ED_IFS_DIS register bit is set to 0). Port DMA transitions to a fatal state until the software clears PCMD.ST bit or resets the interface by way of Port or Global reset.

Bit	Attr	Reset Value	Description
26	RW	0x0	infs This bit is set when any of the following conditions are detected: One or more of the following errors are detected during non-data FIS transfer: Protocol (PnSERR.ERR_P) CRC (PnSERR.DIAG_C) Handshake (PnSERR.DIAG_H) PHY Not Ready (PnSERR.ERR_C) Command list underflow during read operation (such as, DMA read) when the software builds command table that has more total bytes than the transaction given to the device Corrected error detected (when hardware configuration parameter MEM_DP_SUPPORT is set to Include, MEM_DP_TYPE is set to ECC, and the MEMDPCR.MEM_ED_CE_EN register bit is set to 1) In both cases Port operation continues normally. When error is detected during non-data FIS transmission, this FIS is retransmitted continuously until it succeeds, or until the software times out and resets the interface.
25	RO	0x0	reserved
24	RW	0x0	ofs This bit is set when command list overflow is detected during read or write operation when the software builds command table that has fever total bytes than the transaction given to the device. Port DMA transitions to a fatal state until the software clears PnCMD.ST bit or resets the interface by way of Port or Global reset.
23	RW	0x0	ipms Indicates that the HBA received a FIS from a device whose Port Multiplier field did not match what was expected. This bit may be set during enumeration of devices on a Port Multiplier due to the normal Port Multiplier enumeration process. The software must use the IPMS bit only after enumeration is complete on the Port Multiplier.
22	RW	0x0	prcs This bit reflects the state of the PnSERR.DIAG_N bit. When set to 1, indicates the internal Pn_phy_ready signal changed state. To clear this bit, the software must clear the PnSERR.DIAG_N bit to 0.
21:8	RO	0x0000	reserved
7	RW	0x0	dmps This bit is set when the Pn_mp_switch input changes its state as a result of a mechanical switch attached to this Port opening or closing. This bit is valid only when both CAP.SMPS and PnCMD.MPSP are set.
6	RO	0x0	pcs This bit reflects the state of the PnSERR.DIAG_X bit: 1: Change in Current Connect Status; 0: No change in Current Connect Status. This bit is cleared only when PnSERR.DIAG_X is cleared.
5	RW	0x0	dps A PRD with the I bit set has transferred all of its data.

Bit	Attr	Reset Value	Description
4	RO	0x0	ufs When set to 1, indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by the software clearing the PnSERR.DIAG_F bit to 0.
3	RW	0x0	sdbs A Set Device Bits FIS has been received with the 'I' bit set and has been copied into system memory.
2	RW	0x0	dss A DMA Setup FIS has been received with the 'I' bit set and has been copied into system memory.
1	RW	0x0	pss A PIO Setup FIS has been received with the 'I' bit set, it has been copied into system memory, and the data related to that FIS has been transferred.
0	RW	0x0	dhrs A Device-to-Host Register FIS has been received with the 'I' bit set, and has been copied into system memory.

SATA_PIE

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31	RW	0x0	cpde Enable Cold Port Detect.
30	RW	0x0	tfee Enable Task File Error.
29	RW	0x0	hbfe Host Bus Fatal Error Enable.
28	RW	0x0	hbde Host Bus Data Error Enable.
27	RW	0x0	ife Interface Fatal Error Enable.
26	RW	0x0	infe Interface Non-Fatal Error Enable.
25	RO	0x0	reserved
24	RW	0x0	ofe Overflow Enable.
23	RW	0x0	ipme Incorrect Port Multiplier Enable.
22	RW	0x0	prce PHY Ready Change Enable.
21:8	RO	0x0000	reserved
7	RW	0x0	dmpe Device Mechanical Presence Status Enable.
6	RO	0x0	pce Port Connect Change Status Enable.
5	RW	0x0	dpe Descriptor Processed Enable.
4	RO	0x0	ufe Unknown FIS Interrupt Enable.
3	RW	0x0	sdbe Set Device Bits Interrupt Enable.
2	RW	0x0	dse DMA Setup FIS Interrupt Enable.

Bit	Attr	Reset Value	Description
1	RW	0x0	pse PIO Setup FIS Interrupt Enable.
0	RW	0x0	dhre Device-to-Host Register FIS Interrupt Enable.

SATA_CMD

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	icc This field is used to control power management states of the interface. When the Link layer is currently in the L_IDLE state or L_NoCommPower state, writes to this field cause the Port to initiate a transition to the interface power management state requested. When the Link layer is not currently in the L_IDLE state or L_NoCommPower, writes to this field have no effect. Else: Reserved 0x6: Slumber. This causes the Port to request a transition of the interface to the Slumber state. The SATA device can reject the request and the interface remains in its current state. 0x2: Partial. This causes the Port to request a transition of the interface to the Partial state. The SATA device can reject the request and the interface remains in its current state. 0x1: Active. This causes the Port to request a transition of the interface into the active state.
27	RW	0x0	asp The options for this field are: When set to 1, and PnCMD.ALPE=1, the Port aggressively enters the SLUMBER state when one of the following conditions is true: The Port clears the PnCI and the PnSACT register is cleared. The Port clears the PnSACT register and PnCI is cleared. When cleared to 0, and PnCMD.ALPE=1, the Port aggressively enters the PARTIAL state when one of the following conditions is true: The Port clears the PnCI register and the PnSACT register is cleared. The Port clears the PnSACT register and PnCI is cleared.
26	RW	0x0	alpe When set to 1, the Port aggressively enters a lower link power state (PARTIAL or SLUMBER) based on the setting of the PnCMD.ASP bit. When cleared to 0, aggressive power management state transition is disabled.
25	RW	0x0	dlae When set to 1, PnCMD.ATAPI=1, and commands are active, the Port asserts Pn_act_led output .
24	RW	0x0	atapi This bit is used by the Port to control whether to assert Pn_act_led output when commands are active. The options for this field are: 0: non-ATAPI device 1: ATAPI device

Bit	Attr	Reset Value	Description
23	RW	0x0	apste When this bit is set and the DWC_ahsata Link layer negotiates Partial power management state with the device, it transitions into the Slumber state directly, regardless whether it was host software-, Port (aggressive)-, or device-initiated.
22	RW	0x0	fbscp When set to 1, indicates that this Port supports Port Multiplier FIS-based switching. When cleared to 0, indicates that this Port does not support FIS-based switching. This bit may only be set to 1.
21	RW	0x0	esp When set to 1, indicates that this Port's signal only connector is externally accessible. When set to 1, CAP.SXS is also set to 1. When cleared to 0, indicates that this Port's signal only connector is not externally accessible.
20	RW	0x0	cpd To enable the cold presence detection feature, DEV_CP_DET must be set to Include. Otherwise this bit is read-only '0' on reset. The options for this field are: 1: Platform supports cold presence detection on this Port. When this bit is set to 1, PnCMD.HPCP must also be set to 1. 0: Platform does not support cold presence detection on this Port.
19	RW	0x0	mpsp To enable the mechanical presence detection feature. The options for this field are: 1: Indicates the platform supports a mechanical presence switch attached to this Port. 0: Indicates the platform does not support a mechanical presence switch attached to this Port. When this bit is set to 1, PnCMD.HPCP should also be set to 1.
18	RW	0x0	hpcp The options for this field are: 1: Indicates that this Port's signal and power connectors are externally accessible via a joint signal-power connector for blindmate device hot plug. 0: Indicates that this Port's signal and power connectors are not externally accessible.
17	RO	0x0	pma The software is responsible for detecting whether a Port Multiplier is present; the Port does not auto-detect the presence of a Port Multiplier. The options for this field are: 1: A Port Multiplier is attached to this Port. 0: A Port Multiplier is not attached to this Port.
16	RO	0x0	cps This bit reports whether a device is currently detected on this Port as indicated by the Pn_cp_det input state (assuming PnCMD.CPD=1). The options for this field are: 1: device is attached to this Port 0: no device attached to this Port
15	RO	0x0	cr When this bit is set to '1', the command list DMA engine for this Port is running.

Bit	Attr	Reset Value	Description
14	RO	0x0	fr When set to '1', the FIS Receive DMA engine for the Port is running.
13	RO	0x0	mpss The software must use this bit only when both CAP.SMPS and PnCMD.MPSP are set. This bit reports the state of a mechanical presence switch attached to this Port as indicated by the Pn_mp_switch input state (assuming CAP.SMPS=1 and PnCMD.MPSP=1). The options for this field are: 0: Switch is closed 1: Switch is open When CAP.SMPS=0 then this bit is cleared to 0.
12:8	RW	0x00	ccs This field is set to the command slot value of the command that is currently being issued by the Port. When PnCMD.ST transitions from 1 to 0, this field is cleared again to 0x00. After PnCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PnCMD.CCS+1. For example, after the Port has issued its first command, when CCS=0x00 and PnCI is set to 0x3, the next command issued is from command slot 1. This field is valid only when PnCMD.ST is set to 1.
7:5	RO	0x0	reserved
4	RW	0x0	fre When set to 1, the Port may post received FISes into the FIS receive area pointed to by PnFB (and PnFBU when M_HADDR_WIDTH=64). When cleared, received FISes are not accepted by the Port, except for the first D2H register FIS after the initialization sequence, and no FISes are posted to the FIS receive area. The software must not set this bit until PnFB (PnFBU) has been programmed with a valid pointer to the FIS receive area. When the software wishes to move the base, this bit must first be cleared, and the software must wait for the PnCMD.FR bit to be cleared.
3	RW	0x0	clo Setting this bit to 1 causes PnTFD.STS.BSY and PnTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PnTFD.STS register. This bit is cleared to 0 when PnTFD.STS.BSY and PnTFD.STS.DRQ have been cleared to 0. A write to this register with a value of '0' has no effect. This bit should only be set to 1 immediately prior to setting PnCMD.ST bit to 1 from a previous value of 0. Setting this bit to 1 at any other time is not supported and results in indeterminate behavior.

Bit	Attr	Reset Value	Description
2	RW	0x0	pod This bit is read/write when cold presence detection is supported on this Port as indicated by PnCMD.CPD=1. This bit is read-only 1 when cold presence detection is not supported and PnCMD.CPD=0. When set, the Port asserts the Pn_cp_pod output pin so that it may be used to provide power to a cold-presence detectable Port.
1	RW	0x0	sud This bit is read/write when staggered spin-up is supported as indicated by the CAP.SSS=1. This bit is read-only 1 when staggered spin-up is not supported and CAP.SSS=0. On an edge detect from 0 to 1, the Port starts a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface.
0	RW	0x0	st When set to 1, the Port processes the command list. When cleared, the Port does not process the command list. Whenever this bit is changed from a 0 to a 1, the Port starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PnCI register is cleared by the Port upon transition into an idle state.

SATA_TFD

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	err This field contains the latest copy of the task file error register.
7:0	RO	0x00	sts This field contains the latest copy of the task file status register. The bits that affect DWC_ahsata operation are: Bit [7] BSY: Indicates the interface is busy Bits [6:4] cs: Command specific Bit [3] DRQ: Indicates a data transfer is requested Bits [2:1] cs: Command specific Bit [0] ERR: Indicates an error during the transfer

SATA_SIG

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	sig This field contains the signature received from a device on the first D2H Register FIS. The bit order as follows: Bits [31:24]: LBA High (Cylinder High) Register Bits [23:16]: LBA Mid (Cylinder Low) Register Bits [15:8]: LBA Low (Sector Number) Register Bits [7:0]: Sector Count Register This field is updated once after a reset sequence (cause by asynchronous, port, or soft reset). Reset on Global or Port reset.

SATA_SSTS

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
11:8	RO	0x0	ipm Indicates the current interface state. The options for this field are: 0x0: Device not present or communication not established 0x1: Interface in Active state 0x2: Interface in Partial power management state 0x6: Interface in Slumber power management state 0x8: Interface in DevSleep power management state
7:4	RO	0x0	spd Indicates the negotiated interface communication speed. The options for this field are: 0x0: Device not present or communication not established 0x1: 1.5 Gb/s communication rate negotiated 0x2: 3.0 Gb/s communication rate negotiated 0x3: 6.0 Gb/s communication rate negotiated
3:0	RO	0x0	det Indicates the interface device detection and PHY state. The options for this field are: 0x0: No device detected and PHY communication not established 0x1: Device presence detected but PHY communication not established (COMINIT is detected) 0x3: Device presence detected and PHY communication established ('PHY Ready' is detected) 0x4: PHY in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved.

SATA_SCTL

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:8	RW	0x0	ipm This field indicates which power states the Port PHY interface is allowed to transition to. When an interface power management state is disabled, the Port does not initiate that state and any request from the device to enter that state is rejected via PMNAKp. The options for this field are: 0x0: No interface power management state restrictions 0x1: Transitions to the Partial state disabled 0x2: Transitions to the Slumber state disabled 0x3: Transitions to both Partial and Slumber states disabled.
7:6	RO	0x0	reserved
5:4	RW	0x0	spd This field indicates the highest allowable speed of the Port PHY interface. The options for this field are: 0x0: No speed negotiation restrictions 0x1: Limit speed negotiation to SATA 1.5 Gb/s communication rate 0x2: Limit speed negotiation to SATA 3.0 Gb/s communication rate 0x3: Limit speed negotiation to a rate not greater than SATA 6.0 Gb/s communication rate.
3	RO	0x0	reserved

Bit	Attr	Reset Value	Description
2:0	RW	0x0	det Controls the Port's device detection and interface initialization. The options for this field are: 0x0: No device detection or initialization action requested 0x1: Perform interface initialization sequence to establish communication. This results in the interface being reset and communication re initialized. Assert the corresponding Pn_phy_reset(_n) output when DET=0x1. It negates Pn_phy_reset(_n) and sends COMRESET OOB sequence when DET=0x0. 0x4: Disable the Serial ATA interface and put the Port PHY in offline mode.

SATA_SERR

Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26	RW	0x0	diag_x This bit is set to 1 when PHY COMINIT signal is detected. This bit is reflected in the PnIS.PCS bit.
25	RW	0x0	diag_f This bit indicates that one or more FISes were received by the Transport layer with good CRC, but had a type field that was not recognized/known and the length was less than or equal to 64 bytes.
24	RW	0x0	diag_t This bit indicates that a Transport Layer protocol violation was detected since the last time this bit was cleared.
23	RW	0x0	diag_s This bit indicates that one or more Link state machine error conditions was encountered. One of the conditions that cause this bit to be set is device doing SYNC escape during FIS transmission.
22	RW	0x0	diag_h This bit indicates that one or more R_ERRp was received in response to frame transmission. Such errors may be the result of a CRC error detected by the device, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame.
21	RW	0x0	diag_c This bit indicates that one or more CRC errors were detected by the Link layer during FIS reception.
20	RO	0x0	diag_d This bit is always cleared to 0 since it is not used by the AHCI specification.
19	RW	0x0	diag_b This bit indicates errors were detected by 10b/8b decoder.
18	RW	0x0	diag_w This bit is set when PHY COMWAKE signal is detected.
17	RW	0x0	diag_i This bit is set when the PHY detects some internal error as indicated by the assertion of the Pn_phy_rx_err input.
16	RW	0x0	diag_n This bit indicates that the PHY Ready signal changed state. This bit is reflected in the PnIS.PRCS bit.

Bit	Attr	Reset Value	Description
15:12	RO	0x0	reserved
11	RW	0x0	err_e This bit is set to 1 when one or more AXI bus ERROR responses are detected on the master interface.
10	RW	0x0	err_p This bit is set to 1 when any of the following conditions are detected. Transport state transition error (DIAG_T) Link sequence error (DIAG_S) RX FIFO overflow Link bad end error (WTRM instead of EOF is received).
9	RW	0x0	err_c This bit is set to 1 when PHY Ready signal is negated due to the loss of communication with the device or problems with interface, but not after transition from active to Partial or Slumber power management state.
8	RW	0x0	err_t This bit is set when any of the following PnSERR register bits are set during Data FIS transfer: ERR_P (Protocol) DIAG_C (CRC) DIAG_H (Handshake) ERR_C ('PHY Ready' negation) .
7:2	RO	0x00	reserved
1	RW	0x0	err_m This bit is set to 1 when the PHY Ready condition is asserted under the following conditions: At any time except when there is a transition from power-down mode to Active state After interface initialization (after power on or COMRESET) .
0	RW	0x0	err_i This bit is set when any of the following PnSERR register bits is set during non-Data FIS transfer: ERR_P (Protocol) DIAG_C (CRC) DIAG_H (Handshake)

SATA_SACT

Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ds This field is bit significant. Each bit corresponds to the TAG and command slot of a native queued command, where bit 0 corresponds to TAG 0 and command slot 0. Software sets this field prior to issuing a native queued command for a particular command slot. Prior to writing PnCI[TAG] to 1, the software sets DS[TAG] to 1 to indicate that a command with that TAG is outstanding. This field is cleared to 0 when: The software writes PnCMD.ST from a 1 to a 0. The device sends a Set Device Bits FIS to the Port. The Port clears bits in this field that are set in the SActive field of the Set Device Bits FIS. The Port clears only bits that correspond to native queued commands that have completed successfully. This field is not cleared by the following: Port reset (COMRESET). Software reset.

SATA_CI

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ci This field is bit significant. Each bit corresponds to a command slot, where bit 0 corresponds to command slot 0. This field is set by the software to indicate to the Port that a command has been built in system memory for a command slot and may be sent to the device. When the Port receives a FIS which clears the BSY, DRQ, and ERR bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field can only be set to 1 by the software when PnCMD.ST is set to 1.

SATA_SNTF

Address: Operational Base + offset (0x013C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	pmn This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the DWC_ahsata Port with the Notification bit set: PM Port 0x0 sets bit 0. PM Port 0x1 sets bit 1. ... PM Port 0xF sets bit 15. Individual bits are cleared by the software writing 1s to the corresponding bit positions. This field is reset on Global reset, but it is not reset by Port reset (COMRESET) or software reset.

SATA_FBS

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:16	RO	0x0	dwe This field is set by the sata controller to the value of the Port Multiplier port number of the device that experienced a fatal error condition. This field is only valid when PFBS.SDE=1.
15:12	RW	0x0	ado This field is hard-wired to the FBS_PMPN_MAX value.
11:8	RW	0x0	dev Software sets this field to the Port Multiplier port value of the next command to issue. This field enables the sata controller to know the port the command to be issues to without fetching the command header. Software should not issue commands to multiple Port Multiplier ports on the same write of the PCI register. This bit is reset on Global reset.
7:3	RO	0x00	reserved
2	RW	0x0	sde When this field is set to 1 and a fatal error condition has occurred, the sata controller believes the error is localized to one device such that software's first error recovery step should be to utilize the PFBS.DEC functionality. When cleared to 0 and a fatal error condition has occurred, the error applies to the entire Port. To clear the error, software should clear PCMD.ST to 0. This bit is cleared on PFBS.DEC being set to 1 or on PCMD.ST being cleared to 0. This bit is reset on Global reset.
1	RW	0x0	dec When set to 1 by software, the sata controller clears the device-specific error condition. It flushes any commands outstanding for the device that experienced the error, including clearing PCI and PSACT bits for that device to 0. The sata controller clears this bit to 0 when it completes error recovery actions. When software writes a 0 to this bit, there is no effect. Software should only set this bit to 1 if PFBS.EN=1 and PFBS.SDE=1. This bit is reset on Global reset.
0	RW	0x0	en 1: A Port Multiplier is attached and the DWC_ahsata uses FIS-based switching to communicate with it. 0: FIS-based switching is not being used (command-based switching is used instead). Software should only change the value of this bit when PCMD.ST=0. This bit is reset on Global reset.

SATA_DMACR

Address: Operational Base + offset (0x0170)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:4	RW	0x0	rxts This field defines the Port DMA transaction size in FIFO words for receive (system bus write, device read) operation. The options for this field are: 0x0: 1 0x1: 2 0x2: 4 0x3: 8 0x4: 16 0x5: 32 0x6: 64 0x7: 128 0x8: 256 0x9: 512 0xA: 1024 All other values are reserved and should not be used. This field is read-write when PnCMD.ST=0 and read-only when PnCMD.ST=1.
3:0	RW	0x0	txts This field defines the DMA transaction size in FIFO words for transmit (system bus read, device write) operation. The options for this field are: 0x0: 1 0x1: 2 0x2: 4 0x3: 8 0x4: 16 0x5: 32 0x6: 64 0x7: 128 0x8: 256 0x9: 512 0xA: 1024 All other values are reserved and should not be used. This field is read-write when PnCMD.ST=0 and read-only when PnCMD.ST=1.

19.6 Application Notes

19.6.1 Data transfer

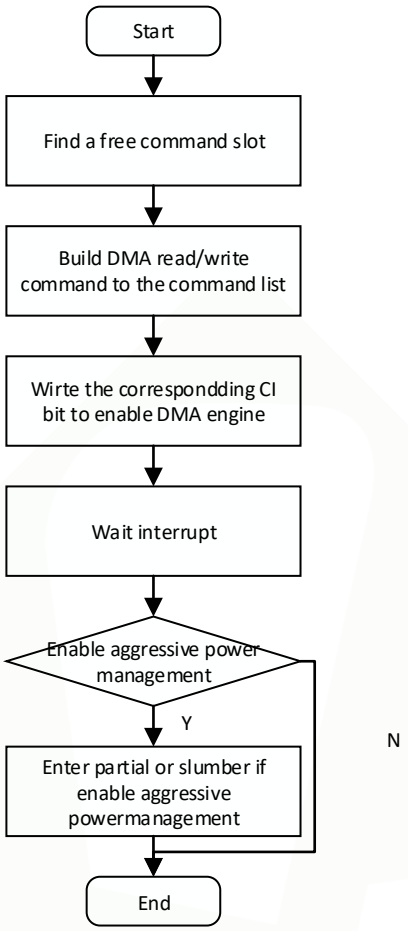

Fig. 19-2 Data transfer flow

19.6.2 Port multiple support

When a port is connected to a Port Multiplier, software must first enumerate it by issuing software reset to Port 0xF(control Port) on the Port Multiplier. When the signature returned corresponds to a Port Multiplier, then a Port Multiplier is attached. When the signature returned corresponds to another device type, then a Port Multiplier is not attached.

The SATA host provides command list override feature via CMD.CLO to help software reliably enumerate the Port Multiplier:

- software ensures that CMD.ST bit is 0;
- software constructs the two register FISes required for a software reset in the command list, where the PM port field value in the register FIS is set to 0xF;
- software set CMD.CLO to 1 to force the BSY and DRQ bits in the TFD register to be cleared;
- software sets CMD.ST bit to 1 and set appropriate CI bits in order to begin execution of the software reset command.

19.6.3 Interrupt

The SATA host uses two-tiered interrupt structure.

First tier(GIS register)

The first tier is identified by the GIS and GHC registers. GHC.IE bit enables interrupts for the entire host: when it is cleared, intrq output is not asserted regardless of any bits set in the GIS register. GHC.IE bit acts as a mask and does not affect the setting of any interrupt status bits.

Second tier(PIS registers)

The second tier is identified in each port through the PIS(status) and PIE(interrupt enable) register. The PIS register has various interrupt bits that can be individually enabled or disabled by setting the corresponding bit in the PIE. The status bit in the PIS is always set regardless of the setting of the corresponding PIE bit.

19.6.4 reset condition

System reset

System bus resets SATA host by asserting aresetn=0. It is usually initiated on power-up or during system bus failure. All components of the host are initialized, including ports, Generic registers, BIU.

Global reset

Software may globally reset host by setting GHC.HR to 1. When software sets the GHC.HR bit to 1, the host performs an internal reset action, then clears this bit to 0 when the reset is complete. A software write of 0 to GHC.HR has no affect.
Port reset (COMRESET)
Software causes a Port reset by writing 1h to the SCTL.DET field to invoke COMRESET on the interface and start a re-establishment of the PHY Layer communication. Software should wait at least 1ms before clearing SCTL.DET to 0h. After clearing SCTL.DET to 0h, software should wait for communication to be re-established as indicated by 0 of SSTS.DET being set to 1. Then software should write all ones to SERR register to clear any bits that were set as part of the Port reset.
Software reset
Software builds two H2D register FISes in the command list. The first register FIS has the SRST bit set to 1 in the control field of the register FIS, the “C” bit is cleared to “0” in the register FIS, and the command table has the CH[R] (reset) and CH[C] (clear BSY ON R_OK) bits set to “1”. The CH[R] bit causes the Port to perform a SYNC escape when necessary to put the device into an idle condition before sending the software reset. The CH[C] bit needs to be set for the first register FIS to clear the BSY bit and proceed to issue the next register FIS since the device does not send a response to the first register FIS in a software reset sequence. The second register FIS has SRST=”0” in the control field of the register FIS, the “C” bit is cleared to “0” in the register FIS, and the command tables has the CH[R] and CH[C] bits cleared to “0”. When issuing a software reset sequence, there should not be other commands in the command list. Before issuing the software reset, software must clear CMD.ST, wait for the Port to be idle, and then re-set CMD.ST. TFD.STS.BSY and TFD.STS.DRQ must be cleared prior to issuing the reset. When TFD.STS.BSY or TFD.STS.DRQ is still set based on the failed command, then a Port reset should be attempted or command list override should be used.

19.6.5 Staggered spin-up

The CMD.SUD bit is used to manipulate the PHY behavior. SCTL.DET and CMD.SUD must be set correctly in order to avoid illegal combinations of the two values. Table 1-1 describes interaction between the CMD.SUD and SCTL.DET bits.

Table 19-2 CMD.SUD and SCTL.DET interaction

SCTL.DET	CMD.SUD	Mode	Behavior
0	0		Interface is in a reduced power state. When COMINIT is received then SERR.DIAG_X is set and no response is sent to the device COMWAVE is ignored. The application must place the Port into this state only when no device is detected as connected to this Port. In this mode, the Port forces the PHY into a low power state without requesting a SLUMBER transition on the link.
0	0->1		Port sends COMRESET, begins initialization sequence.
0	1		Normal operating state when the Port is performing data transfer.
1	0	Illegal	This combination is prohibited in hardware, i.e. CMD.SUD can not be cleared when SCTL/DET=1h, and SCTL.DET can not be set to 1h when CMD.SUD=0.
1	1	Reset	Port continuously transmits COMRESET and does not listen for COMINIT. When COMINIT is received in this state, the SERR.DIAG_X bit is set.
1->0	1	Initialize	Port stops sending COMRESET, being initialization sequence
4	N/A	Off	Port PHY is off.

Software must only clear CMD.SUD when it believe that no device is attached. In listen mode, the Port PHY enters a reduced power state, equivalent to the SLUMBER power management state. The Port PHY enters this state without negotiating a transition to SLUMBER on the link, as asking for a transition to SLUMBER when no device is attached fails, and therefore the PHY remains in a high power state. To avoid this software should ensure that SSTS.DET=0x0 indicating that no device is present before clearing CMD.SUD.

19.6.6 Activity LED

The CAP.SAL=1 indicates that the activity LED feature is enabled to software. Act_led outputs is used to drive an external LED based upon activity of the Port:

- 1 - LED On
- 0 - LED Off

The port drives the LED active if:

- (CI!=0 or SACT!=0) and CMD.ATAPI = 0
- (CI!=0 or SACT!=0) and CMD.ATAPI = 1 and CMD.DLAE = 1

The Port drives the LED off when CI and SACT are both cleared to 0.

19.6.7 Asynchronous notification

The SATA host supports asynchronous notification feature as indicated by the CAP.SSNT=1. This feature allows an ATAPI device to send a signal to the host when media is inserted or removed and avoid polling the device for media changes. The signal sent to the host is Set Device Bits FIS with the "I" and "N" bits set to "1".

To use asynchronous notification, software should set the IS.SDBS bit to enable interrupt notification on a Set Device Bits FIS. When accesses to the ATAPI device are idle, software should place the device in a low power state. When the device has media change, it signals this to the host with a Set Device Bits FIS. In response to receiving a IS.SDBS interrupt on an idle Port, the software should interrogate the device to determine the cause of the interrupt.

The first DWORD of any FIS received by the host contains a 4-bit Port Multiplier field. The PM port field indicates which Port behind the Port Multiplier issued the FIS to the host. When a set device bits FIS is received by the host and "N" bit is set, the bit position in the SNTF register corresponding to the PM Port field is set. The host sets the IS.SDBS to "1" when the "I" bit is set in the set device bits FIS. This causes an interrupt to be generated when that interrupt is enabled.

19.6.8 BIST operation

18.6.8.1 Loopback responder

Software must ensure that the CMD.ST bit is set, the Port is in idle state, and there are no outstanding commands by checking CI and SACT registers are both cleared, TFD.STS register BSY, DRQ and ERR bits are all cleared.

The host enters one of the BIST loopback responder modes when a corresponding BIST Activate FIS is successfully received from the device and is supported by the host. SSTS.DET field return 4h when read. Since BIST registers' locations are shared between all the active ports, software must first select the Port for BIST operation by writing the Port number to the TESTR.PSEL field before accessing BISTAFR.

The following loopback responder modes are supported by the host:

- Far-end retimed
  - The Port receives BIST activate FIS with pattern definition field=0x10 from the RX FIFO and stores it in the BIST AFR.PD field
  - All the data received from the device in the form of a SATA-compliant pattern is retimed in the Link Layer and transmitted back to the device.
  - Alternately, this mode can be initiated with device disconnected from the Port PHY when software writes BISTCR.FERLB=1. After the device is connected to the host, the device must transmit the number of ALIGNs required for the PHY to sync.
- Far-end analog
  - The Port receives BIST active FIS with pattern definition field =0x08 from the RX FIFO and stores it in the BISTAFR.PD field
  - The Port asserts phy_farafelb signal to the PHY to put it to the Far-end analog loopback mode. The PHY receives and retransmits the raw data without retiming
- Far-end transmit only
  - The Port receives BIST activate FIS with pattern definition field = 0xC0(scrambling is enabled) or 0xE0 (scrambling is bypassed) from the RX FIFO and stores it in the BISTAFR.PD field. The second DWORD of the BIST activate FIS least significant byte is stored in the BISTAFR.NCP field.
  - The Port transmits corresponding a SATA non-compliant test pattern to the device based on the BISTAFR.NCP value:
    - 0xF1: Low transition density pattern(LTDP)
    - 0xB5: High transition density pattern(HTDP)
    - 0xAB:Low frequency spectral component pattern(LFSCP)
    - 0x7F:Simultaneous switching outputs pattern(SSOP)
    - 0x78:Mid frequency test pattern(MFTP)
    - 0x4A:High frequency test pattern(HFTP)
    - 0x7E:Low frequency test pattern(LFTP)

If none of the previous pattern is decoded, the Lone bit pattern(LBP) is transmitted by default.

- Alternately, this mode can be initiated with the device disconnected from the Port PHY when software writes a one to BISTCR.TXO bit. Host transmits non-compliant BIST pattern defined by the value in the BISTCR.PATTERN field.

Loopback responder BIST modes can be exited either when the device signals COMINIT OOB condition, or when the software initiates Port reset.

18.6.8.2 Loopback initiator

The software first selects the Port for BIST operation by writing the Port number to the TESTR.PSEL field, then the required pattern by writing to the BISTCR.PATTERN field.
The software builds a BIST FIS with the required mode in the commands list and sets CTBAz[B]. Once a BIST command is placed into the list, software is not allowed to build any more commands until it clears CMD.ST. After the Port successfully transmits this FIS, it enters this mode and generates/receives the compliant test pattern selected by the BISTCR.PATTERN field.
SSTS.DET return 4h when read. BISTCR and BISTFCTR registers are updated with error/FIS count information for each received BIST FIS.
The following BIST initiator modes can be requested by the software:

- Far-end retimed
  - The host software writes the BISTCR.PATTERN field to select one of the SATA-defined compliant patterns:
    - 0x0:Simultaneous switching outputs pattern(SSOP)
    - 0x1:High transition density pattern (HTDP)
    - 0x2:Low transition density pattern(LTDP)
    - 0x3:Low frequency spectral component pattern(LFSCP)
    - 0x4:Composite pattern(COMP)
    - 0x5:Lone bit pattern(LBP)
    - 0x6:Mid frequency test pattern(MFTP)
    - 0x7:High frequency test pattern(HFTP)
    - 0x8:Low frequency test pattern(LFTP)
  - The software prepares BIST Activate FIS with bits[23:16]=0x10 of the first DWORD in the command list. The Port sends this BIST Activate FIS to the device.
  - After successful transmission of the BIST Activate FIS the Port generates the requested compliant pattern in the form of BIST frames continuously and checks for errors on the receive side.
  - BISTCTR register is updated with received BIST frame count and BISTSR - with frame /burst error count. SERR register is updated with CRC, disparity and 10B8B errors for each frame. BISTFCTR, BISTSR, and BISTDECR registers can be cleared by writing 1 to the BISTCR.CNTCLR bit.
  - To change the pattern, the software issues a Port Reset, write to the BISTCR.PATTERN field to select a new pattern and re-issues the command by setting the CI bit.

- Far-end analog
  - The software prepares BIST Activate FIS with bits[23:16]=0x8 of the first DWORD in the command list. The Port sends this BIST Activate FIS to the device.
  - The operation proceeds as described in the Far-end retimed test above.

- Near-end analog
  - This mode can be initiated either in the PARTIAL power management mode or with the device disconnected from the Port PHY. The software issues a PARTIAL power state request to the device via CMD.ICC field and sets the BISTCR.NEALB bit. The BISTCR.PATTERN field selects the required BIST pattern.
  - The Port asserts phy_nearfelb to the PHY. The PHY loops the data from its transmitter to its receiver and ignores any data coming from the device.

- Far-end transmit only
  - The software prepares BIST Activate FIS in the command list with the second and third DWORDs containing the required pattern, and the first DWORD - with the Pattern definition value corresponding to the required mode - Bit 23 is set, bits

20,19,17 cleared and bits 22,21 and 18 are used to enable the following options:
  - Bit 22 is set - Bypass ALIGN
  - Bit 21 is set - Bypass scrambling
  - Bit 18 is set - primitive bit
- The Port sends this BIST Activate FIS to the device.
- After the device acknowledges the reception of this FIS with R_OKp, the Port disables the PHY receiver and transmitter.

Loopback initiator BIST modes can be terminated either by the device when it signals COMINIT OOB condition(except the near-end analog mode), or when the software initiates Port reset.

19.6.9 command completion coalescing

A command completion coalescing(CCC) feature is used to reduce the interrupt and command completion overhead in a heavily-loaded system. The host generates an interrupt to allow software to process completed commands when either of there conditions is true:

- A software-specified number of commands have completed
- A software-specified time-out has expired

This feature applies to all ports selected to be in the CCC set by software via the CCC_PORTS register.
CCC logic used specific register TIMERIMS to generate 1ms interval based on the application clock frequency. Software must load this register with the required value before enabling the CCC feature: Fappclk*1000, where Fappclk = aclk frequency, in MHz.
Additional Command completion coalescing details and examples can be found in the AHCI specification.

Chapter 20 Gigabit Media Access Controller (GMAC)

20.1 Overview

The Ethernet Quality-of-Service controller(EQOS is commonly referred to as GMAC in this document) provides a complete Ethernet interface from processor to a Reduced Media Independent Interface (RMII) and Reduced Gigabit Media Independent Interface (RGMII) compliant Ethernet PHY. The GMAC includes a DMA controller. The DMA controller efficiently moves packet data from microprocessor's RAM, formats the data for an IEEE 802.3-2002 compliant packet and transmits the data to an Ethernet Physical Interface (PHY). It also efficiently moves packet data from RXFIFO to microprocessor's RAM.

20.1.1 MAC Features

20.1.1.1 MAC Tx and Rx Common Features

- Supports 10/100/1000-Mbps data transfer rates with the RGMII interfaces
- Supports 10/100-Mbps data transfer rates with the RMII interfaces
- Half-duplex operation:
  - CSMA/CD Protocol support
  - Flow control using backpressure support (based on implementation-specific white papers and UNH Ethernet Clause 4 MAC Test Suite - Annex D)
  - Packet bursting and packet extension in 1000 Mbps half-duplex operation
- Standard IEEE 802.3az-2010 for Energy Efficient Ethernet in Reduced Gigabit Media Independent Interface (RGMII) PHYs
- 64-bit data transfer interface on the application side
- Full-duplex flow control operations (IEEE 802.3x Pause packets and Priority flow control)
- network statistics with RMON or MIB Counters (RFC2819/RFC2665)
- Support Ethernet packet timestamping as described in IEEE 1588-2002 and IEEE 1588-2008 (64-bit timestamps given in the Tx or Rx status of PTP packet). Both one-step and two-step timestamping is supported in TX direction
- Media clock generation and recovery
- MDIO (Clause 22 and Clause 45) master interface for PHY device configuration and management

20.1.1.2 MAC Tx Features

- Preamble and start of packet data (SFD) insertion
- Separate 32-bit status for each packet transmitted from the application
- Automatic CRC and pad generation controllable on a per-packet basis
- Programmable packet length to support Standard or Jumbo Ethernet packets with up to 16 KB of size
- Programmable Inter Packet Gap (40–96 bit times in steps of 8)
- IEEE 802.3x Flow Control automatic transmission of zero-quanta Pause packet when flow control input transitions from assertion to de-assertion (in full-duplex mode)
- Frame Preemption for MAC Tx

20.1.1.3 MAC Rx Features

- Automatic Pad and CRC Stripping options
- Option to disable Automatic CRC checking
- Preamble and SFD deletion
- Separate 112-bit or 128-bit status
- Programmable watchdog timeout limit
- IEEE 802.1Q VLAN tag detection and option to delete the VLAN tags in received packets
- Optional module to detect remote wake-up packets and AMD magic packets
- Optional forwarding of received Pause packets to the application (in full-duplex mode)
- Frame Preemption for MAC Rx

20.1.2 MTL Features

20.1.2.1 MTL Tx and Rx Common Features

- 32-bit, 64-bit, or 128-bit Transaction Layer block (bridges the application and the MAC)
- Data transfers executed using simple FIFO protocol
- Synchronization for all clocks in the design (Transmit, Receive, and Application clocks)
- Optimization for packet-oriented transfers with packets delimiters
- Option to have dual-port RAM based asynchronous FIFO controllers or Single-port RAM based synchronous FIFO controllers

- RAM memory instantiation outside the top-level module to facilitate memory testing or instantiation
- Programmable burst length, up to half the size of the MTL Rx queue or Tx queue size, to support burst data transfer in the EQOS-MTL configuration
- Programmable threshold capability for each queue (default of 64 bytes)
- Optional Debug and slave mode operation on Queue 0 (default queue)

20.1.2.2 MTL Tx Features

- TX FIFO sizes on transmission is 16 KB
- Store-and-Forward mechanism or threshold mode (cut-through) for transmission to the MAC
- Programmable queue size in configurations with multiple queues. Each queue size can be programmed in terms of 256 bytes
- Automatic retransmission of collision packets in half-duplex mode
- Discard packets on late collision, excessive collisions, excessive deferral, and under-run conditions with appropriate status
- Disabling of Data Memory RAM chip-select when inactive to reduce power consumption
- Optional module to calculate and insert IPv4 header checksum and TCP, UDP, or ICMP checksum
- Programmable interrupt options for different operational conditions
- Statistics by generating pulses for packets dropped (because of underflow) in the Tx FIFO

20.1.2.3 MTL Rx Features

- Rx queue sizes in the Receive path is 32 KB
- Insertion of Rx Status vectors into the Rx queue after the EOP transfer (in Threshold mode) and before SOP (in Store-and-Forward mode) in EQOS-MTL configuration
- Programmable Rx queue threshold (default fixed at 64 bytes) in Threshold (or cut-through) mode
- Option to filter all error packets on reception and not forward them to the application in the store-and-forward mode
- Option to forward the undersized good packets
- Statistics by generating pulses for packets dropped (because of overflow) in the Rx FIFO
- Automatic generation of Pause packet control or backpressure signal to the MAC based on the Rx Queue fill level
- Option to replicate received multicast packets for transfer by multiple Rx DMA channels
- Option to have a programmable lookup table based flexible Parser for filtering and steering the Rx packets

20.1.3 DMA Block Features

- 64-bit data transfers
- Separate DMA channel in the Transmit path for each queue in MTL
- Single or multiple DMA channels for any number of queues in MTL Receive path
- Fully synchronous design operating on a single application clock (except for CSR module, when a separate CSR clock is configured)
- Optimization for packet-oriented DMA transfers with packet delimiters
- Byte-aligned addressing for data buffer support
- Dual-buffer (ring) descriptor support
- Descriptor architecture to allow large blocks of data transfer with minimum CPU intervention (each descriptor can transfer up to 32 KB of data)
- Comprehensive status reporting for normal operation and transfers with errors
- Individual programmable burst length for Tx DMA and Rx DMA engines for optimal host bus utilization
- Programmable interrupt options for different operational conditions
- Per-packet Transmit or Receive Complete Interrupt control
- Round-robin or fixed-priority arbitration between the Receive and Transmit engines
- Start and Stop modes
- Separate ports for host CSR access and host data interface
- support for TCP Segmentation Offload (TSO) and UDP Segmentation Offload (USO)
- Selectable number of Tx DMA channels with TSO/USO feature enabled
- Time-sensitive conditional packet fetching from system memory by comparing the Slot

Time or IEEE 1588 time information provided in the descriptor (useful for AV applications)

- Programmable control for Transmit Descriptor posted writes to improve the throughput
- Sideband signals to control starting and stopping of DMA channels

20.2 Block Diagram

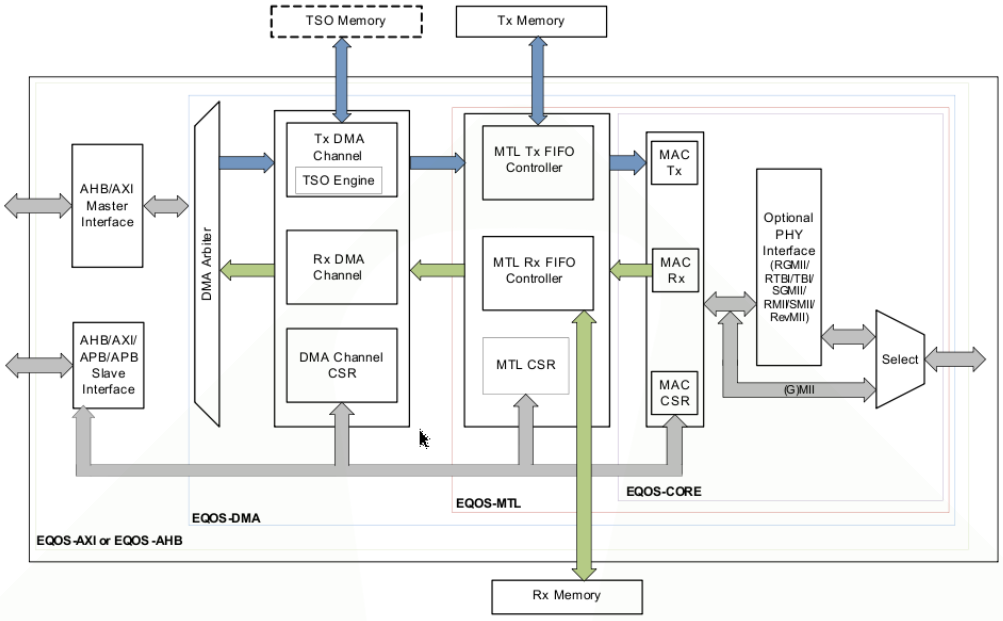

Fig. 20-1 GMAC Block Diagram

The GMAC is broken up into multiple separate functional units. These blocks are interconnected in the MAC module. The block diagram shows the general flow of data and control signals between these blocks.

The GMAC transfers data to system memory through the AXI master interface. The host CPU uses the APB Slave interface to access the GMAC subsystem's control and status registers (CSRs).

The GMAC supports the PHY interfaces of reduced GMII (RGMII) and reduced MII (RMII).

The Transmit FIFO (Tx FIFO) buffers data read from system memory by the DMA before transmission by the GMAC Core. Similarly, the Receive FIFO (Rx FIFO) stores the Ethernet frames received from the line until they are transferred to system memory by the DMA. These are asynchronous FIFOs, as they also transfer the data between the application clock and the GMAC line clocks.

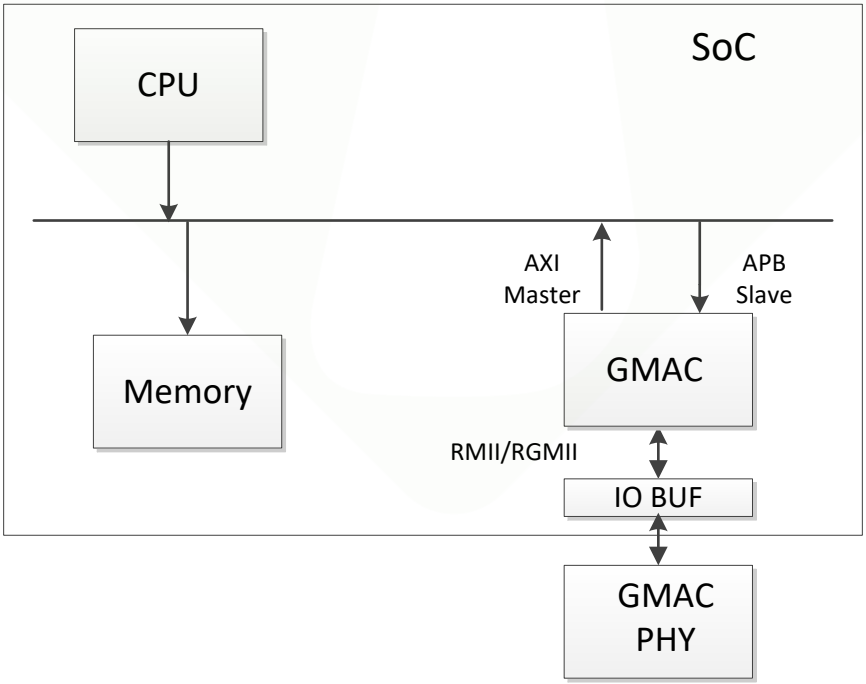

Fig. 20-2 GMAC in SOC

GMAC Supports 10/100/1000-Mbps data transfer rates with the RGMII interfaces and Supports 10/100-Mbps data transfer rates with the RMII interfaces.

20.3 Function Description

20.3.1 Frame Structure

Data frames transmitted shall have the frame format shown in Fig.1-3.

Fig. 20-3 Frame Format

The preamble <preamble> begins a frame transmission. The bit value of the preamble field consists of 7 octets with the following bit values:
10101010 10101010 10101010 10101010 10101010 10101010 10101010
The SFD (start frame delimiter) <sfd> indicates the start of a frame and follows the preamble. The bit value is 10101011.The data in a well formed frame shall consist of N octet's data.

20.3.1.1 RMII Interface timing diagram

The Reduced Media Independent Interface (RMII) specification reduces the pin count between Ethernet PHYs and Switch ASICs (only in 10/100 mode). According to the IEEE 802.3u standard, an MII contains 16 pins for data and control. In devices incorporating multiple MAC or PHY interfaces (such as switches), the number of pins adds significant cost with increase in port count. The RMII specification addresses this problem by reducing the pin count to 7 for each port - a 62.5% decrease in pin count.
The RMII module is instantiated between the GMAC and the PHY. This helps translation of the MAC's MII into the RMII. The RMII block has the following characteristics:
Supports 10-Mbps and 100-Mbps operating rates. It does not support 1000-Mbps operation.
Two clock references are sourced externally or CRU, providing independent, 2-bit wide transmit and receive paths.

20.3.1.2 Transmit Bit Ordering

Each nibble from the MII must be transmitted on the RMII a di-bit at a time with the order of di-bit transmission shown in Fig.1-4. The lower order bits (D1 and D0) are transmitted first followed by higher order bits (D2 and D3).

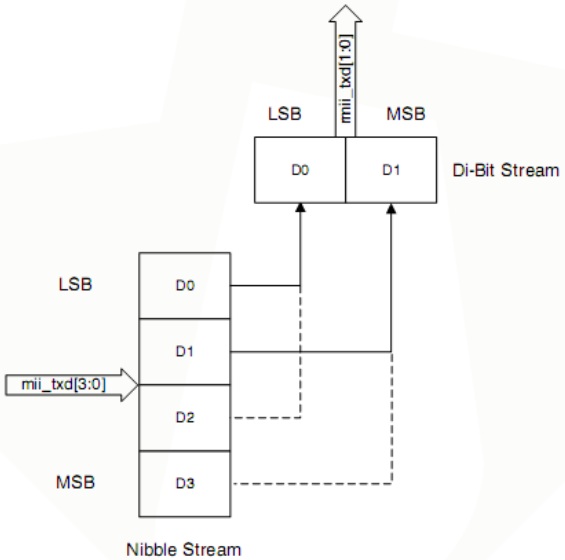

Fig. 20-4 RMII Transmission Bit Ordering

20.3.1.3 RMII Transmit Timing Diagrams

Fig.1-5 through 1-8 show MII-to-RMII transaction timing. The clk_rmii_i (REF_CLK) frequency is 50MHz in RMII interface. In 10Mb/s mode, as the REF_CLK frequency is 10 times as the data rate, the value on rmii_txd_o[1:0] (TXD[1:0]) shall be valid such that TXD[1:0] may be sampled every 10th cycle, regard-less of the starting cycle within the group and yield the correct frame data.

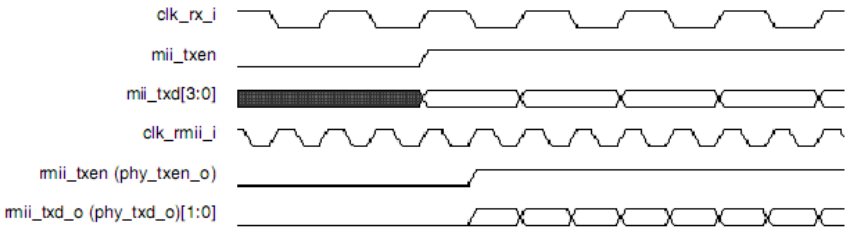

Fig. 20-5 Start of MII and RMII Transmission in 100-Mbps Mode

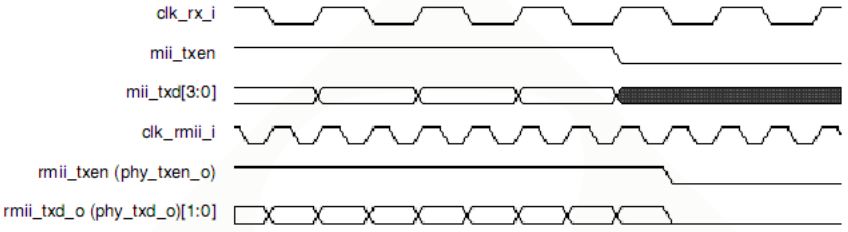

Fig. 20-6 End of MII and RMII Transmission in 100-Mbps Mode

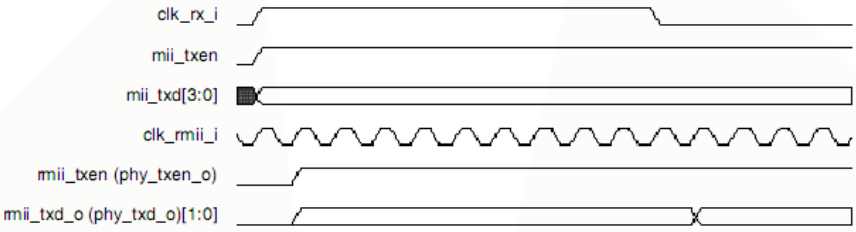

Fig. 20-7 Start of MII and RMII Transmission in 10-Mbps Mode

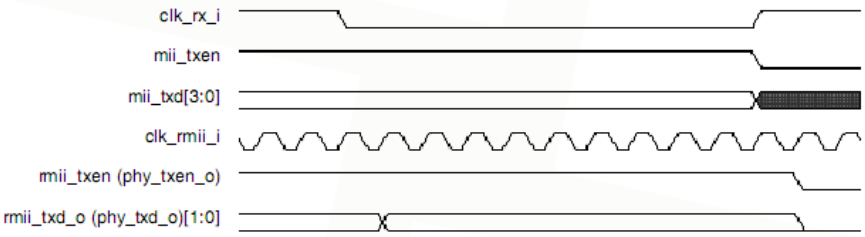

Fig. 20-8 End of MII and RMII Transmission in 10-Mbps Mode

20.3.1.4 Receive Bit Ordering

Each nibble is transmitted to the MII from the di-bit received from the RMII in the nibble transmission order shown in Fig.1-9. The lower order bits (D0 and D1) are received first, followed by the higher order bits (D2 and D3).

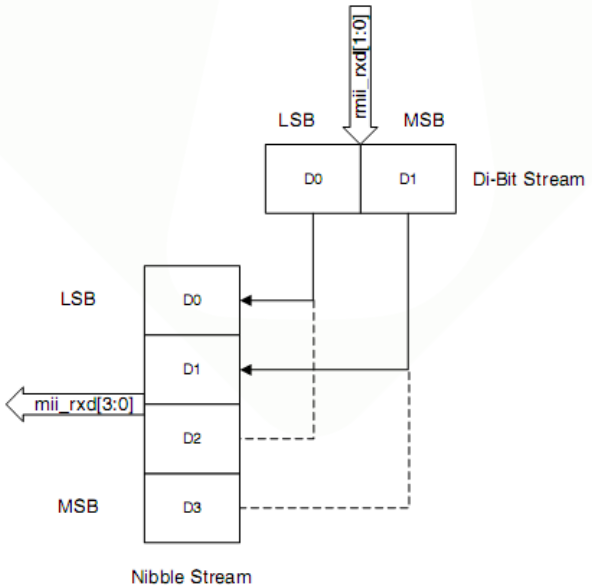

Fig. 20-9 RMII Receive Bit Ordering

20.3.1.5 RGMII Interface

The Reduced Gigabit Media Independent Interface (RGMII) specification reduces the pin count of the interconnection between the GMAC 10/100/1000 controller and the PHY for GMII and MII interfaces. To achieve this, the data path and control signals are reduced and multiplexed together with both the edges of the transmission and receive clocks. For gigabit operation the clocks operate at 125 MHz; for 10/100 operation, the clock rates are 2.5 MHz/25 MHz.

In the GMAC 10/100/1000 controller, the RGMII module is instantiated between the GMAC core's GMII and the PHY to translate the control and data signals between the GMII and RGMII protocols.

The RGMII block has the following characteristics:

- Supports 10-Mbps, 100-Mbps, and 1000-Mbps operation rates
- For the RGMII block, no extra clock is required because both the edges of the incoming clocks are used
- The RGMII block extracts the in-band (link speed, duplex mode and link status) status signals from the PHY and provides them to the GMAC core logic for link detection

20.3.2 Station Management Agent

The application can access the PHY registers through the Station Management Agent (SMA) module. SMA is a two-wire Station Management interface (MIM).

For MIM accesses, the maximum operating frequency of the MDC (gmii_mdc_o) is 2.5 MHz, as specified in the IEEE 802.3. In the GMAC core, the gmii_mdc_o clock is derived from the application clock or clk_csr_i, using a divider-counter. The divide factor depends on the clock range setting (CR field) in the MAC_MDIO_Address register Select the clock divide factor as mentioned in the description of CR field of MAC_MDIO_Address register, to meet IEEE specifications. However, if your system supports higher clock frequencies on the MIM interface, there is a provision to select a different divider.

The MDIO frame structure is as follows:

Table 20-1 MDIO Clause 45 Frame Structure

Field	Description
IDLE	The mdio line is in tri-state; there is no clock on gmii_mdc_o signal.
PREAMBLE	32 continuous bits of value 1
START	Start of packet is 2'b00
OPCODE	■ 2'b00 ■ 2'b01 ■ 2'b10 ■ 2'b11
PHY ADDR	5-bit address select for one of 32 PHYs
DEV ADDR	5-bit address select for one of 32 devices
TA	Turnaround ■ 2'bZ0: Read and post-read increment address ■ 2'b10: Write and address MDIO accesses Where Z is the tri-state level
DATA/ADDRESS	16-bit value: For an address cycle (OPCODE = 2'b00), this frame contains the address of the register to be accessed on the next cycle. For the data cycle of a write frame, this field contains the data to be written to the register. For read or post-read increment address frames, this field contains the contents of the register read from the PHY. ■ In address and data write cycles, the GMAC drives the MDIO line during the transfer of these 16 bits. ■ In read and post-read increment address cycles, the PHY drives the MDIO line during the transfer of these 16

Field	Description
	bits.

The frame structure for Clause 22 frames is also supported. The C45E bit in the MAC_MDIO_Address register can be programmed to enable Clause 22 or Clause 45 mode of operation. Table.1-2 shows the Clause 22 frame format.

Table 20-2 MDIO Clause 22 Frame Structure

Field	Description
IDLE	The mdio line is in tri-state; there is no clock on gmii_mdc_o signal.
PREAMBLE	32 continuous bits of value 1
START	Start of packet is 2'b01
OPCODE	■ 2'b01 : Write ■ 2'b10 : Read
PHY ADDR	5-bit address select for one of 32 PHYs
DEV ADDR	5-bit address to select the register within each MMD
TA	Turnaround ■ 2'bZ0: Read and post-read increment address ■ 2'b10: Write and address MDIO accesses Where Z is the tri-state level
DATA/ADDRESS	Any 16-bit value: ■ In a write operation, the GMAC drives MDIO ■ In read operation, the PHY drives MDIO

In addition to normal read and write operations, the SMA also supports post-read increment address while operating in Clause 45 mode.

20.3.3 Power Management and Energy Efficient Ethernet

The GMAC supports the following techniques to save power.

- Magic Packet
- Remote Wakeup
- Energy Efficient Ethernet

The Magic Packet and Remove Wakeup techniques are used to save power in the host system when it is idle (Sleep mode) and has to be woken up only at the reception of specific packets from the Ethernet network. In the Sleep mode, the power to the host logic along with majority of the GMAC (except the MAC receiver logic), can be shut down. On receiving the specific packets from the network, the MAC provides the trigger to restore the power to the host system and come back to normal state.

The Energy Efficient Ethernet (EEE) mode is compliant with the IEEE 802.3az-2010 standard. It is primarily targeted to save power in the Ethernet port when there is no traffic on the line. In this mode, the host indicates to the far-end that it does not have any packets to transmit for near future and puts the transmitter port (MAC Controller, PCS and PHY layers) into low-power mode. Similarly, the Receiver port can also be put into low-power mode when the far-end host indicates that it does not have any traffic to transfer. This allows significant saving of power in the Ethernet port (mainly in the PHY) with intermittent and bursty traffic profile. The triggering of entry and exit out of the EEE mode is controlled by the MAC and is supported within the GMAC.

Simultaneous operation of the EEE mode along with any or both the other power saving modes is also supported in GMAC.

20.3.4 IEEE 1588 Timestamp Support

The IEEE 1588 defines a Precision Time Protocol (PTP) which enables precise synchronization of time in measurement and control systems. This protocol enables heterogeneous systems that include clocks of varying inherent precision, resolution, and stability to synchronize. The protocol supports system-wide synchronization accuracy in the sub-microsecond range with minimal network and local clock computing resources.

The GMAC supports the IEEE 1588-2002 (version 1) and IEEE 1588-2008 (version 2). The IEEE 1588-2002 supports PTP transported over UDP/IP and IEEE 1588-2008 supports PTP transported over Ethernet. The GMAC provides programmable support for both standards. The controller supports the following features:

- Provides an option to take snapshot of all packets or only PTP type packets
- Provides an option to take snapshot of only event messages
- Provides an option to take the snapshot based on the clock type: ordinary, boundary, end-to-end transparent, and peer-to-peer transparent
- Provides an option to select the node to be a master or slave for ordinary and boundary clock
- Identifies the PTP message type, version, and PTP payload in packets sent directly over Ethernet and sends the status
- Provides an option to measure sub-second time in digital or binary format

20.3.5 TCP/IP Segmentation Offload (TSO) Engine

The TCP Segmentation Offload (TSO) engine is useful in offloading the TCP segmentation functions to the hardware.

It also supports UDP Segmentation Offload (USO) in which the UDP payload is segmented in the hardware. There are no sequencing/ordering controls available or updated in the segments, so it can be used in point to point applications in which out of order packets are not expected by the receiver. The description and flow of TSO mentioned in this section is same as USO, any deviation is provided as notes.

In the TCP segmentation offload (TSO) feature, the DMA splits a large TCP packet into multiple small packets and passes these packets to the MTL Tx Queue.

20.3.6 MAC Management Counters

The GMAC supports storing the statistics about the received and transmitted packets in registers that are accessible through the application.

The counters in the MAC Management Counters (MMC) module can be viewed as an extension of the register address space of the CSR module. The MMC module maintains a set of registers for gathering statistics on the received and transmitted packets. The register set includes a control register for controlling the behavior of the registers, two status registers containing interrupts generated (receive and transmit), and Interrupt Enable registers (receive and transmit). These registers are accessible from the Application through the MAC Control Interface (MCI). Each register is 32-bits wide. The write data is qualified with the corresponding mci_be_i signals. Therefore, non-32-bit accesses are allowed as long as the address is word-aligned. The MMCs are accessed using transactions, in the same way the CSR address space is accessed.

The MMC counters are free running. There is no separate enable for the counters to start. If a particular MMC counter is present in the RTL, it starts counting when corresponding packet is received or transmitted. The Receive MMC counters are updated for packets that are passed by the Address Filter (AFM) block. The statistics of packets, dropped by the AFM module, are not updated unless they are runt packets of less than 6 bytes (DA bytes are not received fully). To get statistics of all packets, set Bit 0 in the “MAC_Packet_Filter” register.

The MMC module gathers statistics on encapsulated IPv4, IPv6, TCP, UDP, or ICMP payloads in received Ethernet packets.

20.4 Register Description

20.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
GMAC_MAC_Configuration	0x0000	W	0x00000000	The MAC Configuration Register establishes the operating mode of the MAC
GMAC_MAC_Ext_Configuration	0x0004	W	0x00000000	The MAC Extended Configuration Register establishes the operating mode of the MAC

Name	Offset	Size	Reset Value	Description
GMAC_MAC_Packet_Filter	0x0008	W	0x00000000	The MAC Packet Filter register contains the filter controls for receiving packets
GMAC_MAC_Watchdog_Timeout	0x000C	W	0x00000000	The Watchdog Timeout register controls the watchdog timeout for received packets
GMAC_MAC_Hash_Table_Reg0	0x0010	W	0x00000000	The Hash Table Register 0 contains the first 32 bits of the hash table
GMAC_MAC_Hash_Table_Reg1	0x0014	W	0x00000000	The Hash Table Register 1 contains the second 32 bits of the hash table
GMAC_MAC_VLAN_Tag	0x0050	W	0x00000000	The VLAN Tag register identifies the IEEE 802.1Q VLAN type packets
GMAC_MAC_Q0_Tx_Flow_Ctrl	0x0070	W	0x00000000	The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC
GMAC_MAC_Rx_Flow_Ctrl	0x0090	W	0x00000000	The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet
GMAC_MAC_Interrupt_Status	0x00B0	W	0x00000000	The Interrupt Status register contains the status of interrupts
GMAC_MAC_Interrupt_Enable	0x00B4	W	0x00000000	The Interrupt Enable register contains the masks for generating the interrupts
GMAC_MAC_Rx_Tx_Status	0x00B8	W	0x00000000	The Receive Transmit Status register contains the Receive and Transmit Error status
GMAC_MAC_PMT_Control_Status	0x00C0	W	0x00000000	The PMT Control and Status Register
GMAC_MAC_RWK_Packet_Filter	0x00C4	W	0x00000000	The Remote Wakeup Filter registers are implemented as 8, 16, or 32 indirect access registers (wkuppktfilter_reg#i) based on whether 4, 8, or 16 Remote Wakeup Filters are selected in the configuration and accessed by application through MAC_RWK_Packet_Filter register
GMAC_RWK_Filter0_Byte_Mask	0x10C0	W	0x00000000	RWK Filter0 Byte Mask
GMAC_RWK_Filter1_Byte_Mask	0x10C4	W	0x00000000	RWK Filter1 Byte Mask
GMAC_RWK_Filter2_Byte_Mask	0x10C8	W	0x00000000	RWK Filter2 Byte Mask
GMAC_RWK_Filter3_Byte_Mask	0x10CC	W	0x00000000	RWK Filter3 Byte Mask
GMAC_RWK_Filter01_CRC	0x10D0	W	0x00000000	RWK Filter 0/1 CRC-16
GMAC_RWK_Filter23_CRC	0x10D4	W	0x00000000	RWK Filter 2/3 CRC-16
GMAC_RWK_Filter_Offset	0x10D8	W	0x00000000	RWK Filter Offset

Name	Offset	Size	Reset Value	Description
GMAC_RWK_Filter_Command	0x10DC	W	0x00000000	RWK Filter Command
GMAC_MAC_LPI_Control_Status	0x00D0	W	0x00000000	The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read
GMAC_MAC_LPI_Timers_Control	0x00D4	W	0x03E80000	The LPI Timers Control register controls the timeout values in the LPI states.
GMAC_MAC_LPI_Entry_Timer	0x00D8	W	0x00000000	This register controls the Tx LPI entry timer
GMAC_MAC_1US_Tic_Counter	0x00DC	W	0x0000003F	This register controls the generation of the Reference time (1 microsecond tic)
GMAC_MAC_PHYIF_Control_Status	0x00F8	W	0x00000000	PHY Interface Control and Status Register
GMAC_MAC_Version	0x0110	W	0x00003051	The version register identifies the version of the DWC_ether_qos
GMAC_MAC_Debug	0x0114	W	0x00000000	The Debug register provides the debug status of various MAC blocks
GMAC_MAC_HW_Feature0	0x011C	W	0x160171E3	This register indicates the presence of first set of the optional features or functions
GMAC_MAC_HW_Feature1	0x0120	W	0x010C01C8	This register indicates the presence of second set of the optional features or functions
GMAC_MAC_HW_Feature2	0x0124	W	0x10000000	This register indicates the presence of third set of the optional features or functions
GMAC_MAC_HW_Feature3	0x0128	W	0x00000000	This register indicates the presence of fourth set the optional features or functions
GMAC_MAC_MDIO_Address	0x0200	W	0x00000000	The MDIO Address register controls the management cycles to external PHY through a management interface
GMAC_MAC_MDIO_Data	0x0204	W	0x00000000	The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in MAC_MDIO_Address
GMAC_MAC_CSR_SW_Ctrl	0x0230	W	0x00000000	This register contains SW programmable controls for changing the CSR access response and status bits clearing
GMAC_MAC_Address0_High	0x0300	W	0x0000FFFF	The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station
GMAC_MAC_Address0_Low	0x0304	W	0xFFFFFFFF	The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station

Name	Offset	Size	Reset Value	Description
GMAC_MMC_Control	0x0700	W	0x00000000	This register establishes the operating mode of MMC
GMAC_MMC_Rx_Interrupt	0x0704	W	0x00000000	Maintains the interrupts generated from all Receive statistics counters
GMAC_MMC_Tx_Interrupt	0x0708	W	0x00000000	Maintains the interrupts generated from all Transmit statistics counters
GMAC_MMC_Rx_Interrupt_Mask	0x070C	W	0x00000000	This register maintains the masks for interrupts generated from all Receive statistics counters
GMAC_MMC_Tx_Interrupt_Mask	0x0710	W	0x00000000	This register maintains the masks for interrupts generated from all Transmit statistics counters
GMAC_Tx_Octet_Count_Good_Bad	0x0714	W	0x00000000	This register provides the number of bytes transmitted by the DWC_ether_qos, exclusive of preamble and retried bytes, in good and bad packets
GMAC_Tx_Packet_Count_Good_Bad	0x0718	W	0x00000000	This register provides the number of good and bad packets, exclusive of retried packets
GMAC_Tx_Underflow_Error_Packets	0x0748	W	0x00000000	This register provides the number of packets aborted because of packets underflow error
GMAC_Tx_Carrier_Error_Packets	0x0760	W	0x00000000	This register provides the number of packets aborted because of carrier sense error (no carrier or loss of carrier)
GMAC_Tx_Octet_Count_Good	0x0764	W	0x00000000	This register provides the number of bytes exclusive of preamble, only in good packets
GMAC_Tx_Packet_Count_Good	0x0768	W	0x00000000	This register provides the number of good packets transmitted by DWC_ether_qos
GMAC_Rx_Packets_Count_Good_Bad	0x0780	W	0x00000000	This register provides the number of good and bad packets received by DWC_ether_qos
GMAC_Rx_Octet_Count_Good_Bad	0x0784	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos, exclusive of preamble, in good and bad packets
GMAC_Rx_Octet_Count_Good	0x0788	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos, exclusive of preamble, only in good packets
GMAC_Rx_Multicast_Packets_Good	0x0790	W	0x00000000	This register provides the number of good multicast packets received by
GMAC_Rx_CRC_Error_Packets	0x0794	W	0x00000000	This register provides the number of packets received by DWC_ether_qos with CRC error

Name	Offset	Size	Reset Value	Description
GMAC_Rx_Length_Error_Packets	0x07C8	W	0x00000000	This register provides the number of packets received by DWC_ether_qos with length error (Length Type field not equal to packet size), for all packets with valid length field
GMAC_Rx_FIFO_Overflow_Packets	0x07D4	W	0x00000000	This register provides the number of missed received packets because of FIFO overflow
GMAC_MMC_IPC_Rx_Interrupt_Mask	0x0800	W	0x00000000	This register maintains the mask for the interrupt generated from the receive IPC statistic counters
GMAC_MMC_IPC_Rx_Interrupt	0x0808	W	0x00000000	This register maintains the interrupt that the receive IPC statistic counters generate
GMAC_RxIPv4_Good_Packets	0x0810	W	0x00000000	This register provides the number of good IPv4 datagrams received by DWC_ether_qos with the TCP, UDP, or ICMP payload
GMAC_RxIPv4_Header_Error_Packets	0x0814	W	0x00000000	This register provides the number of IPv4 datagrams received by DWC_ether_qos with header (checksum, length, or version mismatch) errors
GMAC_RxIPv6_Good_Packets	0x0824	W	0x00000000	This register provides the number of good IPv6 datagrams received by DWC_ether_qos
GMAC_RxIPv6_Header_Error_Packets	0x0828	W	0x00000000	This register provides the number of IPv6 datagrams received by DWC_ether_qos with header (length or version mismatch) errors
GMAC_RxUDP_Error_Packets	0x0834	W	0x00000000	This register provides the number of good IP datagrams received by DWC_ether_qos whose UDP payload has a checksum error
GMAC_RxTCP_Error_Packets	0x083C	W	0x00000000	This register provides the number of good IP datagrams received by DWC_ether_qos whose TCP payload has a checksum error
GMAC_RxICMP_Error_Packets	0x0844	W	0x00000000	This register provides the number of good IP datagrams received by DWC_ether_qos whose ICMP payload has a checksum error
GMAC_RxIPv4_Header_Error_Octets	0x0854	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos in IPv4 data_grams with header errors (checksum, length, version mismatch)

Name	Offset	Size	Reset Value	Description
GMAC_RxIPv6_Header_Error_Octets	0x0868	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos in IPv6 data_grams with header errors (length, version mismatch)
GMAC_RxUDP_Error_Octets	0x0874	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos in a UDP segment that had checksum errors
GMAC_RxTCP_Error_Octets	0x087C	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos in a TCP segment that had checksum errors
GMAC_RxICMP_Error_Octets	0x0884	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos in a good ICMP segment
GMAC_MAC_Timestamp_Control	0x0B00	W	0x00000000	This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver
GMAC_MAC_Sub_Second_Increment	0x0B04	W	0x00000000	Specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock
GMAC_MAC_System_Time_Secs	0x0B08	W	0x00000000	The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC
GMAC_MAC_System_Time_NS	0x0B0C	W	0x00000000	The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC
GMAC_MAC_Sys_Time_Secs_Update	0x0B10	W	0x00000000	The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC
GMAC_MAC_Sys_Time_NS_Update	0x0B14	W	0x00000000	MAC System Time Nanoseconds Update register
GMAC_MAC_Timestamp_Addend	0x0B18	W	0x00000000	Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_Timestamp_Control register)
GMAC_MAC_Timestamp_Status	0x0B20	W	0x00000000	Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register

Name	Offset	Size	Reset Value	Description
GMAC_MAC_Tx_TS_Status_NS	0x0B30	W	0x00000000	This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled
GMAC_MAC_Tx_TS_Status_Secs	0x0B34	W	0x00000000	The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted
GMAC_MAC_Auxiliary_Control	0x0B40	W	0x00000000	The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot
GMAC_MAC_Auxiliary_TS_NS	0x0B48	W	0x00000000	The Auxiliary Timestamp Nanoseconds register, along with MAC_Auxiliary_Timestamp_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot
GMAC_MAC_Auxiliary_TS_Secs	0x0B4C	W	0x00000000	The Auxiliary Timestamp - Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register
GMAC_MAC_TS_Ingress_Corr_NS	0x0B58	W	0x00000000	This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path
GMAC_MAC_TS_Egress_Corr_NS	0x0B5C	W	0x00000000	This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path
GMAC_MAC_TS_Ingress_Latency	0x0B68	W	0x00000000	This register holds the Ingress MAC latency
GMAC_MAC_TS_Egress_Latency	0x0B6C	W	0x00000000	This register holds the Egress MAC latency
GMAC_MAC_PPS_Control	0x0B70	W	0x00000000	PPS Control register
GMAC_MTL_DBG_CTL	0x0C08	W	0x00000000	The FIFO Debug Access Control and Status register controls the operation mode of FIFO debug access
GMAC_MTL_DBG_STS	0x0C0C	W	0x01900000	The FIFO Debug Status register contains the status of FIFO debug access
GMAC_MTL_FIFO_Debug_Data	0x0C10	W	0x00000000	The FIFO Debug Data register contains the data to be written to or read from the FIFOs
GMAC_MTL_Interrupt_Status	0x0C20	W	0x00000000	The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC

Name	Offset	Size	Reset Value	Description
GMAC_MTL_TxQ0_Operation_Mode	0x0D00	W	0x00000000	The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands
GMAC_MTL_TxQ0_Underflow	0x0D04	W	0x00000000	The Queue 0 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush
GMAC_MTL_TxQ0_Debug	0x0D08	W	0x00000000	The Queue 0 Transmit Debug register gives the debug status of various blocks related to the Transmit queue
GMAC_MTL_Q0_Interrupt_Ctrl_Status	0x0D2C	W	0x00000000	This register contains the interrupt enable and status bits for the queue 0 interrupts
GMAC_MTL_RxQ0_Operation_Mode	0x0D30	W	0x00000000	The Queue 0 Receive Operation Mode register establishes the Receive queue operating modes and command
GMAC_MTL_RxQ0_Miss_Pkt_Ovf_Cnt	0x0D34	W	0x00000000	The Queue 0 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow
GMAC_MTL_RxQ0_Debug	0x0D38	W	0x00000000	The Queue 0 Receive Debug register gives the debug status of various blocks related to the Receive queue
GMAC_DMA_Mode	0x1000	W	0x00000000	The Bus Mode register establishes the bus operating modes for the DMA
GMAC_DMA_SysBus_Mode	0x1004	W	0x00010000	The System Bus mode register controls the behavior of the AHB or AXI master
GMAC_DMA_Interrupt_Status	0x1008	W	0x00000000	The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC
GMAC_DMA_Debug_Status0	0x100C	W	0x00000000	The Debug Status 0 register gives the Receive and Transmit process status for DMA Channel 0-Channel 2 for debugging purpose
GMAC_AXI_LPI_Entry_Interval	0x1040	W	0x00000000	This register is used to control the AXI LPI entry interval

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

20.4.2 Detail Registers Description

GMAC_MAC_Configuration

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	ARPEN ARP Offload Enable When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus. When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus. This bit is available only when the Enable IPv4 ARP Offload is selected. Values: 1'b0: ARP Offload is disabled 1'b1: ARP Offload is enabled
30:28	RO	0x0	reserved
27	RW	0x0	IPC Checksum Offload When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled.The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit. Values: 1'b0: IP header/payload checksum checking is disabled 1'b1: IP header/payload checksum checking is enabled
26:24	RW	0x0	IPG Inter-Packet Gap These bits control the minimum IPG between packets during transmission. This range of minimum IPG is valid in full-duplex mode.In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered. When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG.The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in MAC_Ext_Configuration register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in MAC_Ext_Configuration register. Values: 3'b000: 96 bit times IPG 3'b001: 88 bit times IPG 3'b010: 80 bit times IPG 3'b011: 72 bit times IPG 3'b100: 64 bit times IPG 3'b101: 56 bit times IPG 3'b110: 48 bit times IPG 3'b111: 40 bit times IPG

Bit	Attr	Reset Value	Description
23	RW	0x0	GPSLCE Giant Packet Size Limit Control Enable When this bit is set, the MAC considers the value in GPSL field in MAC_Ext_Configuration register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit. When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet).The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status. Values: 1'b0: Giant Packet Size Limit Control is disabled 1'b1: Giant Packet Size Limit Control is enabled
22	RW	0x0	S2KP IEEE 802.3as Support for 2K Packets When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets.When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. Note: When the JE bit is set, setting this bit has no effect on the giant packet status. Values: 1'b0: Support upto 2K packet is disabled 1'b1: Support upto 2K packet is Enabled
21	RW	0x0	CST CRC stripping for Type packets When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. Note: For information about how the settings of the ACS bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bits. Values: 1'b0: CRC stripping for Type packets is disabled 1'b1: CRC stripping for Type packets is enabled

Bit	Attr	Reset Value	Description
20	RW	0x0	ACS Automatic Pad or CRC Stripping When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.When this bit is reset, the MAC passes all incoming packets to the application, without any modification. Note: For information about how the settings of CST bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bit . Values: 1'b0: Automatic Pad or CRC Stripping is disabled 1'b1: Automatic Pad or CRC Stripping is enabled
19	RW	0x0	WD Watchdog Disable When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes.When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes. Values: 1'b0: Watchdog is enabled 1'b1: Watchdog is disabled
18	RW	0x0	BE Packet Burst Enable When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode. Values: 1'b0: Packet Burst is disabled 1'b1: Packet Burst is enabled
17	RW	0x0	JD Jabber Disable When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes. When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet. Values: 1'b0: Jabber is enabled 1'b1: Jabber is disabled
16	RW	0x0	JE Jumbo Packet Enable When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status. Values: 1'b0: Jumbo packet is disabled 1'b1: Jumbo packet is enabled

Bit	Attr	Reset Value	Description
15	RW	0x0	PS Port Select This bit selects the Ethernet line speed. This bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (R/W). The mac_speed_o[1] signal reflects the value of this bit. Values: 1'b0: For 1000 or 2500 Mbps operations 1'b1: For 10 or 100 Mbps operations
14	RW	0x0	FES Speed This bit selects the speed mode. The mac_speed_o[0] signal reflects the value of this bit. Values: 1'b0: 10 Mbps when PS bit is 1 and 1 Gbps when PS bit is 0 1'b1: 100 Mbps when PS bit is 1 and 2.5 Gbps when PS bit is 0
13	RW	0x0	DM Duplex Mode When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations. Values: 1'b0: Half-duplex mode 1'b1: Full-duplex mode
12	RW	0x0	LM Loopback Mode When this bit is set, the MAC operates in the loopback mode at GMII or MII. The (G)MII Rx clock input (clk_rx_i) is required for the loopback to work properly. This is because the Tx clock is not internally looped back. Values: 1'b0: Loopback is disabled 1'b1: Loopback is enabled
11	RW	0x0	ECRSFD Enable Carrier Sense Before Transmission in Full-Duplex Mode When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low.When this bit is reset, the MAC transmitter ignores the status of the CRS signal. Values: 1'b0: ECRSFD is disabled 1'b1: ECRSFD is enabled
10	RW	0x0	DO Disable Receive Own When this bit is set, the MAC disables the reception of packets when the gmii_txen_o is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY.This bit is not applicable in the full-duplex mode. Values: 1'b0: Enable Receive Own 1'b1: Disable Receive Own

Bit	Attr	Reset Value	Description
9	RW	0x0	DCRS Disable Carrier Sense During Transmission When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission. When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission. Values: 1'b0: Enable Carrier Sense During Transmission 1'b1: Disable Carrier Sense During Transmission
8	RW	0x0	DR Disable Retry When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status.When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode. Values: 1'b0: Enable Retry 1'b1: Disable Retry
7	RO	0x0	reserved
6:5	RW	0x0	BL Back-Off Limit The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000/2500 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. n = retransmission attempt. The random integer r takes the value in the range 0 <= r < 2^k This bit is applicable only in the half-duplex mode. Values: 2'b00: k = min(n,10) 2'b01: k = min(n,8) 2'b10: k = min(n,4) 2'b11: k = min(n,1)

Bit	Attr	Reset Value	Description
4	RW	0x0	DC Deferral Check When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode. If the MAC is configured for 1000/2500 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode. Values: 1'b0: Deferral check function is disabled 1'b1: Deferral check function is enabled
3:2	RW	0x0	PRELEN Preamble Length for Transmit packets These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. Values: 2'b00: 7 bytes of preamble 2'b01: 5 bytes of preamble 2'b10: 3 bytes of preamble 2'b11: Reserved
1	RW	0x0	TE Transmitter Enable When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets. Values: 1'b0: Transmitter is disabled 1'b1: Transmitter is enabled
0	RW	0x0	RE Receiver Enable When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface. Values: 1'b0: Receiver is disabled 1'b1: Receiver is enabled

GMAC_MAC_Ext_Configuration

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:25	RW	0x00	EIPG Extended Inter-Packet Gap The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in MAC_Configuration register, gives the minimum IPG greater than 96 bit times in steps of 8 bit times: EIPG, IPG 8'h00 - 104 bit times 8'h01 - 112 bit times 8'h02 - 120 bit times ---------- 8'hFF - 2144 bit times
24	RW	0x0	EIPGEN Extended Inter-Packet Gap Enable When this bit is set, the MAC interprets EIPG field and IPG field in MAC_Configuration register together as minimum IPG greater than 96 bit times in steps of 8 bit times. When this bit is reset, the MAC ignores EIPG field and interprets IPG field in MAC_Configuration register as minimum IPG less than or equal to 96 bit times in steps of 8 bit times. Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-Duplex mode only. There may be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode. Values: 1'b0: Extended Inter-Packet Gap is disabled 1'b1: Extended Inter-Packet Gap is enabled
23:19	RO	0x00	reserved
18	RW	0x0	USP Unicast Slow Protocol Packet Detect When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the MAC_Address0_High and MAC_Address0_Low registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02). When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2015, Section 5. Values: 1'b0: Unicast Slow Protocol Packet Detection is disabled 1'b1: Unicast Slow Protocol Packet Detection is enabled
17	RW	0x0	SPEN Slow Protocol Detection Enable When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Rx status. The MAC discards the Slow Protocol packets with invalid sub-types. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets. Values: 1'b0: Slow Protocol Detection is disabled 1'b1: Slow Protocol Detection is enabled

Bit	Attr	Reset Value	Description
16	RW	0x0	DCRCC Disable CRC Checking for Received Packets When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets. Values: 1'b0: CRC Checking is enabled 1'b1: CRC Checking is disabled
15:14	RO	0x0	reserved
13:0	RW	0x0000	GPSL Giant Packet Size Limit If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes. For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in MAC_Configuration register.

GMAC_MAC_Packet_Filter

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	VTFE VLAN Tag Filter Enable When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag. Values: 1'b0: VLAN Tag Filter is disabled 1'b1: VLAN Tag Filter is enabled
15:11	RO	0x00	reserved
10	RW	0x0	HPF Hash or Perfect Filter When this bit is set, the address filter passes a packet if it matches either the perfect filtering or hash filtering as set by the HMC or HUC bit. When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter. Values: 1'b0: Hash or Perfect Filter is disabled 2'b1: Hash or Perfect Filter is enabled
9:8	RO	0x0	reserved

Bit	Attr	Reset Value	Description
7:6	RW	0x0	PCF Pass Control Packets These bits control the forwarding of all control packets (including unicast and multicast Pause packets). Values: 2'b00: MAC filters all control packets from reaching the application 2'b01: MAC forwards all control packets except Pause packets to the application even if they fail the Address filter 2'b10: MAC forwards all control packets to the application even if they fail the Address filter 2'b11: MAC forwards the control packets that pass the Address filter
5	RW	0x0	DBF Disable Broadcast Packets When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast packets. Values: 1'b0: Enable Broadcast Packets 1'b1: Disable Broadcast Packets
4	RW	0x0	PM Pass All Multicast When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit. Values: 1'b0: Pass All Multicast is disabled 1'b1: Pass All Multicast is enabled
3	RW	0x0	DAIF DA Inverse Filtering When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed. Values: 1'b0: DA Inverse Filtering is disabled 1'b1: DA Inverse Filtering is enabled
2	RW	0x0	HMC Hash Multicast When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the hash table. When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers. Values: 1'b0: Hash Multicast is disabled 1'b1: Hash Multicast is enabled

Bit	Attr	Reset Value	Description
1	RW	0x0	HUC Hash Unicast When this bit is set, the MAC performs the destination address filtering of unicast packets according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers. Values: 1'b0: Hash Unicast is disabled 1'b1: Hash Unicast is enabled
0	RW	0x0	PR Promiscuous Mode When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set. Values: 1'b0: Promiscuous Mode is disabled 1'b1: Promiscuous Mode is enabled

GMAC_MAC_Watchdog_Timeout

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	PWE Programmable Watchdog Enable When this bit is set and the WD bit of the MAC_Configuration register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in MAC_Configuration register. Values: 1'b0: Programmable Watchdog is disabled 1'b1: Programmable Watchdog is enabled
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	WTO Watchdog Timeout When the PWE bit is set and the WD bit of the MAC_Configuration register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet. Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped. Values: 4'b0000: 2 KB 4'b0001: 3 KB 4'b0010: 4 KB 4'b0011: 5 KB 4'b0100: 6 KB 4'b0101: 7 KB 4'b0110: 8 KB 4'b0111: 9 KB 4'b1000: 10 KB 4'b1001: 11 KB 4'b1010: 12 KB 4'b1011: 13 KB 4'b1100: 14 KB 4'b1101: 15 KB 4'b1110: 16383 Bytes 4'b1111: Reserved

GMAC_MAC_Hash_Table_Reg0

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HT31T0 MAC Hash Table First 32 Bits This field contains the first 32 Bits [31:0] of the Hash table. The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5. The hash value of the destination address is calculated in the following way: 1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32). 2. Perform bitwise reversal for the value obtained in Step 1. 3. Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2. If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values. If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written.If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

GMAC_MAC_Hash_Table_Reg1

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HT63T32 MAC Hash Table Second 32 Bits This field contains the second 32 Bits [63:32] of the Hash table.

GMAC_MAC_VLAN_Tag

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	EVLRXS Enable VLAN Tag in Rx status When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status. Values: 1'b0: VLAN Tag in Rx status is disabled 1'b1: VLAN Tag in Rx status is enabled
23	RO	0x0	reserved

Bit	Attr	Reset Value	Description
22:21	RW	0x0	EVLS Enable VLAN Tag Stripping on Receive This field indicates the stripping operation on the outer VLAN Tag in received packet. Values: 2'b00: Do not strip 2'b01: Strip if VLAN filter passes 2'b10: Strip if VLAN filter fails 2'b11: Always strip
20	RW	0x0	DOVLTC Disable VLAN Type Check When this bit is set, the MAC does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit. Values: 1'b0: VLAN Type Check is enabled 1'b1: VLAN Type Check is disabled
19	RW	0x0	ERSVLM Enable Receive S-VLAN Match When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets. The ERIVLT bit determines the VLAN tag position considered for filtering or matching. Values: 1'b0: Receive S-VLAN Match is disabled 1'b1: Receive S-VLAN Match is enabled
18	RW	0x0	ESVL Enable S-VLAN When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets. Values: 1'b0: S-VLAN is disabled 1'b1: S-VLAN is enabled
17	RW	0x0	VTIM VLAN Tag Inverse Match Enable When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched. Values: 1'b0: VLAN Tag Inverse Match is disabled 1'b1: VLAN Tag Inverse Match is enabled

Bit	Attr	Reset Value	Description
16	RW	0x0	ETV Enable 12-Bit VLAN Tag Comparison When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. Similarly, when enabled, only 12 bits of the VLAN tag in the received packet are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for comparison and VLAN hash filtering. Values: 1'b0: 12-Bit VLAN Tag Comparison is disabled 1'b1: 12-Bit VLAN Tag Comparison is enabled
15:0	RW	0x0000	VL VLAN Tag Identifier for Receive Packets This field contains the 802.1Q VLAN tag to identify the VLAN packets. This VLAN tag identifier is compared to the 15th and 16th bytes of the packets being received for VLAN packets. The following list describes the bits of this field: 1. Bits[15:13]: User Priority 2. Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) 3. Bits[11:0]: VLAN Identifier (VID) field of VLAN tag When the ETV bit is set, only the VID is used for comparison. If this field ([11:0] if ETV is set) is all zeros, the MAC does not check the 15th and 16th bytes for VLAN tag comparison and declares all packets with Type field value of 0x8100 or 0x88a8 as VLAN packets.

GMAC_MAC_Q0_Tx_Flow_Ctrl

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PT Pause Time This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	RO	0x00	reserved
7	RW	0x0	DZPQ Disable Zero-Quanta Pause When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. Values: 1'b0: Zero-Quanta Pause packet generation is enabled 1'b1: Zero-Quanta Pause packet generation is disabled

Bit	Attr	Reset Value	Description
6:4	RW	0x0	PLT Pause Low Threshold This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. Values: 3'b000: Pause Time minus 4 Slot Times (PT -4 slot times) 3'b001: Pause Time minus 28 Slot Times (PT -28 slot times) 3'b010: Pause Time minus 36 Slot Times (PT -36 slot times) 3'b011: Pause Time minus 144 Slot Times (PT -144 slot times) 3'b100: Pause Time minus 256 Slot Times (PT -256 slot times) 3'b101: Pause Time minus 512 Slot Times (PT -512 slot times) 3'b110: Reserved
3:2	RO	0x0	reserved
1	RW	0x0	TFE Transmit Flow Control Enable Full-Duplex Mode: In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. Half-Duplex Mode: In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled. Values: 1'b0: Transmit Flow Control is disabled 1'b1: Transmit Flow Control is enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	FCB_BPA Flow Control Busy or Backpressure Activate This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. Full-Duplex Mode: In the full-duplex mode, this bit should be read as 1'b0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Half-Duplex Mode: When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the mti_flowctrl_i input signal for the backpressure function. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Flow Control Busy or Backpressure Acti_vate is disabled 1'b1: Flow Control Busy or Backpressure Acti_vate is enabled

GMAC_MAC_Rx_Flow_Ctrl

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	UP Unicast Pause Packet Detect A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in MAC_Address0_High and MAC_Address0_Low. When this bit is reset, the MAC only detects Pause packets with unique multicast address. Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011. Values: 1'b0: Unicast Pause Packet Detect disabled 1'b1: Unicast Pause Packet Detect enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	RFE Receive Flow Control Enable When this bit is set and the MAC is operating in full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in half-duplex mode, the decode function of the Pause packet is disabled. When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time. Values: 1'b0: Receive Flow Control is disabled 1'b1: Receive Flow Control is enabled

GMAC_MAC_Interrupt_Status

Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18	RO	0x0	MDIOIS MDIO Interrupt Status This bit indicates an interrupt event after the completion of MDIO operation. To reset this bit, the application has to read this bit/Write 1 to this bit when RCWE bit of MAC_CSR_SW_Ctrl register is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: MDIO Interrupt status not active 1'b1: MDIO Interrupt status active
17:15	RO	0x0	reserved
14	RO	0x0	RXSTSIS Receive Status Interrupt This bit indicates the status of received packets. This bit is set when the RWT bit is set in the MAC_Rx_Tx_Status register. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. Values: 1'b0: Receive Interrupt status not active 1'b1: Receive Interrupt status active

Bit	Attr	Reset Value	Description
13	RO	0x0	TXSTSIS Transmit Status Interrupt This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the MAC_Rx_Tx_Status register: 1. Excessive Collision (EXCOL) 2. Late Collision (LCOL) 3. Excessive Deferral (EXDEF) 4. Loss of Carrier (LCARR) 5. No Carrier (NCARR) 6. Jabber Timeout (TJT) This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. Values: 1'b0: Transmit Interrupt status not active 1'b1: Transmit Interrupt status active
12	RO	0x0	TSIS Timestamp Interrupt Status If the Timestamp feature is enabled, this bit is set when any of the following conditions is true: 1. The system time value is equal to or exceeds the value specified in the Target Time High and Low registers. 2. There is an overflow in the Seconds register. 3. The Target Time Error occurred, that is, programmed target time already elapsed. If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted. In configurations other than EQOS_CORE, when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and Mac_TxTimestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Timestamp_Status register. Values: 1'b0: Timestamp Interrupt status not active 1'b1: Timestamp Interrupt status active
11	RO	0x0	MMCRXIPIS MMC Receive Checksum Offload Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Checksum Offload Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) and Enable Receive TCP/IP Checksum Check options. Values: 1'b0: MMC Receive Checksum Offload Inter_rupt status not active 1'b1: MMC Receive Checksum Offload Interrupt status active

Bit	Attr	Reset Value	Description
10	RO	0x0	MMCTXIS MMC Transmit Interrupt Status This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. Values: 1'b0: MMC Transmit Interrupt status not active 1'b1: MMC Transmit Interrupt status active
9	RO	0x0	MMCRXIS MMC Receive Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. Values: 1'b0: MMC Receive Interrupt status not active 1'b1: MMC Receive Interrupt status active
8	RO	0x0	MMCIS MMC Interrupt Status This bit is set high when Bit 11, Bit 10, or Bit 9 is set high. This bit is cleared only when all these bits are low. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. Values: 1'b0: MMC Interrupt status not active 1'b1: MMC Interrupt status active
7:6	RO	0x0	reserved
5	RO	0x0	LPIIS LPI Interrupt Status When the Energy Efficient Ethernet feature is enabled, this bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the corresponding interrupt source bit of MAC_LPI_Control_Status register is read (or corresponding interrupt source bit of MAC_LPI_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). Values: 1'b0: LPI Interrupt status not active 1'b1: LPI Interrupt status active
4	RO	0x0	PMTIS PMT Interrupt Status This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in MAC_PMT_Control_Status register). This bit is cleared when corresponding interrupt source bit are cleared because of a Read operation to the MAC_PMT_Control_Status register (or corresponding interrupt source bit of MAC_PMT_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the Enable Power Management option. Values: 1'b0: PMT Interrupt status not active 1'b1: PMT Interrupt status active

Bit	Attr	Reset Value	Description
3	RO	0x0	PHYIS PHY Interrupt This bit is set when rising edge is detected on the phy_intr_i input. This bit is cleared when this register is read (or this bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). Values: 1'b0: PHY Interrupt not detected 1'b1: PHY Interrupt detected
2:1	RO	0x0	reserved
0	RO	0x0	RGSMIIIS RGMII or SMII Interrupt Status This bit is set because of any change in value of the Link Status of RGMII or SMII interface (LNKSTS bit in MAC_PHYIF_Control_Status register). This bit is cleared when the MAC_PHYIF_Control_Status register is read (or LNKSTS bit of MAC_PHYIF_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the optional RGMII or SMII PHY interface. Values: 1'b0: RGMII or SMII Interrupt Status is not active 1'b1: RGMII or SMII Interrupt Status is active

GMAC_MAC_Interrupt_Enable

Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18	RW	0x0	MDIOIE MDIO Interrupt Enable When this bit is set, it enables the assertion of the interrupt when MDIOIS field is set in the MAC_Interrupt_Status register. Values: 1'b0: MDIO Interrupt is disabled 1'b1: MDIO Interrupt is enabled
17:15	RO	0x0	reserved
14	RW	0x0	RXSTSIE Receive Status Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the MAC_Interrupt_Status register. Values: 1'b0: Receive Status Interrupt is disabled 1'b1: Receive Status Interrupt is enabled
13	RW	0x0	TXSTSIE Transmit Status Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the MAC_Interrupt_Status register. Values: 1'b0: Timestamp Status Interrupt is disabled 1'b1: Timestamp Status Interrupt is enabled

Bit	Attr	Reset Value	Description
12	RW	0x0	TSIE Timestamp Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in MAC_Interrupt_Status register. Values: 1'b0: Timestamp Interrupt is disabled 1'b1: Timestamp Interrupt is enabled
11:6	RO	0x00	reserved
5	RW	0x0	LPIIE LPI Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in MAC_Interrupt_Status register. Values: 1'b0: LPI Interrupt is disabled 1'b1: LPI Interrupt is enabled
4	RW	0x0	PMTIE PMT Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in MAC_Interrupt_Status register. Values: 1'b0: PMT Interrupt is disabled 1'b1: PMT Interrupt is enabled
3	RW	0x0	PHYIE PHY Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in MAC_Interrupt_Status register. Values: 1'b0: PHY Interrupt is disabled 1'b1: PHY Interrupt is enabled
2:1	RO	0x0	reserved
0	RW	0x0	RGSMIIIE RGMII or SMII Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in MAC_Interrupt_Status register. Values: 1'b0: RGMII or SMII Interrupt is disabled 1'b1: RGMII or SMII Interrupt is enabled

GMAC_MAC_Rx_Tx_Status

Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
8	RO	0x0	RWT Receive Watchdog Timeout This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the MAC_Configuration register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No receive watchdog timeout 1'b1: Receive watchdog timed out
7:6	RO	0x0	reserved
5	RO	0x0	EXCOL Excessive Collisions When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after the first collision and the packet transmission is aborted. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No collision 1'b1: Excessive collision is sensed
4	RO	0x0	LCOL Late Collision When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode). This bit is not valid if the Underflow error occurs. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No collision 1'b1: Late collision is sensed
3	RO	0x0	EXDEF Excessive Deferral When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the MAC_Configuration register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbps mode or when Jumbo packet is enabled). Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No Excessive deferral 1'b1: Excessive deferral

Bit	Attr	Reset Value	Description
2	RO	0x0	LCARR Loss of Carrier When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the loss of carrier occurred during packet transmission, that is, the phy_crs_i signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Carrier is present 1'b1: Loss of carrier
1	RO	0x0	NCARR No Carrier When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Carrier is present 1'b1: No carrier
0	RO	0x0	TJT Transmit Jabber Timeout This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the MAC_Configuration register. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No Transmit Jabber Timeout 1'b1: Transmit Jabber Timeout occurr

GMAC_MAC_PMT_Control_Status

Address: Operational Base + offset (0x00C0)

Bit	Attr	Reset Value	Description
31	RW	0x0	RWKFILTRST Remote Wake-Up Packet Filter Register Pointer Reset When this bit is set, the remote wake-up packet filter register pointer is reset to 3'b000. It is automatically cleared after 1 clock cycle. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Remote Wake-Up Packet Filter Register Pointer is not Reset 1'b1: Remote Wake-Up Packet Filter Register Pointer is Reset
30:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:24	RO	0x00	RWKPTR Remote Wake-up FIFO Pointer This field gives the current value (0 to 7, 15, or 31 when 4, 8, or 16 Remote Wake-up Packet Filters are selected) of the Remote Wake-up Packet Filter register pointer. When the value of this pointer is equal to maximum for the selected number of Remote Wake-up Packet Filters, the contents of the Remote Wake-up Packet Filter Register are transferred to the clk_rx_i domain when a Write occurs to that register.
23:11	RO	0x0000	reserved
10	RW	0x0	RWKPFE Remote Wake-up Packet Forwarding Enable When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected Wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet. The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high. Note: If Magic Packet Enable and Wake-Up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Remote Wake-up Packet Forwarding is disabled 1'b1: Remote Wake-up Packet Forwarding is enabled
9	RW	0x0	GLBLUCAST Global Unicast When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet. Values: 1'b0: Global unicast is disabled 1'b1: Global unicast is enabled
8:7	RO	0x0	reserved
6	RO	0x0	RWKPRCVD Remote Wake-Up Packet Received When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Remote wake-up packet is received 1'b1: Remote wake-up packet is received

Bit	Attr	Reset Value	Description
5	RO	0x0	MGKPRCVD Magic Packet Received When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No Magic packet is received 1'b1: Magic packet is received
4:3	RO	0x0	reserved
2	RW	0x0	RWKPKTEN Remote Wake-Up Packet Enable When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet. Values: 1'b0: Remote wake-up packet is disabled 1'b1: Remote wake-up packet is enabled
1	RW	0x0	MGKPKTEN Magic Packet Enable When this bit is set, a power management event is generated when the MAC receives a magic packet. Values: 1'b0: Magic Packet is disabled 1'b1: Magic Packet is enabled
0	RW	0x0	PWRDWN Power Down When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote Wake-Up Packet Enable bit is set high. Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Power down is disabled 1'b1: Power down is enabled

GMAC_MAC_RWK_Packet_Filter

Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	WKUPFRMFTR RWK Packet Filter This field contains the various controls of RWK Packet filter. When the Remote Wakeup Filters are to be programmed, the entire set of wkuppktfilter_reg registers must be written. The wkuppktfilter_reg register is programmed by sequentially writing the eight, sixteen or thirty-two register values in MAC_RWK_Packet_Filter register for wkuppktfilter_reg0, wkuppktfil_ter_reg1, ..., wkuppktfilter_reg31 respectively. The wkuppktfilter_reg register is read in a similar way. The MAC updates the wkuppktfilter_reg register current pointer value in RWKPTR field of MAC_P_MT_Control_Status register. The Remote Wakeup Filters are arranged in blocks of 4 filters each and each such block have eight 32-bit wide registers, viz. wkuppktfilter_reg0-7, wkuppktfilter_reg8-15, wkuppktfilter_reg16-23 and wkuppktfilter_reg24-31. The fields of Remote Wakeup Filter are described as follows: Filter i Command: The 4-bit filter i command controls the filter i operation. 1. Bit 3 specifies the address type, defining the destination address type of the pattern. When the bit is set, the pattern applies to only multicast packets; when the bit is reset, the pattern applies only to unicast packet. 2. Bit 2 (Inverse Mode), when set, reverses the logic of the CRC16 hash function signal, to reject a packet with matching CRC-16 value. Bit 2, along with Bit 1, allows a MAC to reject a subset of remote wake-up packets by creating filter logic such as "Pattern 1 AND NOT Pattern 2". 3. Bit 1 (And_Previous) implements the Boolean logic. When set, the result of the current entry is logically ANDed with the result of the previous filter. This AND logic allows a filter pattern longer than 32 bytes by splitting the mask among two, three, or four filters. This depends on the number of filters that have the And_Previous bit set. The details are provided below: (1) The And_Previous bit setting is applicable within a set of 4 filters. (2) Setting of And_Previous bit of filter that is not enabled has no effect, that is setting And_Pre_vious bit of lowest number filter in the set of 4 filters has no effect. For example, setting of And_Previous bit of Filter 0 has no effect. (3) If And_Previous bit is set for filter to form AND chained filter, the AND chain breaks at the point any filter is not enabled. For example: If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set) but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result is considered. If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 3 And_Previous bit is set (bit 1 in Filter 3 command is set), but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result ANDed with Filter 3 result is considered. If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 3 And_Previous bit is set (bit 1 in Filter 3 command is set), but Filter 2 is not enabled (bit 0 in Filter 2 command is reset), then since setting of Filter 2 And_Previous bit has no effect only Filter 1 result ORed with Filter 3 result is considered.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	WKUPFRMFTR(cont.) (4) If filters chained by And_Previous bit setting have complementary programming, then a frame may never pass the AND chained filter. For example, if Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 1 Address_Type bit is set (bit 3 in Filter 1 command is set) indicating multicast detection and Filter 2 Address_Type bit is reset (bit 3 in Filter 2 command is reset) indicating unicast detection or vice versa, a remote wakeup frame does not pass the AND chained filter as a remote wakeup frame cannot be of both unicast and multicast address type. 4. Bit 0 is the enable for filter i. If Bit 0 is not set, filter i is disabled. Filter i Byte Mask: The filter i byte mask register defines the bytes of the packet that are examined by filter i (0, 1, 2, 3, .., 15) to determine whether or not a packet is a wake-up packet. 1. The MSB (31st bit) must be zero. 2. Bit j[30:0] is the byte mask. 3. If Bit j (byte number) of the byte mask is set, the CRC block processes the Filter i Offset + j of the incoming packet; otherwise Filter i Offset + j is ignored. Filter i Offset: The filter i offset register defines the offset (within the packet) from which the filter i examines the packets. 1. This 8-bit pattern-offset is the offset for the filter i first byte to be examined. 2. The minimum allowed offset is 12, which refers to the 13th byte of the packet. 3. The offset value 0 refers to the first byte of the packet. Filter i CRC-16: The filter i CRC-16 register contains the CRC-16 value calculated from the pattern and the byte mask programmed in the Remote Wakeup filter register. 1. The 16-bit CRC calculation uses the following polynomial: G(x) = x^16 + x^15 + x^2 + 1 2. Each mask, used in the hash function calculation, is compared with a 16-bit value associated with that mask. Each filter has the following: (1)32-bit Mask: Each bit in this mask corresponds to one byte in the detected packet. If the bit is 1, the corresponding byte is taken into the CRC16 calculation. (2) 8-bit Offset Pointer: Specifies the byte to start the CRC-16 computation. The pointer and the mask are used together to locate the bytes to be used in the CRC-16 calculations.

GMAC_MAC_LPI_Control_Status

Address: Operational Base + offset (0x00D0)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved

Bit	Attr	Reset Value	Description
21	RW	0x0	LPITCSE LPI Tx Clock Stop Enable When this bit is set, the MAC asserts sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not assert sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed. Values: 1'b0: LPI Tx Clock Stop is disabled 1'b1: LPI Tx Clock Stop is enabled
20	RW	0x0	LPIATE LPI Timer Enable This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPIATE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the MAC_LPI_Entry_Timer register. After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again. When LPIATE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions. Values: 1'b0: LPI Timer is disabled 1'b1: LPI Timer is enabled
19	RW	0x0	LPITXA LPI Tx Automate This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. This bit is not functional in the EQOS-CORE configurations in which the Tx clock gating is done during the LPI mode. If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of MTL_TxQ0_Operation_Mode register, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode. Values: 1'b0: LPI Tx Automate is disabled 1'b1: LPI Tx Automate is enabled

Bit	Attr	Reset Value	Description
18	RW	0x0	PLSEN PHY Link Status Enable This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER. When this bit is set, the MAC uses the link-status bits of the MAC_PHYIF_Control_Status register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the MAC_PHYIF_Control_Status register and takes only the PLS bit. Values: 1'b0: PHY Link Status is disabled 1'b1: PHY Link Status is enabled
17	RW	0x0	PLS PHY Link Status This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER. When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down. Values: 1'b0: link is down 1'b1: link is okay (UP)
16	RW	0x0	LPIEN LPI Enable When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission. Values: 1'b0: LPI state is disabled 1'b1: LPI state is enabled
15:10	RO	0x00	reserved
9	RO	0x0	RLPIST Receive LPI State When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface. Values: 1'b0: Receive LPI state not detected 1'b1: Receive LPI state detected
8	RO	0x0	TLPIST Transmit LPI State When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface. Values: 1'b0: Transmit LPI state not detected 1'b1: Transmit LPI state detected
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3	RW	0x0	RLPIEX Receive LPI Exit When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. Values: 1'b0: Receive LPI exit not detected 1'b1: Receive LPI exit detected
2	RO	0x0	RLPIEN Receive LPI Entry When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. Values: 1'b0: Receive LPI entry not detected 1'b1: Receive LPI entry detected
1	RO	0x0	TLPIEX Transmit LPI Exit When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Values: 1'b0: Transmit LPI exit not detected 1'b1: Transmit LPI exit detected
0	RO	0x0	TLPIEN Transmit LPI Entry When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Values: 1'b0: Transmit LPI entry not detected 1'b1: Transmit LPI entry detected

GMAC_MAC_LPI_Timers_Control

Address: Operational Base + offset (0x00D4)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved

Bit	Attr	Reset Value	Description
25:16	RW	0x3e8	LST LPI LS Timer This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.
15:0	RW	0x0000	TWT LPI TW Timer This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

GMAC_MAC_LPI_Entry_Timer

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:0	RW	0x03f	TIC_1US_CNTR 1US TIC Counter The application must program this counter so that the number of clock cycles of CSR clock is 1us. (Subtract 1 from the value before programming). For example if the CSR clock is 100MHz then this field needs to be programmed to value 100 - 1 = 99 (which is 0x63). This is required to generate the 1US events that are used to update some of the EEE related counters.

GMAC_MAC_PHYIF_Control_Status

Address: Operational Base + offset (0x00F8)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19	RO	0x0	LNKSTS Link Status This bit indicates whether the link is up (1'b1) or down (1'b0). Values: 1'b0: Link down 1'b1: Link up

Bit	Attr	Reset Value	Description
18:17	RO	0x0	LNKSPEED Link Speed This bit indicates the current speed of the link. Bit 2 is reserved when the MAC is configured for the SMII PHY interface. Values: 2'b00: 2.5 MHz 2'b01: 25 MHz 2'b10: 125 MHz 2'b11: Reserved
16	RO	0x0	LNKMOD Link Mode This bit indicates the current mode of operation of the link. Values: 1'b0: Half-duplex mode 1'b1: Full-duplex mode
15:2	RO	0x0000	reserved
1	RW	0x0	LUD Link Up or Down This bit indicates whether the link is up or down during transmission of configuration in the RGMII, SGMII, or SMII interface. Values: 1'b0: Link down 1'b1: Link up
0	RW	0x0	TC Transmit Configuration in RGMII, SGMII, or SMII When set, this bit enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII, SMII, or SGMII port. When this bit is reset, no such information is driven to the PHY. The details of this feature are provided in the following sections: 1. "Reduced Gigabit Media Independent Interface" 2. "Serial Media Independent Interface" 3. "Serial Gigabit Media Independent Interface" Values: 1'b0: Disable Transmit Configuration in RGMII, SGMII, or SMII 1'b1: Enable Transmit Configuration in RGMII, SGMII, or SMII

GMAC_MAC_Version

GMAC_MAC_MDIO_Address

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	PSE Preamble Suppression Enable When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications. Values: 1'b0: Preamble Suppression disabled 1'b1: Preamble Suppression enabled
26	RW	0x0	BTB Back to Back transactions When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0. Values: 1'b0: Back to Back transactions disabled 1'b1: Back to Back transactions enabled

Bit	Attr	Reset Value	Description
25:21	RW	0x00	PA Physical Layer Address This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. For RevMII, this field gives the PHY Address of the RevMII module. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20:16	RW	0x00	RDA Register/Device Address These bits select the PHY register in selected Clause 22 PHY device. For RevMII, these bits select the CSR register in the RevMII Registers set. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15	RO	0x0	reserved
14:12	RW	0x0	NTC Number of Trailing Clocks This field controls the number of trailing clock cycles generated on gmii_mdc_o (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.
11:8	RW	0x0	CR CSR Clock Range The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: 4'b0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 4'b0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 4'b0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 4'b0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 4'b0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 4'b0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 4'b0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 4'b0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: 4'b1000: CSR clock/4 4'b1001: CSR clock/6 4'b1010: CSR clock/8 4'b1011: CSR clock/10 4'b1100: CSR clock/12 4'b1101: CSR clock/14 4'b1110: CSR clock/16 4'b1111: CSR clock/18 These bits are not used for accessing RevMII. These bits are read-only if the RevMII interface is selected as single PHY interface.
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	SKAP Skip Address Packet When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set. Values: 1'b0: Skip Address Packet is disabled 1'b1: Skip Address Packet is enabled
3	RW	0x0	GOC_1 GMII Operation Command 1 This bit is higher bit of the operation command to the PHY or RevMII, GOC_1 and GOC_O is encoded as follows: 2'b00: Reserved 2'b01: Write 2'b10: Post Read Increment Address for Clause 45 PHY 2'b11: Read When Clause 22 PHY or RevMII is enabled, only Write and Read commands are valid. Values: 1'b0: GMII Operation Command 1 is disabled 1'b1: GMII Operation Command 1 is enabled
2	RW	0x0	GOC_0 GMII Operation Command 0 This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. When only RevMII is selected in configuration this bit is read-only and tied to 1. Values: 1'b0: GMII Operation Command 0 is disabled 1'b1: GMII Operation Command 0 is enabled
1	RW	0x0	C45E Clause 45 PHY Enable When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO. Values: 1'b0: Clause 45 PHY is disabled 1'b1: Clause 45 PHY is enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	GB GMII Busy The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_Address and MAC_MDIO_Data registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDl field (and also RA field when C45E is set) in MAC_MDIO_Data register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_Data register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_Data register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: GMII Busy is disabled 1'b1: GMII Busy is enabled

GMAC_MAC_MDIO_Data

Address: Operational Base + offset (0x0204)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	RA Register Address This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.
15:0	RW	0x0000	GD GMII Data This field contains the 16-bit data value read from the PHY or RevMII after a Management Read operation or the 16-bit data value to be written to the PHY or RevMII before a Management Write operation.

GMAC_MAC_CSR_SW_Ctrl

Address: Operational Base + offset (0x0230)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	RCWE Register Clear on Write 1 Enable When this bit is set, the access mode of some register fields changes to Clear on Write 1, the application needs to set that respective bit to 1 to clear it. When this bit is reset, the access mode of these register fields remain as Clear on Read. Values: 1'b0: Register Clear on Write 1 is disabled 1'b1: Register Clear on Write 1 is enabled

GMAC_MAC_Address0_High

Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31	RO	0x0	AE Address Enable This bit is always set to 1. Values: 1'b0: This bit must be always set to 1 1'b1: This bit is always set to 1
30:16	RO	0x0000	reserved
15:0	RW	0xffff	ADDRHI MAC Address0[47:32] This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

GMAC_MAC_Address0_Low

Address: Operational Base + offset (0x0304)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	ADDRLO MAC Address0[31:0] This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

GMAC_MMC_Control

Address: Operational Base + offset (0x0700)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	UCDBC Update MMC Counters for Dropped Broadcast Packets Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets. Values: 1'b0: Update MMC Counters for Dropped Broadcast Packets is disabled 1'b1: Update MMC Counters for Dropped Broadcast Packets is enabled
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5	RW	0x0	CNTPRSTLVL Full-Half Preset When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. Values: 1'b0: Full-Half Preset is disabled 1'b1: Full-Half Preset is enabled
4	RW	0x0	CNTPRST Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. Values: 1'b0: Counters Preset is disabled 1'b1: Counters Preset is enabled
3	RW	0x0	CNTFREEZ MMC Counter Freeze When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode. Values: 1'b0: MMC Counter Freeze is disabled 1'b1: MMC Counter Freeze is enabled
2	RW	0x0	RSTONRD Reset on Read When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read. Values: 1'b0: Reset on Read is disabled 1'b1: Reset on Read is enabled
1	RW	0x0	CNTSTOPRO Counter Stop Rollover When this bit is set, the counter does not roll over to zero after reaching the maximum value. Values: 1'b0: Counter Stop Rollover is disabled 1'b1: Counter Stop Rollover is enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	CNTRST Counters Reset When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. Values: 1'b0: Counters are not reset 1'b1: All counters are reset

GMAC_RxIPv4_Good_Packets

Address: Operational Base + offset (0x0810)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXIPV4GDPKT RxIPv4 Good Packets This field indicates the number of good IPv4 datagrams received with the TCP, UDP, or ICMP payload.

GMAC_RxIPv4_Header_Error_Packets

Address: Operational Base + offset (0x0814)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXIPV4HDRERRPKT RxIPv4 Header Error Packets This field indicates the number of IPv4 datagrams received with header (checksum, length, or version mismatch) errors.

GMAC_RxIPv6_Good_Packets

Address: Operational Base + offset (0x0824)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXIPV6GDPKT RxIPv6 Good Packets This field indicates the number of good IPv6 datagrams received with the TCP, UDP, or ICMP payload.

GMAC_RxIPv6_Header_Error_Packets

Address: Operational Base + offset (0x0828)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXIPV6HDRERRPKT RxIPv6 Header Error Packets This field indicates the number of IPv6 datagrams received with header (length or version mismatch) errors.

GMAC_RxUDP_Error_Packets

Address: Operational Base + offset (0x0834)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXUDPERRPKT RxUDP Error Packets This field indicates the number of good IP datagrams received whose UDP payload has a checksum error.

GMAC_RxTCP_Error_Packets

Address: Operational Base + offset (0x083C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXTCPERRPKT RxTCP Error Packets This field indicates the number of good IP datagrams received whose TCP payload has a checksum error.

GMAC_RxICMP_Error_Packets

Address: Operational Base + offset (0x0844)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXICMPERRPKT RxICMP Error Packets This field indicates the number of good IP datagrams received whose ICMP payload has a checksum error.

GMAC_RxIPv4_Header_Error_Octets

Address: Operational Base + offset (0x0854)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXIPV4HDRERROCT RxIPv4 Header Error Octets This field indicates the number of bytes received in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

GMAC_RxIPv6_Header_Error_Octets

Address: Operational Base + offset (0x0868)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXIPV6HDRERROCT RxIPv6 Header Error Octets This field indicates the number of bytes received in IPv6 datagrams with header errors (length, version mismatch). The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

GMAC_RxUDP_Error_Octets

Address: Operational Base + offset (0x0874)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXUDPERROCT RxUDP Error Octets This field indicates the number of bytes received in a UDP segment that had checksum errors. This counter does not count IP header bytes.

GMAC_RxTCP_Error_Octets

Address: Operational Base + offset (0x087C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXTCPERROCT RxTCP Error Octets This field indicates the number of bytes received in a TCP segment that had checksum errors. This counter does not count IP header bytes.

GMAC_RxICMP_Error_Octets

Address: Operational Base + offset (0x0884)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RXICMPERROCT RxICMP Error Octets This field indicates the number of bytes received in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

GMAC_MAC_Timestamp_Control

Address: Operational Base + offset (0x0B00)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RW	0x0	AV8021ASMEN AV 802.1AS Mode Enable When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. Values: 1'b0: AV 802.1AS Mode is disabled 1'b1: AV 802.1AS Mode is enabled
27:25	RO	0x0	reserved

Bit	Attr	Reset Value	Description
24	RW	0x0	TXTSSTSM Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. Values: 1'b0: Transmit Timestamp Status Mode is disabled 1'b1: Transmit Timestamp Status Mode is enabled
23:21	RO	0x0	reserved
20	RW	0x0	ESTI External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: 1. To take the timestamp provided as status 2. To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time. Values: 1'b0: External System Time Input is disabled 1'b1: External System Time Input is enabled
19	RO	0x0	reserved
18	RW	0x0	TSENMACADDR Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. Values: 1'b0: MAC Address for PTP Packet Filtering is disabled 1'b1: MAC Address for PTP Packet Filtering is enabled
17:16	RW	0x0	SNAPTYPSEL Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.

Bit	Attr	Reset Value	Description
15	RW	0x0	TSMSTRENA Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. Values: 1'b0: Snapshot for Messages Relevant to Master is disabled 1'b1: Snapshot for Messages Relevant to Master is enabled
14	RW	0x0	TSEVNTENA Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. Values: 1'b0: Timestamp Snapshot for Event Messages is disabled 1'b1: Timestamp Snapshot for Event Messages is enabled
13	RW	0x0	TSIPV4ENA Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. Values: 1'b0: Processing of PTP Packets Sent over IPv4-UDP is disabled 1'b1: Processing of PTP Packets Sent over IPv4-UDP is enabled
12	RW	0x0	TSIPV6ENA Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. Values: 1'b0: Processing of PTP Packets Sent over IPv6-UDP is disabled 1'b1: Processing of PTP Packets Sent over IPv6-UDP is enabled
11	RW	0x0	TSIPENA Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. Values: 1'b0: Processing of PTP over Ethernet Packets is disabled 1'b1: Processing of PTP over Ethernet Packets is enabled
10	RW	0x0	TSVER2ENA Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. Values: 1'b0: PTP Packet Processing for Version 2 Format is disabled 1'b1: PTP Packet Processing for Version 2 Format is enabled

Bit	Attr	Reset Value	Description
9	RW	0x0	TSCTRLSSR Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit. Values: 1'b0: Timestamp Digital or Binary Rollover Control is disabled 1'b1: Timestamp Digital or Binary Rollover Control is enabled
8	RW	0x0	TSENALL Enable Timestamp for All Packets When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. Values: 1'b0: Timestamp for All Packets disabled 1'b1: Timestamp for All Packets enabled
7:6	RO	0x0	reserved
5	RW	0x0	TSADDREG Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Addend Register is not updated 1'b1: Addend Register is updated
4	RW	0x0	TSTRIG Enable Timestamp Interrupt Trigger When this bit is set, the timestamp interrupt is generated when the System Time becomes greater than the value written in the Target Time register. This bit is reset after the Timestamp Trigger Interrupt is generated. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Timestamp Interrupt Trigger is not enabled 1'b1: Timestamp Interrupt Trigger is enabled

Bit	Attr	Reset Value	Description
3	RW	0x0	TSUPDT Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated.When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Timestamp is not updated 1'b1: Timestamp is updated
2	RW	0x0	TSINIT Initalize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized.When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Timestamp is not initialized 1'b1: Timestamp is initialized
1	RW	0x0	TSCFUPDT Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. Values: 1'b0: Coarse method is used to update system timestamp 1'b1: Fine method is used to update system timestamp
0	RW	0x0	TSENA Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode.On the Receive side, the MAC processes the 1588 packets only if this bit is set. Values: 1'b0: Timestamp is disabled 1'b1: Timestamp is enabled

GMAC_MAC_Sub_Second_Increment

Address: Operational Base + offset (0x0B04)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	SSINC Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in MAC_Timestamp_Control]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15:0	RO	0x0000	reserved

GMAC_MAC_System_Time_Secs

Address: Operational Base + offset (0x0B08)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSS Timestamp Second The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

GMAC_MAC_System_Time_NS

Address: Operational Base + offset (0x0B0C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	RW	0x00000000	TSSS Timestamp Sub Seconds The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in MAC_Timestamp_Control, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

GMAC_MAC_Sys_Time_Secs_Update

Address: Operational Base + offset (0x0B10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSS Timestamp Seconds The value in this field is the seconds part of the update. When ADDSUB is reset, this field must be programmed with the seconds part of the update value. When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, the TSS field in the MAC_Timestamp_Seconds_Update register must be 0xFFFF_FFFE (that is, 2^32 - 2).

GMAC_MAC_Sys_Time_NS_Update

Address: Operational Base + offset (0x0B14)

Bit	Attr	Reset Value	Description
31	RW	0x0	ADDSUB Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. Values: 1'b0: Add time 1'b1: Subtract time
30:0	RW	0x00000000	TSSS Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the MAC_Timestamp_Control register.When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_Timestamp_Control is set, the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR bit in MAC_Timestamp_Control is reset, the programmed value must be 2^31 - <sub-second_value>. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is set.

GMAC_MAC_Timestamp_Addend

Address: Operational Base + offset (0x0B18)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSAR Timestamp Addend Register This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

GMAC_MAC_Timestamp_Status

Address: Operational Base + offset (0x0B20)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:25	RO	0x00	ATSNS Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.

Bit	Attr	Reset Value	Description
24	RO	0x0	ATSSTM Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Values: 1'b0: Auxiliary Timestamp Snapshot Trigger Missed status not detected 1'b1: Auxiliary Timestamp Snapshot Trigger Missed status detected
23:16	RO	0x00	reserved
15	RO	0x0	TXTSSIS Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_Tx_Timestamp_Status_Seconds register is read (or write to MAC_Tx_Timestamp_Status_Seconds register when RCWE bit of MAC_CSR_SW_Ctrl register is set). Values: 1'b0: Tx Timestamp Status Interrupt status not detected 1'b1: Tx Timestamp Status Interrupt status detected
14:4	RO	0x000	reserved
3	RO	0x0	TSTRGTERR0 Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Timestamp Target Time Error status not detected 1'b1: Timestamp Target Time Error status detected
2	RO	0x0	AUXTSTRIG Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Auxiliary Timestamp Trigger Snapshot status not detected 1'b1: Auxiliary Timestamp Trigger Snapshot status detected

Bit	Attr	Reset Value	Description
1	RO	0x0	TSTARGT0 Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Timestamp Target Time Reached status not detected 1'b1: Timestamp Target Time Reached status detected
0	RO	0x0	TSSOVF Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Timestamp Seconds Overflow status not detected 1'b1: Timestamp Seconds Overflow status detected

GMAC_MAC_Tx_TS_Status_NS

Address: Operational Base + offset (0x0B30)

Bit	Attr	Reset Value	Description
31	RO	0x0	TXTSSMIS Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: 1. The timestamp of the current packet is ignored if TXTSSTSM bit of the MAC_Timestamp_Control register is reset. 2. The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_Timestamp_Control register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. Values: 1'b0: Transmit Timestamp Status Missed status not detected 1'b1: Transmit Timestamp Status Missed status detected
30:0	RO	0x00000000	TXTSSLO Transmit Timestamp Status Low This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

GMAC_MAC_Tx_TS_Status_Secs

Address: Operational Base + offset (0x0B34)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TXTSSHI Transmit Timestamp Status High This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

GMAC_MAC_Auxiliary_Control

Address: Operational Base + offset (0x0B40)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	ATSFC Auxiliary Snapshot FIFO Clear When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Auxiliary Snapshot FIFO Clear is disabled 1'b1: Auxiliary Snapshot FIFO Clear is enabled

GMAC_MAC_Auxiliary_TS_NS

Address: Operational Base + offset (0x0B48)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	RO	0x00000000	AUXTSLO Auxiliary Timestamp Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

GMAC_MAC_Auxiliary_TS_Secs

Address: Operational Base + offset (0x0B4C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	AUXTSHI Auxiliary Timestamp Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

GMAC_MAC_TS_Ingress_Corr_NS

Address: Operational Base + offset (0x0B58)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSIC Timestamp Ingress Correction This field contains the ingress path correction value as defined by the Ingress Correction expression.

GMAC_MAC_TS_Egress_Corr_NS

Address: Operational Base + offset (0x0B5C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSEC Timestamp Egress Correction This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

GMAC_MAC_TS_Ingress_Latency

Address: Operational Base + offset (0x0B68)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	ITLNS Ingress Timestamp Latency, in sub-nanoseconds This register holds the average latency in sub-nanoseconds between the input ports (phy_rxd_i) of MAC and the actual point (GMII/MII) where the ingress timestamp is taken.

Bit	Attr	Reset Value	Description

31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	PPSCTRL_PPSCMD PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: 4'b0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. 4'b0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. 4'b0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. 4'b0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. ... 4'b1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: 1. When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms. 2. When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high). 3. When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high). This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register.

Bit	Attr	Reset Value	Description
3:0	RW	0x0	PPSCTRL_PPSCMD(cont.) Flexible PPS Output (ptp_pps_o[0]) Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: 4'b0000: No Command 4'b0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. 4'b0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. 4'b0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. 4'b0100: STOP Pulse train at time This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. 4'b0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). 4'b0110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command. 4'b0111-4'b1111: Reserved

During debug or slave access read operation, this field contains the data read from the Tx FIFO, Rx FIFO, TSO FIFO, or Tx Status FIFO.

GMAC_MTL_Interrupt_Status

Address: Operational Base + offset (0x0C20)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RO	0x0	DBGIS Debug Interrupt status This bit indicates an interrupt event during the slave access. To reset this bit, the application must read the FIFO Debug Access Status register to get the exact cause of the interrupt and clear its source. Values: 1'b0: Debug Interrupt status not detected 1'b1: Debug Interrupt status detected

Bit	Attr	Reset Value	Description
16:1	RO	0x0000	reserved
0	RO	0x0	Q0IS Queue 0 Interrupt status This bit indicates that there is an interrupt from Queue 0. To reset this bit, the application must read Queue 0 Interrupt Control and Status register to get the exact cause of the interrupt and clear its source. Values: 1'b0: Queue 0 Interrupt status not detected 1'b1: Queue 0 Interrupt status detected

GMAC_MTL_TxQ0_Operation_Mode

Address: Operational Base + offset (0x0D00)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x0	TTC Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. Values: 3'b000: 32 bytes 3'b001: 64 bytes 3'b010: 96 bytes 3'b011: 128 bytes 3'b100: 192 bytes 3'b101: 256 bytes 3'b110: 384 bytes 3'b111: 512 bytes
3:2	RO	0x0	reserved
1	RW	0x0	TSF Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. Values: 1'b0: Transmit Store and Forward is disabled 1'b1: Transmit Store and Forward is enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	FTQ Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Flush Transmit Queue is disabled 1'b1: Flush Transmit Queue is enabled

GMAC_MTL_TxQ0_Underflow

Address: Operational Base + offset (0x0D04)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RO	0x0	UFCNTOVF Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. Values: 1'b0: Overflow not detected for Underflow Packet Counter 1'b1: Overflow detected for Underflow Packet Counter
10:0	RO	0x000	UFFRMCNT Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

GMAC_MTL_TxQ0_Debug

Address: Operational Base + offset (0x0D08)

Bit	Attr	Reset Value	Description

22:20	RO	0x0	STXSTSF Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue.When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.

Bit	Attr	Reset Value	Description
19	RO	0x0	reserved
18:16	RO	0x0	PTXQ Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15:6	RO	0x000	reserved
5	RO	0x0	TXSTSFSTS MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. Values: 1'b0: MTL Tx Status FIFO Full status is not detected 1'b1: MTL Tx Status FIFO Full status is detected
4	RO	0x0	TXQSTS MTL Tx Queue Not Empty Status When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. Values: 1'b0: MTL Tx Queue Not Empty status is not detected 1'b1: MTL Tx Queue Not Empty status is detected
3	RO	0x0	TWCSTS MTL Tx Queue Write Controller Status When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. Values: 1'b0: MTL Tx Queue Write Controller status is not detected 1'b1: MTL Tx Queue Write Controller status is detected
2:1	RO	0x0	TRCSTS MTL Tx Queue Read Controller Status This field indicates the state of the Tx Queue Read Controller: Values: 2'b00: Idle state 2'b01: Read state (transferring data to the MAC transmitter) 2'b10: Waiting for pending Tx Status from the MAC transmitter 2'b11: Flushing the Tx queue because of the Packet Abort request from the MAC
0	RO	0x0	TXQPAUSED Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: 1. Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled 2. Reception of 802.3x Pause packet when PFC is disabled Values: 1'b0: Transmit Queue in Pause status is not detected 1'b1: Transmit Queue in Pause status is detected

GMAC_MTL_Q0_Interrupt_Ctrl_Status

Address: Operational Base + offset (0x0D2C)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	RXOIE Receive Queue Overflow Interrupt Enable When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. Values: 1'b0: Receive Queue Overflow Interrupt is disabled 1'b1: Receive Queue Overflow Interrupt is enabled
23:17	RO	0x00	reserved
16	RW	0x0	RXOVFIS Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 1'b0: Receive Queue Overflow Interrupt Status not detected 1'b1: Receive Queue Overflow Interrupt Status detected
15:9	RO	0x00	reserved
8	RW	0x0	TXUIE Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. Values: 1'b0: Transmit Queue Underflow Interrupt Status is disabled 1'b1: Transmit Queue Underflow Interrupt Status is enabled
7:1	RO	0x00	reserved
0	RW	0x0	TXUNFIS Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 1'b0: Transmit Queue Underflow Interrupt Status not detected 1'b1: Transmit Queue Underflow Interrupt Status detected

GMAC_MTL_RxQ0_Operation_Mode

Address: Operational Base + offset (0x0D30)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:14	RW	0x00	RFD Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: 0: Full minus 1 KB, that is, FULL 1 KB 1: Full minus 1.5 KB, that is, FULL 1.5 KB 2: Full minus 2 KB, that is, FULL 2 KB 3: Full minus 2.5 KB, that is, FULL 2.5 KB ... 62: Full minus 32 KB, that is, FULL 32 KB 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	RW	0x00	RFA Threshold for Activating Flow Control (in half-duplex and full-duplex) These bits control the threshold (fill-level of Rx queue) at which the flow control is activated:For more information on encoding for this field, see RFD.
7	RW	0x0	EHFC Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. Values: 1'b0: Hardware Flow Control is disabled 1'b1: Hardware Flow Control is enabled
6	RW	0x0	DIS_TCP_EF Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. Values: 1'b0: Dropping of TCP/IP Checksum Error Packets is enabled 1'b1: Dropping of TCP/IP Checksum Error Packets is disabled

Bit	Attr	Reset Value	Description
5	RW	0x0	RSF Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. Values: 1'b0: Receive Queue Store and Forward is disabled 1'b1: Receive Queue Store and Forward is enabled
4	RW	0x0	FEP Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. Values: 1'b0: Forward Error Packets is disabled 1'b1: Forward Error Packets is enabled
3	RW	0x0	FUP Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. Values: 1'b0: Forward Undersized Good Packets is disabled 1'b1: Forward Undersized Good Packets is enabled
2	RO	0x0	reserved
1:0	RW	0x0	RTC Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

GMAC_MTL_RxQ0_Miss_Pkt_Ovf_Cnt

3	RO	0x0	reserved
2:1	RO	0x0	RRCSTS MTL Rx Queue Read Controller State This field gives the state of the Rx queue Read controller: Values: 2'b00: Idle state 2'b01: Reading packet data 2'b10: Reading packet status (or timestamp) 2'b11: Flushing the packet data and status
0	RO	0x0	RWCSTS MTL Rx Queue Write Controller Active Status When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. Values: 1'b0: MTL Rx Queue Write Controller Active Status not detected 1'b1: MTL Rx Queue Write Controller Active Status detected

GMAC_DMA_Mode

Address: Operational Base + offset (0x1000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
17:16	RW	0x0	INTM Interrupt Mode This field defines the interrupt mode of DWC_ether_qos. The behavior of the following outputs changes depending on the following settings: 1. sbd_perch_tx_intr_o[] (Transmit Per Channel Interrupt) 2. sbd_perch_rx_intr_o[] (Receive Per Channel Interrupt) 3. sbd_intr_o (Common Interrupt) It also changes the behavior of the RI/TI bits in the DMA_CH0_Status. 2'b00: sbd_perch_* are pulse signals for each TX/RX packet transfer completion events (irrespective of whether corre_sponding interrupts are enabled) for which IOC bits are enabled in descriptor. sbd_intr_o is also asserted when corresponding interrupts are enabled and cleared only when software clears the corresponding RI/TI status bits. 2'b01: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. 2'b10: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. However, the signal is asserted again if the same event occurred again before it was cleared. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. 2'b11: Reserved Values: 2'b00: See above description 2'b01: See above description 2'b10: See above description 2'b11: Reserved
15:9	RO	0x00	reserved
8	RW	0x0	DSPW Descriptor Posted Write When this bit is set to 0, the descriptor writes are always non-posted. When this bit is set to 1, the descriptor writes are non-posted only when IOC (Interrupt on completion) is set in last descriptor, otherwise the descriptor writes are always posted. Values: 1'b0: Descriptor Posted Write is disabled 1'b1: Descriptor Posted Write is enabled
7:1	RO	0x00	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	SWR Software Reset When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all DWC_ether_qos clock domains. Before reprogramming any DWC_ether_qos register, a value of zero should be read in this bit. This bit must be read at least 4 CSR clock cycles after it is written to 1. Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Software Reset is disabled 1'b1: Software Reset is enabled

GMAC_DMA_SysBus_Mode

Address: Operational Base + offset (0x1004)

Bit	Attr	Reset Value	Description
31	RW	0x0	EN_LPI Enable Low Power Interface (LPI) When set to 1, this bit enables the LPI mode supported by the EQOS-AXI configuration and accepts the LPI request from the AXI System Clock controller. When set to 0, this bit disables the LPI mode and always denies the LPI request from the AXI System Clock controller. Values: 1'b0: Low Power Interface (LPI) is disabled 1'b1: Low Power Interface (LPI) is enabled
30	RW	0x0	LPI_XIT_PKT Unlock on Magic Packet or Remote Wake-Up Packet When set to 1, this bit enables the AXI master to come out of the LPI mode only when the magic packet or remote wake-up packet is received. When set to 0, this bit enables the AXI master to come out of the LPI mode when any packet is received. Values: 1'b0: Unlock on Magic Packet or Remote Wake-Up Packet is disabled 1'b1: Unlock on Magic Packet or Remote Wake-Up Packet is enabled
29:26	RO	0x0	reserved
25:24	RW	0x0	WR_OSR_LMT AXI Maximum Write Outstanding Request Limit This value limits the maximum outstanding request on the AXI write interface. Maximum outstanding requests = WR_OSR_LMT + 1 Note: 1. Bit 26 is reserved if DWC_ETHER_QOS_AXI_MAX-_WR_REQ = 4 2. Bit 27 is reserved if DWC_ETHER_QOS_AXI_MAX-_WR_REQ!= 16

Bit	Attr	Reset Value	Description
23:19	RO	0x00	reserved
18:16	RW	0x1	RD_OSR_LMT AXI Maximum Read Outstanding Request Limit This value limits the maximum outstanding request on the AXI read interface. Maximum outstanding requests = RD_OSR_LMT + 1 Note: 1. Bit 18 is reserved if parameter DWC_ETHER_QOS_AXI_-MAX_RD_REQ = 4 2. Bit 19 is reserved if parameter DWC_ETHER_QOS_AXI_-MAX_RD_REQ!= 16
15:13	RO	0x0	reserved
12	RW	0x0	AAL Address-Aligned Beats When this bit is set to 1, the EQOS-AXI or EQOS-AHB master performs address-aligned burst transfers on Read and Write channels. Values: 1'b0: Address-Aligned Beats is disabled 1'b1: Address-Aligned Beats is enabled
11	RO	0x0	reserved
10	RW	0x0	AALE Automatic AXI LPI enable When set to 1, enables the AXI master to enter into LPI state when there is no activity in the DWC_ether_qos for number of system clock cycles programmed in the LPIEI field of AXI_LPI_Entry_Interval register. Values: 1'b0: Automatic AXI LPI is disabled 1'b1: Automatic AXI LPI is enabled
9:4	RO	0x00	reserved
3	RW	0x0	BLEN16 AXI Burst Length 16 When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 16 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. Values: 1'b0: No effect 1'b1: AXI Burst Length 16
2	RW	0x0	BLEN8 AXI Burst Length 8 When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 8 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. Values: 1'b0: No effect 1'b1: AXI Burst Length 8
1	RW	0x0	BLEN4 AXI Burst Length 4 When this bit is set to 1 or the FB bit is set to 0, the EQOS-AXI master can select a burst length of 4 on the AXI interface. When the FB bit is set to 0, setting this bit has no effect. Values: 1'b0: No effect 1'b1: AXI Burst Length 4

Bit	Attr	Reset Value	Description
0	RW	0x0	FB Fixed Burst Length When this bit is set to 1, the EQOS-AXI master initiates burst transfers of specified lengths as given below. 1. Burst transfers of fixed burst lengths as indicated by the BLEN256, BLEN128, BLEN64, BLEN32, BLEN16, BLEN8, or BLEN4 field 2. Burst transfers of length 1 When this bit is set to 0, the EQOS-AXI master initiates burst transfers that are equal to or less than the maximum allowed burst length programmed in Bits[7:1]. Values: 1'b0: Fixed Burst Length is disabled 1'b1: Fixed Burst Length is enabled

GMAC_DMA_Interrupt_Status

Address: Operational Base + offset (0x1008)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RO	0x0	MACIS MAC Interrupt Status This bit indicates an interrupt event in the MAC. To reset this bit to 1'b0, the software must read the corresponding register in the MAC to get the exact cause of the interrupt and clear its source. Values: 1'b0: MAC Interrupt Status not detected 1'b1: MAC Interrupt Status detected
16	RO	0x0	MTLIS MTL Interrupt Status This bit indicates an interrupt event in the MTL. To reset this bit to 1'b0, the software must read the corresponding register in the MTL to get the exact cause of the interrupt and clear its source. Values: 1'b0: MTL Interrupt Status not detected 1'b1: MTL Interrupt Status detected
15:1	RO	0x0000	reserved
0	RO	0x0	DC0IS DMA Channel 0 Interrupt Status This bit indicates an interrupt event in DMA Channel 0. To reset this bit to 1'b0, the software must read the corresponding register in DMA Channel 0 to get the exact cause of the interrupt and clear its source. Values: 1'b0: DMA Channel 0 Interrupt Status not detected 1'b1: DMA Channel 0 Interrupt Status detected

20.6 Application Note

20.6.1 Descriptors

The DMA engine uses descriptors to efficiently move data from source to destination with minimal application CPU intervention. The DMA is designed for packet-oriented data transfers such as packets in Ethernet. The DMA controller can be programmed to interrupt the application CPU for situations such as Packet Transmit and Receive Transfer completion, and other normal or error conditions.

The DMA and the application communicate through the following two data structures:

- Control and Status registers (CSR)
- Descriptor lists and data buffers

The base address of each list is written to the respective Tx Descriptor List Address register and Rx Descriptor List Address register. The descriptor list is forward linked and the next descriptor is always considered at a fixed offset to the current one. The offset is controlled by the DSL field of DMA_Ch[n]_Control register. The number of descriptors in the list is programmed in the respective Tx (or Rx) Descriptor Ring Length register. Once the DMA processes the last descriptor in the list, it automatically jumps back to the descriptor in the List Address register to create a descriptor ring.

The descriptor lists reside in the physical memory address space of the application. Each descriptor can point to a maximum of two buffers in the system memory. This enables two buffers to be used, physically addressed, rather than contiguous buffers in memory.

A data buffer resides in the application physical memory space and consists of an entire packet or part of a packet but cannot exceed a single packet. Buffers contain only data. Buffer status is maintained in the descriptor. Data chaining refers to packets that span multiple data buffers. However, a single descriptor cannot span multiple packets. The DMA skips to the data buffer of next packet when EOP is detected.
The GMAC supports the following two types of descriptors:

- Normal Descriptor: Normal descriptors are used for packet data and to provide control information applicable to the packets to be transmitted
- Context Descriptor: Context descriptors are used to provide control information applicable to the packet to be transmitted

The GMAC supports the ring structure for the DMA descriptor.

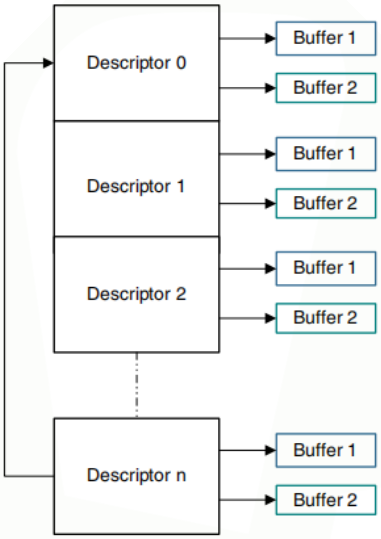

Fig. 20-10 Descriptor Ring Structure

In Ring structure, descriptors are separated by the Word, DWord, or LWord number programmed in the DSL field of the DMA_CH#_Control register. The application needs to program the total ring length, that is, the total number of descriptors in ring span in the following registers of a DMA channel:

- Transmit Descriptor Ring Length Register (DMA_CH#_TxDesc_Ring_Length)
- Receive Descriptor Ring Length Register (DMA_CH#_RxDesc_Ring_Length)

The Descriptor Tail Pointer Register contains the pointer to the descriptor address (N). The base address and the current descriptor pointer decide the address of the current descriptor that the DMA can process.
The descriptors up to one location less than the one indicated by the descriptor tail pointer (N – 1) are owned by the DMA. The DMA continues to process the descriptors until the following condition occurs:

Current Descriptor Pointer == Descriptor Tail Pointer

The DMA goes into the Suspend mode when this condition occurs. The application must perform a write to the Descriptor Tail pointer register and update the tail pointer so that the following condition is true:

Current Descriptor Pointer < Descriptor Tail Pointer

The DMA automatically wraps around the base address when the end of ring is reached.
For descriptors owned by the application, the OWN bit of DES3 is reset to 0. For descriptors owned by the DMA, the OWN bit is set to 1. If the application has only one descriptor in the beginning, the application sets the last descriptor address (tail pointer) to Descriptor Base Address + 1. The DMA processes the first descriptor and then waits for the application to advance the tail pointer.

20.6.2 Transmit Descriptors

The DMA in GMAC requires at least one descriptor for a transmit packet. In addition to two buffers, two byte-count buffers, and two address pointers, the transmit descriptor has control fields which can be used to control the MAC operation on per-transmit packet basis.
The Transmit Normal descriptor has two formats: Read format and Write-Back format.

20.6.3 Transmit Normal Descriptor (Read Format)

Table 20-6 TDES0 Normal Descriptor (Read Format)

Bit	Name	Description
31:0	BUF1AP	Buffer 1 Address Pointer or TSO Header Address Pointer These bits indicate the physical address of Buffer 1. These bits indicate the TSO Header Address pointer when the following bits are set: ■ TSE bit of TDES3 ■ FD bit of TDES3

Table 20-7 TDES1 Normal Descriptor (Read Format)

Bit	Name	Description
31:0	BUF2AP	Buffer 2 or Buffer 1 Address Pointer This bit indicates the physical address of Buffer 2 when a descriptor ring structure is used. There is no limitation for the buffer address alignment. In 40- or 48-bit addressing mode, these bits indicate the most-significant 8- or 16-bits of the Buffer 1 Address Pointer.

Table 20-8 TDES2 Normal Descriptor (Read Format)

Bit	Name	Description
31	IOC	Interrupt on Completion This bit controls the setting of TI and ETI status bits in the DMA_CH#_Status register. When ETIC = 1 and TDES2[LD] = 0, this bit sets the ETI bit. When TDES3[LD] = 1, this bit sets the TI status bit.
30	TTSE/T MWD	Transmit Timestamp Enable or External TSO Memory Write Enable This bit enables the IEEE1588 time stamping for Transmit packet referenced by the descriptor, if TSE bit is not set. If TSE bit is set and external TSO memory is enabled, setting this bit disables external TSO memory writing for this packet.
29:16	B2L	Buffer 2 Length The driver sets this field. When set, this field indicates Buffer 2 length
15:14	VTIR	VLAN Tag Insertion or Replacement These bits request the MAC to perform VLAN tagging or untagging before transmitting the packets. The application must set the CRC Pad Control bits appropriately when VLAN Tag Insertion, Replacement, or Deletion is enabled for the packet. The following list describes the values of these bits: ■ 2'b00: Do not add a VLAN tag. ■ 2'b01: Remove the VLAN tag from the packets before transmission. This option

Bit	Name	Description
		should be used only with the VLAN packets. ■ 2'b10: Insert a VLAN tag with the tag value programmed in the MAC_VLAN_Incl register or context descriptor. ■ 2'b11: Replace the VLAN tag in packets with the tag value programmed in the MAC_VLAN_Incl register or context descriptor. This option should be used only with the VLAN packets. These bits are valid when the Enable SA and VLAN Insertion on Tx option is selected while configuring the core
13:0	HL or B1L	Header Length or Buffer 1 Length For Header length only bits [9:0] are taken. The size 13:0 is applicable only when interpreting buffer 1 length. If the TCP Segmentation Offload feature is enabled through the TSE bit of TDES3, this field is equal to the header length. When the TSE bit is set in TDES3, the header length includes the length in bytes from Ethernet Source address till the end of the TCP header. The maximum header length supported for TSO feature is 1023 bytes. The maximum header length supported for TSO feature is 1023 bytes. If the TCP Segmentation Offload feature is not enabled, this field is equal to Buffer 1 length.

Table 20-9 TDES3 Normal Descriptor (Read Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit after it completes the transfer of data given in the associated buffer(s).
30	CTXT	Context Type This bit should be set to 1'b0 for normal descriptor.
29	FD	First Descriptor When this bit is set, it indicates that the buffer contains the first segment of a packet.
28	LD	Last Descriptor When this bit is set, it indicates that the buffer contains the last segment of the packet. When this bit is set, the B1L or B2L field should have a non-zero value.
27:26	CPC	CRC Pad Control This field controls the CRC and Pad Insertion for Tx packet. This field is valid only when the first descriptor bit

Bit	Name	Description
		(TDES3[29]) is set. The following list describes the values of Bits[27:26]: ■ 2'b00: CRC and Pad Insertion. The MAC appends the cyclic redundancy check (CRC) at the end of the transmitted packet of length greater than or equal to 60 bytes. The MAC automatically appends padding and CRC to a packet with length less than 60 bytes. ■ 2'b01: CRC Insertion (Disable Pad Insertion). The MAC appends the CRC at the end of the transmitted packet but it does not append padding. The application should ensure that the padding bytes are present in the packet being transferred from the Transmit Buffer, that is, the packet being transferred from the Transmit Buffer is of length greater than or equal to 60 bytes. ■ 2'b10: Disable CRC Insertion. The MAC does not append the CRC at the end of the transmitted packet. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer. ■ 2'b11: CRC Replacement. The MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer. This field is valid only for the first descriptor. Note: When the TSE bit is set, the MAC ignores this field because the CRC and pad insertion is always done for segmentation.
25:23	SAIC	SA Insertion Control These bits request the MAC to add or replace the Source Address field in the Ethernet packet with the value given in the MAC Address 0 register. The application must set the CRC Pad Control bits appropriately when SA Insertion Control is enabled for the packet. Bit 25 specifies the MAC Address Register (1 or 0) value that is used for Source Address insertion or replacement. The following list describes the values of Bits[24:23]: ■ 2'b00: Do not include the source address

Bit	Name	Description
		■ 2'b01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses. ■ 2'b10: Replace the source address. For reliable transmission, the application must provide frames with source addresses. ■ 2'b11: Reserved These bits are valid in the EQOS-DMA, EQOS-AXI, and EQOS-AHB configurations when the Enable SA and VLAN Insertion on Tx option is selected while configuring the core and when the First Segment control bit (TDES3 [29]) is set. This field is valid only for the first descriptor.
22:19	SLOTNUM or THL	SLOTNUM: Slot Number Control Bits in AV Mode These bits indicate the slot interval in which the data should be fetched from the corresponding buffers addressed by TDES0 or TDES1. When the Transmit descriptor is fetched, the DMA compares the slot number value in this field with the slot interval maintained in the RSN field DMA_CH#_Slot_Function_Control_Status. It fetches the data from the buffers only if a value matches. These bits are valid only for the AV channels. THL: TCP/UDP Header Length If the TSE bit is set, this field contains the length of the TCP/UDP header. The minimum value of this field must be 5 for TCP header. The value must be equal to 2 for UDP header. This field is valid only for the first descriptor.
18	TSE	TCP Segmentation Enable When this bit is set, the DMA performs the TCP/UDP segmentation or UDP fragmentation for a packet depending on the TSE_MODE[1:0] bit of the DMA_CH(#i)_Tx_Control Register. This bit is valid only if the FD bit is set.
17:16	CIC/TPL	Checksum Insertion Control or TCP Payload Length These bits control the checksum calculation and insertion. The following list describes the bit encoding: ■ 2'b00: Checksum Insertion Disabled. ■ 2'b01: Only IP header checksum calculation and insertion are enabled. ■ 2'b10: IP header checksum and payload checksum calculation and

Bit	Name	Description
		insertion are enabled, but pseudo-header checksum is not calculated in hardware. ■ 2'b11: IP Header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware. This field is valid when the Enable Transmit TCP/IP Checksum Offload option is selected and the TSE bit is reset. When the TSE bit is set, this field contains the upper bits [17:16] of the TCP Payload (or IP Payload for UDP fragmentation). This allows the TCP/UDP packet length field to be spanned across TDES3[17:0] to provide 256 KB packet length support. This field is valid only for the first descriptor.
15	TPL	Reserved or TCP Payload Length When the TSE bit is reset, this bit is reserved. When the TSE bit is set, this is Bit 15 of the TCP payload length [17:0]. This field is valid only when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected while configuring the core.
14:0	FL/TPL	Frame Length or TCP Payload Length This field is equal to the length of the packet to be transmitted in bytes. When the TSE bit is not set, this field is equal to the total length of the packet to be transmitted: Ethernet Header Length + TCP /IP Header Length – Preamble Length – SFD Length + Ethernet Payload Length When the TSE bit is set, this field is equal to the lower 15 bits of the TCP payload length in case of segmentation and IP payload in case of UDP fragmentation. In case of segmentation, this length does not include Ethernet header or TCP/UDP/IP header length. In case of fragmentation, this length does not include Ethernet header and IP header. When DWRR/WFQ algorithm is NOT enabled, value written into this field is not used when TSE = 0.

20.6.4 Transmit Normal Descriptor (Write-back Format)

The write-back format of the Transmit Descriptor includes timestamp low, timestamp high, OWN, and Status bits. The write-back format is applicable only for the last descriptor of the corresponding packet. The LD bit (TDES3[28]) is set in the descriptor where the DMA writes back the status and timestamp information for the corresponding Transmit packet.
this format is only applicable to the last descriptor of a packet.

Table 20-10 TDES0 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31:0	TTSL	Transmit Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for the corresponding Transmit packet. The DMA writes the timestamp only if TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and the Timestamp status (TTSS) bit is set

Table 20-11 TDES1 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31:0	TTSH	Transmit Packet Timestamp High The DMA updates this field with the most significant 32 bits of the timestamp captured for corresponding transmit packet. The DMA writes the timestamp only if the TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set.

Table 20-12 TDES2 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31:0	Rsvd	Reserved

Table 20-13 TDES2 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit after it completes the transfer of data given in the associated buffer(s).
30	CTXT	Context Type This bit should be set to 1'b0 for normal descriptor.
29	FD	First Descriptor When this bit is set, it indicates that the buffer contains the first segment of a packet.
28	LD	Last Descriptor When this bit is set, it indicates that the buffer contains the last segment of the packet. When this bit is set, the B1L or B2L field should have a non-zero value.
27:24	Rsvd	Reserved
23	DE	Descriptor Error When this bit is set, it indicates that the descriptor content is incorrect. The DMA sets this bit during write-back while closing the descriptor. Descriptor Errors can be:

Bit	Name	Description
		■ Incorrect sequence from the context descriptor. For example, a location after the first descriptor for a packet ■ All 1s ■ CTXT, LD, and FD bits set to 1 Note 1: When Descriptor Error occurs due to All 1s or CTXT, LD, and FD bits set to 1, the Transmit DMA closes the transmit descriptor with DE and LD bits set to 1. When IOC bit in TDES2 of corresponding first descriptor is set to 1, Transmit DMA will set the TI bit in the DMA_CH#_Status register. Note 2: Based on CTXT, LD, and FD bits of the transmit descriptor, the subsequent descriptor might be considered as the First Descriptor (even if FD bit is not set) and partial packet is sent.
22:18	Rsvd	Reserved
17	TTSS	Tx Timestamp Status This status bit indicates that a timestamp has been captured for the corresponding transmit packet. When this bit is set, TDES0 and TDES1 have timestamp values that were captured for the Transmit packet. This field is valid only when the Last Segment control bit (TDES3 [28]) in a descriptor is set. This bit is valid only when IEEE1588 timestamping feature is enabled; otherwise, it is reserved.
16	EUE	ECC Uncorrectable Error Status Indicates the ECC uncorrectable error in the TSO memory. Note: Uncorrectable error in Transmit FIFO memory is reported with (Bit 13) FF = 1. This is because, all such packets are flushed by GMAC.
15	ES	Error Summary This bit indicates the logical OR of the following bits: ■ TDES3[0]: IP Header Error ■ TDES3[14]: Jabber Timeout ■ TDES3[13]: Packet Flush ■ TDES3[12]: Payload Checksum Error ■ TDES3[11]: Loss of Carrier ■ TDES3[10]: No Carrier ■ TDES3[9]: Late Collision ■ TDES3[8]: Excessive Collision ■ TDES3[3]: Excessive Deferral ■ TDES3[2]: Underflow Error This bit is also set when EUE (bit 16) is set
14	JT	Jabber Timeout This bit indicates that the MAC transmitter has experienced a jabber time-out. This

Bit	Name	Description
		bit is set only when the JD bit of the MAC_Configuration register is not set.
13	PF	Packet Flushed This bit indicates that the DMA or MTL flushed the packet because of a software flush command given by the CPU.
12	PCE	Payload Checksum Error This bit indicates that the Checksum Offload engine had a failure and did not insert any checksum into the encapsulated TCP, UDP, or ICMP payload. This failure can be either because of insufficient bytes, as indicated by the Payload Length field of the IP Header or the MTL starting to forward the packet to the MAC transmitter in Store-and-Forward mode without the checksum having been calculated yet. This second error condition only occurs when the Transmit FIFO depth is less than the length of the Ethernet packet being transmitted to avoid deadlock, the MTL starts forwarding the packet when the FIFO is full, even in the store-and-forward mode. This error can also occur when Bus Error is detected during packet transfer. When the Full Checksum Offload engine is not enabled, this bit is reserved.
11	LoC	Loss of Carrier This bit indicates that Loss of Carrier occurred during packet transmission (that is, the gmii_crs_i signal was inactive for one or more transmit clock periods during packet transmission). This is valid only for the packets transmitted without collision and when the MAC operates in the half-duplex mode.
10	NC	No Carrier This bit indicates that the carrier sense signal form the PHY was not asserted during transmission.
9	LC	Late Collision This bit indicates that packet transmission was aborted because a collision occurred after the collision window (64 byte times including Preamble in MII mode and 512 byte times including Preamble and Carrier Extension in GMII mode). This bit is not valid if Underflow Error is set.
8	EC	Excessive Collision This bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after first collision and the transmission of the packet is aborted.

Bit	Name	Description
7:4	CC	Collision Count This 4-bit counter value indicates the number of collisions occurred before the packet was transmitted. The count is not valid when the EC bit is set.
3	ED	Excessive Deferral This bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 bits times in 1000 Mbps mode or Jumbo Packet enabled mode) if DC bit is set in the MAC_Configuration register. When TBS is enabled in full duplex mode and this bit is set, it indicates that the frame has been dropped after the expiry time has reached.
2	UF	Underflow Error This bit indicates that the MAC aborted the packet because the data arrived late from the system memory. The underflow error can occur because of either of the following conditions: ■ The DMA encountered an empty Transmit Buffer while transmitting the packet ■ The application filled the MTL Tx FIFO slower than the MAC transmit rate The transmission process enter the suspended state and sets the underflow bit corresponding to a queue in the MTL_Interrupt_Status register.
1	DB	Deferred Bit This bit indicates that the MAC deferred before transmitting because of presence of carrier. This bit is valid only in the half-duplex mode.
0	IHE	IP Header Error When IP Header Error is set, this bit indicates that the Checksum Offload engine detected an IP header error. This bit is valid only when Tx Checksum Offload is enabled. Otherwise, it is reserved. If COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet Type field indicates an IPv4 payload. In full duplex mode, when EST/Qbv is enabled and this bit is set, it indicates the frame drop status due to Frame Size error or Schedule Error.

20.6.5 Transmit Context Descriptor

The context descriptor is used to provide the timestamps for one-step timestamp correction, VLAN Tag ID for VLAN insertion feature. The Transmit Context descriptor can be provided any time before a packet descriptor. The context is valid for the current packet and subsequent packets. The context descriptor is used to provide the timestamps for one-step

timestamp correction and VLAN Tag ID for VLAN insertion feature. Write back is done on a context descriptor only to reset the OWN bit

Table 20-14 TDES0 Context Descriptor

Bit	Name	Description
31:0	TTSL	Transmit Packet Timestamp Low For one-step correction, the driver can provide the lower 32 bits of timestamp in this descriptor word. The DMA uses this value as the low word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.

Table 20-15 TDES1 Context Descriptor

Bit	Name	Description
31:0	TTSH	Transmit Packet Timestamp High For one-step correction, the driver can provide the upper 32 bits of timestamp in this descriptor. The DMA uses this value as the high word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.

Table 20-16 TDES2 Context Descriptor

Bit	Name	Description
31:16	IVT	Inner VLAN Tag When the IVLTV bit of TDES3 context descriptor is set and the TCMSSV and OSTC bits of TDES3 context descriptor are reset, TDES2[31:16] contains the inner VLAN Tag to be inserted in the subsequent Transmit packets.
15:14	Rsvd	Reserved
13:0	MSS	Maximum Segment Size When the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected, the driver can provide maximum segment size in this field. This segment size is used while segmenting the TCP/IP payload. This field is valid only if the TCMSSV bit of TDES3 context descriptor is set and the OSTC bit of the TDES3 context descriptor is reset.

Table 20-17 TDES3 Context Descriptor

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the GMAC DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit immediately after the read.

Bit	Name	Description
30	CTXT	Context Type This bit should be set to 1'b1 for Context descriptor.
29:28	Rsvd	Reserved
27	OSTC	One-Step Timestamp Correction Enable When this bit is set, the DMA performs a one-step timestamp correction with reference to the timestamp values provided in TDES0 and TDES1.
26	TCMSSV	One-Step Timestamp Correction Input or MSS Valid When this bit and the OSTC bit are set, it indicates that the Timestamp Correction input provided in TDES0 and TDES1 is valid. When the OSTC bit is reset and this bit and the TSE bit of TDES3 are set in subsequent normal descriptor, it indicates that the MSS input in TDES2 is valid.
25:24	Rsvd	Reserved
23	DE	Descriptor Error When this bit is set, it indicates that the descriptor content is incorrect.The DMA sets this bit during write-back while closing the context descriptor. Descriptor Errors can be: ■ Incorrect sequence from the context descriptor. For example, a location before the first descriptor for a packet ■ All 1s ■ CD, LD, and FD bits set to 1 Note 1: When Descriptor Error occurs due to All 1s or CTXT, LD, and FD bits set to 1, the Transmit DMA closes the transmit descriptor with DE and LD bits set to 1. When IOC bit in TDES2 of corresponding first descriptor is set to 1, Transmit DMA will set the TI bit in the DMA_CH#_Status Register. Note 2: Based on CTXT, LD, and FD bits of the transmit descriptor, the subsequent descriptor might be considered as the First Descriptor (even if FD bit is not set) and partial packet is sent.
22:20	Rsvd	Reserved
19:18	IVTIR	Inner VLAN Tag Insert or Replace When this bit is set, these bits request the MAC to perform Inner VLAN tagging or un-tagging before transmitting the packets. If the packet is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes. The following list describes the values of these bits:

Bit	Name	Description
		■ 2'b00: Do not add the inner VLAN tag. ■ 2'b01: Remove the inner VLAN tag from the packets before transmission. This option should be used only with the VLAN frames. ■ 2'b10: Insert an inner VLAN tag with the tag value programmed in the MAC_Inner_VLAN_Incl register or context descriptor. ■ 2'b11: Replace the inner VLAN tag in packets with the tag value programmed in the MAC_Inner_VLAN_Incl register or context descriptor. This option should be used only with the VLAN frames. These bits are valid when the Enable SA and VLAN Insertion on Tx and Enable Double VLAN Processing options are selected.
17	IVLTV	Inner VLAN Tag Valid When this bit is set, it indicates that the IVT field of TDES2 is valid.
16	VLTV	VLAN Tag Valid When this bit is set, it indicates that the VT field of TDES3 is valid.
15:0	VT	VLAN Tag This field contains the VLAN Tag to be inserted or replaced in the packet. This field is used as VLAN Tag only when the VLTI bit of the MAC_VLAN_Incl register is reset.

20.6.6 Receive Descriptors

The DMA in GMAC attempts to read a descriptor only if the Tail Pointer is different from the Base Pointer or current pointer. It is recommended to have a descriptor ring with a length that can accommodate at least two complete packets received by the MAC. Otherwise, the performance of the DMA is impacted greatly because of the unavailability of the descriptors. In such situations, the RxFIFO in MTL becomes full and starts dropping packets.
The following Receive Descriptors are present:

- Normal descriptors
- Context descriptors

All RX descriptors are prepared by the software and given to the DMA as "Normal" Descriptors with the content as shown in Receive Normal Descriptor (Read Format). The DMA reads this descriptor and after transferring a received packet (or part of) to the buffers indicated by the descriptor, the Rx DMA will close the descriptor with the corresponding packet status. The format of this status is given in the "Receive Normal Descriptor (Write-Back Format)". For some packets, the normal descriptor bits are not enough to write the complete status. For such packets, the RX DMA writes the extended status to the next descriptor (without processing or using the Buffers/ Pointers embedded in that descriptor). The format and content of the descriptor write back is described in "Receive Context Descriptor".

20.6.7 Receive Normal Descriptors(Read Format)

Table 20-18 TDES0 Normal Descriptor(Read Format)

Bit	Name	Description
31:0	BUF1AP	Header or Buffer 1 Address Pointer

Bit	Name	Description
		When the SPH bit of Control register of a channel is reset, these bits indicate the physical address of Buffer 1. When the SPH bit is set, these bits indicate the physical address of Header Buffer where the Rx DMA writes the L2/L3/L4 header bytes of the received packet. The application can program a byte-aligned address for this buffer which means that the LS bits of this field can be non-zero. However, while transferring the start of packet, the DMA performs a Write operation with RDES0[1:0] (or RDES0[2:0]/[3:0] in case of 64-/128-bit configuration) as zero. However, the packet data is shifted as per actual offset as given by buffer address pointer. If the address pointer points to a buffer where the middle or last part of the packet is stored, the DMA ignores the offset address and writes to the full location as indicated by the data-width.

Table 20-19 TDES1 Normal Descriptor(Read Format)

Bit	Name	Description
31:0	Reserved or BUF1AP	In 64-bit addressing mode, this field contains the most-significant 32 bits of the Buffer 1 Address Pointer. Otherwise, this field is reserved.

Table 20-20 TDES2 Normal Descriptor(Read Format)

Bit	Name	Description
31:0	Reserved or BUF1AP	In 64-bit addressing mode, this field contains the most-significant 32 bits of the Buffer 1 Address Pointer. Otherwise, this field is reserved.

Table 20-21 TDES3 Normal Descriptor(Read Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the GMAC DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true: ■ The DMA completes the packet reception ■ The buffers associated with the descriptor are full
30	IOC	Interrupt Enabled on Completion When this bit is set, an interrupt is issued to the application when the DMA closes this descriptor.
29:26	Rsvd	Reserved

Bit	Name	Description
25	BUF2V	Buffer 2 Address Valid When this bit is set, it indicates to the DMA that the buffer 2 address specified in RDES2 is valid. The application must set this bit so that the DMA can use the address, to which the Buffer 2 address in RDES2 is pointing, to write received packet data.
24	BUF1V	Buffer 1 Address Valid When set, this indicates to the DMA that the buffer 1 address specified in RDES1 is valid. The application must set this value if the address pointed to by Buffer 1 address in RDES1 can be used by the DMA to write received packet data.
23:0	Rsvd	Reserved

20.6.8 Receive Normal Descriptors(Write-Back Format)

Table 20-22 TDES0 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31:16	IVT	Inner VLAN Tag This field contains the Inner VLAN tag of the received packet if the RS0V bit of RDES3 is set. This is valid only when Double VLAN tag processing and VLAN tag stripping are enabled.
15:0	OVT	Outer VLAN Tag This field contains the Outer VLAN tag of the received packet if the RS0V bit of RDES3 is set.

Table 20-23 TDES1 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31:16	OPC	OAM Sub-Type Code, or MAC Control Packet opcode OAM Sub-Type Code If Bits[18:16] of RDES3 are set to 3'b111, this field contains the OAM sub-type and code fields. MAC Control Packet opcode If Bits[18:16] of RDES3 are set to 3'b110, this field contains the MAC Control packet opcode field.
15	TD	Timestamp Dropped This bit indicates that the timestamp was captured for this packet but it got dropped in the MTL Rx FIFO because of overflow. This bit is available only when you select the Timestamp feature. Otherwise, this bit is reserved.
14	TSA	Timestamp Available When Timestamp is present, this bit indicates that the timestamp value is available in a context descriptor word 2 (RDES2) and word 1(RDES1). This is valid

Bit	Name	Description
		only when the Last Descriptor bit (RDES3 [28]) is set. The context descriptor is written in the next descriptor just after the last normal descriptor for a packet.
13	PV	PTP Version This bit indicates that the received PTP message has the IEEE 1588 version 2 format. When this bit is reset, it indicates the IEEE 1588 version 1 format. This bit is available only when you select the Timestamp feature. Otherwise, this bit is reserved.
12	PFT	PTP Packet Type This bit indicates that the PTP message is sent directly over Ethernet. This bit is available only when you select the Timestamp feature. Otherwise, this bit is reserved.
11:8	PMT	PTP Message Type These bits are encoded to give the type of the message received: ■ 0000: No PTP message received ■ 0001: SYNC (all clock types) ■ 0010: Follow_Up (all clock types) ■ 0011: Delay_Req (all clock types) ■ 0100: Delay_Resp (all clock types) ■ 0101: Pdelay_Req (in peer-to-peer transparent clock) ■ 0110: Pdelay_Resp (in peer-to-peer transparent clock) ■ 0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock) ■ 1000: Announce ■ 1001: Management ■ 1010: Signaling ■ 1011–1110: Reserved ■ 1111: PTP packet with Reserved message type These bits are available only when you select the Timestamp feature.
7	IPCE	IP Payload Error When this bit is set, it indicates either of the following: ■ The 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) calculated by the MAC does not match the corresponding checksum field in the received segment. ■ The TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field. ■ The TCP, UDP, or ICMP segment length is less than minimum allowed segment length for TCP, UDP, or ICMP.

Bit	Name	Description
		Bit 15 (ES) of RDES3 is not set when this bit is set.
6	IPCB	IP Checksum Bypassed This bit indicates that the checksum offload engine is bypassed. This bit is available when you select the Enable Receive TCP/IP Checksum Check feature.
5	IPV6	IPv6 header Present This bit indicates that an IPV6 header is detected. When the Enable Split Header Feature option is selected and the SPH bit of Control Register of a channel is set, the IPV6 header is available in the header buffer area to which RDES0 is pointing.
4	IPV4	IPV4 Header Present This bit indicates that an IPV4 header is detected. When the SPH bit of RDES3 is set, the IPV4 header is available in the header buffer area to which RDES0 is pointing.
3	IPHE	IP Header Error When this bit is set, it indicates either of the following: ■ The 16-bit IPv4 header checksum calculated by the MAC does not match the received checksum bytes. ■ The IP datagram version is not consistent with the Ethernet Type value. ■ Ethernet packet does not have the expected number of IP header bytes. This bit is valid when either Bit 5 or Bit 4 is set. This bit is available when you select the Enable Receive TCP/IP Checksum Check feature.
2:0	PT	Payload Type These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE): ■ 3'b000: Unknown type or IP/AV payload not processed ■ 3'b001: UDP ■ 3'b010: TCP ■ 3'b011: ICMP ■ 3'b110: AV Tagged Data Packet ■ 3'b111: AV Tagged Control Packet ■ 3'b101: AV Untagged Control Packet ■ 3'b100: IGMP if IPV4 Header Present bit is set else DCB (LLDP) Control Packet If the COE does not process the payload of an IP datagram because there is an IP header error or fragmented IP, it sets these bits to 3'b000.

Table 20-24 TDES2 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31:29	L3L4FM	Layer 3 and Layer 4 Filter Number Matched

Bit	Name	Description
		These bits indicate the number of the Layer 3 and Layer 4 Filter that matched the received packet: ■ 000: Filter 0 ■ 001: Filter 1 ■ 010: Filter 2 ■ 011: Filter 3 ■ 100: Filter 4 ■ 101: Filter 5 ■ 110: Filter 6 ■ 111: Filter 7 This field is valid only when Bit 28 or Bit 27 is set high. When more than one filter matches, these bits give the number of lowest filter. Note: This status is not available when Flexible RX Parser is enabled.
28	L4FM	Layer 4 Filter Match When this bit is set, it indicates that the received packet matches one of the enabled Layer 4 Port Number fields. This status is given only when one of the following conditions is true: ■ Layer 3 fields are not enabled and all enabled Layer 4 fields match ■ All enabled Layer 3 and Layer 4 filter fields match When more than one filter matches, this bit gives the layer 4 filter status of filter indicated by Bits[31:29]. Note: This status is not available when Flexible RX Parser is enabled.
27	L3FM	Layer 3 Filter Match When this bit is set, it indicates that the received packet matches one of the enabled Layer 3 IP Address fields. This status is given only when one of the following conditions is true: ■ All enabled Layer 3 fields match and all enabled Layer 4 fields are bypassed ■ All enabled filter fields match When more than one filter matches, this bit gives the layer 3 filter status of filter indicated by Bits[31:29]. Note: This status is not available when Flexible RX Parser is enabled.
26:19	MADRM	MAC Address Match or Hash Value When the HF bit is reset, this field contains the MAC address register number that matched the Destination address of the received packet. This field is valid only if the DAF bit is reset. When the HF bit is set, this field contains the hash value computed by

Bit	Name	Description
		the MAC. A packet passes the hash filter when the bit corresponding to the hash value is set in the hash filter register. Note: This status is not available when Flexible RX Parser is enabled.
18	HF	Hash Filter Status When this bit is set, it indicates that the packet passed the MAC address hash filter. Bits[26:19] indicate the hash value. Note: This status is not available when Flexible RX Parser is enabled.
17	DAF/RXPI	Destination Address Filter Fail When Flexible RX Parser is disabled, and this bit is set, it indicates that the packet failed the DA Filter in the MAC. When Flexible RX Parser is enabled, this bit is set to indicate that the packet parsing is incomplete (RXPI) due to ECC error. Note: When this bit is set, ES bit of RDES3 is also set.
16	SAF/RXPD	SA Address Filter Fail When Flexible RX Parser is disabled, and this bit is set, it indicates that the packet failed the SA Filter in the MAC. When Flexible RX Parser is enabled, this bit is set to indicate that the packet is dropped (RXPD) by the parser. Note: When this bit is set, ES bit of RDES3 is also set.
15	OTS	VLAN Filter Status When set, this bit indicates that the VLAN Tag of the received packed passed the VLAN filter. This bit is valid only when DWC_EQOS_ERVFE is not enabled. If DWC_EQOS_ERVFE is enabled, the bit is redefined as Outer VLAN Tag Filter Status (OTS). This bit is valid for both Single and Double VLAN Tagged frames.
14	ITS	Inner VLAN Tag Filter Status (ITS) This bit is valid only when DWC_EQOS_ERVFE is enabled. This bit is valid only for Double VLAN Tagged frames, when Double VLAN Processing is enabled. For more information, see the Filter Status topic.
13:11	Rsvd	Reserved
10	ARPNR	ARP Reply Not Generated When this bit is set, it indicates that the MAC did not generate the ARP

Bit	Name	Description
		Reply for received ARP Request packet. This bit is set when the MAC is busy transmitting ARP reply to earlier ARP request (only one ARP request is processed at a time). This bit is reserved when the Enable IPv4 ARP Offload option is not selected.
9:0	HL	L3/L4 Header Length This field contains the length of the header of the packet split by the MAC at L3 or L4 header. boundary as identified by the MAC receiver. This field is valid only when the first descriptor bit is set (FD = 1). The header data is written to the Buffer 1 address of corresponding descriptor. If header length is zero, this field is not valid. It implies that the MAC did not identify and split the header. This field is valid when the Enable Split Header Feature option is selected.

Table 20-25 TDES3 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the GMAC DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true: ■ The DMA completes the packet reception ■ The buffers associated with the descriptor are full
30	CTXT	Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context type descriptor. The DMA writes 1'b0 to this bit for normal receive descriptor. When CTXT and FD bits are used together, {CTXT, FD} ■ 2'b00: Intermediate Descriptor ■ 2'b01: First Descriptor ■ 2'b10: Reserved ■ 2'b11: Descriptor Error (due to all 1s) Note: When Descriptor Error occurs, the Receive DMA closes the receive descriptor indicating Descriptor Error. This receive descriptor is skipped and the buffer addresses are not used to write the packet data Receive DMA will set the CDE bit in DMA_CH#_Status register but not the RI bit even when IOC is set, as this is not

Bit	Name	Description
		marked as last receive descriptor for the packet. The subsequent valid receive descriptor is used to write the packet data.
29	FD	First Descriptor When this bit is set, it indicates that this descriptor contains the first buffer of the packet. If the size of the first buffer is 0, the second buffer contains the beginning of the packet. If the size of the second buffer is also 0, the next descriptor contains the beginning of the packet. See the CTXT bit description for details of using the CTXT bit and FD bit together.
28	LD	Last Descriptor When this bit is set, it indicates that the buffers to which this descriptor is pointing are the last buffers of the packet.
27	RS2V	Receive Status RDES2 Valid When this bit is set, it indicates that the status in RDES2 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.
26	RS1V	Receive Status RDES1 Valid When this bit is set, it indicates that the status in RDES1 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.
25	RS0V	Receive Status RDES0 Valid When this bit is set, it indicates that the status in RDES0 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.
24	CE	CRC Error When this bit is set, it indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received packet. This field is valid only when the LD bit of RDES3 is set.
23	GP	Giant Packet When this bit is set, it indicates that the packet length exceeds the specified maximum Ethernet size of 1518, 1522, or 2000 bytes (9018 or 9022 bytes if jumbo packet enable is set). Note: Giant packet indicates only the packet length. It does not cause any packet truncation.
22	RWT	Receive Watchdog Timeout When this bit is set, it indicates that the Receive Watchdog Timer has expired while receiving the current packet. The current packet is truncated after watchdog timeout.
21	OE	Overflow Error

Bit	Name	Description
		When this bit is set, it indicates that the received packet is damaged because of buffer overflow in Rx FIFO. Note: This bit is set only when the DMA transfers a partial packet to the application. This happens only when the Rx FIFO is operating in the threshold mode. In the store-and-forward mode, all partial packets are dropped completely in Rx FIFO.
20	RE	Receive Error When this bit is set, it indicates that the gmii_rxer_i signal is asserted while the gmii_rxdv_i signal is asserted during packet reception. This error also includes carrier extension error in the GMII and half-duplex mode. Error can be of less or no extension, or error (rxd!= 0f) during extension.
19	DE	Dribble Bit Error when this bit is set, it indicates that the received packet has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.
18:16	LT	Length/Type Field This field indicates if the packet received is a length packet or a type packet. The encoding of the 3 bits is as follows: ■ 3'b000: The packet is a length packet ■ 3'b001: The packet is a type packet. ■ 3'b011: The packet is a ARP Request packet type ■ 3'b100: The packet is a type packet with VLAN Tag ■ 3'b101: The packet is a type packet with Double VLAN Tag ■ 3'b110: The packet is a MAC Control packet type ■ 3'b111: The packet is a OAM packet type ■ 3'b010: Reserved
15	ES	Error Summary When this bit is set, it indicates the logical OR of the following bits: ■ RDES3[24]: CRC Error ■ RDES3[19]: Dribble Error ■ RDES3[20]: Receive Error ■ RDES3[22]: Watchdog Timeout ■ RDES3[21]: Overflow Error ■ RDES3[23]: Giant Packet ■ RDES2[17]: Destination Address Filter Fail, when Flexible RX Parser is enabled ■ RDES2[16]: SA Address Filter Fail, when Flexible RX Parser is enabled This field is valid only when the LD bit of RDES3 is set.

Bit	Name	Description
14	PL	Packet Length These bits indicate the byte length of the received packet that was transferred to system memory (including CRC). This field is valid when the LD bit of RDES3 is set and Overflow Error bits are reset. The packet length also includes the two bytes appended to the Ethernet packet when IP checksum calculation is enabled and the received packet is not a MAC control packet. This field is valid when the LD bit of RDES3 is set. When the Last Descriptor and Error Summary bits are not set, this field indicates the accumulated number of bytes that have been transferred for the current packet.

20.6.9 Receive Context Descriptor

This descriptor is read-only for the application. Only the DMA can write to this descriptor. The context descriptor provides information about the extended status related to the last received packet. The Bit 30 of RDES3 indicates the context type descriptor.

Table 20-26 TDES0 Context Descriptor

Bit	Name	Description
31:0	RSTL	Receive Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for corresponding Receive packet. When this field and the RTSH field of RDES1 show all-ones value, the timestamp must be considered as corrupt.

Table 20-27 TDES1 Context Descriptor

Bit	Name	Description
31:0	RSTH	Receive Packet Timestamp High The DMA updates this field with most significant 32 bits of the timestamp captured for corresponding receive packet. When this field and the RTSL field of RDES0 show all-ones value, the timestamp must be considered as corrupt.

Table 20-28 TDES2 Context Descriptor

Bit	Name	Description
31:0	Rsvd	Reserved

Table 20-29 TDES3 Context Descriptor

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true: ■ The DMA completes the packet reception

Bit	Name	Description
		■ The buffers associated with the descriptor are full
30	CTXT	Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context descriptor. The DMA writes 1'b1 to this bit for context descriptor. DMA writes 2'b11 to indicate a descriptor error due to all 1s. When CTXT and DE bits are used together, {CTXT, DE} ■ 2'b00: Reserved ■ 2'b01: Reserved ■ 2'b10: Context Descriptor ■ 2'b11: Descriptor Error Note: When Descriptor Error occurs, the Receive DMA closes the receive descriptor indicating Descriptor Error. This receive descriptor is skipped and the buffer addresses are not used to write the packet data Receive DMA will set the CDE bit in DMA_CH#_Status register but not the RI bit even when IOC is set, as this is not marked as last receive descriptor for the packet. The subsequent valid receive descriptor is used to write the packet data.
29	DE	Descriptor Error See the CTXT bit description for details of using theDE bit along with CTXT bit.
28:0	Rsvd	Reserved

20.6.10 Programming Guide

20.6.10.1 Initializing DMA

Complete the following steps to initialize the DMA:
1. Provide a software reset. This resets all of the MAC internal registers and logic (bit-0 of DMA_Mode).
2. Wait for the completion of the reset process (poll bit 0 of the DMA_Mode, which is only cleared after the reset operation is completed).
3. Program the following fields to initialize the DMA_SysBus_Mode register:
a. AAL
b. Fixed burst or undefined burst
c. Burst mode values in case of AHB bus interface, OSR_LMT in case of AXI bus interface.
d. If fixed length value is enabled, select the maximum burst length possible on the AXI Bus (bits [7:1])
4. Create a descriptor list for transmit and receive. In addition, ensure that the descriptors are owned by DMA (set bit 31 of descriptor TDES3/RDES3). For more information about descriptors, see section "Descriptors".
5. Program the Transmit and Receive Ring length registers (DMA_CH(#i)_TxDesc_Ring_Length (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1) and DMA_CH(#i)_RxDesc_Ring_Length (for i = 0; i <= DWC_EQOS_NUM_DMA_RX_CH-1)). The ring length programmed must be at least 4.
6. Initialize receive and transmit descriptor list address with the base address of the transmit and receive descriptor (DMA_CH(#i)_TxDesc_List_Address (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1), DMA_CH(#i)_RxDesc_List_Address (for i = 0; i <= DWC_EQOS_NUM_DMA_RX_CH-1)). Also, program transmit and receive tail pointer registers indicating to the DMA about the available descriptors (DMA_CH(#i)_TxDesc_Tail_Pointer (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1) and

DMA_CH(#i)_RxDesc_Tail_Pointer (for i = 0; i <= DWC_EQOS_NUM_DMA_RX_CH-1)).
7. Program the settings of the following registers for the parameters like maximum burst-length (PBL) initiated by DMA, descriptor skip lengths, OSP in case of TxDMA, RBSZ in case of RxDMA, and so on:
- DMA_CH(#i)_Control (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1)
- DMA_CH(#i)_TX_Control (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1)
- DMA_CH(#i)_RX_Control (for i = 0; i <= DWC_EQOS_NUM_DMA_RX_CH-1)

8. Enable the interrupts by programming the DMA_CH(#i)_Interrupt_Enable (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1) register.
9. Start the Receive and Transmit DMAs by setting SR (bit 0) of the DMA_CH(#i)_RX_Control (for i = 0; i <= DWC_EQOS_NUM_DMA_RX_CH-1) and ST (bit 0) of the DMA_CH(#i)_TX_Control (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1) register.
10. Repeat steps 4 to 9 for all the Tx DMA and Rx DMA channels selected in the hardware.

20.6.10.2 Initializing MTL Registers

The Transaction Layer (MTL) registers must be initialized to establish the transmit and receive operating modes and commands.
Complete the following steps to initialize the MTL registers:
1. Program the Tx Scheduling (SCHALG) and Receive Arbitration Algorithm (RAA) fields in MTL_Operation_Mode to initialize the MTL operation in case of multiple Tx and Rx queues.
2. Program the Receive Queue to DMA mapping in MTL_RxQ_DMA_Map0 and MTL_RxQ_DMA_Map1 registers.
3. Program the following fields to initialize the mode of operation in the MTL_TxQ0_Operation_Mode register.
a. Transmit Store And Forward (TSF) or Transmit Threshold Control (TTC) in case of threshold mode
b. Transmit Queue Enable (TXQEN) to value 2'b10 to enable Transmit Queue0
c. Transmit Queue Size (TQS)
4. Program the following fields to initialize the mode of operation in the MTL_RxQ0_Operation_Mode register:
a. Receive Store and Forward (RSF) or RTC in case of Threshold mode
b. Flow Control Activation and De-activation thresholds for MTL Receive FIFO (RFA and RFD)
c. Error Packet and undersized good Packet forwarding enable (FEP and FUP)
d. Receive Queue Size (RQS)
5. Repeat previous two steps for all MTL Tx and Rx queues selected in the configuration.

20.6.10.3 Initializing MAC

The MAC configuration registers establish the operating mode of the MAC. These registers must be initialized before initializing the DMA.
The following MAC Initialization operations can be performed after DMA initialization. If the MAC initialization is completed before the DMA is configured, enable the MAC receiver (last step in the following sequence) only after the DMA is active. Otherwise, received frames fill the Rx FIFO and overflow.
1. Provide the MAC address registers: MAC_Address0_High and MAC_Address0_Low. If more than one MAC address is enabled in your configuration, program the MAC addresses appropriately.
2. Program the following fields to set the appropriate filters for the incoming frames in the MAC_Packet_Filter register:
a. Receive All
b. Promiscuous mode
c. Hash or Perfect Filter
d. Unicast, multicast, broadcast, and control frames filter settings
3. Program the following fields for proper flow control in the MAC_Q0_Tx_Flow_Ctrl register:
a. Pause time and other Pause frame control bits
b. Transmit Flow control bits
c. Flow Control Busy
4. Program the MAC_Interrupt_Enable register, as required, and if applicable, for your configuration.

5. Program the appropriate fields in the MAC_Configuration register. For ex: Inter-packet gap while transmission and jabber disable.
6. Set bit 0 and 1 in MAC_Configuration registers to start the MAC transmitter and receiver.

20.6.10.4 Performing Normal Receive and Transmit Operation

During normal operation of the GMAC, normal and transmit interrupts are read, descriptors polled, the DMA is suspended (if it does not own descriptors), and values of current host transmitter or receiver descriptor pointers are read for debugging.
For normal operation, complete the following steps:
1. For normal transmit and receive interrupts, read the interrupt status. Then, poll the descriptors, reading the status of the descriptor owned by the Host (either transmit or receive).
2. Set appropriate values for the descriptors, ensuring that transmit and receive descriptors are owned by the DMA to resume the transmission and reception of data.
3. If the descriptors are not owned by the DMA (or no descriptor is available), the DMA goes into SUSPEND state. The transmission or reception can be resumed by freeing the descriptors and writing the descriptor tail pointer to Tx/Rx tail pointer register (DMA_CH[n]_TxDesc_Tail_Pointer and DMA_CH[n]_RxDesc_Tail_Pointer).
4. The values of the current host transmitter or receiver descriptor address pointer can be read for the debug process (DMA_CH[n]_Current_App_TxDesc and DMA_CH[n]_Current_App_RxDesc).
5. The values of the current host transmit buffer address pointer and receive buffer address pointer can be read for the debug process (Register DMA_CH[n]_Current_App_TxBuffer and DMA_CH[n]_Current_App_RxBuffer)

20.6.10.5 Stopping and Starting Transmission

Complete the following steps to pause the transmission for some time.
1. Disable the Transmit DMA (if applicable) by clearing Bit 0 (ST) of DMA_CH(#i)_TX_Control (for i = 0; i <= DWC_EQOS_NUM_DMA_TX_CH-1) Register.
2. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of MTL_TxQ0_Debug Register (TRCSTS is not 01 and TXQSTS=0).
3. Disable the MAC transmitter and MAC receiver by clearing Bit (RE) and Bit 1(TE) of the MAC_Configuration Register.
4. Disable the Receive DMA (if applicable), after making sure that the data in the Rx FIFO is transferred to the system memory (by reading the appropriate bits of MTL_TxQ0_Debug Register, PRXQ=0 and RXQSTS=00).
5. Make sure that both Tx Queue and Rx Queue are empty (TXQSTS is 0 in MTL_TxQ0_Debug Register and RXQSTS is 0 in MTL_RxQ0_Debug Register).
6. To restart the operation, first start the DMAs, and then enable the MAC Transmitter and Receiver.

20.6.10.6 Initialization Guidelines for System Time Generation

You can enable the timestamp feature by setting Bit 0 of the MAC_Timestamp_Control Register. However, it is essential that the timestamp counter be initialized after this bit is set. Complete the following steps during GMAC initialization:
1. Mask the Timestamp Trigger interrupt by clearing the bit 16 of MAC_Interrupt_Enable Register.
2. Set Bit 0 of MAC_Timestamp_Control Register to enable timestamping.
3. Program MAC_Sub_Second_Increment Register based on the PTP clock frequency.
4. If you are using the Fine Correction approach, program MAC_Timestamp_Addend and set Bit 5 of MAC_Timestamp_Control Register.
5. Poll the MAC_Timestamp_Control Register until Bit 5 is cleared.
6. Program Bit 1 of MAC_Timestamp_Control Register to select the Fine Update method (if required).
7. Program MAC_System_Time_Seconds_Update Register and MAC_System_Time_Nanoseconds_Update Register with the appropriate time value.
8. Set Bit 2 in MAC_Timestamp_Control Register.
The timestamp counter starts operation as soon as it is initialized with the value written in the Timestamp Update registers. If one-step timestamping is enabled
a. To enable one-step timestamping, program Bit 27 of the TDES3 Context Descriptor.

b. Program registers MAC_Timestamp_Ingress_Asym_Corr and MAC_Timestamp_Egress_Asym_Corr to update the correction field in PDelay_Req PTP messages.
9. Enable the MAC receiver and transmitter for proper timestamping.

20.6.10.7 Coarse Correction Method

To synchronize or update the system time in one process (coarse correction method), complete the following steps:
1. Set the offset (positive or negative) in the Timestamp Update registers (MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update).
2. Set Bit 3 (TSUPDT) of MAC_Timestamp_Control Register. The value in the Timestamp Update registers is added to or subtracted from the system time when the TSUPDT bit is cleared.

20.6.10.8 Programming Guidelines for TSO

The TCP Segmentation Offload (TSO) engine is used to offload the TCP segmentation functions to the hardware. To program the TSO, set the TSE bit to enable TCP packet segmentation, and program descriptor fields to enable TSO for the current packet. Complete the following steps to program TSO:
1. Program the TSE bit of corresponding DMA_CH[n]_Tx_Control register to enable TCP packet segmentation in that DMA.
2. In addition to the normal transfer descriptor setting, the following descriptor fields must be programmed to enable TSO for the current packet:
a. Enable TSE in Bit 18 of TDES3
b. Program the length of the un-segmented TCP/IP packet payload in bits [17:0] of TDES3 and the TCP header in bits [22:19] of TDES3.
c. Program the maximum size of the segment in MSS of DMA_CH[n]_Control register or MSS in the context descriptor. If MSS field is programmed in both DMA_CH[n]_Control register and in the context descriptor, the latest software programmed sequence is considered.
3. The header of the unsegmented TCP/IP packet should be in Buffer 1 of the first descriptor and this buffer must not hold any payload bytes. The payload is allocated to Buffer 2 and the buffers of the subsequent descriptors.

20.6.11 Clock Architecture

In RMII mode, reference clock and TX/RX clock can be from CRU or external OSC as following figure. The mux selecting rmii_speed is CRU_CLKSEL_CON31[2]/ CRU_CLKSEL_CON31[2].

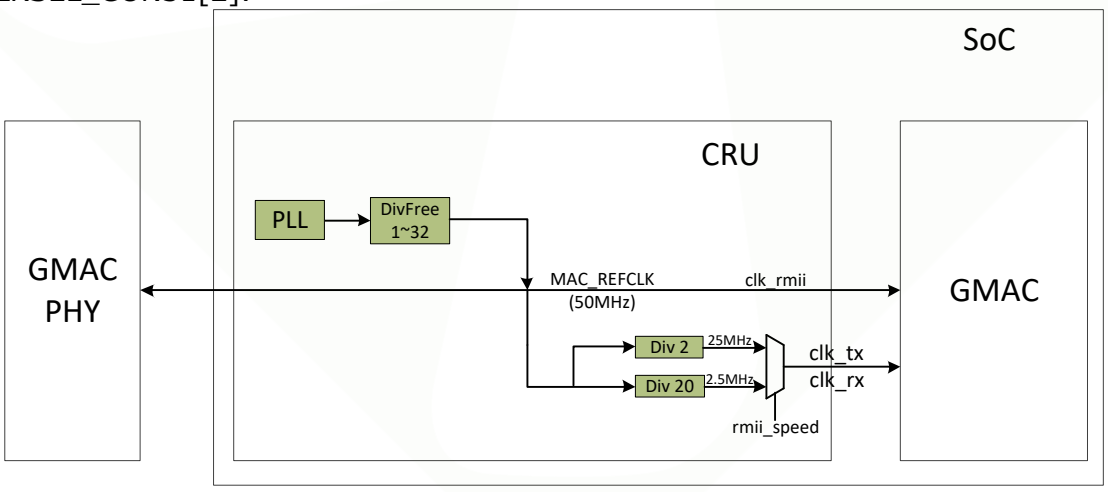

Fig. 20-11 RMII Clock Architecture When Clock Source From CRU

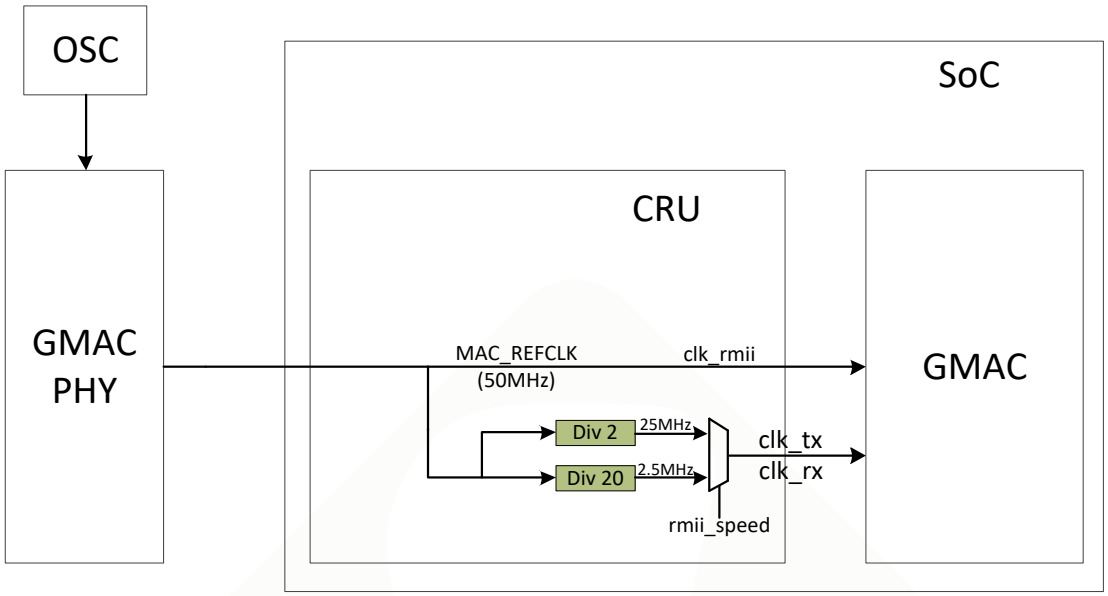

Fig. 20-12 RMII Clock Architecture When Clock Source From External OSC

In RGMII mode, clock architecture only supports that TX clock source is from CRU as following figure.In order to dynamically adjust the timing between TX/RX clocks with data, delayline is integrated in TX and RX clock path. Register GRF_MAC0_CON1[1:0]/GRF_MAC1_CON1[1:0] can enable the delayline and GRF_MAC0_CON0[15:0]/GRF_MAC1_CON0[15:0] is used to determine the delay length. There are 200 delay elements in each delayline.

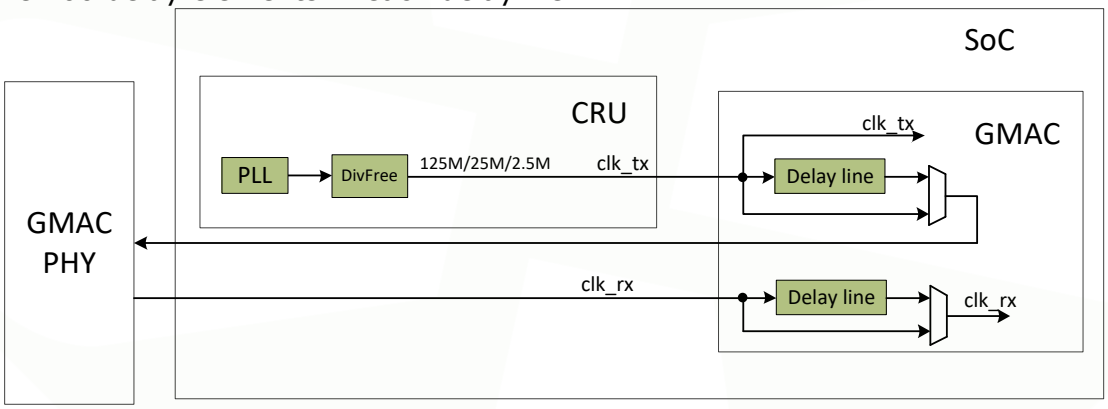

Fig. 20-13 RGMII Clock Architecture When Clock Source From CRU

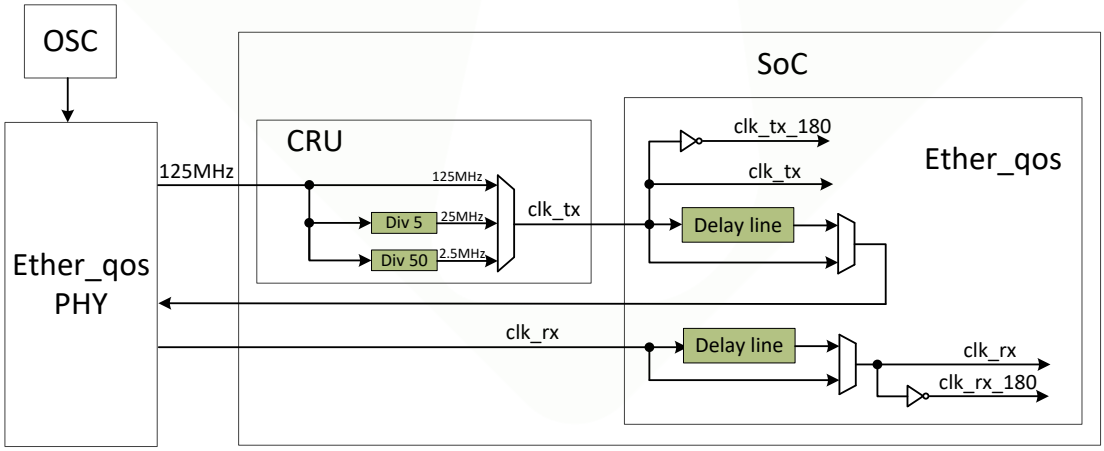

Fig. 20-14 RGMII Clock Architecture When Clock Source From External OSC

Chapter 21 QSGMII/SGMII_PCS

21.1 Overview

The Physical Coding Sublayer (PCS) layer provides an interface between the Media Access Control (MAC) and Physical Medium Attachment Sublayer (PMA) through a Media independent interface.

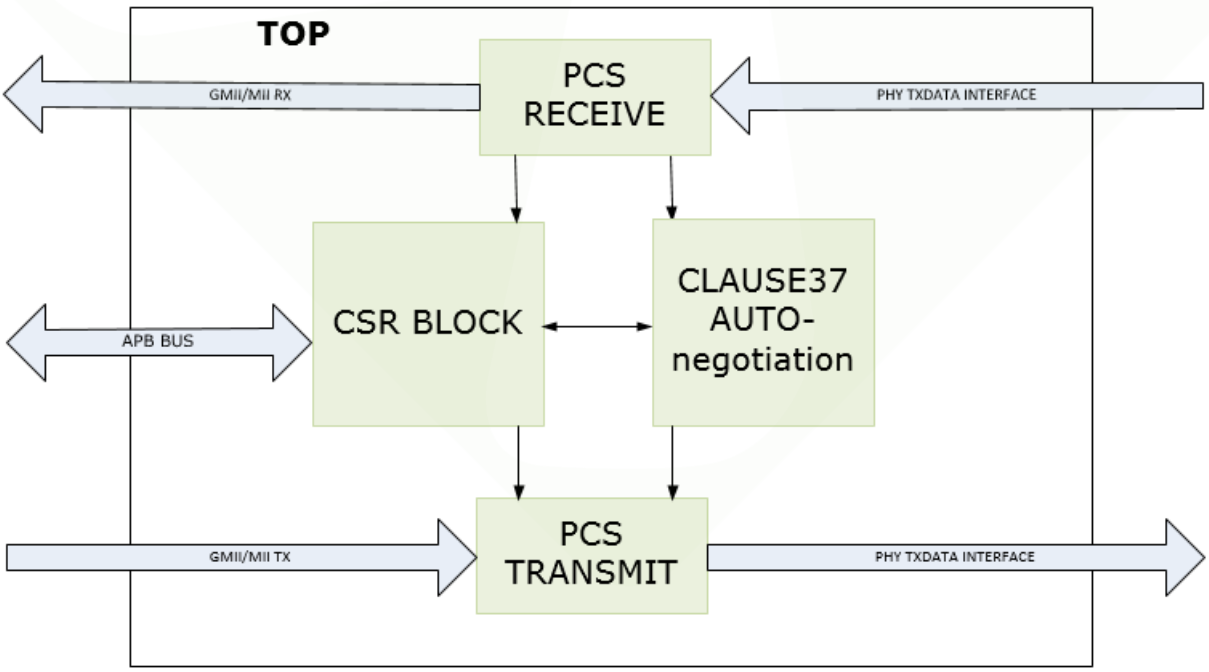
The following features are implemented in the QSGMII/SGMII_PCS:

- 1000BASE-X support
- Clause 37 auto-negotiation support in 1G mode
- SGMII/QSGMII interface support
- AMBA APB-3 (32-bit register) configuration management interface
- GMII interface Mac interface
- Configurable Device and Package Identifier (OUI numbers)
- Vendor-specific Register sets (VR) to control the PCS functions
- HFTP, LFTP and MFTP test pattern generation in 1000BASEX_Only PCS mode
- Clock Rate compensation of 200ppm (+/- 100 ppm) on the Receive MAC interface
- Energy Efficient Ethernet Support
- Supports loopback control from the PHY Transmit to the PHY Receive lane
- Supports various error status signals and statistics for monitoring and debugging.
- Provides programmable control to reduce the simulation time by reducing the timer values defined in the IEEE standard.
- Provides programmable Device or Package identifiers (OUI numbers as defined in IEEE Std 802.3).
- Provides programmable features to dynamically enable or disable MMD devices present in some configurations.
- Supports various error status signals and statistics for monitoring and debugging.

21.2 Function Description

21.2.1 QSGMII/SGMII_PCS Block Diagram

Fig. 21-1 illustrates the functional blocks of QSGMII/SGMII_PCS.



21.2.2 PCS Transmit Block

The PCS Transmit block implements the following functions:

- Support GMII interface in 1000BASE-X
- Performs 8B/10B data encoding
- Generates Idle pattern (as defined in Clause 36 for 1000BASE-X)
- Generates the following test patterns defined in IEEE Std 802.3
- Provides lane disable control for Lane 3, Lane 2, and Lane 1

21.2.3 PCS Receive Block

The PCS Transmit block implements the following functions:

- Support GMII interface in 1000BASE-X
- Performs code group alignment on each lane
- Performs 8B/10B data decoding on each lane
- Generates Idle pattern (as defined in Clause 36 for 1000BASE-X)
- Generates the following test patterns defined in IEEE Std 802.3
- Provides lane disable control for Lane 3, Lane 2, and Lane 1

21.2.4 Clause 37 Auto-Negotiation

The QSGMII/SGMII_PCS supports auto-negotiation in the 1000BASE-X and SGMII/QSGMII modes. Auto-negotiation enables the QSGMII/SGMII_PCS to do the following:

- Advertise its speed, duplex mode (full-duplex or half-duplex), and flow control capabilities.
- Acquire capabilities of its remote partner and link status to converge on a common operating mode and flow-control mechanism.

This block performs the following functions:

- Recognizes or generates the |C| order set
- Supports the SGMII and 1000BASE-X Clause 37 auto-negotiation protocol

1.2.4.1 Description of Clause 37 Auto-Negotiation

The Clause 37 auto-negotiation is enabled by default when Mode of Operation (MAIN_MODE) is 1000BASEX-Only PCS. The QSGMII/SGMII_PCS supports the IEEE-defined MII and auto-negotiation registers as defined in Clause 22 and Clause 37. The Clause 37 auto-negotiation is based on the PCS /C/ order set shown in Table 1-1

/C/	Configurtation	Number of Code Groups	Alternating /C1/ and /C2/
/C1/	Configuration 1	4	/K28.5/D21.5/Config_Reg
/C2/	Configuration 2	4	/K28.5/D2.2/Config_Reg

Table 21-1 Configuration Order Sets

The /C/ order set is sent or received during auto-negotiation. The link partners exchange information in a 16-bit word known as configuration register (Config_Reg) which is a part of the /C/ order set. The link partners first exchange the Config_Reg Base Page, and then may exchange the Config_Reg Next Page.

21.2.5 Serial Gigabit Media Independent Interface (SGMII)

The Serial Gigabit Media Independent Interface (SGMII) converts the GMII or MII interface, between the Gigabit MAC and the Gigabit PHY, to a serial interface. Using the SGMII interface lowers the pin count required for the GMII interface. However, the reduced pin count may increase the power consumption because the SGMII interface maintains a constant 1250 Mbps data rate, irrespective of the operating speed of the MAC.

The SGMII block has the following features:

- Supports 10 Mbps, 100 Mbps, and 1000 Mbps speed modes.
  The QSGMII/SGMII_PCS uses the RAL blocks to convert the data (with different speed and data width) from the MAC to the internal speed of 125 MHz, 8-bit required for the SGMII link speed (1.25 Gbps).
- Provides status signals (link speed, duplex mode, and link status) from the PHY to the MAC.

The SGMII interface uses the Clause 37 auto-negotiation to know the speed, duplex mode, and link status negotiated by the PHY. To enable the Clause 37 auto-negotiation in the SGMII mode, you need to program Bits[2:1] of the VR_MII_AN_CTRL to 2'b10.

1.2.5.1 SGMII Auto-Reconfiguration

QSGMII/SGMII_PCS supports automatic reconfiguration of SGMII speed/duplex mode based on the outcome of auto-negotiation. This feature can be enabled by programming bit[9] (MAC_AUTO_SW) of VR_MII_DIG_CTRL1 when operating in SGMII MAC mode. QSGMII/SGMII_PCS is initially configured in the speed/duplex mode as programmed in the SR_MII_CTRL. If MAC_AUTO_SW bit is enabled, QSGMII/SGMII_PCS automatically switches to the negotiated speed mode after the completion of CL37 Auto-negotiation. This eliminates the software over-head of reading CL37 AN SGMII Status from VR_MII_AN_INTR_STS and then programming SS13 and SS6 speed-selection bits of SR_MII_CTRL appropriately.
When QSGMII/SGMII_PCS is configured in PHY Mode and if bit[0] (PHY_MODE_CTRL) of VR_MII_DIG_CTRL1 is set to 1, QSGMII/SGMII_PCS configures itself to the speed/duplex mode as indicated by PCS_sgmii_link_speed_i[1:0] and PCS_sgmii_full_duplex_i inputs (which are provided by the underlying copper PHY). In addition, when there is a change in any of these inputs QSGMII/SGMII_PCS intiates/restarts SGMII auto-negotiation.
The SGMII Link speed, duplex mode, and link status are indicated on the PCS_link_speed_o, PCS_sgmii_full_duplex_o, and PCS_sgmii_link_sts_o output ports respectively. These ports reflect the values as shown in Table 1-2 based on the selected configuration/register settings.

21.2.6 Quad SGMII (QSGMII)

Quad Serial Gigabit Media Independent Interface is an extension of SGMII. QSGMII interface transfers data between a 4-port Gigabit MAC (or 4 separate MACs) and a 4-port Gigabit PHY (or 4 separate PHYs) over a serial line operating at 5Gbps. QSGMII eliminates the need to have 4 separate GMII or MII interfaces between the MAC and PHY and reduces the pin count considerably. Each port can operate at a data rate of 10/100/100Mbps. QSGMII Mode can be enabled in QSGMII/SGMII_PCS by programming bits[2:1] of VR MII MMD AN Control Register to 2'b11.
Figure 20-2 the components of QSGMII Transmitter.

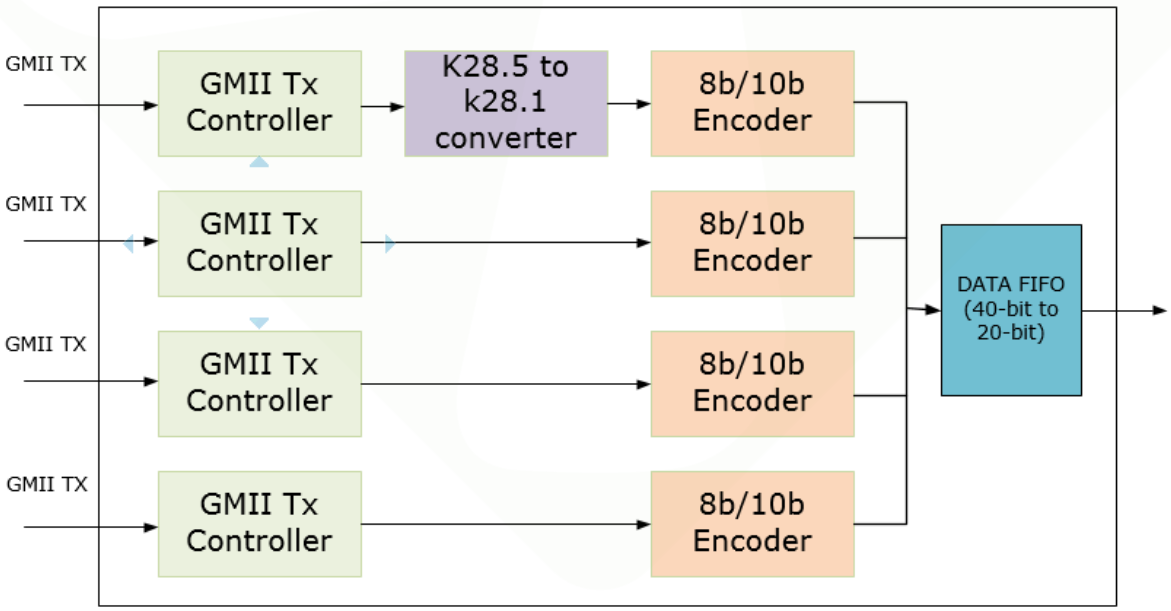


Fig. 21-2 QSGMII Transmitter Architecture

Fig. 20-3 the components of QSGMII Receiver.

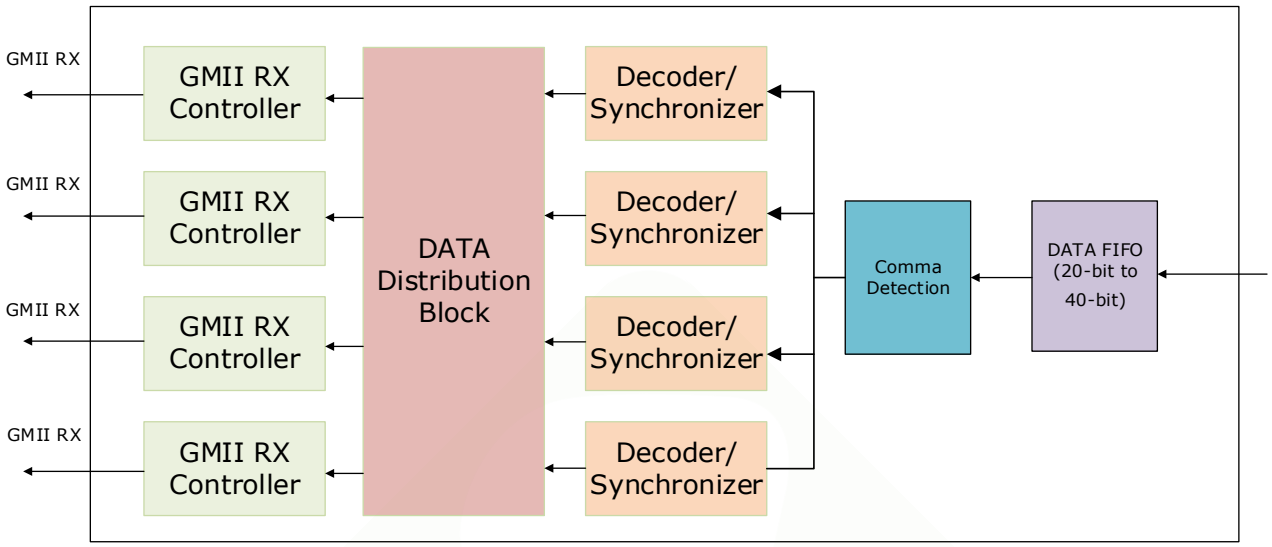

Fig. 21-3 QSGMII Receiver Architecture

QSGMII/SGMII_PCS supports the following features in QSGMII mode:

- Supports 10 Mbps, 100 Mbps and 1000 Mbps along each port

  QSGMII/SGMII_PCS uses the RAL blocks at each of the 4 GMII/MII interface to convert the data (with different speed and data width) from the MACs to 8-bit data operating at 125MHz. In the transmit path, the data from the four MAC ports are time-division multiplexed, processed suitably (as defined by the specification) and finally converted to 20-bit data at 250MHz to interface with the SERDES. As per QSGMII specification, K28.5 pattern is replaced with K28.1 pattern in the data sent from port 0 MAC. In the receive path, QSGMII/SGMII_PCS receives 20-bit data at 250MHz from the SERDES. The received data is processed suitably, de-multiplexed and separated-out into 4 separate data traffics. The K28.1 character plays a key role in ensuring that the received data traffic is routed correctly to the intended GMII/MII port.

- Supports Clause 37 auto-negotiation for each port

  Each of the 4 ports can make use of QSGMII auto-negotiation (based on IEEE802.3-Clause 37) to exchange the speed, duplex mode and the link status with the link partner. Auto-negotiation operation along one port is independent of the other ports. QSGMII/SGMII_PCS can be used either at MAC end of QSGMII link (TX_CONFIG=0) or at the PHY end. The auto-negotiation operation is similar to that of SGMII and involves the exchange of /C/ order sets.

21.2.7 EEE Controller

Energy Efficient Ethernet, specified in IEEE Std 802.3az-2010, helps to save energy or reduce power consumption in the PHY when no data transmission or reception is required for a very long duration. The basic principle of this feature is that when the MAC transmitter indicates that it does not have any data to transmit, the local transmitter (which includes the PCS and the PHY) and the remote-end PHY receiver can be put in the power-save or sleep mode to save energy.

1.2.7.1 EEE Transmit Controller

The QSGMII/SGMII_PCS Transmit path implements the following functions when the EEE support is selected:

- Monitor the XGMII or GMII interface for Low Power Idle (LPI) pattern
- Maintain the following EEE states in the Transmit path:
  - Sleep (LPI request monitoring state)
  - Quiet (Power-save state)
  - Alert (Pre-wakeup state) in the PCS-R mode
  - Wakeup (Refresh state)

The Transmit LPI flow is triggered when the MAC drives the LPI signals on the XGMII or GMII interface. The QSGMII/SGMII_PCS maintains various states in which it periodically includes refresh signaling and freezing the transmitter in the quiet state. By maintaining this predefined sequence, the protocol ensures that the link is alive and at the same time power is saved. When the MAC stops sending the LPI pattern (and starts sending the IDLE pattern), the EEE Transmit controller also comes out of this sequence and reverts to the IDLE (or normal transmit) state.
The timers used in the EEE Transmit Controller have the default values given in the IEEE standard. You can change these default values (within a range) according to your requirement.

Figure 1-4 describes the Transmit LPI flow on the GMII Interface. The MAC triggers the LPI mode in the QSGMII/SGMII_PCS by driving the following:

- gmii_txd_i[7:0] = 8'h01, gmii_en_i = 0, and gmii_tx_er_i = 1 when GMII port is present in your configuration
- xgmii_txd_i[7:0] = 8'h01, xgmii_txc_i[0] = 0, and xgmii_txc_i[1] = 1 when the GMII interface is shared with the XGMII pins in your configuration

If the clk_xgmii_tx_i or clk_mii_tx_i clock (SGMII mode) is used in the QSGMII/SGMII_PCS to sample GMII, theMAC can gate the clk_xgmii_tx_i or clk_mii_tx_i clock after 9 clocks of asserting the LPI Idle. If the clk_xgxs_i or clk_rpcs_tx_i clock is used to sample GMII, clock gating based on the MAC is not applicable.

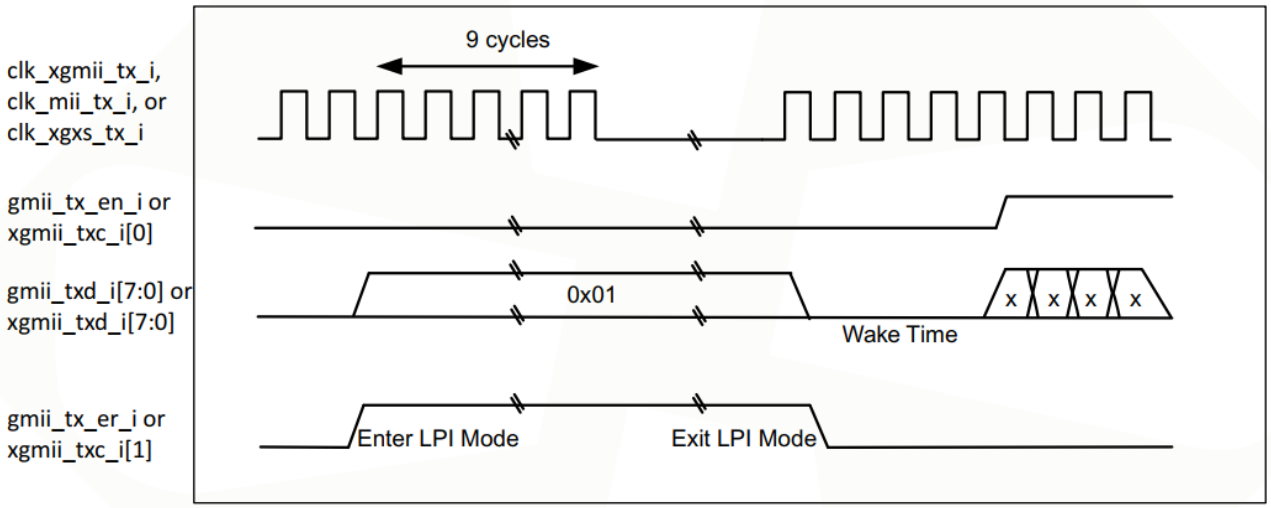

Fig. 21-4 1G MAC Transmit LPI

1.2.7.2 Transparent LPI Mode

In addition to the standard EEE Mode, QSGMII/SGMII_PCS supports the transparent LPI Mode in its transmit path. In this mode, EEE operation involves mere encoding of LPI patterns (received on on XGMII/GMII Tx interface) and sending it to the SERDES. On detecting Lower-Power Idle on XGMII/GMII Tx interface, QSGMII/SGMII_PCS goes to the TX_SLEEP state and remains in this state till MAC stops sending LPI. It does not transition to TX_QUIET state. This mode does not involve gating-off of any clocks to QSGMII/SGMII_PCS. In addition, the serdes transmitter is not disabled (PCS_tx_data_en_o signal remains high). MAC should ensure that it does not gate-off XGMII/GMII Tx clock to QSGMII/SGMII_PCS during this mode of operation.
This mode can be enabled by programming 'TRN_LPI' bit of VR XS or PCS MMD EEE Mode Control 1 Register (or VR MII MMD PCS MMD EEE Mode Control 1 Register for 1000BaseX-Only PCS configurations) in addition to 'LTX_EN' bit of VR XS or PCS MMD EEE Mode Control 0 Register.

1.2.7.3 EEE Receive Controller

The PCS Receive path implements the following functions when the EEE support is selected:

- Decode the received LPI code group from the link partner.
- Maintain the following EEE states in the Receive path:
  - Sleep (LPI request monitoring state)

- Quiet (Power-Save state)
- Wake (Refresh state)
- Wake-up Fault (Error Monitoring)

The sequence in the state machine helps in saving the power in the PHY or PCS because some of the functional blocks can be switched off in the Quiet state. In addition, during Refresh state, the Rx path is re-synchronized so that it can monitor the link status. The timers used in the EEE Rx Controller have the default values as given in the IEEE standard. You can change these default values (within a range) according to your requirement.
The Rx low power mode is triggered when the QSGMII/SGMII_PCS receives the LPI Idle code group on the link. It exits the LPI mode when the link partner stops transmitting the LPI Idle code groups.
The Rx LPI mode is triggered when the QSGMII/SGMII_PCS receives the LPI from the link partner. After successful decoding, the controller enters the Sleep state and drives the LPI patterns on the Rx XGMII signals as shown in the Figure 1-5. the following LPI pattern is driven to the MAC on GMII:

- gmii_rxd_o[7:0] or xgmii_rxd_o[7:0] = 8'h06
- gmii_rx_dv_o or xgmii_rxd_o[0] = 0
- gmii_rx_er_o or xgmii_rxd_o[1] = 1

In this mode, the PCS_lrx_clk_gat_o signal is asserted after the 9 clocks of driving the LPI pattern on the GMII interface. It can be used to gate off the clocks on the GMII Rx interface on the MAC and the QSGMII/SGMII_PCS. The 9 clock duration can be increased by programming Bits[15:12] of VR_XS_PCS_EEE_MCTRL0 RegisterVR PCS MMD EEE Mode Control Register.

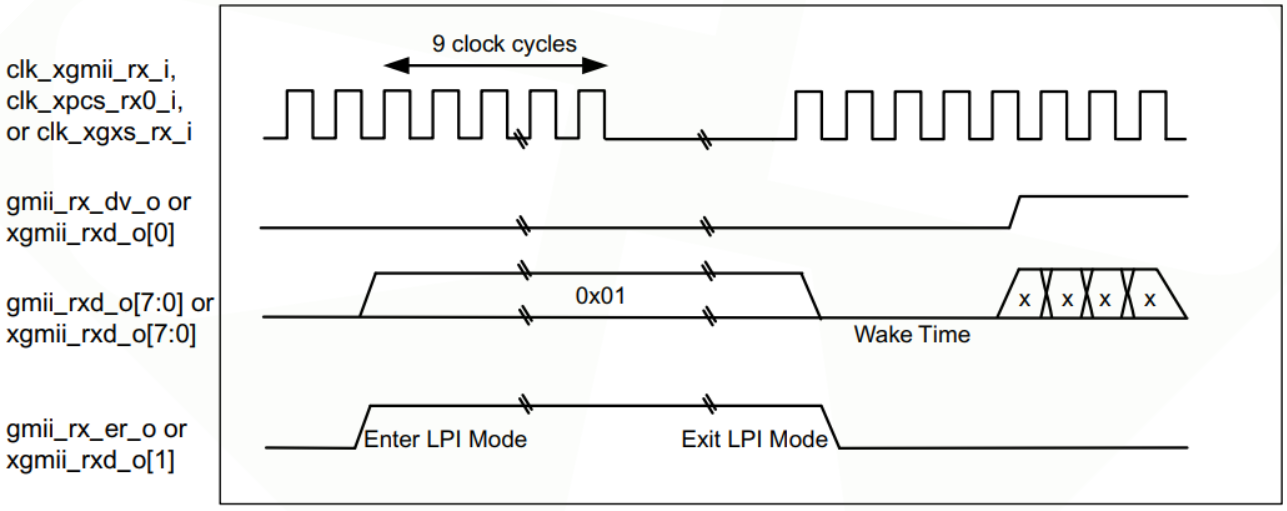

Fig. 21-5 1G MAC Receive LPI

21.2.8 Reset Generation

The reset generation block generates the reset for other blocks of the QSGMII/SGMII_PCS. The QSGMII/SGMII_PCS supports the following types of reset:

- Hardware Reset
  You can issue the hardware reset by asserting the pwr_on_rst_n signal. When this reset is asserted, all internal blocks of the QSGMII/SGMII_PCS are reset. In addition, the PCS_reset_n_o signal is asserted to reset
- Standard Soft Reset
  You can issue the standard soft reset by setting Bit 15 of the following registers:
  - SR_PMA_CTRL1 Register
  - SR_XS_PCS_CTRL1 Register or SR PCS MMD Control1 Register
  - SR_AN_CTRL Register

- SR_MII_CTRL Register

The QSGMII/SGMII_PCS clears this bit after 32 clocks cycles of the clk_csr_i clock. When this reset bit is set, all internal blocks of the QSGMII/SGMII_PCS, except the Management Interface block, get reset. In addition, the PCS_reset_n_o signal is asserted to reset the PHY.

- Power-Down Mode

You can issue the power-down mode by setting Bit 11 of the following registers:

- VR_MII_AN_CTRL
- VR_XS_PCS_DIG_CTRL1 Register or VR PCS MMD Digital Control1 Register
- VR_AN_DIG_CTRL1 Register or VR AN MMD Digital Control1 Register
- VR_MII_DIG_CTRL1 Register or VR MII MMD Digital Control1 Register

When this bit is set, the host needs to clear this bit when it wants to power up the QSGMII/SGMII_PCS. When this bit is set, all internal blocks of the QSGMII/SGMII_PCS are reset, except the Management Interface block and the CSR block. The PCS_reset_n_o output is not asserted during the power-down mode.

21.3 Register Description

21.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

21.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
QSGMII/SGMII_PCS_SR_MII_1_CTRL	0x080000	W	0x00000140	SR MII_1 MMD Control Register

21.3.3 Detail Registers Description

QSGMII/SGMII_PCS_SR_MII_1_CTRL

Address: Operational Base + offset (0x080000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	RST Soft Reset (RW,SC Type) For Non-Synopsys PHY configurations: When the host sets this bit, the CSR block triggers the software reset process in which all internal blocks are reset, except the Management Interface block. The registers are reset to their default values. When this bit is set, it also resets the PHY. This bit is self-cleared after the following: 32 clk_csr_i clocks for the MCI interface 1 MDC clock period for the MDIO interface
14	RO	0x0	LBE Loopback Enable This bit reflects the value of LBE bit of SR_MII_CTRL Register.
13	RW	0x0	SS13 Speed Selection (LSB) This bit, along with the SS6 bit and SS5 bit of this register, indicates the speed of GMII/XGMII port 1. Speed encoding as follows: For QSGMII: When SS6=1 and SS13=0, speed is 1000 Mbps When SS6=0 and SS13=1, speed is 100 Mbps When SS6=0 and SS13=0, speed is 10 Mbps
12	RW	0x0	AN_ENABLE Enable Auto-Negotiation When set to 1, this bit enables the Clause 37 auto-negotiation process for port 1.
11	RW	0x0	LPM Power-Down Mode This bit controls the power-down mode of the QSGMII/SGMII_PCS. 0: Normal operation 1: The QSGMII/SGMII_PCS goes to the power-down mode along with the PHY. For non-Synopsys PHY, the PCS_pdown_o port is asserted. When the host clears this bit, the QSGMII/SGMII_PCS resumes the normal operation. In a Synopsys PHY configuration, after clearing this bit, the host must wait until Bits[4:2] of VR_XS_PCS_DIG_STS/VR_MII_DIG_STS Register indicate that the QSGMII/SGMII_PCS is in the normal state
10	RO	0x0	Reserved_10 Reserved
9	RW	0x0	RESTART_AN Restart Auto-Negotiation (RW,SC Type) When the host writes this bit, the QSGMII/SGMII_PCS initiates the auto-negotiation process for port 1. This bit is used to restart the auto-negotiation which is already initiated by setting Bit 12. The QSGMII/SGMII_PCS clears this bit after restarting the auto-negotiation.

Bit	Attr	Reset Value	Description
8	RW	0x1	DUPLEX_MODE Duplex Mode This bit specifies the duplex mode of the QSGMII/SGMII_PCS along port 1. 0: Half duplex 1: Full duplex If Bit 12 is set to 0, this bit determines the PHY link duplex mode. If Bit 12 is set to 1, then the PHY link duplex mode is independent of this bit (although the host can write any value) and is determined by the outcome of the Clause 37 auto-negotiation process.
7	RO	0x0	Reserved_7 Reserved
6	RW	0x1	SS6 Speed Selection This bit, along with the SS5 and SS13 bits of this register indicates the speed of operation of GMII/XGMII Port 1. For more information, see description of the SS13 bit.
5	RO	0x0	SS5 Speed Selection This bit, along with SS6 and SS13 bits, control the speed of operation of XGMII/GMII Port 1. For more information, see description of the SS13 bit.
4:0	RO	0x00	Reserved_4_0 Reserved

QSGMII/SGMII_PCS_SR_MII_1_STS

Address: Operational Base + offset (0x080004)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	ABL100T4 100BASE-T4 Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality.
14	RO	0x0	FD100ABL 100BASE-X Full-Duplex Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality.
13	RO	0x0	HD100ABL 100BASE-X Half-Duplex Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality
12	RO	0x0	FD10ABL 10 Mbps Full-Duplex Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality.
11	RO	0x0	HD10ABL 10 Mbps Half-Duplex Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality

Bit	Attr	Reset Value	Description
10	RO	0x0	FD100T 100BASE-T2 Full-Duplex Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality
9	RO	0x0	HD100T 100BASE-T2 Half-Duplex Ability The QSGMII/SGMII_PCS always returns 0 because it does not support this functionality.
8	RO	0x1	EXT_STS_ABL Extended Status Information 0: No Extended Status information is present at register address 16'h000F of this MMD device. 1: Extended Status information is present at register address 16'h000F of this MMD device. QSGMII/SGMII_PCS returns this bit as 1.
7	RO	0x0	UN_DIR_ABL Unidirectional Ability 1: The QSGMII/SGMII_PCS is able to transmit GMII irrespective of whether device has determined the valid link or not. 0: The QSGMII/SGMII_PCS is able to transmit GMII only when the device has determined the valid link. The QSGMII/SGMII_PCS always returns this bit as 0.
6	RO	0x0	MF_PRE_SUP MF Preamble Suppression 1: The QSGMII/SGMII_PCS accepts the MDIO frames with preamble suppressed. 0: The QSGMII/SGMII_PCS does not accept the MDIO frames with preamble suppressed. This bit is always set to 0
5	RO	0x0	AN_CMPL Auto-negotiation Complete for Port 1 1: The AN process is complete 0: The AN process is not complete This bit returns 0 if AN_ENABLE of SR_MII_1_CTRL Register is set to 0.
4	RO	0x0	RF Remote Fault This register bit is shared with RF bit of SR_MII_STS register. The value returned by this field should be ignored by the software as it is not valid in QSGMII/SGMII/USXGMII Modes
3	RO	0x1	AN_ABL Auto-negotiation Ability The QSGMII/SGMII_PCS always returns this bit as 1. 1: The QSGMII/SGMII_PCS is able to perform auto-negotiation. 0: The QSGMII/SGMII_PCS is not able to perform auto-negotiation
2	RO	0x0	LINK_STS Link Status This register bit is shared with RLU bit of SR_MII_STS register.
1	RO	0x0	Reserved_1 Reserved

Bit	Attr	Reset Value	Description
0	RO	0x1	EXT_REG_CAP Extended Register Capability 1: Extended Register capability exists. This bit is always set to 1. 0: Extended Register capability does not exist.

QSGMII/SGMII_PCS_SR_MII_1_DEV_ID1

Address: Operational Base + offset (0x080008)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x7996	VS_MII_DEV_OUI_3_18 Organizationally Unique Identifier[3:18] This field contains Bits [18:3] of 24-bit OUI of device manufacturer. The QSGMII/SGMII_PCS offers 24 configurable Bits[24:1] for identifying the device manufacturer. This register reflects the same value as that of SR_MII_DEV_ID1 register.

QSGMII/SGMII_PCS_SR_MII_1_DEV_ID2

Address: Operational Base + offset (0x08000C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:10	RO	0x33	VS_MMD_DEV_OUI_19_24 Organizationally Unique Identifier [19:24] This field contains Bits[24:19] of 24-bit OUI of device manufacturer. The QSGMII/SGMII_PCS offers 24 configurable Bits[24:1] for identifying the device manufacturer.
9:4	RO	0x00	VS_MMD_DEV_MMN_5_0 Model Number This field contains the 5-bit Model Number of the device.
3:0	RO	0x0	VS_MMD_DEV_RN_3_0 Revision Number This field contains the 4-bit Revision Number of the device

QSGMII/SGMII_PCS_SR_MII_1_AN_ADV

Address: Operational Base + offset (0x080010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	NP Next Page This bit reflects the value of NP bit of SR_MII_AN_ADV Register.
14	RO	0x0	Reserved_14 Reserved
13:12	RO	0x0	RF Remote Fault This bit reflects the value of RF bit of SR_MII_AN_ADV Register.
11:9	RO	0x0	Reserved_11_9 Reserved
8:7	RO	0x0	PAUSE Pause Ability. This bit reflects the value of PAUSE bit of SR_MII_AN_ADV Register
6	RO	0x0	HD Half Duplex This bit reflects the value of HD bit of SR_MII_AN_ADV Register.

Bit	Attr	Reset Value	Description
5	RW	0x1	FD Full Duplex When this bit is set, it indicates the device (port 1) can operate in full-duplex mode. This bit is used in Clause 37 auto-negotiation (Tx_Config_Reg) done by port 1, when QSGMII/SGMII_PCS is configured as PHY-side QSGMII.
4:0	RO	0x00	Reserved_4_0 Reserved

QSGMII/SGMII_PCS_SR_MII_1_LP_BABL

Address: Operational Base + offset (0x080014)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	LP_NP Next Page
14	RO	0x0	LP_ACK ACK bit from the Link Partner
13:12	RO	0x0	LP_RF Remote Fault
11:9	RO	0x0	Reserved_11_9 Reserved
8:7	RO	0x0	LP_PAUSE Pause Ability
6	RO	0x0	LP_HD Half Duplex
5	RO	0x0	LP_FD Full Duplex
4:0	RO	0x00	Reserved_4_0 Reserved

QSGMII/SGMII_PCS_SR_MII_1_AN_EXPN

Address: Operational Base + offset (0x080018)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RO	0x0	LD_NP_ABL Local Device NP Able 1: The local device has the next page ability 0: The local device does not have the next page ability The QSGMII/SGMII_PCS always returns this bit as 0 because it does not support Next Page.
1	RO	0x0	PG_RCVD Page Received (RO, LH Type) This bit indicates that the local device received a page from the link partner (during port 1 auto-negotiation). 1: The local device received a new page 0: The local device did not receive a new page
0	RO	0x0	Reserved_0 Reserved

QSGMII/SGMII_PCS_SR_MII_1_EXT_STS

Address: Operational Base + offset (0x08003C)

Bit	Attr	Reset Value	Description
15	RO	0x1	CAP_1G_X_FD 1000BASE-X Full-Duplex Capable
14	RO	0x1	CAP_1G_X_HD 1000BASE-X Half-Duplex Capable
13	RO	0x0	CAP_1G_T_FD 1000BASE-T Full-Duplex Capable
12	RO	0x0	CAP_1G_T_HD 1000BASE-T Half-Duplex Capable
11:0	RO	0x000	Reserved_11_0 Reserved

QSGMII/SGMII_PCS_VR_MII_1_DIG_CTRL1

Address: Operational Base + offset (0x0A0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	VR_RST Vendor-Specific Soft Reset (RW,SC Type) When the host sets this bit, the CSR block triggers the vendor-specific software reset process in which all internal blocks, except the Management Interface block and CSR block, are reset. When this bit is set, it also resets the PHY. This bit is self cleared under the following conditions: For Synopsys PHY: This bit is self cleared when Bits[4:2] in VR_MII_DIG_STS Register are equal to 3'b100, that is, Tx/Rx clocks are stable and in Power_Good state. For Non-Synopsys PHY:This bit is self cleared after the following: 32 clk_csr_i clocks for the MCI interface 1 MDC clock period for the MDIO interface Note: For information about the read or write access for any register during the reset process, see "Special Case Register Access" section.
14	RW	0x0	R2TLBE Rx to Tx Loopback Enable This bit controls the loopback path from the GMII/XGMII Rx to the GMII/XGMII Tx at the GMII/XGMII interface (port 1). 0: Loopback path is disabled 1: Loopback path is enabled
13	RO	0x1	EN_VSMMD1 Enable Vendor-Specific MMD1 This is a read-only bit which reflects the value of EN_VSMMD1 bit of VR_MII_DIG_CTRL1 Register.
12	RO	0x0	CL37_BP Enable Clause 37 AN in Backplane Configuration This is a read-only bit which reflects the value of CL37_BP bit of VR_MII_DIG_CTRL1 Register.
11	RO	0x0	PWRSV Reserved
10	RW	0x1	CS_EN Clock Stop Enable 1: The PHY may stop the clock during LPI mode 0: The clock cannot be stopped during LPI mode You should program this bit based on the capability of the MAC (connected to GMII Port 1) during Rx LPI mode. Note: This field is valid only in QSGMII mode

Bit	Attr	Reset Value	Description
9	RW	0x0	MAC_AUTO_SW Automatic Speed Mode Change after CL37 AN (for port 1) If this field is set to 1, QSGMII/SGMII_PCS automatically switches to the negotiated USXGMII/QSGMII(port1) speed, after the completion of Clause 37 auto-negotiation. This mode is valid only when QSGMII/SGMII_PCS is configured as MAC-side USXGMII/QSGMII and should be set only when Auto-negotiation is enabled (AN_ENABLE bit is set to 1). If this bit is set to 0, QSGMII/SGMII_PCS operates at the speed/duplex mode as per the values programmed to SR_MII_1_CTRL Register. In that case, after the completion of CL37 AN, application has to read the negotiated Speed/Duplex Mode from VR_MII_1_AN_INTR_STS Register and then program SR_MII_1_CTRL Register appropriately. If this bit is set to 1 in QSGMII mode, PCS_qsgmii_link_sts_p1_o, PCS_link_speed_p1_o and PCS_qsgmii_full_duplex_p1_o outputs reflect the auto-negotiated values, that is, values from CL37_ANSGM_STS field of VR_MII_1_AN_INTR_STS Register. For USXGMII mode, if clk_xgmii_tx_p1_i and clk_xgmii_rx_p1_i do not stabilize at the new operating frequency (based on the selected speed) immediately after the completion of auto-negotiation, then software might need to program 'USRA_RST' bit prior to starting packet transfer in the new speed mode.
8	RO	0x0	INIT INIT This bit reflects the value of INIT bit of VR_MII_DIG_CTRL1 Register.
7	RO	0x0	MSK_RD_ERR Mask Running Disparity Error This bit reflects the value of MSK_RD_ERR bit of VR_MII_DIG_CTRL1 Register.
6	RW	0x0	PRE_EMP Pre-emption Packet Enable. This bit should be set to 1 to allow the QSGMII/SGMII_PCS to properly receive/transmit pre-emption packets along GMII port 1, when operating in 10M/100M Modes.

Bit	Attr	Reset Value	Description
5	RO	0x0	USRA_RST USXGMII Rate Adaptor Reset (Port 1) This bit can be set to 1 to reset/initialize the USXGMII Rate Adaptor Logic (for port 1) inside QSGMII/SGMII_PCS. The Rate Adaptor Logic maps GMII data to XGMII (and vice-versa in Rx path) data and perform data replication for lower USXGMII speeds. This is a self-clear bit (RW,SC) and clears itself after the reset of Tx and Rx Rate Adaptor Logic is complete. After setting this bit to 1, application should poll this bit till it self-clears. Note: If CLKCOMP=Enabled, this bit also initializes the clock compensation FIFO (corresponding to port 1). When this bit is programmed to 1, RXFIFO_OVF/RXFIFO_UNF bits of VR_MII_1_DIG_STS Register might get set incorrectly. Therefore, read these register bits (RXFIFO_OVF and RXFIFO_UNF) so that they get cleared. Thereafter, RXFIOF_UNF and RXFIFO_UNF bits are reliable.
4	RO	0x0	DTXLANED_0 Tx Lane 0 Disable This bit reflects the value of DTXLANED_0 bit of VR_MII_DIG_CTRL1 Register.
3	RO	0x0	CL37_TMR_OVR_RIDE Over-Ride Control for CL37 Link Timer. This bit reflects the value of CL37_TMR_OVR_RIDE bit of VR_MII_DIG_CTRL1 Register.
2	RO	0x0	EN_2_5G_MODE Enable 2.5G GMII Mode (GMII interface over-clocked 2.5 This bit reflects the value of EN_2_5G_MODE bit of VR_MII_DIG_CTRL1 Register.
1	RO	0x0	BYP_PWRUP Reserved
0	RO	0x0	PHY_MODE_CTRL QSGMII/USXGMII PHY mode control on Port 1 This bit controls the Clause 37 auto-negotiation when operating in QSGMII/USXGMII (Port 1) PHY mode. QSGMI: When this bit is set to 1, QSGMII/SGMII_PCS advertises the values of input ports PCS_qsgmii_link_sts_p1_i, PCS_qsgmii_link_speed_p1_i and PCS_qsgmii_full_duplex_p1_i during QSGMII(Port 1) auto-negotiation. When this bit is set to 0, QSGMII(Port 1) auto-negotiation advertises the values programmed to: bit 4 (SGMII_LINK_STS) of VR_MII_1_AN_CTRL Register bit 13 (ss13) and 6 (ss6) of SR_MII_1_CTRL Register and bit 5 (FD) of SR_MII_1_AN_ADV Register

QSGMII/SGMII_PCS_VR_MII_1_AN_CTRL

Address: Operational Base + offset (0x0A0004)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:10	RO	0x00	Reserved_15_10 Reserved

Bit	Attr	Reset Value	Description
9	RW	0x0	IND_TX_EN Independent Transmit Enable If this bit is set to 1, QSGMII/SGMII_PCS is able to transmit the port 1 GMII Tx data, irrespective of its receive link status during QSGMII mode (provided auto-negotiation is not enabled). If this bit is set to 0, QSGMII/SGMII_PCS sends IDLE (for port 1) till its receiver has attained synchronization.
8	RW	0x0	MII_CTRL MII Control This bit controls the width of the MAC interface (connected to GMII port 1) when operating at 10 Mbps or 100 Mbps 0: 4-bit MII 1: 8-bit MII This bit also controls the PCS_mii_ctrl_p1_o signal which is used for external clock multiplexing of the clk_mii_tx_p1_i/clk_xgmii_tx_p1_i and clk_mii_rx_p1_i/clk_xgmii_rx_p1_i signals
7:5	RO	0x0	Reserved_7_5 Reserved
4	RW	0x0	SGMII_LINK_STS QSGMII/USXGMII Link Status (port 1) This bit is used in Bit 15 of the Tx_Config_Reg during Clause 37 auto-negotiation (along port 1) when QSGMII/SGMII_PCS is programmed as QSGMII-PHY (or as USXGMII-PHY) and when PHY_MODE_CTRL bit of VR_MII_1_DIG_CTRL1 Register is 0 . 0: Link Down 1: Link Up
3	RO	0x0	TX_CONFIG Transmit Configuration This field reflects the value of TX_CONFIG of VR_MII_AN_CTRL Register.
2:1	RO	0x0	PCS_MODE PCS Mode This field reflects the value of PCS_MODE of VR_MII_AN_CTRL Register for configurations with QSGMII support. For other configurations, this field returns 2'b00.
0	RW	0x0	MII_AN_INTR_EN Clause 37 AN Complete Interrupt Enable (port 1) When set to 1, this bit enables the generation of Clause 37 auto-negotiation complete (on port 1) interrupt output. When set to 0, it disables the generation of Clause 37 auto-negotiation complete interrupt.

QSGMII/SGMII_PCS_VR_MII_1_AN_INTR_STS

0	RW	0x0	COR Clear on Read When this bit is set and the host reads port 1 error counter (VR_MII_1_ICG_ERRCNT1 Register), that counter is cleared after the read cycle. 0: Normal operation 1: Clear error counter that is read

QSGMII/SGMII_PCS_SR_MII_2_CTRL

Address: Operational Base + offset (0x0C0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	RST Soft Reset (RW,SC Type) For Non-Synopsys PHY configurations: When the host sets this bit, the CSR block triggers the software reset process in which all internal blocks are reset, except the Management Interface block. The registers are reset to their default values. When this bit is set, it also resets the PHY. This bit is self-cleared after the following: 32 clk_csr_i clocks for the MCI interface 1 MDC clock period for the MDIO interface
14	RO	0x0	LBE Loopback Enable This bit reflects the value of LBE bit of SR_MII_CTRL Register.
13	RW	0x0	SS13 Speed Selection (LSB) This bit, along with the SS6 bit and SS5 bit of this register, indicates the speed of GMII/XGMII port 2. Speed encoding as follows: For QSGMII: When SS6=1 and SS13=0, speed is 1000 Mbps When SS6=0 and SS13=1, speed is 100 Mbps When SS6=0 and SS13=0, speed is 10 Mbps
12	RW	0x0	AN_ENABLE Enable Auto-Negotiation When set to 1, this bit enables the Clause 37 auto-negotiation process for port 2.
11	RW	0x0	LPM Power-Down Mode This bit controls the power-down mode of the QSGMII/SGMII_PCS. 0: Normal operation 1: The QSGMII/SGMII_PCS goes to the power-down mode along with the PHY. For non-Synopsys PHY, the PCS_pdown_o port is asserted. When the host clears this bit, the QSGMII/SGMII_PCS resumes the normal operation. In a Synopsys PHY configuration, after clearing this bit, the host must wait until Bits[4:2] of VR_XS_PCS_DIG_STS/VR_MII_DIG_STS Register indicate that the QSGMII/SGMII_PCS is in the normal state
10	RO	0x0	Reserved_10 Reserved
9	RW	0x0	RESTART_AN Restart Auto-Negotiation (RW,SC Type) When the host writes this bit, the QSGMII/SGMII_PCS initiates the auto-negotiation process for port 2. This bit is used to restart the auto-negotiation which is already initiated by setting Bit 12. The QSGMII/SGMII_PCS clears this bit after restarting the auto-negotiation.

Bit	Attr	Reset Value	Description
8	RW	0x1	DUPLEX_MODE Duplex Mode This bit specifies the duplex mode of the QSGMII/SGMII_PCS along port 2. 0: Half duplex 1: Full duplex If Bit 12 is set to 0, this bit determines the PHY link duplex mode. If Bit 12 is set to 1, then the PHY link duplex mode is independent of this bit (although the host can write any value) and is determined by the outcome of the Clause 37 auto-negotiation process.
7	RO	0x0	Reserved_7 Reserved
6	RW	0x1	SS6 Speed Selection This bit, along with the SS5 and SS13 bits of this register indicates the speed of operation of GMII/XGMII Port 2. For more information, see description of the SS13 bit.
5	RO	0x0	SS5 Speed Selection This bit, along with SS6 and SS13 bits, control the speed of operation of XGMII/GMII Port 2. For more information, see description of the SS13 bit.

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	VR_RST Vendor-Specific Soft Reset (RW,SC Type) When the host sets this bit, the CSR block triggers the vendor-specific software reset process in which all internal blocks, except the Management Interface block and CSR block, are reset. When this bit is set, it also resets the PHY. This bit is self cleared under the following conditions: For Synopsys PHY: This bit is self cleared when Bits[4:2] in VR_MII_DIG_STS Register are equal to 3'b100, that is, Tx/Rx clocks are stable and in Power_Good state. For Non-Synopsys PHY:This bit is self cleared after the following: 32 clk_csr_i clocks for the MCI interface 1 MDC clock period for the MDIO interface Note: For information about the read or write access for any register during the reset process, see "Special Case Register Access" section.
14	RW	0x0	R2TLBE Rx to Tx Loopback Enable This bit controls the loopback path from the GMII/XGMII Rx to the GMII/XGMII Tx at the GMII/XGMII interface (port 1). 0: Loopback path is disabled 1: Loopback path is enabled
13	RO	0x1	EN_VSMMD1 Enable Vendor-Specific MMD1 This is a read-only bit which reflects the value of EN_VSMMD1 bit of VR_MII_DIG_CTRL1 Register.
12	RO	0x0	CL37_BP Enable Clause 37 AN in Backplane Configuration This is a read-only bit which reflects the value of CL37_BP bit of VR_MII_DIG_CTRL1 Register.
11	RO	0x0	PWRSV Reserved
10	RW	0x1	CS_EN Clock Stop Enable 1: The PHY may stop the clock during LPI mode 0: The clock cannot be stopped during LPI mode You should program this bit based on the capability of the MAC (connected to GMII Port 1) during Rx LPI mode. Note: This field is valid only in QSGMII mode

Bit	Attr	Reset Value	Description
9	RW	0x0	MAC_AUTO_SW Automatic Speed Mode Change after CL37 AN (for port 1) If this field is set to 1, QSGMII/SGMII_PCS automatically switches to the negotiated USXGMII/QSGMII(port1) speed, after the completion of Clause 37 auto-negotiation. This mode is valid only when QSGMII/SGMII_PCS is configured as MAC-side USXGMII/QSGMII and should be set only when Auto-negotiation is enabled (AN_ENABLE bit is set to 1). If this bit is set to 0, QSGMII/SGMII_PCS operates at the speed/duplex mode as per the values programmed to SR_MII_1_CTRL Register. In that case, after the completion of CL37 AN, application has to read the negotiated Speed/Duplex Mode from VR_MII_1_AN_INTR_STS Register and then program SR_MII_1_CTRL Register appropriately. If this bit is set to 1 in QSGMII mode, PCS_qsgmii_link_sts_p1_o, PCS_link_speed_p1_o and PCS_qsgmii_full_duplex_p1_o outputs reflect the auto-negotiated values, that is, values from CL37_ANSGM_STS field of VR_MII_1_AN_INTR_STS Register. For USXGMII mode, if clk_xgmii_tx_p1_i and clk_xgmii_rx_p1_i do not stabilize at the new operating frequency (based on the selected speed) immediately after the completion of auto-negotiation, then software might need to program 'USRA_RST' bit prior to starting packet transfer in the new speed mode.
8	RO	0x0	INIT INIT This bit reflects the value of INIT bit of VR_MII_DIG_CTRL1 Register.
7	RO	0x0	MSK_RD_ERR Mask Running Disparity Error This bit reflects the value of MSK_RD_ERR bit of VR_MII_DIG_CTRL1 Register.
6	RW	0x0	PRE_EMP Pre-emption Packet Enable. This bit should be set to 1 to allow the QSGMII/SGMII_PCS to properly receive/transmit pre-emption packets along GMII port 1, when operating in 10M/100M Modes.

Bit	Attr	Reset Value	Description
5	RO	0x0	USRA_RST USXGMII Rate Adaptor Reset (Port 1) This bit can be set to 1 to reset/initialize the USXGMII Rate Adaptor Logic (for port 1) inside QSGMII/SGMII_PCS. The Rate Adaptor Logic maps GMII data to XGMII (and vice-versa in Rx path) data and perform data replication for lower USXGMII speeds. This is a self-clear bit (RW,SC) and clears itself after the reset of Tx and Rx Rate Adaptor Logic is complete. After setting this bit to 1, application should poll this bit till it self-clears. Note: If CLKCOMP=Enabled, this bit also initializes the clock compensation FIFO (corresponding to port 1). When this bit is programmed to 1, RXFIFO_OVF/RXFIFO_UNF bits of VR_MII_1_DIG_STS Register might get set incorrectly. Therefore, read these register bits (RXFIFO_OVF and RXFIFO_UNF) so that they get cleared. Thereafter, RXFIOF_UNF and RXFIFO_UNF bits are reliable.
4	RO	0x0	DTXLANED_0 Tx Lane 0 Disable This bit reflects the value of DTXLANED_0 bit of VR_MII_DIG_CTRL1 Register.
3	RO	0x0	CL37_TMR_OVR_RIDE Over-Ride Control for CL37 Link Timer. This bit reflects the value of CL37_TMR_OVR_RIDE bit of VR_MII_DIG_CTRL1 Register.
2	RO	0x0	EN_2_5G_MODE Enable 2.5G GMII Mode (GMII interface over-clocked 2.5 This bit reflects the value of EN_2_5G_MODE bit of VR_MII_DIG_CTRL1 Register.
1	RO	0x0	BYP_PWRUP Reserved
0	RO	0x0	PHY_MODE_CTRL QSGMII/USXGMII PHY mode control on Port 1 This bit controls the Clause 37 auto-negotiation when operating in QSGMII/USXGMII (Port 1) PHY mode. QSGMI: When this bit is set to 1, QSGMII/SGMII_PCS advertises the values of input ports PCS_qsgmii_link_sts_p1_i, PCS_qsgmii_link_speed_p1_i and PCS_qsgmii_full_duplex_p1_i during QSGMII(Port 1) auto-negotiation. When this bit is set to 0, QSGMII(Port 1) auto-negotiation advertises the values programmed to: bit 4 (SGMII_LINK_STS) of VR_MII_1_AN_CTRL Register bit 13 (ss13) and 6 (ss6) of SR_MII_1_CTRL Register and bit 5 (FD) of SR_MII_1_AN_ADV Register

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	VR_RST Vendor-Specific Soft Reset (RW,SC Type) When the host sets this bit, the CSR block triggers the vendor-specific software reset process in which all internal blocks, except the Management Interface block and CSR block, are reset. When this bit is set, it also resets the PHY. This bit is self cleared under the following conditions: For Synopsys PHY: This bit is self cleared when Bits[4:2] in VR_MII_DIG_STS Register are equal to 3'b100, that is, Tx/Rx clocks are stable and in Power_Good state. For Non-Synopsys PHY:This bit is self cleared after the following: 32 clk_csr_i clocks for the MCI interface 1 MDC clock period for the MDIO interface Note: For information about the read or write access for any register during the reset process, see "Special Case Register Access" section.
14	RW	0x0	R2TLBE Rx to Tx Loopback Enable This bit controls the loopback path from the GMII/XGMII Rx to the GMII/XGMII Tx at the GMII/XGMII interface (port 3). 0: Loopback path is disabled 1: Loopback path is enabled
13	RO	0x1	EN_VSMMD1 Enable Vendor-Specific MMD1 This is a read-only bit which reflects the value of EN_VSMMD1 bit of VR_MII_DIG_CTRL1 Register.
12	RO	0x0	CL37_BP Enable Clause 37 AN in Backplane Configuration This is a read-only bit which reflects the value of CL37_BP bit of VR_MII_DIG_CTRL1 Register.
11	RO	0x0	PWRSV Reserved
10	RW	0x1	CS_EN Clock Stop Enable 1: The PHY may stop the clock during LPI mode 0: The clock cannot be stopped during LPI mode You should program this bit based on the capability of the MAC (connected to GMII Port 1) during Rx LPI mode. Note: This field is valid only in QSGMII mode

Bit	Attr	Reset Value	Description
9	RW	0x0	MAC_AUTO_SW Automatic Speed Mode Change after CL37 AN (for port 3) If this field is set to 1, QSGMII/SGMII_PCS automatically switches to the negotiated USXGMII/QSGMII(port3) speed, after the completion of Clause 37 auto-negotiation. This mode is valid only when QSGMII/SGMII_PCS is configured as MAC-side USXGMII/QSGMII and should be set only when Auto-negotiation is enabled (AN_ENABLE bit is set to 1). If this bit is set to 0, QSGMII/SGMII_PCS operates at the speed/duplex mode as per the values programmed to SR_MII_1_CTRL Register. In that case, after the completion of CL37 AN, application has to read the negotiated Speed/Duplex Mode from VR_MII_1_AN_INTR_STS Register and then program SR_MII_1_CTRL Register appropriately. If this bit is set to 1 in QSGMII mode, PCS_qsgmii_link_sts_p1_o, PCS_link_speed_p1_o and PCS_qsgmii_full_duplex_p1_o outputs reflect the auto-negotiated values, that is, values from CL37_ANSGM_STS field of VR_MII_1_AN_INTR_STS Register. For USXGMII mode, if clk_xgmii_tx_p1_i and clk_xgmii_rx_p1_i do not stabilize at the new operating frequency (based on the selected speed) immediately after the completion of auto-negotiation, then software might need to program 'USRA_RST' bit prior to starting packet transfer in the new speed mode.
8	RO	0x0	INIT INIT This bit reflects the value of INIT bit of VR_MII_DIG_CTRL1 Register.
7	RO	0x0	MSK_RD_ERR Mask Running Disparity Error This bit reflects the value of MSK_RD_ERR bit of VR_MII_DIG_CTRL1 Register.
6	RW	0x0	PRE_EMP Pre-emption Packet Enable. This bit should be set to 1 to allow the QSGMII/SGMII_PCS to properly receive/transmit pre-emption packets along GMII port 1, when operating in 10M/100M Modes.

Bit	Attr	Reset Value	Description
5	RO	0x0	USRA_RST USXGMII Rate Adaptor Reset (Port 1) This bit can be set to 1 to reset/initialize the USXGMII Rate Adaptor Logic (for port 1) inside QSGMII/SGMII_PCS. The Rate Adaptor Logic maps GMII data to XGMII (and vice-versa in Rx path) data and perform data replication for lower USXGMII speeds. This is a self-clear bit (RW,SC) and clears itself after the reset of Tx and Rx Rate Adaptor Logic is complete. After setting this bit to 1, application should poll this bit till it self-clears. Note: If CLKCOMP=Enabled, this bit also initializes the clock compensation FIFO (corresponding to port 1). When this bit is programmed to 1, RXFIFO_OVF/RXFIFO_UNF bits of VR_MII_1_DIG_STS Register might get set incorrectly. Therefore, read these register bits (RXFIFO_OVF and RXFIFO_UNF) so that they get cleared. Thereafter, RXFIOF_UNF and RXFIFO_UNF bits are reliable.
4	RO	0x0	DTXLANED_0 Tx Lane 0 Disable This bit reflects the value of DTXLANED_0 bit of VR_MII_DIG_CTRL1 Register.
3	RO	0x0	CL37_TMR_OVR_RIDE Over-Ride Control for CL37 Link Timer. This bit reflects the value of CL37_TMR_OVR_RIDE bit of VR_MII_DIG_CTRL1 Register.
2	RO	0x0	EN_2_5G_MODE Enable 2.5G GMII Mode (GMII interface over-clocked 2.5 This bit reflects the value of EN_2_5G_MODE bit of VR_MII_DIG_CTRL1 Register.
1	RO	0x0	BYP_PWRUP Reserved
0	RO	0x0	PHY_MODE_CTRL QSGMII/USXGMII PHY mode control on Port 3 This bit controls the Clause 37 auto-negotiation when operating in QSGMII/USXGMII (Port 1) PHY mode. QSGMI: When this bit is set to 1, QSGMII/SGMII_PCS advertises the values of input ports PCS_qsgmii_link_sts_p1_i, PCS_qsgmii_link_speed_p1_i and PCS_qsgmii_full_duplex_p1_i during QSGMII(Port 3) auto-negotiation. When this bit is set to 0, QSGMII(Port 3) auto-negotiation advertises the values programmed to: bit 4 (SGMII_LINK_STS) of VR_MII_1_AN_CTRL Register bit 13 (ss13) and 6 (ss6) of SR_MII_1_CTRL Register and bit 5 (FD) of SR_MII_1_AN_ADV Register

QSGMII/SGMII_PCS_VR_MII_DIG_CTRL1

Address: Operational Base + offset (0x1E0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	VR_RST Vendor-Specific Soft Reset (RW,SC Type) When the host sets this bit, the CSR block triggers the vendor-specific software reset process in which all internal blocks, except the Management Interface block and CSR block, are reset. When this bit is set, it also resets the PHY. This bit is self cleared under the following conditions: For Synopsys PHY: This bit is self cleared when Bits[4:2] in VR_MII_DIG_STS Register are equal to 3'b100, that is, Tx/Rx clocks are stable and in Power_Good state. For Non-Synopsys PHY:This bit is self cleared after the following: 32 clk_csr_i clocks for the MCI interface 1 MDC clock period for the MDIO interface Note: For information about the read or write access for any register during the reset process, see "Special Case Register Access" section.

Bit	Attr	Reset Value	Description
14	RW	0x0	R2TLBE Rx to Tx Loopback Enable This bit controls the loopback path from the GMII/XGMII Rx to the GMII/XGMII Tx at the GMII/XGMII interface (port 1). 0: Loopback path is disabled 1: Loopback path is enabled
13	RW	0x1	EN_VSMMD1 Enable Vendor-Specific MMD1 This is a read-only bit which reflects the value of EN_VSMMD1 bit of VR_MII_DIG_CTRL1 Register.
12	RO	0x0	CL37_BP Enable Clause 37 AN in Backplane Configuration This is a read-only bit which reflects the value of CL37_BP bit of VR_MII_DIG_CTRL1 Register.
11	RO	0x0	PWRSV Reserved
10	RW	0x1	CS_EN Clock Stop Enable 1: The PHY may stop the clock during LPI mode 0: The clock cannot be stopped during LPI mode You should program this bit based on the capability of the MAC (connected to GMII Port 1) during Rx LPI mode. Note: This field is valid only in QSGMII mode
9	RW	0x0	MAC_AUTO_SW Automatic Speed Mode Change after CL37 AN (for port 1) If this field is set to 1, QSGMII/SGMII_PCS automatically switches to the negotiated USXGMII/QSGMII(port1) speed, after the completion of Clause 37 auto-negotiation. This mode is valid only when QSGMII/SGMII_PCS is configured as MAC-side USXGMII/QSGMII and should be set only when Auto-negotiation is enabled (AN_ENABLE bit is set to 1). If this bit is set to 0, QSGMII/SGMII_PCS operates at the speed/duplex mode as per the values programmed to SR_MII_1_CTRL Register. In that case, after the completion of CL37 AN, application has to read the negotiated Speed/Duplex Mode from VR_MII_1_AN_INTR_STS Register and then program SR_MII_1_CTRL Register appropriately. If this bit is set to 1 in QSGMII mode, PCS_qsgmii_link_sts_p1_o, PCS_link_speed_p1_o and PCS_qsgmii_full_duplex_p1_o outputs reflect the auto-negotiated values, that is, values from CL37_ANSGM_STS field of VR_MII_1_AN_INTR_STS Register. For USXGMII mode, if clk_xgmii_tx_p1_i and clk_xgmii_rx_p1_i do not stabilize at the new operating frequency (based on the selected speed) immediately after the completion of auto-negotiation, then software might need to program 'USRA_RST' bit prior to starting packet transfer in the new speed mode.
8	RW	0x0	INIT INIT This bit reflects the value of INIT bit of VR_MII_DIG_CTRL1 Register.

Bit	Attr	Reset Value	Description
7	RW	0x0	MSK_RD_ERR Mask Running Disparity Error This bit reflects the value of MSK_RD_ERR bit of VR_MII_DIG_CTRL1 Register.
6	RW	0x0	PRE_EMP Pre-emption Packet Enable. This bit should be set to 1 to allow the QSGMII/SGMII_PCS to properly receive/transmit pre-emption packets along GMII port 1, when operating in 10M/100M Modes.
5	RO	0x0	EN_100M Enable 100Mbps PCS Mode. This bit should be set to 1 to enable 100Mbps PCS Mode of operation.This bit drives the output port 'PCS_100m_o'.
4	RW	0x0	DTXLANED_0 Tx Lane 0 Disable This bit reflects the value of DTXLANED_0 bit of VR_MII_DIG_CTRL1 Register.
3	RW	0x0	CL37_TMR_OVR_RIDE Over-Ride Control for CL37 Link Timer. This bit reflects the value of CL37_TMR_OVR_RIDE bit of VR_MII_DIG_CTRL1 Register.
2	RW	0x0	EN_2_5G_MODE Enable 2.5G GMII Mode (GMII interface over-clocked 2.5 This bit reflects the value of EN_2_5G_MODE bit of VR_MII_DIG_CTRL1 Register.
1	RO	0x0	BYP_PWRUP Reserved
0	RO	0x0	PHY_MODE_CTRL QSGMII/USXGMII PHY mode control on Port 1 This bit controls the Clause 37 auto-negotiation when operating in QSGMII/USXGMII (Port 1) PHY mode. QSGMI: When this bit is set to 1, QSGMII/SGMII_PCS advertises the values of input ports PCS_qsgmii_link_sts_p1_i, PCS_qsgmii_link_speed_p1_i and PCS_qsgmii_full_duplex_p1_i during QSGMII(Port 1) auto-negotiation. When this bit is set to 0, QSGMII(Port 1) auto-negotiation advertises the values programmed to: bit 4 (SGMII_LINK_STS) of VR_MII_1_AN_CTRL Register bit 13 (ss13) and 6 (ss6) of SR_MII_1_CTRL Register and bit 5 (FD) of SR_MII_1_AN_ADV Register

QSGMII/SGMII_PCS_VR_MII_DBG_CTRL

Address: Operational Base + offset (0x1E0014)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	TX_PMBL_CTL Transmit Preamble Control This bit can be set to 1 to prevent possible preamble truncation in the QSGMII/SGMII_PCS transmitter when operating in 1000BASE-X (or 2.5G Mode over GMII) Mode. As per IEEE spec, it is permissible for a compliant 1000BASE-X PCS transmit process to truncate the first byte of preamble in order to align the start of the packet on the EVEN boundary. If this bit is set to 1, QSGMII/SGMII_PCS does not delete any preamble bytes (received from GMII Tx interface) and passes on the same number of preamble bytes to its output. QSGMII/SGMII_PCS carries out this operation by adjusting the IPG. This mode is a deviation from Clause 36 of IEEE802.3 specification. But it can prove useful when operating at 2.5G Mode (over clocked 1000BASE-X Mode) and the far-end device is compliant to IEEE802.3bz/cb specification.
7	RO	0x0	RX_SYNC_CTL Receive Synchronization Control . This bit merely reflects the value of RX_SYNC_CTL field of VR_MII_DBG_CTRL Register (for 1000BaseX-Only PCS configurations) or VR_XS_PCS_DEBUG_CTRL Register (for other configurations).
6	RO	0x0	RX_DT_EN_CTL Reserved
5	RW	0x0	SUPRESS_EEE_LOS_DET Suppress EEE Loss of Signal Detection. When this field is set to 1, Loss of Signal indicated by the PHY (based on input port PCS_los_i) is ignored by QSGMII/SGMII_PCS while evaluating the Receive link when operating in EEE mode. Receive link is evaluated based the on data received by QSGMII/SGMII_PCS from PHY. When this field is set to 0, Loss of signal indicated by the PHY is considered by the QSGMII/SGMII_PCS while evaluating the Receive link status in EEE mode.
4	RW	0x0	SUPRESS_LOS_DET Suppress Loss of Signal Detection When this field is set to 1, Loss of Signal indicated by the PHY (based on input port PCS_los_i) is ignored by QSGMII/SGMII_PCS while evaluating the Receive link. Receive link is evaluated based the Rx data received on the 'xgxs_rx_datalane_i' port of QSGMII/SGMII_PCS. When this field is set to 0, Loss of signal indicated by the PHY is considered by the QSGMII/SGMII_PCS while evaluating the Receive link status.
3:1	RO	0x0	reserved
0	RW	0x0	RESTAR_SYNC Restart Synchronization When set to 1, this bit restarts the Rx Synchronization State machine on port 1. The host must clear this bit to 0 before setting it to 1 next time.

QSGMII/SGMII_PCS_VR_MII_EEE_MCTRL0

Address: Operational Base + offset (0x1E0018)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:12	RO	0x8	CLKSTOP Clock Stop This field holds the count value after which the Rx clock to the MAC can be stopped. The default value is 8. The host should program this value depending on the capability of the MAC. This field is used to control the assertion of the PCS_lrx_clk_gat_o signal (to gate the Rx clock of the MAC) By default, the PCS_lrx_clk_gat_o signal is asserted after the PCS Rx module detects the LPI pattern followed by the following: Number of clk_xgxs_rx0_i or clk_rpcs_rx_i clocks (specified in this field) + clk_eee_i synchronization delay + FIFO initialization delay
11:8	RW	0x9	MULT_FACT_100NS 100 ns Clock Tic Multiplying Factor This bit is the multiplying factor to the clk_eee_i clock time period to make it closer to 100 ns. For example, if the clk_eee_i clock time period (clk_eee_i_time_period) is 10 ns, the value of this field is 9, that is, 1 less than 10. This value should be programmed such that the clk_eee_i_time_period * (MULT_FACT_100NS + 1) should be within 80 ns to 120 ns. The default value of this register is 9, assuming that the default clk_eee_i time period to be 10 ns.
7	RO	0x1	RX_EN_CTRL Rx Control Enable This bit controls the generation of the PCS_rx_en_olane signal. When this bit is set to 1, the PCS_rx_en_olane signal is de-asserted when the EEE receive controller reaches the Quiet state. When this bit set to 0, the PCS_rx_en_olane signal is not de-asserted when the EEE transmit controller reaches the Quiet state.
6	RO	0x0	SIGN_BIT Effective 100 ns Tic Value The host should use this bit to fine tune the EEE timing requirement. The host should set this bit to 0 when the clk_eee_i_time_period * (MULT_FACT_100NS + 1) value is more than 100 ns. The host should set this bit to 1 when the clk_eee_i clock period * (MULT_FACT_100NS + 1) value is less than or equal to 100 ns.
5	RO	0x0	Reserved_5 Reserved
4	RW	0x1	TX_EN_CTRL Tx Control Enable This bit controls the generation of the following signals: xgxs_txlane_en_o (for Synopsys PHY) PCS_tx_en_olane (for non-Synopsys PHY) When this bit is set to 1, the xgxs_txlane_en_o or PCS_tx_en_olane signal is de-asserted when the EEE transmit controller reaches the Quiet state. When this bit set to 0, the xgxs_txlane_en_o or PCS_tx_en_olane signal is not de-asserted when the EEE transmit controller reaches the Quiet state.

Bit	Attr	Reset Value	Description
3	RW	0x1	RX_QUIET_EN Rx Quiet Enable This bit controls the generation of the PCS_lpitx_quiet_o output. When this bit is set to 1, the PCS_lpitx_quiet_o output is set to 1 when the EEE receive controller reaches the Quiet state. When this bit set to 0, the PCS_lpitx_quiet_o output is not set to 1.
2	RW	0x1	TX_QUIET_EN Tx Quiet Enable This bit controls the generation of the PCS_lpitx_quiet_o output. When this bit is set to 1, the PCS_lpitx_quiet_o output is set to 1 when the EEE transmit controller reaches the Quiet state. When this bit set to 0, the PCS_lpitx_quiet_o output is not set to 1.
1	RW	0x0	LRX_EN LPI Rx Enable When set to 1, this bit enables the Energy Efficient Ethernet support in the QSGMII/SGMII_PCS receive path. When set to 0, it disables the support for Energy Efficient Ethernet in the QSGMII/SGMII_PCS receive path.
0	RW	0x0	LTX_EN LPI Rx Enable When set to 1, this bit enables the Energy Efficient Ethernet support in the QSGMII/SGMII_PCS receive path. When set to 0, it disables the support for Energy Efficient Ethernet in the QSGMII/SGMII_PCS receive path.

QSGMII/SGMII_PCS_VR_MII_EEE_TXTIMER

Address: Operational Base + offset (0x1E0020)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x00	TSL_RES TSL Resolution This field stores the resolution value for the TSL timer. When the generated 100 ns tic timer is not exactly 100 ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the TSL timer. The QSGMII/SGMII_PCS maintains the default value of the TSL timer as 199, assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100 ns to produce 19900 ns (19.9 us) as per the TSL requirement in the IEEE standard. If clk_eee_i_time_period * (MULT_FACT_100NS + 1) is 90, the default TSL timer produces 17910 ns (17.91 us) which is lesser than the standard 19.9 us. To make it 19.9 us, you should program this register such that (199 +/- TSL_RES) * ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) is greater than 19.9 us and less than 20.1 us (max limit), that is, (199 + TSL_RES)*90 = 19.9 us. TWL_RES = 23 meets the requirement which produces 19.98 us. The SIGN_BIT should be programmed as 1.

QSGMII/SGMII_PCS_VR_MII_EEE_RXTIMER

Address: Operational Base + offset (0x1E0024)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13:8	RW	0x00	TWR_RES TWR Resolution This field stores the resolution value for the TWR timer. When the generated 100 ns tic timer is not exactly 100 ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the TWR timer. The default value is 11 us for 1000BASEX-Only PCS mode. This value is as per the requirements specified in the standard assuming that clk_eee_i_time_period * (MULT_FACT_100NS + 1) produces 100 ns tick. Example: For KX mode, the time requirement is 11 us. The QSGMII/SGMII_PCS maintains the default value of the TWR timer as 110, assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100 ns to produce 11000 ns (11 us). If clk_eee_i_time_period * (MULT_FACT_100NS + 1) is 110, the default TWR timer produces 12100 ns (12.1 us) which is more than 11 us. To make it 11 us, you must program this register such that (110 +/- TWR_RES) * ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) = 11 us. Therefore, use the following equation: (110 - TWR_RES) * 110 = 11000 ns TWL_RES = 10 meets the requirement which produces 11 us. The SIGN_BIT should be programmed as 0.
7:0	RW	0x00	RES_100U 100 us Resolution This field stores the resolution value for the 100 us timer. If the generated 100 ns tic timer is not exactly 100 ns, this field is programmed with the required value. The programmed value is equivalent to the number of more (SIGN_BIT is low) or less (SIGN_BIT is high) counts than the ideal count to meet the range of the 100 us timer. This field is used to control the generation of 100 us time tick using the clk_eee_i clock and MULT_FACT_100NS field. By default, the 100 us timer is generated assuming clk_eee_i_time_period * (MULT_FACT_100NS + 1) is equal to 100 ns. Therefore, the QSGMII/SGMII_PCS maintains the default value of the 100 us timer as 1000 to achieve 100000 ns (100 us). You should use this field if clk_eee_i_time_period * (MULT_FACT_100NS + 1) is not equal to 100 ns. To program this field, use the following equation: (1000 +/- RES_100US)* ((MULT_FACT_100NS + 1) * clk_eee_i_time_period) = 100 us The SIGN_BIT should be programmed as 1 for (+) and 0 for (-).

QSGMII/SGMII_PCS_VR_MII_LINK_TIMER_CTRL

Address: Operational Base + offset (0x1E0028)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	VR_MII_1_LINK_TIMER_CTRL Programmable Link Timer Value for Clause 37 auto-negotiation. This field can be programmed to any desired value if application wishes to override the standard specified values for Link Timer used during Clause 37 Auto negotiation. Link timer is implemented in QSGMII/SGMII_PCS using a 24-bit timer.When operating in USXGMII mode, link timer runs at 156.25 MHz. When operating in 1000BaseX/SGMII mode, this timer operates at 125 MHz. For USXGMII configurations:This field forms the upper 16-bit of the 24-bit value that gets loaded to the link timer.The lower 8-bits are hard-coded as zero. For example, if CL37_LINK_TIME = 1, the value that is loaded to the timer is 24'h100, which corresponds to a duration of 1638 ns (256*6.4ns) in USXGMII mode or 2048 ns (256*8ns) in 1000BaseX/SGMII mode. For configurations without USXGMII:This field forms the upper 16-bit of the 24-bit value that gets loaded to the link timer.The lower 8-bits are hardcoded as 8'h7D. For example, if CL37_LINK_TIME = 1, the value that is loaded to the timer is 24'h17D, which corresponds to a duration of 3048 ns (381*8ns). After programming this register, application should perform either of the following steps, so that the new values takes effect: Set CL37_TMR_OVR_RIDE bit (bit[3]) of VR_MII_DIG_CTRL1 Register to 1 FAST_SIM bit of SR Control MMD Control Register should be cleared (if already set) and then set back to 1.

QSGMII/SGMII_PCS_VR_MII_EEE_MCTRL1

Address: Operational Base + offset (0x1E002C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	TRN_LPI Transparent Tx LPI Mode Enable. When set to 1 (along with LTX_EN=1), transparent LPI mode gets activated in the QSGMII/SGMII_PCS Transmit path. In this mode, the transmit LPI state-machine does not move to TX_QUIET state. On detecting Lower-Power Idle on GMII Tx interface, QSGMII/SGMII_PCS goes to the TX_SLEEP state and remains in this state till MAC stops sending LPI. In this mode,QSGMII/SGMII_PCS merely sends the encoded LPI pattern to the serdes. This mode does not involve gating-off of any clocks to QSGMII/SGMII_PCS. In addition, the serdes transmitter is not disabled (PCS_tx_data_en_o signal remains high). MAC should ensure that it does not gate-off XGMII/GMII Tx clock to QSGMII/SGMII_PCS during this mode of operation.

QSGMII/SGMII_PCS_VR_MII_DIG_STS

21.4 Application Notes

21.4.1 Initializing the QSGMII/SGMII_PCS Controller

Complete the following steps to initialize the QSGMII/SGMII_PCS controller:
1. Switch on the power supply. Reset is asserted (pwr_on_rst_n=0).
2. Wait for the required amount of time depending on the PHY requirements.
3. De-assert reset (pwr_on_rst_n=1)
4. Wait till the 15th bit of SR_MII_CTRL Register is read as 0
5. (Optional). If you have "Enable Clause 37 Auto-Negotiation" parameter enabled, then follow the programming flow outlined in "Programming Guidelines for Clause 37 Auto-Negotiation"
6. If clauses 37, 72, or 73 are not enabled, wait for LINK_STS of SR_MII_STS Register to be set to 1 The QSGMII/SGMII_PCS core is now ready to transmit or receive data.

21.4.2 Switching to 1G and 10 or 100 Mbps SGMII Speed

In 1G mode, the QSGMII/SGMII_PCS-PHY interface works at 10-bit parallel data with the clock rate of 125 MHz. Only Lane 0 is functional. The serial lane works at the baud rate of 1.25 Gbps. The effective data transfer rate, considering the overhead of 8B/10B encoding or decoding, is 1 Gbps.
To switch between the 1G and 10G modes, program Bit 13 (SS13) of SR_PMA_CTRL1and SR_XS_PCS_CTRL1 Registers. When this bit is cleared to 1, QSGMII/SGMII_PCS operates in the 1000BASE-X (1G) mode. The output signal PCS_kx_kx4n_o is asserted when the QSGMII/SGMII_PCS works in this mode.
To switch from SGMII and 1000BASE-X mode and vice-versa, program PCS_MODE field of VR_MII_AN_CTRL register to 2'b10 or 2'b00 respectively.

Programming Sequence for Non-Synopsys PHY
To switch to 1G or KX mode when using non-Synopsys PHY, complete the following steps:
1. Write 4'b0001 to Bits[3:0] of SR_XS_PCS_CTRL2
2. Clear Bit 0 of VR_XS_PCS_XAUI_CTRL to 0. This bit controls the PCS_rxaui_mode_o output.
3. Set Bit 13 of SR_PMA_CTRL1 (only for Backplane Ethernet PCS configurations) or SR_XS_PCS_CTRL1 to 0. This bit controls the PCS_kx_kx4n_o output. This bit is inverted to drive the PCS_kx_kx4n_o output.
4. (Optional) If the SGMII mode is enabled, you can program Bit 13 and Bit 6 of the SR_MII_CTRL to set the SGMII speed as shown in following table.

Speed mode	SS6	SS13
1000 Mbps SGMII	1	0
100 Mbps SGMII	0	1
10 Mbps SGMII	0	0

5. Set Bit 11 of SR_XS_PCS_CTRL1 to 1 to power down QSGMII/SGMII_PCS.
6. Wait till Bits[4:2] of VR_XS_PCS_DIG_STS are set to any value other than 3'b100.
7. Clear Bit 11 of the SR_XS_PCS_CTRL1 to 0 to power up QSGMII/SGMII_PCS.

21.4.3 Programming Guidelines for QSGMII Mode

To switch to QSGMII mode, perform the following steps:
1. Clear Bit [13] of SR_XS_PCS_CTRL1 Register to 0.
2. Program bits [2:1] of VR_MII_AN_CTRL Register to 2'b11. This asserts 'xgxs_qsgmii_mode_o' port of QSGMII/SGMII_PCS.
3. Set Bit [11] of SR_MII_CTRL Register to 1 to power down QSGMII/SGMII_PCS.
4. Wait till Bits[4:2] of VR_MII_DIG_STS Register are set to any value other than 3'b100.
5. Clear Bit [11] of SR_MII_CTRL Register to 0 to power up QSGMII/SGMII_PCS.

21.4.4 Programming Guidelines for Clause 37 Auto-Negotiation

The Clause 37 auto-negotiation is enabled only when Bit 12 of the SR_MII_CTRL Register is set. The default value of this bit is 1. When this bit is enabled, the Clause 37 auto-negotiation is initiated on the following events:

- Power on Reset
- Soft Reset

The QSGMII/SGMII_PCS initiates the auto-negotiation on the following events:

- When the link partner requests auto-negotiation by transmitting configuration code groups.
- When the receive data path loses code group synchronization for more than 10 ms (in 1000BASE-X mode) or 1.6 ms (in SGMII mode).
- When an error condition is detected while receiving the /C/ or /I/ order sets.
- When the host or software requests auto-negotiation by setting Bit 9 in the SR_MII_CTRL Register.

The following list explains the auto-negotiation process:
1. The QSGMII/SGMII_PCS starts auto-negotiation by first transmitting the configuration words with all zeroes for 10 ms (1.6 ms for the SGMII interface).
2. The SR_MII_AN_ADV Register content is transmitted in the configuration words in the 1000BASE-X mode. In the SGMII mode, the values given in the following Table are transmitted in the configuration word. The auto-negotiation is complete when both link partners have exchanged their base pages.

Config_Reg Bit	1000BASE-X Mode	SGMII ModeValue When TX _CONFIG = 0 Value	SGMII ModeValue When TX _CONFIG = 1 Value
15	Next page support (NP)	0	Link UP or Link Down. If bit[0] of VR_MII_DIG_CTRL1 is 0, this bit is derived from Bit 4 (SGMII_LINK_STS) of the VR_MII_AN_CTRL. If bit[0] of VR_MII_DIG_CTRL1 is 1, this bit is derived from the input port 'PCS_sgmii_link_sts_i'
14	ACK	1	1
13	RF[1]	0	0

Config_Reg Bit	1000BASE-X Mode	SGMII ModeValue When TX _CONFIG = 0 Value	SGMII ModeValue When TX _CONFIG = 1 Value
12	RF[0]	0	FULL_DUPLEX If bit[0] of VR_MII_DIG_CTRL1 is 0, this bit is derived from Bit 5 (FD) of the SR_MII_AN_ADV. If bit[0] of VR_MII_DIG_CTRL1 is 1, this bit is derived from the input port 'PCS_sgmii_full_duplex_i'
11:10	Reserved	0	If bit[0] of VR_MII_DIG_CTRL1 is 0,the value of these bits is derived from Bit 13 (SS13) and Bit 6 (SS6) of the SR_MII_CTRL. If bit[0] of VR_MII_DIG_CTRL1 is 1, this bit is derived from the input port 'PCS_sgmii_link_speed_i[1:0]' ■ 10: 1000 Mbps ■ 01: 100 Mbps ■ 00: 10 Mbps
9	0 (Reserved)	0	0
8	PAUSE[1]	0	0
7	PAUSE[0]	0	0
6	HALF_DUPLEX	0	0
5	FULL_DUPLEX	0	0
4	0 (Reserved)	0	0
3	0 (Reserved)	0	0
2	0 (Reserved)	0	0
1	0 (Reserved)	0	0
0	0 (Reserved)	1	1

3. QSGMII/SGMII_PCS generates an interrupt on completion (sbd_intr_o) of auto-negotiation when Bit 0 of VR_MII_AN_CTRL Register is set to 1.
4. The auto-negotiation completion is indicated in the VR_MII_AN_INTR_STS Register.
5. In the MAC attached to the QSGMII/SGMII_PCS, the Transmit and Receive Flow Control mode is determined based on the capabilities of the partner (given in SR_MII_LP_BABL) and the half-duplex or full-duplex operating mode.
In SGMII auto-negotiation, the received link status such as speed, duplex mode is also given in the VR_MII_AN_INTR_STS Register.
When Clause 37 auto-negotiation is complete, QSGMII/SGMII_PCS automatically resolves the duplex mode by selecting the duplex mode of its link partner. If auto-negotiation is disabled, the QSGMII/SGMII_PCS selects the duplex mode defined in Bit 8 of SR_MII_CTRL Register.

21.4.4.1 SGMII Auto-Negotiation

Clause 37 auto-negotiation can be performed in the SGMII mode by programming various registers as follows:
1. In configurations with both 10G and 1G mode speed mode, switch QSGMII/SGMII_PCS to 1G speed mode by following the steps described in "Switching to 1G or KX Mode and 10 or 100 Mbps SGMII Speed"
2. Disable Clause 37 auto-negotiation by programming bit [12] (AN_ENABLE) of SR_MII_CTRL Register to 0 (in case it is already enabled).
4. Program various fields of VR_MII_AN_CTRL Register appropriately as follows:

- Program PCS_MODE to 2'b10
- Program TX_CONFIG to 1 (PHY side SGMII) or 0 (MAC side SGMII) based on your

requirement

- Program MII_AN_INTR_EN to 1, to enable auto-negotiation complete interrupt
- If TX_CONFIG is set to 1 and bit[0] of VR_MII_DIG_CTRL1 Register is set to 0, program SGMII_LINK_STS to indicate the link status to the MAC side SGMII.
- Program MII_CTRL to 0 or 1, as per your requirement.

5. If QSGMII/SGMII_PCS is configured as PHY-side SGMII in the previous step, you can program bit [0] of VR_MII_DIG_CTRL1 Register to 1, if you wish to use the values of the PCS_sgmii_link_sts_i input ports. PCS_sgmii_full_duplex_i and PCS_sgmii_link_speed_i as the transmitted configuration word.
6. If QSGMII/SGMII_PCS is configured as PHY-side SGMII and if bit[0] of VR_MII_DIG_CTRL1 Register is set to 0,

- Program SS13 and SS6 bits of SR_MII_CTRL Register to the required SGMII Speed
- Program bit [5] (FD) of SR_MII_AN_ADV to the desired mode. This step is mandatory even if you wish to leave the FD register bit to its default value.

7. If QSGMII/SGMII_PCS is configured as MAC-side SGMII in step 4, program bit[9] of VR_MII_DIG_CTRL1 Register to 1, for QSGMII/SGMII_PCS to automatically switch to the negotiated link-speed, after the completion of auto-negotiation.
8. Enable CL37 Auto-negotiation by programming bit[12] of the SR_MII_CTRL Register to 1.

21.4.4.2 QSGMII Auto-Negotiation

Clause 37 auto-negotiation can be independently performed for each of the 4 ports, when operating in QSGMII mode. QSGMII/SGMII_PCS has 4 separate MMDs (MII, MII_1, MII_2 and MII_3) to control (and to reflect the status) the auto-negotiation operation.

- MII MMD -> Port 0
- MII_1 MMD -> Port 1
- MII_2 MMD -> Port 2
- MII_3 MMD -> Port 3

After switching to QSGMII mode (as described in "Programming Guidelines for QSGMII Mode" follow these steps to enable auto-negotiation on a particular port (say port 2).
1. In Backplane Ethernet PCS configurations, program bit [12] (AN_EN) of SR AN MMD Control Register to 0 and bit [12] (CL37_BP) of VR XS or PCS MMD Digital Control1 Register to 1.
2. Disable Clause 37 auto-negotiation by programming bit [12] (AN_ENABLE) of SR MII_2 MMD Control Register to 0 (required only in case it is already enabled).
3. Program various fields of VR MII_2 MMD AN Control Register appropriately as follows:

- Program TX_CONFIG to 1 (PHY side QSGMII) or 0 (MAC side QSGMII) based on your requirement
- Program MII_AN_INTR_EN to 1, to enable auto-negotiation complete interrupt (optional step)
- Program QSGMII_LINK_STS suitably to indicate the link status to the MAC side QSGMII, if TX_CONFIG is set to 1 (QSGMII-PHY) and bit [0] of VR MII_2 MMD Digital Control 1 Register is set to 0.
- Program MII_CTRL to 0 or 1, as per your requirement.

4. If QSGMII/SGMII_PCS is configured as PHY-side QSGMII in the previous step, you can program bit [0] of VR MII_2 MMD Digital Control 1 Register to 1, if you wish to use the values of the PCS_qsgmii_link_sts_p2_i,PCS_qsgmii_full_duplex_p2_i andPCS_qsgmii_link_speed_p2_i input ports as the transmitted configuration word.
5. If QSGMII/SGMII_PCS is configured as PHY-side QSGMII and if bit [0] of VR MII_2 MMD Digital Control 1 Register is set to 0,

- Program SS13 and SS6 bits of SR MII_2 MMD Control Register to the required Speed Mode.
- Program bit [5] (FD) of SR MII_2 MMD AN Advertisement Register to the desired mode

These values get advertised in the configuration word transmitted to the link partner.
6. If QSGMII/SGMII_PCS is configured as MAC-side QSGMII in step 3, program bit [9] of VR MII_2 MMD Digital Control 1 Register to 1, so that QSGMII/SGMII_PCS automatically switches to the negotiated link-speed, after the completion of auto-negotiation. (optional step)
7. Enable CL37 Auto-negotiation, by programming bit [12] of the SR MII_2 MMD Control Register to 1. Completion of auto-negotiation is indicated by bit [0] of VR MII_2 MMD AN Interrupt Status Register. If step 6 has not been performed, program SS13 and SS6 bits of SR MII_2 MMD Control Register suitably, based on the outcome of auto-negotiation (CL37_ANSGM_STS field of VR MII_2 MMD AN Interrupt Status Register).

21.4.5 Programming Guidelines for Energy Efficient Ethernet

To enable the Energy Efficient Ethernet (EEE) feature, the host should complete the following:
1. Check if QSGMII/SGMII_PCS supports the EEE feature by reading the SR_XS_PCS_EEE_ABL register. If Bit 4 of this register is set, it indicates that QSGMII/SGMII_PCS supports EEE in1000BASE-X mode.
2. Program various timers used in the EEE mode depending on the clk_eee_i clock frequency:
For 1000BASEX-Only PCS configurations, program the following registers:

- VR_MII_EEE_MCTRL0
- VR_MII_EEE_TXTIMER
- VR_MII_EEE_RXTIMER

3. Enable the EEE feature on the Tx path by setting Bit 0 of VR_XS_PCS_EEE_MCTRL0 Register. Similarly, enable the EEE feature on the Rx path by setting Bit 1 of VR_XS_PCS_EEE_MCTRL0 Register. When these bits are set, QSGMII/SGMII_PCS enables the encoding or decoding of the LPI code groups and also enables the EEE Tx and Rx controllers.

Chapter 22 MULTI-PHY

22.1 Overview

MULTI-PHY IP support physical layer of multiple application including USB3.0 Super Speed (5GT/s), PCIE Gen1/Gen2(2.5GT/s and 5GT/s), SATA Gen1/Gen2/Gen3 (1.5GT/3GT/6GT) and QSGMII(1.25GT/5GT).

The key features of the MULTI-PHY core include:

- Compatible with PCIE/USB3/SATA/QSGMII base Specification
- Fully compatible with PIPE3.1 interface specification
- Data rate configurable to 1.25G/1.5G/2.5G/3G/5G/6G for different application
- Support 16-bit or 32-bit parallel interface when encode/decode enabled
- Support 20-bit parallel interface when encode/decode bypassed
- Support flexible reference clock frequency
- Support 100MHz differential reference clock input or output (optional with SSC) in PCIE Mode
- Support Spread-Spectrum clock (SSC) generation and receiving from -5000ppm to 0ppm
- Support programmable transmit amplitude and De-emphasis
- Support TX detect RX function in PCIE and USB3.0 Mode
- Support Beacon signal generation and detection in PCIE Mode
- Support Low Frequency Periodic Signaling (LFPS) generation and detection in USB3.0 Mode
- Support COMWAKE, COMINIT and COMRESET (OOB) generation and detection in SATA Mode
- Support L1 sub-state power management
- Support RX low latency mode in SATA operation mode
- Support Loopback BERT and Multiple Pattern BIST Mode

22.2 Function Description

22.2.1 Block Diagram and Description

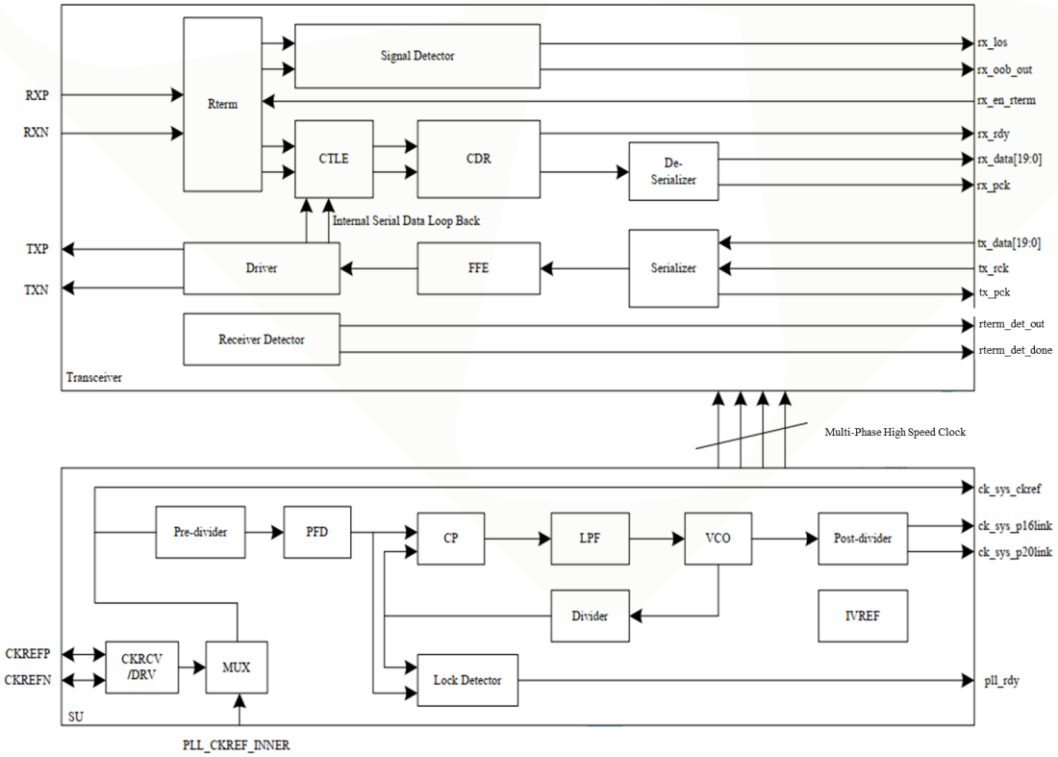

Fig. 22-1 PMA Block Diagram of Multi-PHY

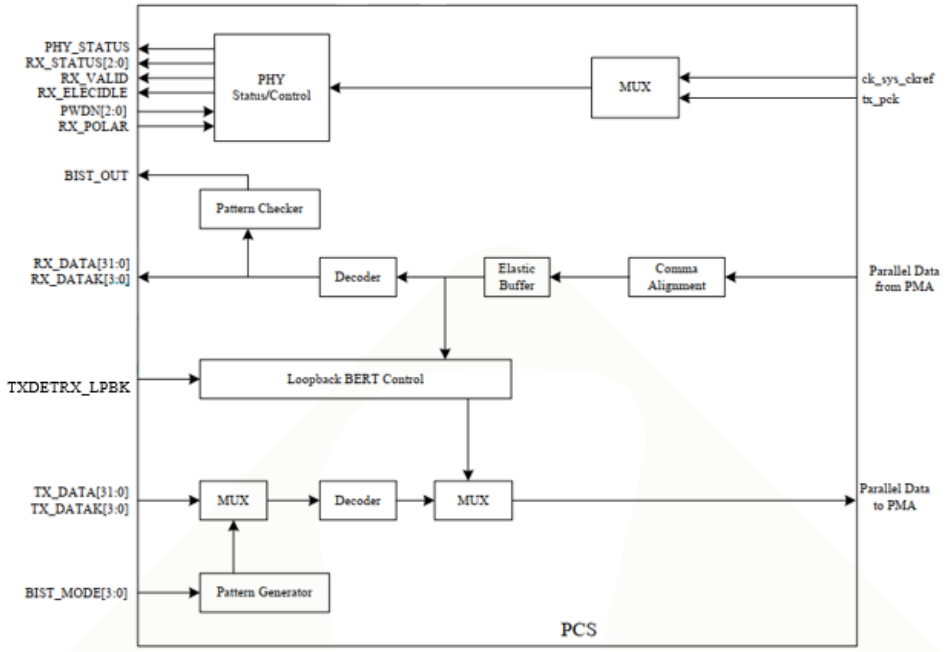

Fig. 22-2 PCS Block Diagram of Multi-PHY

Multi-PHY includes two major blocks, PMA and PCS. PMA is an analog macro to perform serialto parallel and parallel to serial conversion. PMA includes three blocks, Transmitter, Receiver and SU(includes PLL, IVREF, etc.). PCS is a digital synthesis macro to perform PHY coding sub-layer function like 8bit/10bit code and decode, elastic buffer, comma alignment and BERT loopback, it also includes a register interface to access internal control registers with APB interface.

22.2.2 SHARED UNIT (SU)

PLL takes reference clock input from CKREFP/N and PLL_CKREF_INNER, to generate a high speed clock for data transmission and clock data recovery. The high speed clock generated by PLL could be SSC (spectrum spread clock) modulated if SSC mode is turned on. When SSC is enabled, the PHY is transmitting spread-spectrum serial data with frequency offset in 31.5KHz periodically.

IVREF includes a voltage and current reference generator, which comprises a Bandgap Reference and a Voltage Regulator. Reference voltage and current are generated for internal circuit usage. IVREF block is always on as long as IP power up, it will consume ~170uA static current all the time.

CKDRV is an input/output differential clock buffer, when it is used as input, it can receive a wide range differential reference clock. When used as output, CKDRV can drive a 100MHz differential clock for PCIE host application.

22.2.3 TRANSMITTER (TX)

The Serializer block converts parallel data from PHY PCS to high speed serial data by using high speed clock generated by PLL. A feed forward equalizer (FFE) is implemented to compensate channel ISI.

Driver will convert the serial data to differential signal on TXP/TXM, also the driver will transmit Beacon Signal (PCIE2.0), OOB(SATA) or LFPS(USB3.0) signaling. The differential output amplitude and Deemphasis level can be programmed via setting PIPE3 control pins TX_SWING, TX_DEEMPH[2:0] and TX_MARGIN[2:0].

The receiver detector will be used to detect the far-end receiver present or not.

22.2.4 RECEIVER (RX)

The CTLE (Continuous Time Linear Equalizer) is used to compensate channel loss and cancel ISI of the input signals by boosting high frequency gain. The CTLE can be set to adaptive

mode or manual setting mode.
The CDR (Clock and Data Recover) tracks input data stream and generate recovered clock for data deserializer. De-Serializer converts incoming serial bit stream recovered by CDR into a synchronized parallel data bus and forward it to PHY PCS block.
The Signal Detector detects OOB/LFPS on the RX input pair.

22.2.5 PCS

PCS module is a pure digital synthesis module, it works as an interface between PMA and MAC, it accomplishes functions including comma alignment, 8bit/10bit code/decode, elastic buffer, power control and IP testing. This module also includes a APB interface for accessing PHY control registers. PCS is fully compatible with the PIPE3 interface of "PHY interface for PCI express and USB3.0 architecture by intel".

22.3 Register Description

22.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

22.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
Multi-PHY_Register001	0x0000	W	0x00000000	Register001
Multi-PHY_Register002	0x0004	W	0x00000080	Register002

7:4	RW	0x8	TX_RTERM TX output resister adjust signal by step about 1ohm 4'b0000: 60 4'b1000: 50 4'b1111: 44 default: not supported
3:0	RW	0x8	RX_RTERM RX input resister adjust signal by step about 1ohm 4'b0000: 60 4'b1000: 50 4'b1111: 43.5 default: not supported

Multi-PHY_Register008

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	BYPS_CDR_EN 1'b0: CDR recovered clock will be operation while PLL is locked and CDR is operation, and rx_cdr_trim[7] only can be set to 1'b0 using reference clock for rx_rdy generation. 1'b1: CDR recovered clock will be operation while PLL is locked, and rx_cdr_trim[7] can be set to 1'b1 using recovered clock for rx_rdy generation.
6	RW	0x0	TX_SWING Reserved

Bit	Attr	Reset Value	Description
5	RW	0x0	NEAR_END_LPK_ENABLE PHY Near end loop back enable in BIST mode
4	RW	0x0	SSC_EN In U3 and SATA mode, this bit= 1, set SSC on In PCIE mode, this bit=0 set SSC off
3:0	RW	0x8	TX_SWING_COM TX boost level adjust signal 3'b000: minimum 3'b111: maximum default: not supported

Multi-PHY_Register009

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	BYPS_CDR_FL_EN 1'b0: rx_rdy is pulse singal to indicate CDR start to clock and data recoved from input serial data. 1'b1: rx_rdy is not controlled by PMA/PCS interface signal "cdr_fl_en".
6	RW	0x1	BYPS_CPATH_LIMIT 1'b0: CDR CPATH will be reset while CDR CPATH is overflow. 1'b1: CDR CPATH will be locked to MAX frequency offset while CDR CPATH is overflow.
5	RW	0x1	BYPS_CPATH_OVERFLOW 1'b0: CDR CPATH is controlled by CDR CPATH overflow. 1'b1: CDR CPATH is not controlled by CDR CPATH overflow
4	RW	0x0	BYPS_FGAIN_ADPT 1'b0: CDR CPATH gain is X2 while CDR recover frequency while rx_cdr_trim[6]=0. 1'b1: CDR CPATH gain is X1 while CDR recover frequency while rx_cdr_trim[6]=0.
3	RW	0x0	BYPS_PWON_RX_BUF 1'b0: CTLE and LOS detector is controlled by PWDN[1:0]. 1'b1: CTLE and LOS detector is operation while reference clock and RX termination are present.
2	RW	0x0	BYPS_PWON_RX_CDR 1'b0: CDR is controlled by PWDN[1:0]. 1'b1: CDR is operation after PLL is locked while reference clock and RX termination are present.
1	RW	0x0	BYPS_PWON_TX_BUF 1'b0: TX Driver is controlled by PWDN[1:0]. 1'b1: TX Driver is operation after PLL is locked while reference clock is present and TX detect RX is finished.
0	RW	0x0	BYPS_RESETN 1'b0: PMA is reset by RSTN. 1'b1: PMA is not controlled by RSTN.

Multi-PHY_Register011

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description

22.4 Interface Description
22.5 Application Notes
22.5.1 Operation Mode Support
The following mode are supported for IP operation, IP configuration other than this list are not supported

Table 22-1 PHY operation mode

QSGMII MODE	PHY_MODE	RATE	BUS_WIDTH	PHY Operation Mode
0	00	00	00	PCIE Gen1, 32bit, PCLK=62.5M
			01	PCIE Gen1, 16bit, PCLK=125M
		01	00	PCIE Gen2, 32bit, PCLK=125M
			01	PCIE Gen2, 16bit, PCLK=250M
	01	00	00	USB3.0, 32bit, PCLK=125M
	01	00	01	USB3.0, 16bit, PCLK=250M
	10	00	00	SATA Gen1, 32bit, PCLK=37.5M
			01	SATA Gen1, 16bit, PCLK=75M
		01	00	SATA Gen2, 32bit, PCLK=75M
			01	SATA Gen2, 16bit, PCLK=150M
		10	00	SATA Gen3, 32bit, PCLK=150M
			01	SATA Gen3, 16bit, PCLK=300M
1	00	00	01	SGMII, 20bit, PCLK=62.5M
		10	01	QSGMII, 20bit, PCLK=125M

- QSGMII MODE is configured by GRF_PIPE_CON3[15]
- PHY MODE is configured by GRF_PIPE_CON2[1] first to enable the selection, then configured by GRF_PIPE_CON0[3:2]
- RATE is configured by GRF_PIPE_CON0[5:4]
- BUS_WIDTH is configured by GRF_PIPE_CON0[1:0]

22.5.2 POWER DOWN MODE
Power down control signals to individual analog modules are generated based on PWDN[1:0]

setting from PIPE inputs as shown in table2/3/4. An override function is provided for debug purpose, see register list. (√ – active; ×– power down)

Table 22-2 PCIE power down mode

PWDN[1:0]	TX_ELECIDLE	TX_Buffer	RX_Buffer	CDR	TX_PLL
00	--	√	√	√	√
01	0(illegal)	√	√	√	√
	1	×	√	√	√
10	0(illegal)	√	×	×	√
	1	×	×	×	√
11	0	√	×	×	×
	1	×	×	×	×

In PCIE mode, power for IVREF and PCIE idle detector are always on, while power for LFPS, 1.5G SATA idle and 3G/6G SATA idle detectors are always off, and power of Rx buffer is off when RX_STANDBY is high.

Note: If TX_ELECIDLE and TX_COMPLIANCE are both asserted, all powers are off.

Table 22-3 USB3 power down mode

PWDN[1:0]	TX_ELECIDLE	TX_Buffer	RX_Buffer	CDR	TX_PLL
00	--	√	√	√	√
01	0	√	√	×	√
	1	√	√	×	√
10	0	√	√	×	√
	1	√	√	×	√
11	0	√	√	×	×
	1	×	√	×	×

In USB3.0 mode, power for IVREF and LFPS detector are always on, while power for PCIE idle, 1.5G SATA idle and 3G/6G SATA idle detectors are always off, and power of LFPS detector and power of Rx buffer are turned off if termination is not on.

Table 22-4 SATA power down mode

PWDN[1:0]	TX_ELECIDLE	TX_Buffer	RX_Buffer	CDR	TX_PLL
00	--	√	√	√	√
01	0(illegal)	√	×	√	√
	1	×	×	√	√
11	0	√	×	×	√
	1	×	×	×	√

In SATA mode, power for IVREF and 1.5G SATA idle detector are always on, while power for LFPS and PCIE idle detectors are always off, and power of Rx buffer is off when RX_STANDBY is high.

Chapter 23 AXI_SPLIT

23.1 AXI_SPLIT

AXI_SPLIT is a bridge between main bus interconnect and DDR controller to covert standard AXI protocol to specific format that conforms to the AXI interface of the DDR controller. It is designed to support the applications that two different capacity of memory particles are used in 32-bit memory interface or 16-bit memory interface.

AXI_SPLIT supports the following features:

- Support bypass mode
- Support one internal 12-bit wide and 32-location deep FIFO for storing AXI read command
- Support split address configurable by DDRGRF
- Support memory system made up of different capacity of memory particles
- Support the high or low 16 bits of 32-bit memory interface, high or low 8 bits of 16-bit memory interface configurable if the input address is above the split address

23.2 Block Diagram

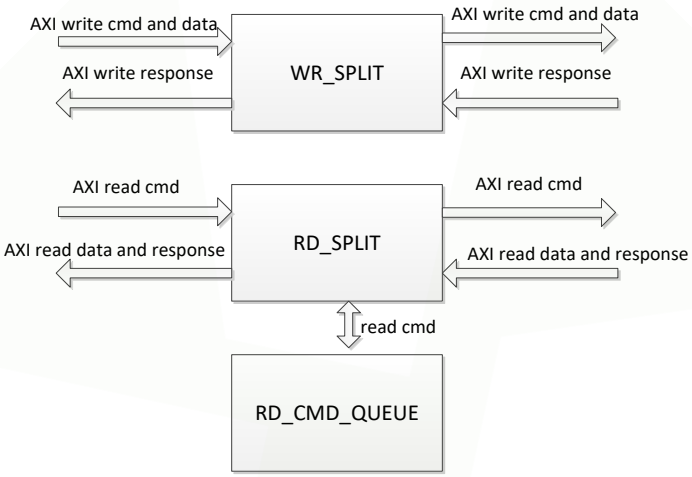

Fig.23-1 AXI_SPLIT Block Diagram

AXI_SPLIT comprises with:

- WR_SPLIT: AXI write split
- RD_SPLIT: AXI read split
- RD_CMD_QUEUE: AXI read command queue

The WR_SPLIT and RD_SPLIT are used to covert standard AXI protocol to specific format. In order to support read outstanding transactions, the read commands extracted from standard AXI are pushed into RD_CMD_QUEUE and pop from the queue if read response return.

23.3 Register Description

This section describes the control/status registers of the design. There is no configuration port in AXI_SPLIT, it is configured by DDR_GRF. Please refer to DDR_GRF or the following register summary.

23.3.1 Registers Summary

Name	Offset	Size	Reset Value	Description
AXI_SPLIT_SPLIT_CTRL	0x0000	W	0x00000110	Split Control Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

23.3.2 Detail Register Description

AXI_SPLIT_SPLIT_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10:9	RW	0x0	SPMODE 2'b00: DDR controller and PHY are configured as 32 bits mode. Low 16 bits are valid if access address is above split address. 2'b01: DDR controller and PHY are configured as 32 bits mode. High 16 bits are valid if access address is above split address. 2'b10: DDR controller and PHY are configured as 16 bits mode. Low 8 bits are valid if access address is above split address. 2'b11: DDR controller and PHY are configured as 16 bits mode. High 8 bits are valid if access address is above split address.
8	RW	0x0	BYPASS 1'b0: Not bypass 1'b1: Bypass
7:0	RW	0x00	SPADDR Split address high 8 bits. For example, if SPADDR=0x10, then the split address is 0x10000000. The AXI_SPLIT will be bypassed if read or write DDR below split address, otherwise a standard AXI burst will be split.

23.4 Application Notes

The AXI_SPLIT begins to work if BYPASS=0 and write or read DDR address are above SPADDR, otherwise it will be bypassed. Following figures are four modes that it supports. In order to illustrate how the AXI_SPLIT works, it assumes that total range of DDR is from 0x00000000 to 0x2fffffff and split address is 0x20000000.

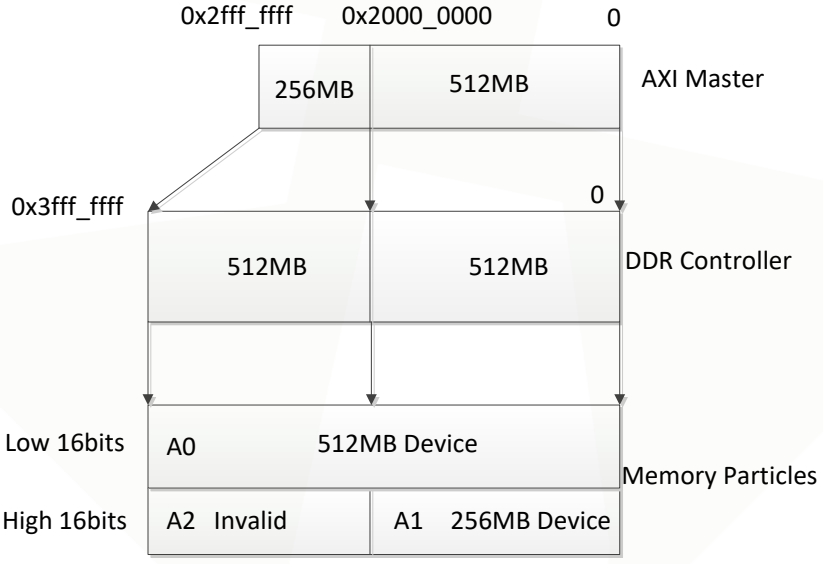

Fig.23-2 Mode 0

Mode 0 shows that an AXI Master can access DDR from address 0x00000000 to 0x2fff_ffff. The AXI_SPLIT will convert input write or read DDR address above split address if BYPASS is 0, and then output converted address to the DDR controller. As a result, area A2 is invalid and will not be accessed. This mode is only valid if the DDR controller and PHY are configured as 32-bit mode.

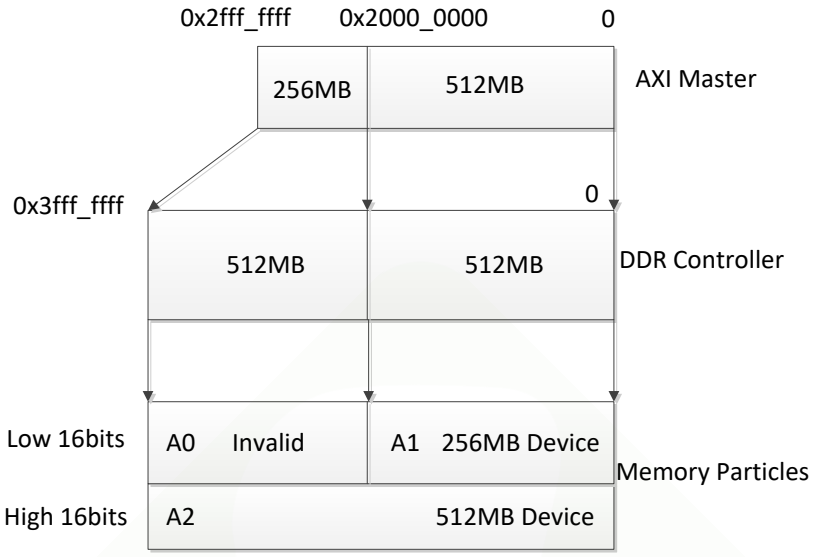

Fig.23-3 Mode 1

Mode 1 is similar as mode 0 except that high 16 bits are valid if access address is above split address. As a result, area A0 is invalid and will not be accessed.

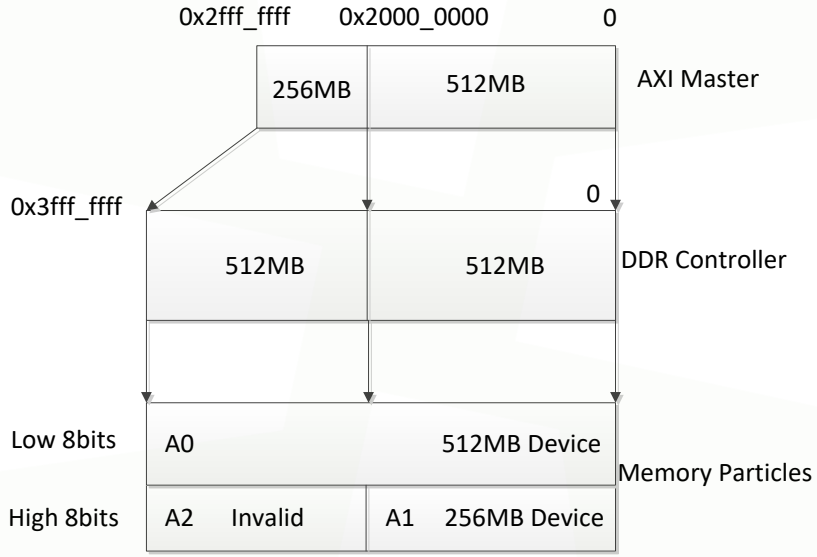

Fig.23-4 Mode 2

Mode 2 is only valid if the DDR controller and PHY are configured as 16-bit mode. As a result, area A2 is invalid and will not be accessed.

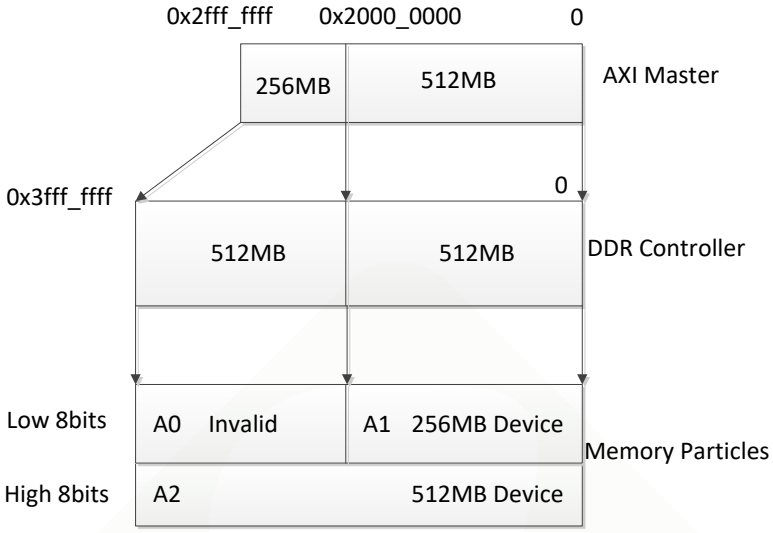

Fig.23-5 Mode 3

Mode 3 is similar as mode 2 except that high 8 bits are valid if access address is above split address. As a result, area A0 is invalid and will not be accessed.

Chapter 24 CAN

24.1 Overview

CAN (Controller Area Network) bus is a robust vehicle bus standard designed to allow microcontrollers and devices to communicate with each other in applications without a host computer. It is a message-based protocol, designed originally for multiplex electrical wiring within automobiles to save on copper, but is also used in many other contexts.

CAN controller supports the following features:

- Support CAN 2.0B protocol
- Support 32-bit APB bus
- Support classical and can-fd transmit or receive standard frame
- Support classical and can-fd transmit or receive extended frame
- Support transmit or receive data frame, remote frame, overload frame, error frame and frame interval
- Support transmit or receive error count
- Support acceptance filtering
- Support bit error, bit stuffing error, form error, ack error and crc error
- Support 7 types of interrupt and all interrupt can be masked
- Support CAN controller status query
- Support capture the bit position of arbitration section where the arbitration was lost
- Support error code check
- Support self test mode
- Support single sample and three sample configurable
- Support SJW(reSynchronization Jump Width) configurable
- Support BRP(system prescaler coefficient) configurable
- Support bit timing configurable
- Support loop-back mode for self-test operation
- Support silent mode for debug
- Support receive self-transmit data mode(rxstx_mode)
- Support TX data and RX data order select
- Support RX data cover mode
- Support auto retransmission mode
- Support auto bus on after bus-off state
- Support space_rx_mode
- Support transmitter delay compensation and SSP position configurable
- Support sleep mode
- Support timestamp
- Support transmit event FIFO
- Support 2 transmit buffers
- Support receive buffer/FIFO mode
- Support protocol exception event
- Support DMA

24.2 Function Description

The features listed below which may or may not be present in actual product, may be subject to the third party licensing requirements. Please contact Rockchip for actual product feature configurations and licensing requirements.

24.2.1 Block Diagram

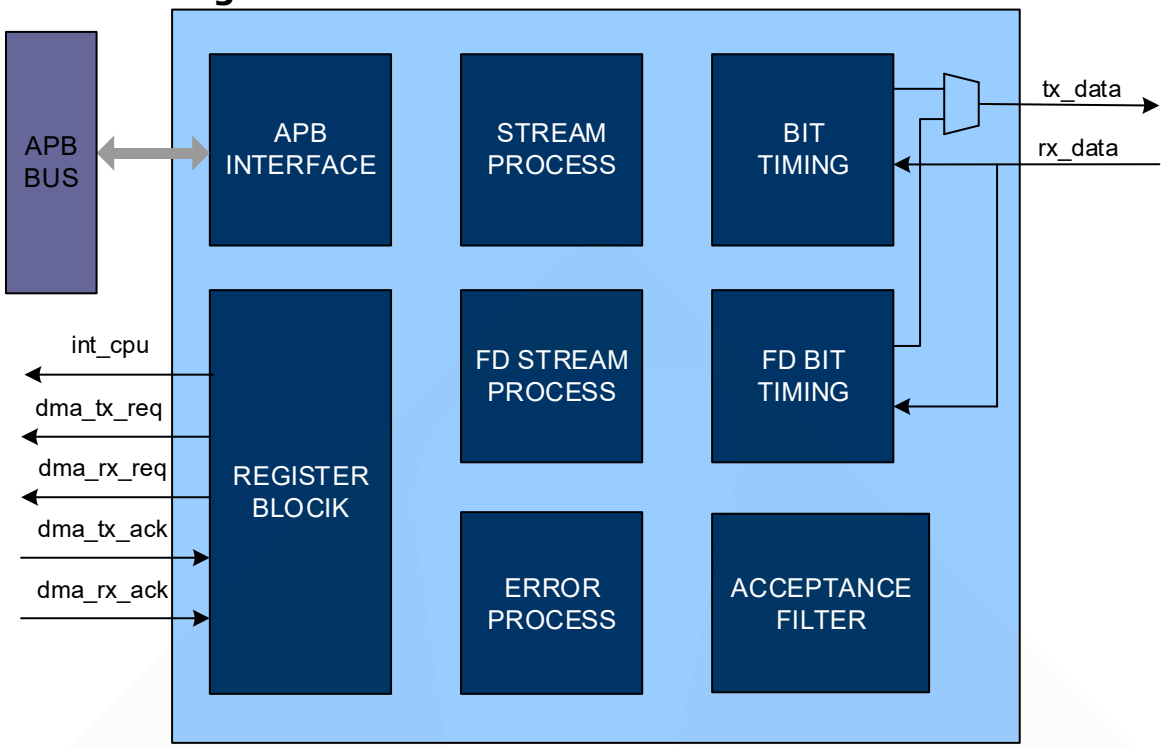

Fig.24-1 CAN Controller Block Diagram

This version of CAN controller includes the previous version of CAN logic in compliance with old software application and also includes new CANFD logic which support transmitting and receiving both CAN and CANFD frame.

24.2.2 ACCEPTANCE FILTER

The acceptance filter performs filtering using the acceptance ID register and the ID mask register. The acceptance filter uses multiple-time filtering. It includes the old version receiving filter and five addition ID filters. Each ID filter pair has a Filter Mask register and a Filter ID register. Each filter pair is controlled by corresponding FILTER CTRL bit in AFR register. For each pair using ID register and ID mask register(controlled by acceptance filter register)sampling all the bits of the ID, it is compared with the ID register. It is not a comparison every time a bit is sampled. And don't check the bit in the ID mask register that is 1. Once all the ID bits have passed the filtering, the controller considers the frame data as the desired ID, thereby performing the next operation.

24.2.3 BIT TIMING

24.2.3.1 Bit Timing Logic

The CAN FD protocol defines two bit rates, the first for the ARBITRATION-PHASE with a longer bit time and the second for the data phase with the same or with a shorter bit time. The definition for the first bit rate is the same as for the NOMINAL BIT RATE and the NOMINAL BIT TIME in the CAN protocol specification. The definition for the second bit rate, the DATA BIT RATE WITH the DATA BIT TIME, requires a separate configuration register set.

The bit timing logic controls the sampling point position through the buffer bits in the timing register to ensure the accuracy of the data sampling. The bit timing logic receives the clock frequency division signal for identification, sets the bus timing parameters, establishes synchronization parameters, and adjusts the bus transmission rate. At the same time, the bus is monitored and the message to be sent is transmitted to the bus at the set timing.

According to the provisions of the CAN protocol: the CAN bus is always at a high level when no message is sent, and the continuous recessive bit is monitored on the bus. At this time, the bus is in an idle state, and the arbitration priority is low, ready to receive data at any time. When the bus detects a transition from a recessive bit to a dominant bit, it is proved that the frame start bit starts transmitting, and the bus performs a hard synchronization in the bit start sync segment. Then, in the process of receiving the message, once the edge of the transition close to the sampling point is detected and the

edge of the edge and the synchronization segment have a phase error lower than the synchronization width (SJW is taken when the value exceeds SJW), the controller executes once resynchronization, resynchronization can be performed multiple times during one data transmission.

24.2.3.2 Bit Timing Definition

The transmission time of each bit is divided into 4 parts:

$$t_{nbt} = t_{sync\_seg} + t_{prop\_seg} + t_{phase\_seg1} + t_{phase\_seg2}$$

t_{sync_seg}, t_{prop_seg}, t_{phase_seg1} and t_{phase_seg2} are integer multiples of the unit time(t_{sclk}), and this unit time is a specific multiple of the system clock, which is determined by the division factor BRP in the bus timing register: 1. The counter is obtained by the BRP operation; 2. The system clock clk is counted by the counter; 3. When the limit is reached, a clock with a period of t_{sclk} is generated.

In the system design, considering the cyclical occurrence of each time period, a state machine with three states is used in the bit timing design. The three states correspond to the sync segment(sync_seg) and the phase buffer segment 1 (phase_seg1=phase_seg1+prog_seg) and the phase buffer segment 2 (phase_seg2), respectively. Where PHASE_SEG1 range: 1~16; PHASE_SEG2 range: 1~8; BRP range: 1~64.

$$t_{sync\_seg} = 1 \times t_{sclk}$$

$$t_{prop\_seg} + t_{phase\_seg1} = t_{sclk} \times (8 \times TSEG1.3 + 4 \times TSEG1.2 + 2 \times TSEG1.1 + TSEG1.0 + 1)$$

$$t_{phase\_seg2} = t_{sclk} \times (4 \times TSEG2.2 + 2 \times TSEG2.1 + TSEG1.0 + 1)$$

Define a counter to count t_{sclk}. When the count reaches the TSEG1, TSEG2 defined in the bus timing register and the length of the synchronization segment defined in the design, the system will generate the corresponding transition conditions: go_seg1, go_seg2, go_sync. By judging these transition conditions, the control state machine cycles through the above three states.

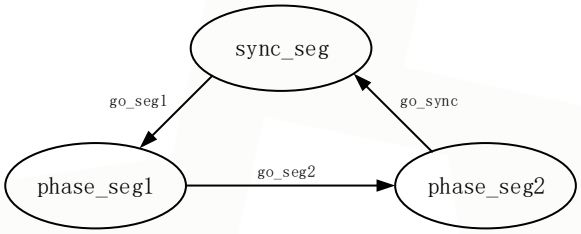

Fig.24-2 Bit timing FSM

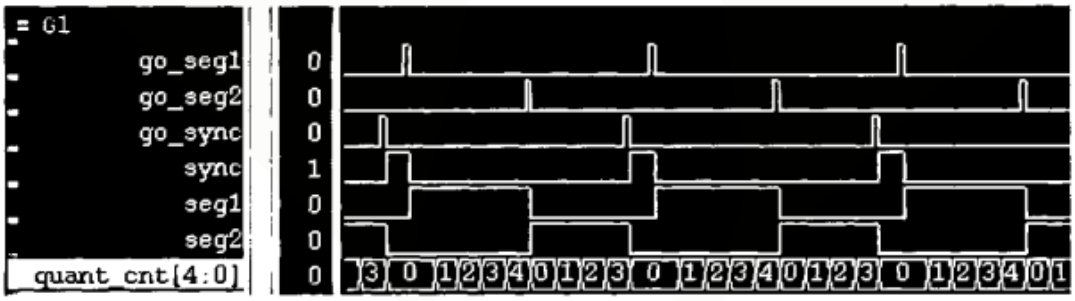

Fig.24-3 Bit timing waveform diagram

24.2.3.3 Bit time transition

The first part of a CAN FD frame, until the BRS bit, is transmitted with the NOMINAL BIT RATE. The bit rate is switched if the BRS bit is recessive, until the CRC DELIMITER is reached or until the CAN FD controller sees an error condition that results in the starting of an ERROR FRAME. CAN FD ERROR FRAMES, as well as ACK FIELD, END OF FRAME, OVERLOAD FRAMES, and all frames in CAN format are transmitted with the NOMINAL BIT RATE.

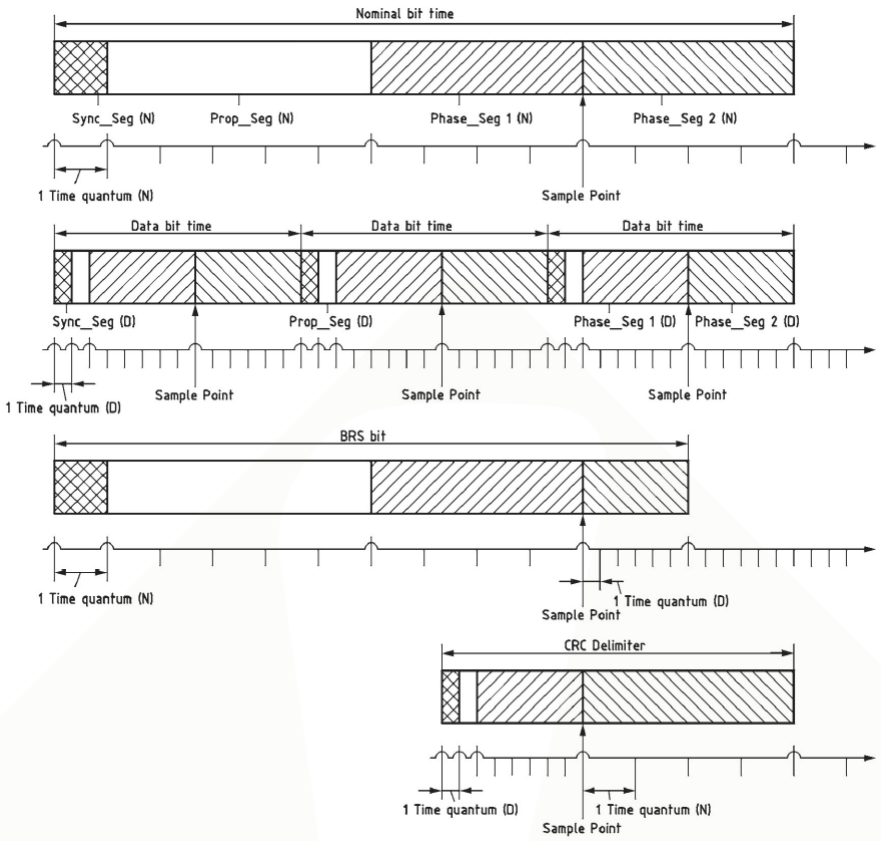

Fig.24-4 CANFD Frame Bit Time

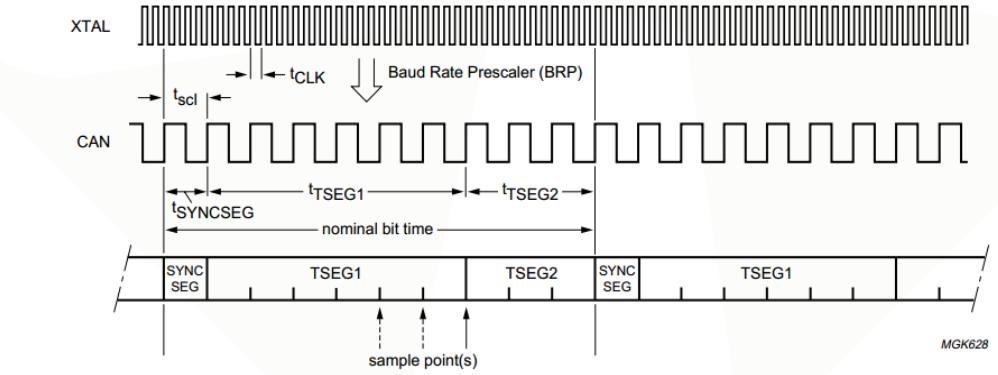
24.2.3.4 Sampling Point and Sending Point

Sampling Point: According to the agreement, the sample point sample_point should be between phase_seg1 and phase_seg2. It is designed to be in the position of phase_seg2 synchronization. The sampling pulse width is defined as one system clock cycle. Considering the accuracy of sampling, you can use the method of taking three samples to take the mean. The interval between each sample point is one t_{sclk}.



Possible values are BRP = 000001, TSEG1 = 0101 and TSEG2 = 010.

Fig.24-5 Three sampling diagram

Sending Point: The location of the transmission point(tx_point) should be at the beginning of each bit time according to the protocol, and it is designed to synchronize it with the go_sync signal. In addition, if it is in sync or resynchronize, tx_point will be valid immediately.

24.2.3.5 Bit Synchronization

With the synchronization method, one or more nodes that satisfy the synchronization condition align their synchronization segments with the transmission data on the bus at a

specific time. Synchronization occurs on the 1-to-0 transition edge in order to control the distance from the transition edge to the sample point. Two synchronization methods are defined in the CAN bus communication protocol: hard synchronization and resynchronization.

Hard_sync: All nodes must be synchronized to the leading edge of the starting frame of the node that first started transmitting the message. At the beginning of each frame of data, a synchronization action is taken between the nodes.

Hard synchronization implementation method: determine whether the bus state meets the frame start condition specified in the protocol, and the node is not in the state of the data to be transmitted. At this time, a hard synchronization flag signal hard_sync is generated, and the pulse width is a system clock; The hard_sync entry is added to the control condition of the go_seg1 signal, and go_seg1 is valid immediately when the hard_sync signal is '1'. Therefore, once the hard synchronization condition is met, the system enters the phase_seg1 segment, thereby achieving synchronization.

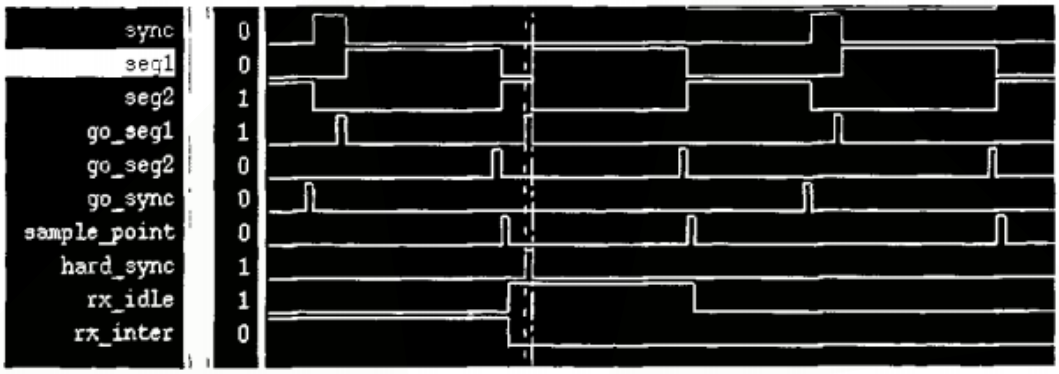


Fig.24-6 Hard_sync waveform diagram

Resynchronization: In addition to generating hard synchronization at the beginning of each frame of data, the CAN bus communication protocol also specifies the transmission of data for each frame. When the timing coordination between the nodes is not ideal, it will be resynchronized, so that the cooperation between the nodes is in a good state.

For the receiver, the bus changes it received should occur in the sync segment. Once the receiver's status violates this rule, the receiver will perform a resynchronization.

Two situations that require resynchronization:

1. The jump of the bus value '1' to '0' occurs between the sync segment and the sample point, which is a delay jump;

2. The jump of the bus value '1' to '0' occurs between the sample point and the sync segment, which is an early jump.

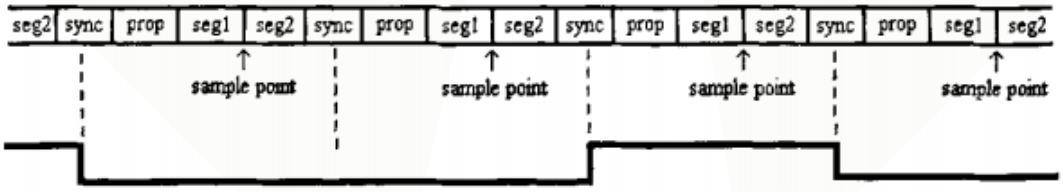

Fig.24-7 Resynchronization

Resynchronization method:

1. Condition for resynchronization: the receiver is in a mode of receiving data (not inter-frame space or bus idle), and a resynchronization flag signal ‘resync’ is generated when a jump of the bus value '1' to '0' occurs;

2. According to the position of the resynchronization flag signal, it is determined that the abnormal jump is a delay jump or an early jump;

3. Counting the delay or the length of the advance by the counter;

4. In this bit, phase_seg1 is added with a delay time or phase_seg2 is subtracted from the advance time to obtain a new phase buffer time for the bit, thereby achieving synchronization.

24.2.3.6 Transmitter Delay Compensation

During the data phase of a CAN FD transmission, only one node is transmitting; all others are receiving. Therefore, the propagation delay does not limit the maximum data

rate.
When transmitting via pin, TXCAN, the CAN FD Controller module receives the transmitted data from its local CAN transceiver via pin, RXCAN. The received data are delayed by the CAN
transceiver's loop delay. In case this delay is greater than 1 + DTSEG1, a bit error will be detected.

In order to enable a data phase bit time that is shorter than the transceiver loop delay, the
Transmitter Delay Compensation (TDC) is implemented. Instead of sampling after DTSEG1, a
Secondary Sample Point (SSP) is calculated and used for sampling during the data phase of a
CAN FD message.

Fig. 1-8 illustrates how the transceiver loop delay is measured and Equation SSP = TDCV + TDCO shows how the SSP is calculated.

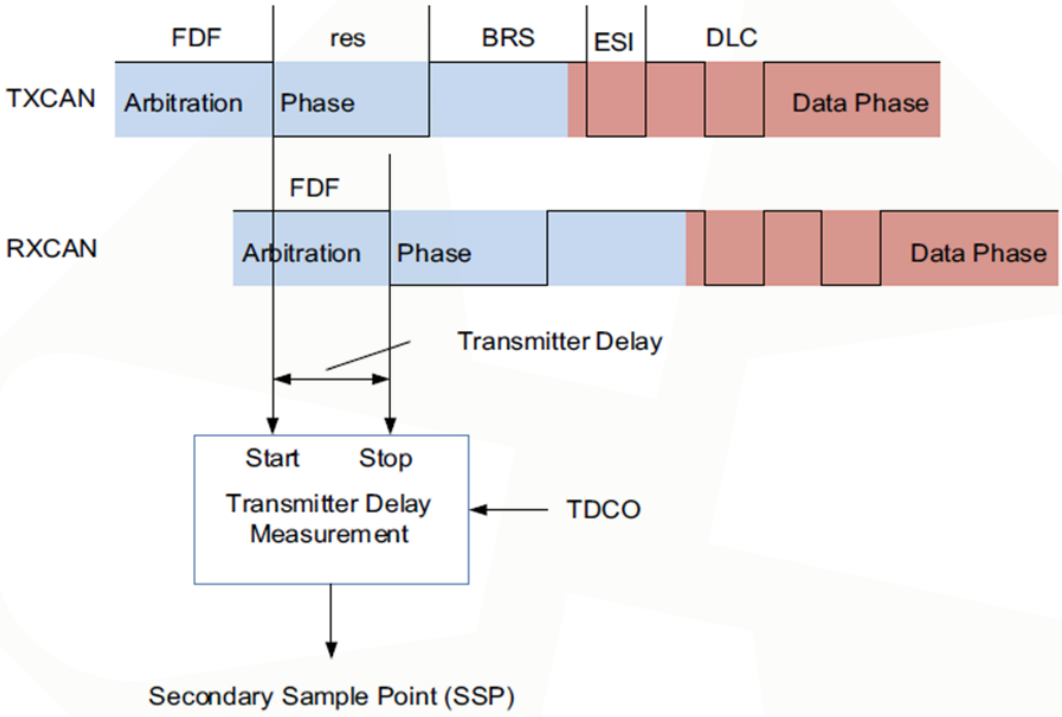

Fig.24-8 Measurement of Secondary Sample Point

24.2.4 STREAM PROCESS

24.2.4.1 Data Buffering

The data cache includes two parts: a transmit buffer and a receive buffer. The data to be sent on the CAN bus is loaded into the buffer area. This buffer area is called the "transmission buffer"; The data received from the CAN bus is also stored in the buffer area, which is called the "receiver buffer". The size of the buffer is 13 bytes, including 1 byte frame information, 2 to 4 byte identifiers (standard or extended frame), and 8 bytes of data.

The CPU configures the transmission of the data information (frame information, identification code, data), and then enable the transmit bit. The transmit data information is spliced into a parallel complete data to be transmitted (including the CRC check code) according to the current frame information and stored in transmission buffer. Stream process unit wait for the appropriate time to send data to the bit timing unit.

The received message is placed in the receiving buffer. After receiving, the receiving completion interrupt will be generated. After receiving the interrupt, the CPU will read the data in the receiving buffer and clear the receiving buffer, and STATE[0] will be 0. If the CPU does not read in time, STATE[1] will remain at 1. If a new message is received at this time,

overflow will occur and not respond with ack by default.

In new CANFD design, there is another independent transmit buffer which has another corresponding transmit request bit. Besides, there is a receive FIFO can be configured to use. Rx data has a RDATA address to be read by host. The size of data is 18 word (1 word frame information, 1 word Id, 16 word data) for transmit and 19 word (1 word timestamp additional) for receive. Rx FIFO has 32bits×128 memory space which allow to contain 6 receive message.

Two transmit request bit in CAN_CMD corresponds to two transmit buffers. Transmit message must written to registers before setting transmit request bit. After setting transmit request bit, transmit messages in registers stores in corresponding transmit buffer. When the RKCAN buffer1 transmission frame complete, 'tx_req_1' is automatically cleared to 0.

CANFD support RX FIFO. When FIFO enabled, receive data stored in FIFO as Receive FIFO message format shown below. Rdata should read from the RXFIFO entrance. IF FIFO is disabled, Rdata stored in Rdata registers and should read from those registers every time.

Table 24-1 Receive FIFO message format

NAME	Offset	Access	Description
RX FIFO RB0-INFO	0x0000	RO	Same as CAN_RXFRAMEINFO
RX FIFO RB0-ID	0x0004	RO	Same as CAN_RXID
RX FIFO TB0-TIMESTAMP	0x0008	RO	RX TIMESTAMP VALUE
RX FIFO RB0-DATA0	0x000c	RO	Same as CAN_RXDATA
RX FIFO RB0-DATA1	0x0010	RO	Same as CAN_RXDATA
RX FIFO RB0-DATA2	0x0014	RO	Same as CAN_RXDATA
...	...	...	...
RX FIFO RB0-DATA15	0x0048	RO	Same as CAN_RXDATA

24.2.4.2 Receive Data

According to the bus protocol, taking the data frame of the extended frame format as an example, the receiving data state machine is as follows:

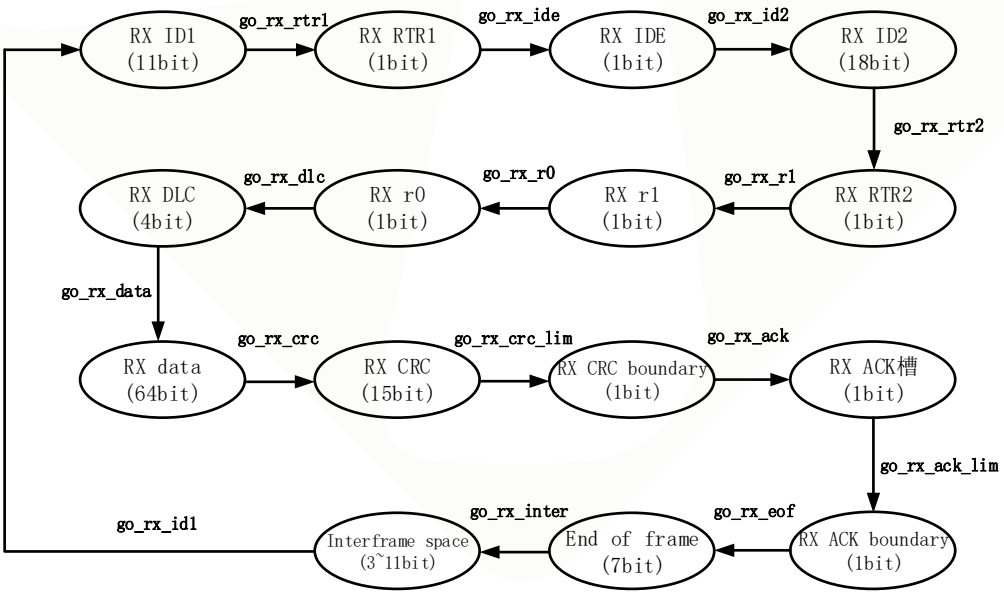

Fig.24-9 Receive data state diagram

Each state of the state machine corresponds to which "field" of the frame data the receiver is in when receiving data, and only one of all state flags is valid at the same time. The method of implementation is as follows:

Define a bit counter(bit_cnt), add one to each sample point (provided by the bit timing

module). At the same time, according to the current state of the state machine, it is determined in this state that the bit counter needs to count to what value (determined by the length of each field defined in the protocol) to generate a jump signal to the next state transition. Whenever a hopping signal is generated, the counter is cleared and ready to begin counting for the next state.

The receiving state machine ensures that the bus controller can automatically recognize the current receiving state when receiving data. After that, the data of each data field needs to be stored in the corresponding register according to different states, and then the next operation is performed.

24.2.4.3 Transmit Data

The CAN FD accesses message element space of a buffer in TX block only if the respective request bit is set. The Host must respect access rules to avoid memory collisions, that is, after the Host sets a buffer ready request through the CMD register, it should not read or write the respective message element space until the respective request bit is in a clear/unset state.

Parallel data is serially transmitted to the bus according to a specific timing. The sending point is the tx_point. The transmit counter is self-added in the valid data portion of the data frame, and is cleared when one frame of data is transmitted or the bus is in an error state.

The implementation is as follows:

1. Combine all the data to be sent into a completely parallel data chain according to the currently set frame type;

2, using tx_pointer as a data link pointer, obtaining a serial data signal (tx_bit) to be transmitted;

3. Determine what type of data to send according to the current state, and determine the data tx_next to be sent at the next transmission time;

4. Synchronize the data transmission signal tx with the tx_next through the transmission point tx_point to obtain a true transmission signal tx.

24.2.4.4 Bit Stuffing

Bit stuffing is a function set to prevent burst errors. Add a bit of inversion data when the same level lasts 5 bits.

In CAN FD format frames, the CAN bit stuffing method is changed for the CRC SEQUENCE. Here, the STUFF-BITS shall be inserted at fixed positions. There shall be a fixed STUFF-BIT before the first bit of the CRC SEQUENCE, even if the last bits of the preceding field do not fulfill the CAN stuff condition. A further STUFF-BIT shall be inserted after each fourth bit of the CRC SEQUENCE. The value of such a fixed STUFF-BIT shall be the inverse value of the bit preceding the fixed STUFF-BIT.

Sending unit: The data between the SOF and CRC segments when transmitting data frames and remote frames. If the same level lasts for 5 bits, the next bit (bit 6) is inserted with the level of the 1st bit and the first 5 bits.

Receiving unit: Data between SOF and CRC segments when receiving data frames and remote frames. If the same level lasts for 5 digits, the next bit (bit 6) needs to be deleted and received. If the 6th bit is the same level as the first 5 bits, it will be treated as an error and an error frame will be sent.

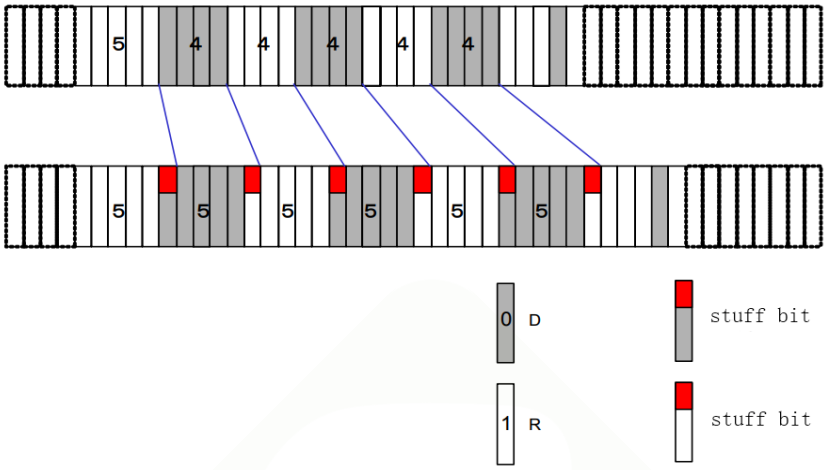

Fig.24-10 Bit Stuffing

24.2.4.5 Transmit Event FIFO

The Transmit Event FIFO (TEF) allows the application to keep track of the order and time the messages were transmitted. The TEF works similar to a Receive FIFO, which is a 32bits× 16 FIFO. Instead of storing received messages, it stores transmitted messages. Messages are only saved if TEF.enable is set. The Sequence Number (SEQ) of the transmitted message is copied into the TEF Object. The payload data are not stored. Transmitted messages are timestamped if TEFTSEN is set. Transmit message format store in TXE FIFO as follow:

Table 24-2 TXE FIFO message format

NAME	Offset	Access	Description
TXE FIFO TB0-INFO	0x0000	RO	Same as CAN_TXFRAMEINFO
TXE FIFO TB0-ID	0x0004	RO	Same as CAN_TXID
TXE FIFO TB0-TIMESTAMP	0x0008	RO	TX TIMESTAMP VALUE
TXE FIFO TB1-INFO	0x000c	RO	Same as CAN_TXFRAMEINFO
TXE FIFO TB1-ID	0x0010	RO	Same as CAN_TXID
TXE FIFO TB1-TIMESTAMP	0x0014	RO	TX TIMESTAMP VALUE
…	…	…	…

24.2.4.6 TIMESTAMP

The CAN FD Controller module contains a Time Base Counter (TBC). The TBC is a 32-bit free-running counter that increments on multiples of CANCLK and rolls over to zero. TBC can be cleared by writing any value to TBC.

- TIMESTAMP_CTRL is used to configure the prescaler for the TBC.
- Setting TIMESTAMP_CTRL.TBCEN enables the TBC.
- Clearing TBCEN disables, stops and resets the TBC.
- The TBC has to be disabled before writing to TBC by clearing TBCEN.
- The application can read TBC at any time. Like with any multibyte counter, the application has to consider that the counter increments and might rollover between reading the different bytes of the counter. A rollover of the TBC will generate an interrupt.

Capturing of time stamps at the SAMPLE POINTS of the START OF FRAME bits of received and transmitted frames.

24.2.5 ERROR PROCESS

There are five types of errors. Multiple errors can occur at the same time.

- **BIT ERROR**:
  A unit that is sending a bit on the bus also monitors the bus. A BIT ERROR has to be detected at that bit time, when the bit value that is monitored is different form the bit value that is sent. An exception is the sending of a 'recessive' bit

during the stuffed bit stream of the ARBITRATION FIELD of during the ACK SLOT. Then no BIT ERROR occurs when a 'dominant' bit is monitored. A TRANSMITTER sending a PASSIVE ERROR FLAG and detecting a 'dominant' bit does not interpret this as a BIT ERROR.

- **BIT STUFF ERROR**:
  A STUFF ERROR has to be detected at the bit time of the 6th consecutive equal bit level in a message field that should be coded by the method of bit stuffing.
- **FORM ERROR**:
  A FORM ERROR has to be detected when a fixed-form bit field contains one or more illegal bits. (Exception is the detection of a dominant bit during the last bit of END OF FRAME by a RECEIVER, or the detection of a dominant bit during the last bit of ERROR DELIMITER or OVERLOAD DELIMITER by any node). When the value of a fixed STUFF-BIT in the CAN FD format CRC SEQUENCE is equal to its preceding bit, this shall also be detected as a FORM-ERROR.
- **ACK ERROR**:
  An ACK ERROR has to be detected by a transmitter whenever it does not monitor a 'dominant' bit during the ACK SLOT.
- **CRC ERROR**:
  The CRC sequence consists of the result of the CRC calculation by the transmitter. The receivers calculate the CRC in the same way as the transmitter. A CRC ERROR has to be detected, if the calculated result is not the same as that received in the CRC sequence.

24.3 Register Description

24.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

24.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
CAN_MODE	0x0000	W	0x00000000	CAN controller working mode configure register
CAN_CMD	0x0004	W	0x00000000	CAN command register
CAN_STATE	0x0008	W	0x00000000	CAN state register
CAN_INT	0x000c	W	0x00000000	Interrupt state register
CAN_INT_MASK	0x0010	W	0x00000000	Interrupt enable registers
CAN_DMA_CTRL	0x0014	W	0x00000000	dma mode control
CAN_BITTIMING	0x0018	W	0x00000000	Bit timing configure register
CAN_ARBITFAIL	0x0028	W	0x00000000	Arbit fail code register
CAN_ERROR_CODE	0x002c	W	0x00000000	Error code register
CAN_RXERRORCNT	0x0034	W	0x00000000	Receive error counter
CAN_TXERRORCNT	0x0038	W	0x00000000	Transmit error counter

24.3.3 Detail Register Description

CAN_MODE

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	reserved
15	RW	0x0	CAN_FD_mode_enable CAN FD Mode ENABLE. 1'b0 : Disable. 1'b1 : Enable.

Bit	Attr	Reset Value	Description
14	RW	0x0	DPEE Disable Protocol Exception Event Detection/Generation. 1'b0: PEE detection/generation is enabled. If the CAN FD receiver detects the res bit as 1, it goes to Bus Integration state (PEE_config) and waits for Bus Idle condition (11 consecutive nominal recessive bits). The error counter remains unchanged. 1'b1: Disable Protocol Exception Event detection/generation by CAN FD receiver if "res" bit in CAN FD frame is detected as 1. In this case, CAN FD receiver generates Form error.
13	RW	0x0	BRSD CAN FD Bit Rate Switch Disable Override. 1'b0: Makes the core transmit CAN FD frames as per BRS bit in the TX Message element. 1'b1: Makes the core transmit CAN FD frames only in nominal bit rate (by overriding the TX Message element BRS bit setting).
12	RW	0x0	space_rx_mode Interframe Spaceing RX Mode. 1'b0 : Enable. 1'b1 : Disable.
11	RW	0x0	auto_bus_on Auto Bus On Enable. 1'b0 : After the RKCAN has entered bus_off state, the software can start a bus_off_recovery sequence by resetting the work_mode to 0. 1'b1 : Automatic reset TEC/REC to bus_on after 128 occurrence of 11 consecutive recessive bits have been monitored on the bus.
10	RW	0x0	auto_retx_mode Auto Retransmission Mode. 1'b0 : Disable. RKCAN return to idle state after transmit DATA/RTR frame failed, and set tx_req to 0. 1'b1 : Enable. The RKCAN automatically retransmit frames which have lost arbitration or have been disturbed by errors during transmission.
9	RW	0x0	ovld_mode Overload Mode. 1'b0: overload lite mode. 1'b1: overload extended mode. RKCAN
8	RW	0x0	cover_mode Rx Data Cover Mode. 1'b0 : RKCAN can't receive new frame before receive registers cleared. 1'b1 : RKCAN can receive new frame before receive registers cleared, and new rxdata will cover old rxdata.

Bit	Attr	Reset Value	Description
7	RW	0x0	rxsort_mode RX Data Sort Mode. 1'b0: The data received first is placed in the lower address. 1'b1: The data received first moves to the upper address, and the data received later is placed at the lower addrsss.
6	RW	0x0	txorder_mode TX Data Order Mode. 1'b0: tx_data1[7:0] --> tx_data1[15:8] --> tx_data1[23:16] --> tx_data1[31:24] -->tx_data2[7:0] --> tx_data2[15:8] --> tx_data2[23:16] --> tx_data2[31:24]. 1'b1: tx_data2[31:0] --> tx_data1[31:0].
5	RW	0x0	rxstx_mode Receive Self Transmit data mode. 1'b0: Disable; 1'b1: Enable. When the RKCAN sends data, it can also receive the data sent by itself.
4	RW	0x0	lback_mode Loopback Mode. 1'b0: Disable. 1'b1: Enable.
3	RW	0x0	silent_mode Silent Mode. 1'b0: Disable. 1'b1: Enable.
2	RW	0x0	self_test Self check ACK slot when TX frame. 1'b0: Normal 1'b1: Self test mode. When in self test mode, the receiver does not need to return an ACK signal when receiving data. Therefore, no ack_error will occur in self test mode. When in 'lback_mode' or 'silent_mode', it need to enable 'self_test' mode when sending frame.
1	RW	0x0	sleep_mode Sleep Mode This is the Sleep mode request bit. 1'b0: No such request. 1'b1: Request core to be in Sleep mode. This bit is cleared when the core wakes up from Sleep mode.
0	RW	0x0	work_mode Work Mode. 1'b0: Reset mode, CAN stop transmit and registers can be configured. 1'b1: Work mode, CAN enter the working mode, RX/TX data.

CAN_CMD

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	reserved
1	R/W SC	0x0	tx1_req Transmit request enable 1'b0: Disable; 1'b1: Enable. When 'tx_req' is enable, the RKCAN buffer1 is in the transmit mode and cannot receive frames from other CANs. When the RKCAN buffer1 transmission frame complete, 'tx_req' is automatically cleared to 0. Also, when RKCAN is set 'work_mode' to 'reset_mode', tx_req' is cleared to 0.
0	R/W SC	0x0	tx0_req Transmit request enable 1'b0: Disable; 1'b1: Enable. When 'tx_req' is enable, the RKCAN buffer0 is in the transmit mode and cannot receive frames from other CANs. When the RKCAN buffer0 transmission frame complete, 'tx_req' is automatically cleared to 0. Also, when RKCAN is set 'work_mode' to 'reset_mode', tx_req' is cleared to 0.

CAN_STATE

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:7	RO	0x0	reserved
6	RO	0x0	sleep_state sleep_state 1'b0: None 1'b1: CAN controller is in the sleep state
5	RO	0x0	bus_off_state 1'b0: None 1'b1: Bus off state: When the error counter is incremented to 255, the CAN controller will enter the bus off state, generate an error warning interrupt and enter reset mode, waiting for the CPU to restart. (rx/tx_err_cnt >=32'd255)
4	RO	0x0	error_warning_state 1'b0: None 1'b1: Error state: At least one error counter has reached the error warning threshold (rx/tx_err_cnt >=32'd96)
3	RO	0x0	tx_period 1'b0: Not in transmiting state 1'b1: CAN controller is in the transmiting state
2	RO	0x0	rx_period 1'b0: Not in receiving state 1'b1: CAN controller is in the receiving state

Bit	Attr	Reset Value	Description
1	RO	0x0	tx_buffer_full Transmit buffer full flag bit 1'b0: Not full 1'b1: TX buffer is full. There is data in buffer waiting to be sent or being sent.
0	RO	0x0	rx_buffer_full Receive buffer full flag bit 1'b0: Not full 1'b1: RX buffer is full. A complete message is stored in the buffer.

CAN_INT

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14	RW	0x0	wakeup_int 1'b0: None 1'b1: Indicates that the core entered Normal mode from Sleep mode. Write 1 then clear.
13	W1C	0x0	tx_event_fifo_full_int 0 = None 1 = Indicates that TX Event FIFO is full based on watermark programming. The interrupt continues to assert as long as the TX Event FIFO Fill Level is above TX Event FIFO Full watermark.
12	W1C	0x0	tx_event_fifo_overflow_int 0 = None 1 = Indicates that a message has been lost. This condition occurs when the core has successfully transmitted a message for which an event store is requested but the TX Event FIFO is full.
11	W1C	0x0	timestamp_counter_overflow_int 1'b0: None 1'b1: 1 = Indicates that Timestamp counter rolled over (from 0xffff to 0x0). Write 1 then clear.
10	W1C	0x0	bus_off_recovery_int 1'b0: None 1'b1: Indicates that the core recoveryed from Bus-off mode. Write 1 then clear.
9	W1C	0x0	bus_off_int 1'b0: None 1'b1: Indicates that the CAN core entered Bus-off mode. Write 1 then clear.

Bit	Attr	Reset Value	Description
8	W1C	0x0	rx_fifo_overflow_int RX FIFO Overflow Interrupt (RX FIFO ENABLE). 0 = None 1 = Indicates that a message has been lost. This condition occurs when a new message with ID matching to Receive FIFO is received and the Receive FIFO is full.
7	W1C	0x0	rx_fifo_full_int RX FIFO full Interrupt (FIFO Mode enable). 1'b0: None 1'b1: Indicates that RX FIFO is full based on watermark setting.
6	W1C	0x0	error_int 1'b0: None 1'b1: CAN bus error interrupt. This interrupt is generated when a bus error is detected. Error details can refer to the ERROR_CODE register. Write 1 then clear.
5	W1C	0x0	tx_arbit_fail_int 1'b0: None 1'b1: Arbitration loss interrupt. This interrupt is generated when the loss of arbitration is turned into a receiver. Write 1 then clear.
4	W1C	0x0	passive_error_int 1'b0: None 1'b1: Passive error interrput. This interrupt is generated when the controller enters an error passive state (at least one error counter reaches 127) or returns from the error passive state to the error active state. Write 1 then clear.
3	W1C	0x0	overload_int 1'b0: None 1'b1: CAN bus overload interrupt. This interrupt is generated when a overload frame is generated.
2	W1C	0x0	error_warning_int Error warning interrupt 1'b0: None 1'b1: error_warning_int. This interrupt is generated when the error_warning_state bits change. Write 1 then clear.
1	W1C	0x0	tx_finish_int Transmit finish interrupt 1'b0: None 1'b1: tx_finish_int. CAN controller sends the message and the buffer is empty. Write 1 then clear.
0	W1C	0x0	rx_finish_int Receive finish interrupt 1'b0: None 1'b1: RX finish int. CAN controller has received the message and the rx_buffer is full. Write 1 then clear.

CAN_INT_MASK

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14	RW	0x0	wakeup_int_mask 1'b0: Unmasked 1'b1: Masked

0	RW	0x0	rx_finish_int_mask 1'b0: Unmasked 1'b1: Masked

CAN_DMA_CTRL

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	reserved
1	RW	0x0	dma_rx_mode DMA receive request enable 1'b0: Disable; 1'b1: Enable. When 'DMA_rx_req' is enable, the RKCAN is in the DMA receive mode. Also, when RKCAN is set 'work_mode' to 'reset_mode', tx_req' is clear.
0	RW	0x0	dma_tx_mode DMA Transmit request enable 1'b0: Disable; 1'b1: Enable. When 'DMA_tx_req' is enable, the RKCAN is in the DMA transmit mode. When RKCAN is set 'work_mode' to 'reset_mode', tx_req' is cleared to 0.

CAN_BITTIMING

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	reserved
16	RW	0x0	sample_mode CAN controller sampling mode configuration register. 1'b0: Single sample mode 11'b1: Three sample mode 推荐使用single sample mode.
15:14	RW	0x0	sjw SJW: reSynchronization Jump Width Each unit has a synchronization error due to a clock frequency deviation or a transmission delay. SJW is to compensate for the maximum value of this error.
13:8	RW	0x00	brp brp: system prescaler coefficient Tsclk = 2 x Tclk x (brp + 1).
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:4	RW	0x0	tseg2 Phase buffer segment 2 Tphase_seg2 = Tsclk x (tseg2 + 1)
3:0	RW	0x0	tseg1 Phase buffer segment 1 Tphase_seg1 = Tsclk x (tseg1 + 1)

CAN_ARBITFAIL

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:7	RO	0x0	reserved
6:0	RO	0x00	arbit_fail_code This register indicates the bit position of arbitration section where the arbitration was lost.

CAN_ERROR_CODE

Address: Operational Base + offset (0x002c)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	error_phase 0: Arbitration Phase 1: Data Phase

24.5 Application Notes

24.5.1 Controller initialization flow

The controller must configure the registers after power-up or hardware reset. During the operation of the controller, a software reset request may be sent and reconfigured (re-initialized) as shown below.

After the initialization is completed, the controller enters the working mode, sends the frame to be sent to the buffer, and then sets the "send request" flag of the command register to start transmitting.

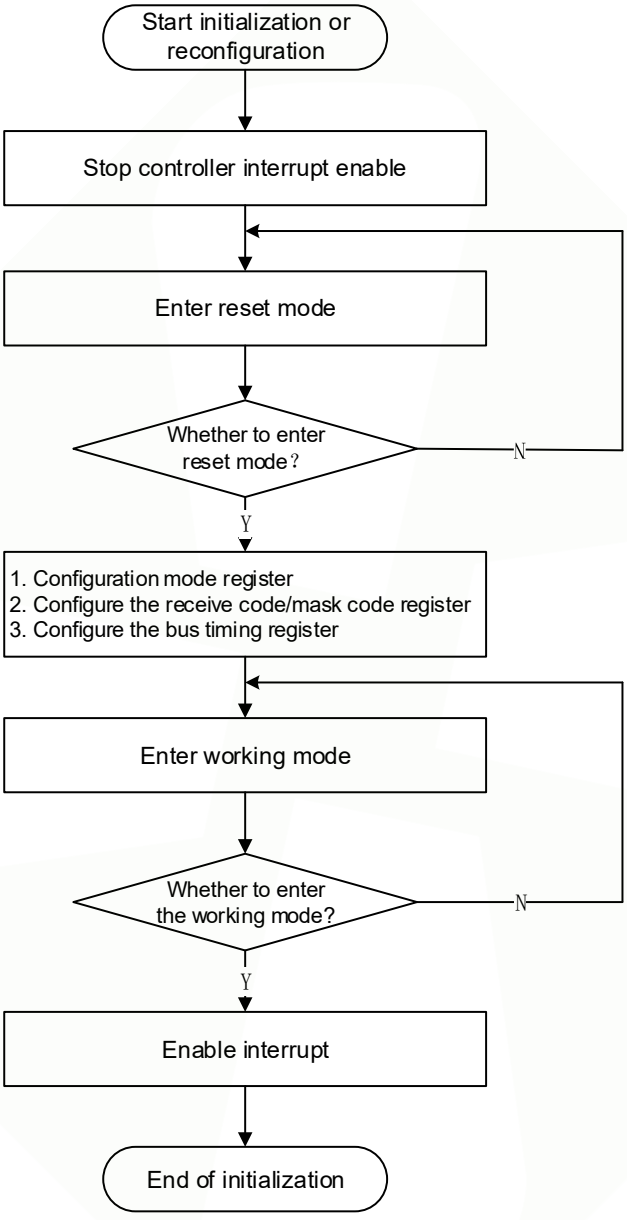

Fig.24-11 CANFD Initialization Flow

24.5.2 Loop-back Mode

The controller must configure the registers after power-up or hardware reset. During the operation of the controller, a software reset request may be sent and reconfigured (re-initialized) as shown below.

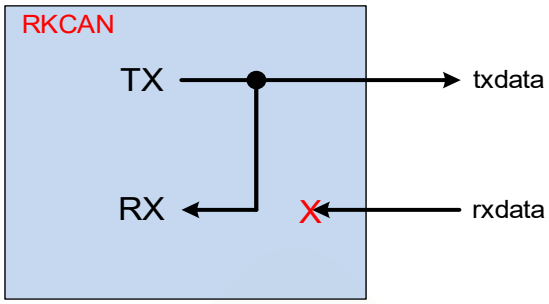

Fig.24-12 Loopback Mode

24.5.3 Silent Mode

The controller must configure the registers after power-up or hardware reset. During the operation of the controller, a software reset request may be sent and reconfigured (re-initialized) as shown below.

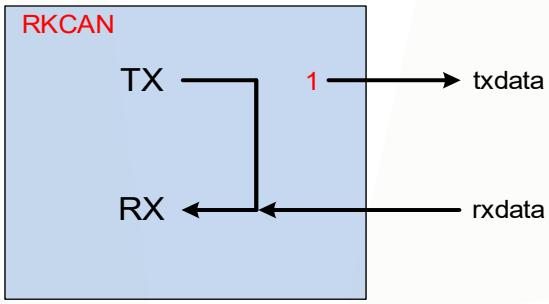

Fig.24-13 Silent Mode

24.5.4 RXSTX Mode

(1)rxstx_mode=0, RKCAN cannot receive the data sent by itself;
(2)rxstx_mode=1, RKCAN can receive the data sent by itself, and when the ID of the frame is the same as the ID_CODE of RKCAN itself, RKCAN will store the frame information into CAN_RXDATA1/2.

24.5.5 TXORDER Mode

The TXORDER Mode is used to determine the order in which data is sent.
(1)txorder_mode=0, Data transmission order is "tx_data1[7:0] --> tx_data1[15:8] --> tx_data1[23:16] --> tx_data1[31:24] -->tx_data2[7:0] --> tx_data2[15:8] --> tx_data2[23:16] --> tx_data2[31:24]";
(2)txorder_mode=1, Data transmission order is "tx_data2[31:0] --> tx_data1[31:0]".

24.5.6 RXSORT Mode

The TXSORT Mode is used to determine how the received data is stoted.
(1)rxsort_mode=0: The data received first is placed in the lower address;
(2)rxsort_mode=1: The data received first moves to the upper address, and the data received later is placed at the lower addrsss.

24.5.7 COVER Mode

(1)cover_mode=1'b0 : RKCAN can't receive new frame before receive registers cleared.
(2)cover_mode=1'b1 : RKCAN can receive new frame before receive registers cleared, and new rxdata will cover old rxdata.

24.5.8 Overload Mode

According to the CAN protocol, a CAN transceiver will generate an OVERLOAD frame in three cases:

CASE1: When the CAN is used as a receiver, if it is necessary to delay the next frame.

CASE2:Detection of a dominant bit at the first and second bit of Intermission.

CASE3:If an CAN node samples a dominant bit at the eight bit(the last bit) of an ERROR DELIMITER or OVERLOAD DELIMITER.

1’b0:Overload Lite Mode: RKCAN only generates overload frames in the CASE2.

1’b1:Overload Extended Mode: RKCAN can generates overload frames in all three cases.

24.5.9 Auto Retx Mode

Auto Retransmission Mode.

1'b0 : Disable. RKCAN return to idle state after transmit DATA/RTR frame failed, and set tx_req to 0.

1'b1 : Enable. The RKCAN automatically retransmit frames which have lost arbitration or have been disturbed by errors during transmission.

24.5.10 Auto Bus On

Auto Bus On Enable.

1'b0 : After the RKCAN has entered bus_off state, the software can start a bus_off_recovery sequence by resetting the work_mode to 0.

1'b1 : Automatic reset TEC/REC to bus_on after 128 occurrence of 11 consecutive recessive bits have been monitored on the bus.

24.5.11 Sleep Mode

The core enters Sleep mode from Configuration or Normal mode when the SLEEP bit is 1 in the CAN_MODE register, the CAN bus is idle, and there are no pending transmission requests.

The core enters Configuration mode when any configuration condition is satisfied. The core enters Normal mode (clearing the SLEEP request bit in thesleep register and also clearing the corresponding status bit) under the following (wake-up) conditions:

- Whenever the SLEEP bit is set to 0.
- Whenever the SLEEP bit is 1, and bus activity is detected.
- Whenever there is a new message for transmission.

Interrupts are generated when the core enters Sleep mode or wakes up from Sleep mode.

24.5.12 DMA Support

The CANFD supports DMA signalling with the use of two output signals (dma_tx_req and dma_rx_req) to indicate when transmit buffer is empty or when the receive FIFO is full. The controller uses two DMA channels, one for the transmit data and one for the receive data. DMA transmit and receive support enabled by setting corresponding bit in CAN_DMA_CTRL register. Once enabled whenever both transmit buffer is empty dma_tx_req is set, DMA should write transmit message. At last CPU set transmit request bit to initiate CANFD.

If RX FIFO is disabled, dma_rx_req is set when message received successfully, DMA should read Rdata from receive registers.

If RX FIFO is enabled, dma_rx_req is set when message received and FIFO reached watermark，DMA should read Rdata from Rx FIFO entrance.

24.5.13 CANFD MODE

The CANFD MODE from CAN_MODE register decide the controller internal setting. When it is disabled, it uses the previous can design, which only transmit and receive CAN frame. If CANFD mode enabled, it allows added feature and can transmit/receive both CAN and CANFD frame.

```

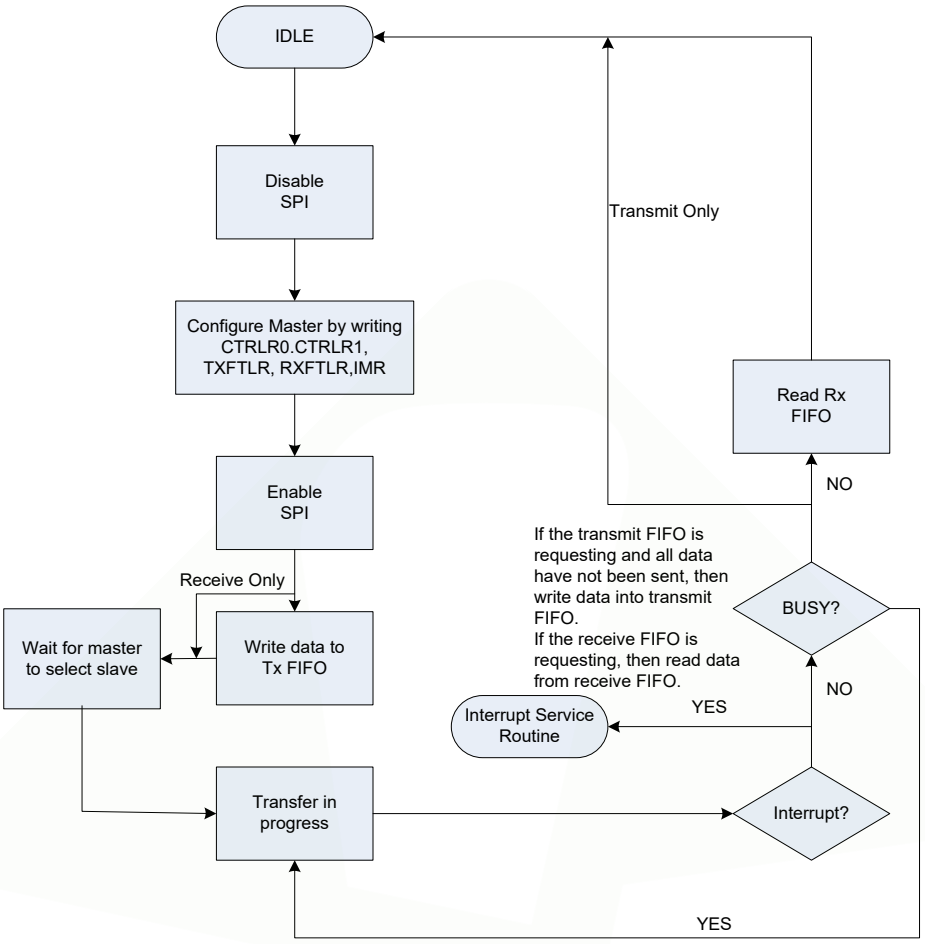

Fig.24-15 SPI Slave transfer flow diagram

Chapter 25 Smart Card Reader (SCR)

25.1 Overview

The Smart Card Reader (SCR) is a communication controller that transmits data between the superior system and the Smart Card. The controller can perform a complete smart card session, including card activation, card deactivation, cold/warm reset, Answer to Reset (ATR) response reception, data transfers, etc.

SCR supports the following features:

- Supports the ISO/IEC 7816-3:1997(E) and EMV2000 (4.0) specifications
- Performs functions needed for complete smart card sessions, including:
- Card activation and deactivation
- Cold/warm reset
- Answer to Reset (ATR) response reception
- Data transfers to and from the card
- Extensive interrupt support system
- Adjustable clock rate and bit (baud) rate
- Configurable automatic byte repetition
- Handles commonly used communication protocols:
- T=0 for asynchronous half-duplex character transmission
- T=1 for asynchronous half-duplex block transmission
- Automatic convention detection
- Configurable timing functions:
- Smart card activation time
- Smart card reset time
- Guard time
- Timeout timers
- Automatic operating voltage class selection
- Supports synchronous and any other non-ISO 7816 and non-EMV cards
- Advanced Peripheral Bus (APB) slave interface for easy integration with AMBA-based host systems Block Diagram

25.2 Block Diagram

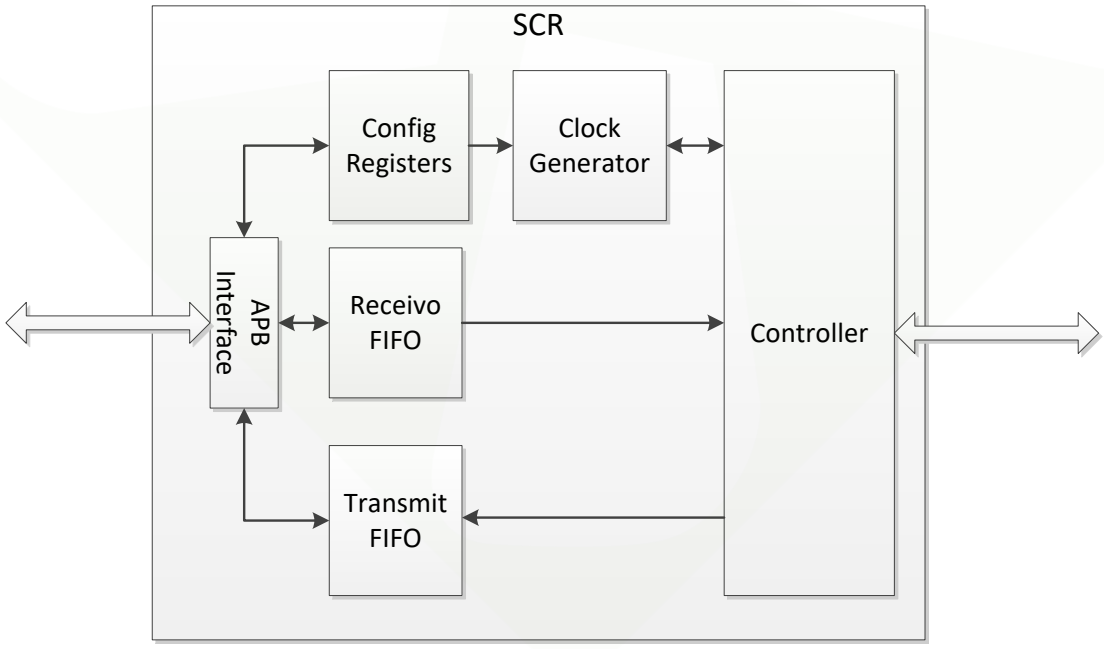

Fig.25-1 SCR Block Diagram

The host processor gets access to PWM Register Block through the APB slave interface.

25.2.1 APB Interface

The host processor gets access to PWM Register Block through the APB slave interface.

25.2.2 Configuration Registers
The Configuration Registers block provides control over all functions of the Smart Card Reader

25.2.3 Controller
The Controller is the main block in the SCR core. This block controls receiving characters transmitted by the Smart Card, storing them in the RX FIFO, and transmitting them to the Smart Card. This block also performs card activation, deactivation, and cold and warm reset. After the card is reset, the Answer To Reset (ATR) sequence is received by the controller and stored in RX FIFO.
The parallel to serial conversion needed to transmit data from a Smart Card Reader to a Smart Card and the serial to parallel conversion needed to transmit data in the opposite direction is performed by the UART. The UART also performs the guard time, parity checking and character repeating functions.

25.2.4 Receive FIFO
The Receive FIFO is used to store the data received from the Smart Card until the data is read out by the superior system.

25.2.5 Transmit FIFO
The Transmit FIFO is used to store the data to be transmitted to the Smart Card.

25.2.6 Clock Generator
The Clock Generator generates the Smart Card Clock signal and the Baud Clock Impulse signal, used in timing the Smart Card Reader.)

25.3 Function Description
A Smart Card session consists of following stages:
- Smart Card insertion
- Activation of contacts and cold reset sequence
- Answer To Reset sequence (ATR)
- Execution of transaction
- Deactivation of contacts
- Smart Card removal

25.3.1 Smart Card Insertion
A Smart Card session starts with the insertion of the Smart Card. This event is signaled to the SCR using the SCDETECT input. The SCPRESENT bit is set and also the SCINS interrupt is asserted (if enabled).
When the external card detect switch is not used, the input pin SCDETECT must be tied to inactive state.

25.3.2 Automatic operating voltage class selection
There are three operating classes (1.8V - class C, 3V - class B and 5V - class A) defined in ISO/IEC 7816-3(2006) specification. Only 1.8V and 3.3V are supported by the SCR.
Before the activation of contacts, operating classes have to be enabled via bits VCC18, VCC33 in CTRL2 register. In case that no operating class is enabled, the controller performs activation for all two voltage classes (1.8V, 3V) in sequence.
When Smart Card Reader performs activation of contacts the lowest enabled voltage class is automatically applied first. When the first character start bit of ATR sequence is received, the selected voltage class is correct (even if the ATR is then received with errors). When the ATR sequence reception does not start, ATRFAIL interrupt is not activated, deactivation is performed and next higher enabled voltage class is applied. If the ATR sequence reception does not start and no other higher class is enabled was already applied the ATRFAIL interrupt is activated and the last applied voltage class remains active.
After the automatic voltage class selection is finished the selected class can be read from bits VCC18, VCC33 in CTRL2 register. If the automatic voltage class selection fails, these bits remain untouched.
There is a delay applied between deactivation of contacts with lower voltage class and activation of contacts with higher voltage class. This delay should be at least 10 ms according to the ISO/IEC 7816-3 specification.

25.3.3 Activation of Contacts and Cold Reset Sequence
When the Smart Card is properly inserted and the ACT bit in CTRL2 register is asserted, the

activation of contacts can be started. The duration of each part of the activation is the time Ta, which is equal to the ADEATIME register value. If no Vpp is necessary, the activation and deactivation part of Vpp can be omitted by clearing the AUTOADEAVPP bit in SCPADS register.
The Cold Reset sequence follows immediately after the activation. Time (Tc) is the duration of the Reset. The EMV specification recommends that this value should be between 40000 and 45000. The activation of contacts and cold reset sequence is shown in Fig.24-2.

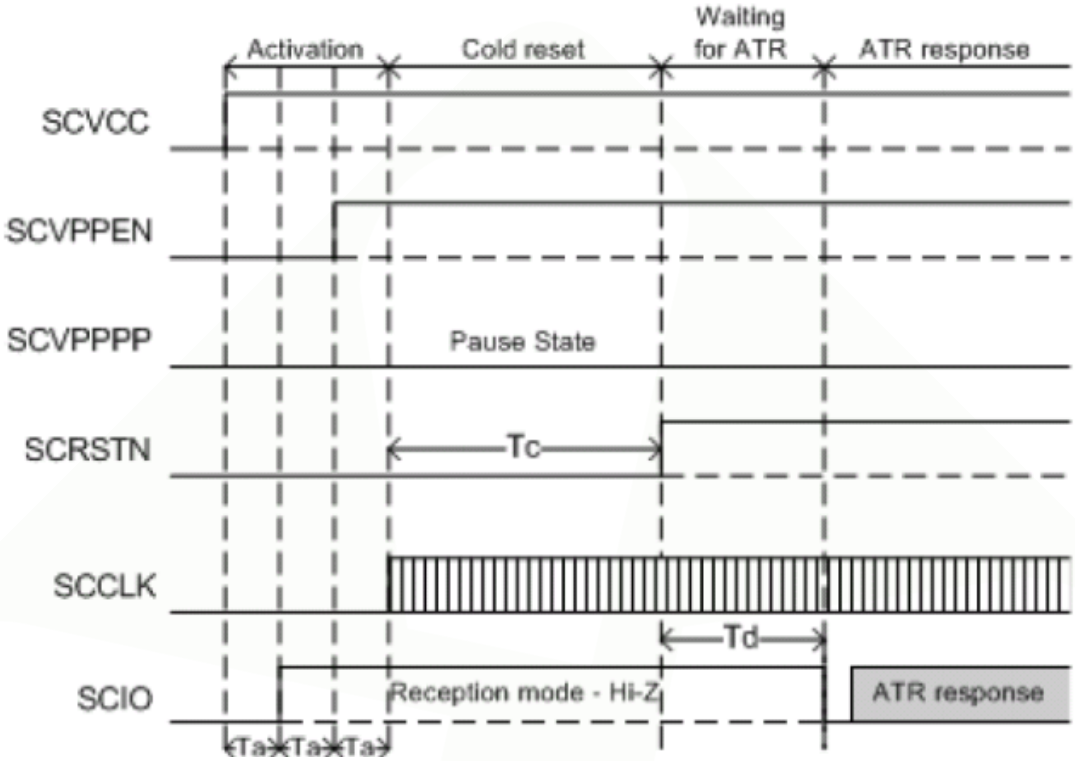

Fig.25-2 Activation, Cold Reset and ATR

25.3.4 Execution of Transaction

All transfers between the Smart Card Reader and a Smart Card are under the control of the superior system. It controls the number of characters sent to the Smart Card and it knows the number of characters expected to be returned from the Smart Card.

25.3.5 Warm Reset

The Warm Reset sequence is initialized by setting the WRST bit in the CTRL2 register to '1'.Smart Card Reader drives the SCRSTN signal to '0' to perform the Warm Reset as shown in Fig. 24-3. After the SCRSTN assertion, the Warm Reset sequence then continues the same way as the Cold Reset sequence.

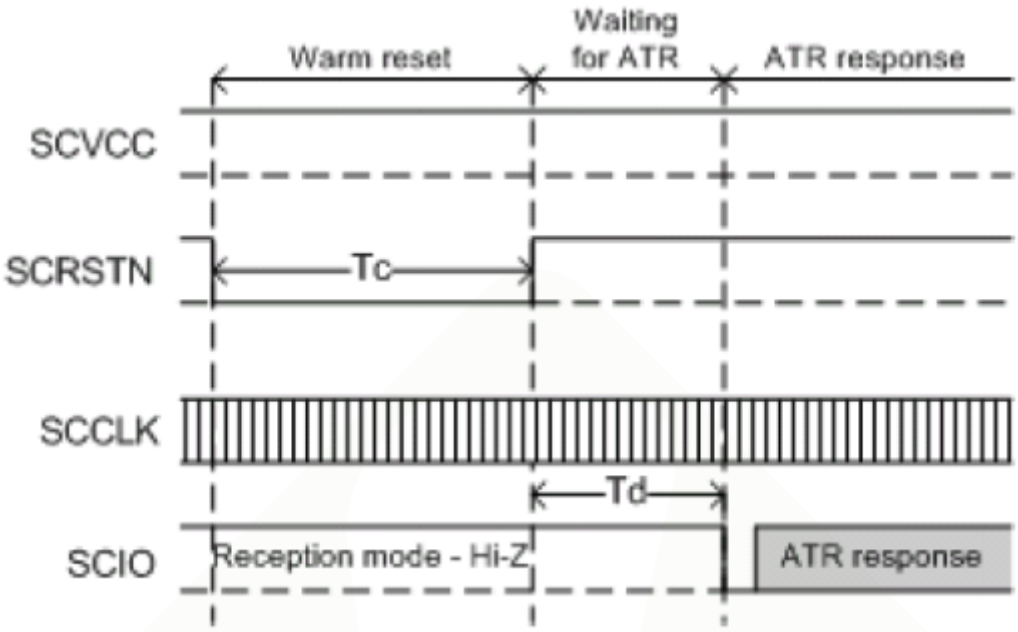

Fig.25-3 Warm Reset and ATR

25.3.6 Deactivation of Contacts

After the smart card reader detects the removal of the smart card (SCREM interrupt) or the superior system initiates deactivation by setting the DEACT bit in the CTRL2 register to '1', the deactivation is performed immediately as shown in . The duration time (Ta), of each part of the deactivation sequence time is defined in the ADEATIME register.

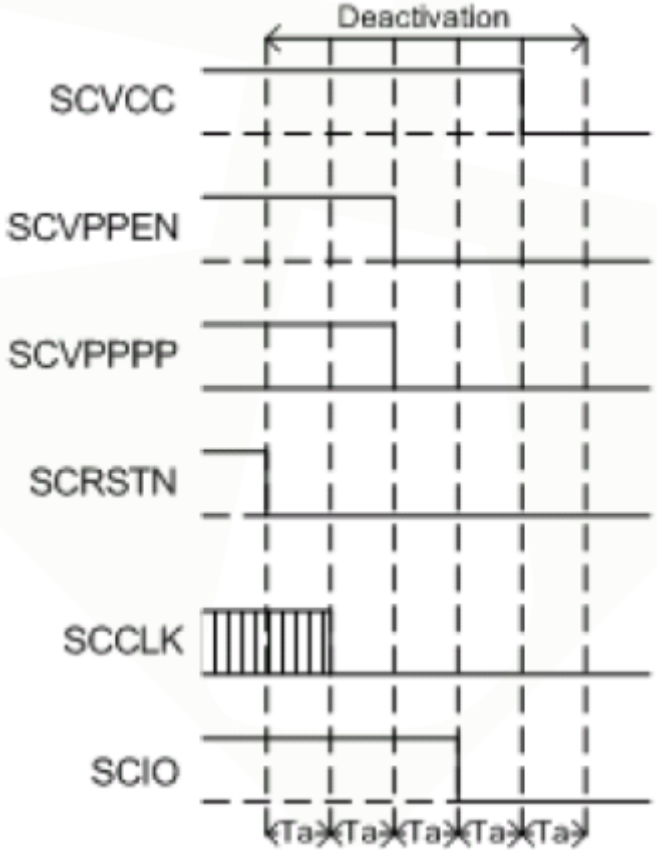

Fig.25-4 Deactivation Sequence

25.4 Register Description

25.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
SCR_CTRL1	0x0000	HW	0x00000000	Control Register 1
SCR_CTRL2	0x0004	HW	0x00000000	Control Register 2
SCR_SCPADS	0x0008	HW	0x00000000	Smart Card Pads Register
SCR_INTEN1	0x000C	HW	0x00000000	Interrupt Enable Register 1
SCR_INTSTAT1	0x0010	HW	0x00000000	Interrupt Status Register 1
SCR_FIFOCTRL	0x0014	HW	0x00000000	FIFO Control Register
SCR_LEGTXFICNT	0x0018	B	0x00000000	Legacy TX FIFO Counter
SCR_LEGRXFICNT	0x0019	B	0x00000000	Legacy RX FIFO Counter
SCR_RXFITH	0x001C	HW	0x00000000	RX FIFO Threshold
SCR_REP	0x0020	B	0x00000000	Repeat
SCR_SCCDDIV	0x0024	HW	0x00000000	Smart Card Clock Divisor
SCR_BAUDDIV	0x0028	HW	0x00000000	Baud Clock Divisor
SCR_SCGUTIME	0x002C	B	0x00000000	Smart Card Guard-time
SCR_ADEATIME	0x0030	HW	0x00000000	Activation / Deactivation Time
SCR_LOWRSTTIME	0x0034	HW	0x00000000	Reset Duration
SCR_ATRSTARTLIMIT	0x0038	HW	0x00000000	ATR Start Limit
SCR_C2CLIM	0x003C	HW	0x00000000	Two Characters Delay Limit
SCR_INTEN2	0x0040	HW	0x00000000	Interrupt Enable Register 2
SCR_INTSTAT2	0x0044	HW	0x00000000	Interrupt Status Register 2
SCR_TXFITH	0x0048	HW	0x00000000	TX FIFO Threshold
SCR_TXFIFOCNT	0x004C	HW	0x00000000	TX FIFO Counter
SCR_RXFIFOCNT	0x0050	HW	0x00000000	RX FIFO Counter
SCR_BAUDTUNE	0x0054	B	0x00000000	Baud Tune Register
SCR_FIFO	0x0200	B	0x00000000	FIFO

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

25.4.2 Detail Registers Description

SCR_CTRL1

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	GINTEN When high, INTERRUPT output assertion is enabled.
14	RO	0x0	reserved
13	RW	0x0	TCKEN When enabled all ATR bytes beginning from T0 are being XOR-ed. The result must be equal to TCK byte (when present). If the TCK byte does not match the computed value the ATR is considered to be malformed.
12	RW	0x0	ATRSTFLUSH When enabled, both FIFOs are flushed before the ATR is started.
11	RW	0x0	T0T1 Controls the using of T=0 or T=1 protocol. No character repeating is used when T=1 protocol is selected. The Character Guard-time (minimum delay between the leading edges of two consecutive characters) is reduced to 11 ETU when T=1 protocol is used and Guard-time value N = 255. The delay between the leading edge of the last received character and the leading edge of the first character transmitted is 16 ETU when T=0 protocol is used and 22 ETU when T=1 protocol is used.

Bit	Attr	Reset Value	Description
10	RW	0x0	TS2FIFO Enables to store the first ATR character TS in RX FIFO. During ideal card session there is no necessity to store TS character, so it can be disabled
9	RW	0x0	RXEN When enabled the characters sent by the Smart Card are received by the UART and stored in RX FIFO. Receiving is internally disabled while a transmission is in progress.
8	RW	0x0	TXEN When enabled the characters are read from TX FIFO and transmitted through UART to the Smart Card
7	RW	0x0	CLKSTOPVAL The value of the scclk output during the clock stop state.
6	RW	0x0	CLKSTOP Clock Stop. When this bit is asserted and the smart card I/O line is in 'Z' state, the SCR core stops driving of the smart card clock signal after the CLKSTOPDELAY time expires. The smart card clock is restarted immediately after the CLKSTOP signal is de-asserted. New character transmission can be started by superior system after the CLKSTARTDELAY time expires. The expiration of both times is signaled by the CLKSTOPRUN bit in the Interrupt registers. Reading '1' from this bit signals that the clock is stopped or CLKSTARTDELAY time not expired yet. Reading '0' from this bit signals that the clock is not stopped.
5:3	RO	0x0	reserved
2	RW	0x0	PECH2FIFO Enables storage of the characters received with wrong parity in RX FIFO.
1	RW	0x0	INVORD When High, inverse bit ordering convention(MSB-LSB) is used.
0	RW	0x0	INVLEV When high, inverse level convention is used(A= '1', Z='0');

SCR_CTRL2

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	Reserved Reserved bits are hard-wired to zero
7	RW	0x0	VCC50 Control 5V Smart Card Vcc. Setting of this bit allows selection of 5V Vcc for Smart Card session (Class A). After the selection of operating class is completed, this bit is in '1' if this class was selected. Default value after reset is '0'.
6	RW	0x0	VCC33 Setting of this bit allows selection of 3V Vcc for Smart Card session (Class B). After the selection of operating class is completed, this bit is in '1' if this class was selected. Default value after reset is '0'.
5	RW	0x0	VCC18 Control 1.8V Smart Card Vcc. Setting of this bit allows selection of 1.8V Vcc for Smart Card session (Class C). After the selection of operating class is completed, this bit is in '1' if this class was selected. Default value after reset is '0'.

Bit	Attr	Reset Value	Description
4	RW	0x0	DEACT Setting of this bit initializes the deactivation sequence. When the deactivation is finished, the DEACT bit is automatically cleared.
3	RW	0x0	ACT Setting of this bit initializes the activation sequence. When the activation is finished, the ACT bit is automatically cleared.
2	WO	0x0	WARMRST Writing '1' to this bit initializes Warm Reset of the Smart Card. This bit is always read as '0'.
1:0	RO	0x0	reserved

SCR_SCPADS

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RO	0x0	SCPRESENT This bit is set to '1' when the SCDETECT input is active at least for SCDETECTTIME
8	RW	0x0	DSCFCB It provides direct access to SCFCB output
7	RW	0x0	DSCVPPPP It provides direct access to SCVPPPP output
6	RW	0x0	DSCVPPEN It provides direct access to SCVPPEN output
5	RW	0x0	AUTOADEAVPP When high, it enables automatic handling of DSCVPPEN and DSCVPPPP signals during activation and deactivation sequence.
4	RW	0x0	DSCVCC Direct Smart Card Vcc. When DIRACCPADS = '1', the DSCVCC bit provides direct access to SCVCCx outputs. The appropriate SCVCC18, SCVCC33 and SCVCC50 outputs are driven according to state of bits VCC18, VCC33 and VCC50 in CTRL2 register.
3	RW	0x0	DSCRST When DIRACCPADS = '1', the DSCRST bit provides direct access to SCRST output
2	RW	0x0	DSCCLK When DIRACCPADS = '1', the DSCCLK bit provides direct access to SCCLK output
1	RW	0x0	DSCIO When DIRACCPADS = '1', the DSCIO bit provides direct access to SCIO pad.
0	RW	0x0	DIRACCPADS When high, it disables a serial interface functionality and enables direct control of the smart card pads using following 4 bits.

SCR_INTEN1

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	SCDEACT When enabled, this interrupt is asserted after the Smart Card deactivation sequence is complete.
14	RW	0x0	SCACT When enabled, this interrupt is asserted after the Smart Card activation sequence is complete.

Bit	Attr	Reset Value	Description
13	RW	0x0	SCINS When enabled, this interrupt is asserted after the smart card insertion
12	RW	0x0	SCREM When enabled, this interrupt is asserted after the smart card removal.
11	RW	0x0	ATRDONE When enabled, this interrupt is asserted after the ATR sequence is successfully completed.
10	RW	0x0	ATRFAIL When enabled, this interrupt is asserted if the ATR sequence fails.
9	RW	0x0	RXTHRESHOLD When enabled, this interrupt is asserted if the number of bytes in RX FIFO is equal or exceeds the RX FIFO threshold.
8	RW	0x0	C2CFULL When enabled, this interrupt is asserted if the time between two consecutive characters, transmitted between the Smart Card and the Reader in both directions, is equal the Two Characters Delay Limit described below. The C2CFULL interrupt is internally enabled from the ATR start to the deactivation or ATR restart initialization. It is recommended to use this counter to detect unresponsive Smart Cards.
7	RW	0x0	RXPERR When enabled, this interrupt is asserted after the character with wrong parity was received when the number of repeated receptions exceeds RXREPEAT value or T=1 protocol is used
6	RW	0x0	TXPERR When enabled, this interrupt is asserted if the Smart Card signals wrong character parity during the guard-time after the character transmission was repeated TXREPEAT-times
5	RW	0x0	RXDONE When enabled, this interrupt is asserted after a character was received from the Smart Card.
4	RW	0x0	TXDONE When enabled, this interrupt is asserted after one character was transmitted to the Smart Card.
3	RW	0x0	CLKSTOPRUN When enabled, this interrupt is asserted in two cases: 1. When the smart card clock is stopped (after CLOCKSTOP assertion). 2. When the new character transfer can be started (the smart card clock is fully running after CLOCKSTOP de-assertion).
2	RW	0x0	RXFIFULL When enabled, this interrupt is asserted if the RX FIFO is filled up.
1	RW	0x0	TXFIEMPTY When enabled, this interrupt is asserted if the TX FIFO is emptied out.
0	RW	0x0	TXFIDONE When enabled, this interrupt is asserted after all bytes from TX FIFO were transferred to the Smart Card

SCR_INTSTAT1

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	SCDEACT When enabled, this interrupt is asserted after the Smart Card deactivation sequence is complete.
14	RW	0x0	SCACT When enabled, this interrupt is asserted after the Smart Card activation sequence is complete.
13	RW	0x0	SCINS When enabled, this interrupt is asserted after the smart card insertion
12	RW	0x0	SCREM When enabled, this interrupt is asserted after the smart card removal.
11	RW	0x0	ATRDONE When enabled, this interrupt is asserted after the ATR sequence is successfully completed.
10	RW	0x0	ATRFAIL When enabled, this interrupt is asserted if the ATR sequence fails.
9	RW	0x0	RXTHRESHOLD When enabled, this interrupt is asserted if the number of bytes in RX FIFO is equal or exceeds the RX FIFO threshold.
8	RW	0x0	C2CFULL When enabled, this interrupt is asserted if the time between two consecutive characters, transmitted between the Smart Card and the Reader in both directions, is equal the Two Characters Delay Limit described below. The C2CFULL interrupt is internally enabled from the ATR start to the deactivation or ATR restart initialization. It is recommended to use this counter to detect unresponsive Smart Cards.
7	RW	0x0	RXPERR When enabled, this interrupt is asserted after the character with wrong parity was received when the number of repeated receptions exceeds RXREPEAT value or T=1 protocol is used
6	RW	0x0	TXPERR When enabled, this interrupt is asserted if the Smart Card signals wrong character parity during the guard-time after the character transmission was repeated TXREPEAT-times
5	RW	0x0	RXDONE When enabled, this interrupt is asserted after a character was received from the Smart Card.
4	RW	0x0	TXDONE When enabled, this interrupt is asserted after one character was transmitted to the Smart Card.
3	RW	0x0	CLKSTOPRUN When enabled, this interrupt is asserted in two cases: 1. When the smart card clock is stopped (after CLOCKSTOP assertion). 2. When the new character transfer can be started (the smart card clock is fully running after CLOCKSTOP de-assertion).
2	RW	0x0	RXFIFULL When enabled, this interrupt is asserted if the RX FIFO is filled up.
1	RW	0x0	TXFIEMPTY When enabled, this interrupt is asserted if the TX FIFO is emptied out.

Bit	Attr	Reset Value	Description
0	RW	0x0	TXFIDONE When enabled, this interrupt is asserted after all bytes from TX FIFO were transferred to the Smart Card

SCR_FIFOCTRL

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10	WO	0x0	RXFIFLUSH RX FIFO is flushed, when '1' is written to this bit.
9	RO	0x0	RXFIFULL RX FIFO Full
8	RO	0x0	RXFIEMPTY RX FIFO Empty
7:3	RO	0x00	reserved
2	WO	0x0	TXFIFLUSH TX FIFO is flushed, when '1' is written to this bit.
1	RO	0x0	TXFIFULL TX FIFO Full
0	RO	0x0	TXFIEMPTY TX FIFO Empty.

SCR_LEGTXFICNT

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RO	0x00	LEGTXFICNT It is equal to TX FIFO Counter up to value 255. All values above 255 are read as 255. It is recommended to use the 16-bit TX FIFO Counter instead of this register.

SCR_LEGRXFICNT

Address: Operational Base + offset (0x0019)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RO	0x00	LEGRXFICNT It is equal to RX FIFO Counter up to value 255. All values above 255 are read as 255. It is recommended to use the 16-bit RX FIFO Counter instead of this register.

SCR_RXFITH

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	RXFITH The interrupt is asserted when the number of bytes it receives is equal to, or exceeds the threshold

SCR_REP

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:4	RW	0x0	RXREP This is a 4-bit, read/write register that specifies the number of attempts to request character re-transmission after wrong parity was detected. The re-transmission of the character is requested using the 1 ETU long error signal during the guard-time
3:0	RW	0x0	TXREP This is a 4-bit, read/write register that specifies the number of attempts to re-transmit the character after the Smart Card signals the wrong parity during the guardtime.

SCR_SCCDDIV

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	SCCDDIV This is a 16-bit, read/write register that defines the divisor value used to generate the Smart Card Clock from the system clock.

SCR_BAUDDIV

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	BAUDDIV This is a 16-bit, read/write register that defines a divisor value used to generate the Baud Clock impulses from the system clock

SCR_SCGUTIME

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	SCGUTI This is an 8-bit, read/write register that sets a delay at the end of each character transmitted from the Smart Card Reader to the Smart Card. The value is in Elementary Time Units (ETU). The parity error is besides signaled during the guardtime

SCR_ADEATIME

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x00	ADEATIME Sets the duration of each part of the activation and deactivation sequence. The value is in Smart Card Clock Cycles.
7:0	RW	0x00	Reserved Reserved bits are hard-wired to zero.

SCR_LOWRSTTIME

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x00	LOWRSTTIME Sets the duration of the smart card reset sequence. This value is same for the cold and warm reset. The value is in terms of smart card clock cycles.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	Reserved Bits (7:0) of this register are hard-wired to zero.

SCR_ATRSTARTLIMIT

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x00	ATRSTARTLIMIT Defines the maximum time between the rising edge of the SCRSTN signal and the start of ATR response. The value is in terms of smart card clock cycles
7:0	RW	0x00	Reserved Bits (7:0) of this register are hard-wired to zero

SCR_C2CLIM

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	C2CLIM This is a 16-bit, read/write register that sets the maximum time between the leading edges of two, consecutive characters. The value is in ETUs.

SCR_INTEN2

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	TCKERR When enabled, this interrupt is asserted if the TCK byte does not match computed value.
0	RW	0x0	TXTHRESHOLD When enabled, this interrupt is asserted if the number of bytes in TX FIFO is equal or less than the TX FIFO threshold.

SCR_INTSTAT2

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	TCKERR When enabled, this interrupt is asserted if the TCK byte does not match computed value.
0	RW	0x0	TXTHRESHOLD When enabled, this interrupt is asserted if the number of bytes in TX FIFO is equal or less than the TX FIFO threshold.

SCR_TXFITH

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	TXFITH The interrupt is asserted when the number of bytes in TX FIFO is equal or less than the threshold

SCR_TXFIFOCNT

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x0000	TXFIFOCNT This is a 16-bit, read-only register that provides the number of bytes stored in the RX FIFO

SCR_RXFIFOCNT

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x0000	RXFIFOCNT This is a 16-bit, read-only register that provides the number of bytes stored in the RX FIFO.

SCR_BAUDTUNE

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	BAUDTUNE This is a 3-bit, read/write register that defines an additional value used to increase the accuracy of the Baud Clock impulses

SCR_FIFO

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	FIFO This is an 8-bit, read/write register that provides access to the receive and transmit FIFO buffers. The TX FIFO is accessed during the APB write transfer. The RX FIFO is accessed during the APB read transfer. All read/write accesses at address range 200h-3ffh are redirected to the FIFO.

25.5 Interface Description

Table 25-1 SCR Interface Description

Module Pin	Dir.	Pad Name	IOMUX Setting
sc_clk	O	I2S1_MCLK_M0/UART3_RTSn_M0/SCR_CLK/PCIE30X1_PERSTn_M2/GPIO1_A2_d	GRF_GPIO1A_IOMUX_L[11:8]=4'h3
sc_rst	O	I2S1_LRCK_TX_M0/UART4_RTSn_M0/SCR_RST/PCIE30X1_CLKREQn_M2/ACODEC_DAC_SYNC/GPIO1_A5_d	GRF_GPIO1A_IOMUX_H[7:4]=4'h3
sc_detect	I	I2S1_SDO0_M0/UART4_CTSn_M0/SCR_DET/AUDIOPWM_ROUT_N/ACODEC_DAC_DATAL/GPIO1_A7_d	GRF_GPIO1A_IOMUX_H[15:12]=4'h3
sc_io	I	I2S1_SCLK_TX_M0/UART3_CTSn_M0/SCR_IO/PCIE30X1_WAKEn_M2/ACODEC_DAC_CLK/GPIO1_A3_d	GRF_GPIO1A_IOMUX_L[15:12]=4'h3

Notes: I=input, O=output, I/O=input/output, bidirectional

25.6 Application Notes

25.6.1 BCHST/BCHLOC/BCHDE/SPARE Application

The Smart Card Clock signal is used as the main clock for the smart card. Its frequency can be adjusted using the Smart Card Clock Divisor (SCCDIV). This value is used to divide the system clock.

The SCCLK frequency is given by the following equation:

$$\mathrm{SCCLK_{freq}} = \frac{\mathrm{CLK\_freq}}{2 * (\mathrm{SCCDIV} + 1)}, \qquad \mathrm{SCCDIV} \cong \frac{\mathrm{CLK_{freq}}}{2 * \mathrm{SCCLK_{freq}}} - 1$$

SCCLK_freq– Smart Card Clock Frequency

CLK_freq- System Clock Frequency

The Baud Clock Impulse signal is used to transmit and receive serial data between the Smart Card Reader and the Smart Card. The baud rate can be modified using the Baud Clock Divisor (BAUDDIV)which is used to divide the system clock. The BAUDDIV value must be >= 4. The BAUD rate is given by the following equation:

$$\mathrm{BAUD_{rate}} = \frac{\mathrm{CLK\_freq}}{2 * (\mathrm{BAUDDIV} + 1)}$$

The duration of one bit, Elementary Time Unit (ETU) and parameters F and D are defined in the ISO/IEC7816-3 specification.

$$\frac{1}{\mathrm{BAUD\_rate}} \cong \mathrm{ETU} = \frac{\mathrm{F}}{\mathrm{D}} * \frac{1}{\mathrm{SCCLK_{freq}}}, \frac{\mathrm{F}}{\mathrm{D}} \cong \frac{\mathrm{BAUDDIV} + 1}{\mathrm{SCCDIV} + 1}$$

BAUDDIV equation based on SCCDIV value and Smart Card parameters F and D is following:

$$\mathrm{BAUDDIV} \cong (\mathrm{SCCDIV} + 1) * \frac{\mathrm{F}}{\mathrm{D}} - 1$$

During the first answer to reset response after the cold reset, the initial ETU must be equal to 372 Smart Card Clock Cycles (given by parameters F=372 and D=1). In this case, the BAUDDIV should be:

$$\mathrm{BAUDDIV} \cong (\mathrm{SCCDIV} + 1) * \frac{372}{1} - 1$$

After the ATR is completed, the BAUDDIV register value can be changed according to Smart Card parameters F and D.

Baud Tune Register (BAUDTUNE) 3-bit value that can be used to increase the accuracy of the Baud Clock impulses timing by using the BAUDTUNE Increment from Table listed below in combination with BAUDDIV register value.

Table 25-2 BAUDTUNE register

BAUDTUNE	000	001	010	011	100	101	110	111
BAUDTUNEINCR	+0	+0.125	0.25	+0.375	+0.5	+0.625	+0.75	+0.875

$$\mathrm{BAUDDIV} + \mathrm{BAUDTUNE_{INCR}} \cong (\mathrm{SCCDIV} + 1) * \frac{\mathrm{F}}{\mathrm{D}} - 1$$

The BAUDDIV register value (nearest integer) can be computed using following equation:

$$\mathrm{BAUDDIV} \cong (\mathrm{SCCDIV} + 1) * \frac{\mathrm{F}}{\mathrm{D}} - 1 - \mathrm{BAUDTUNE_{INCR}}$$

25.6.2 Smart Card Detect Application

It is configurable for SCR's detect pin when Smart Card is inserted.

When config GRF_SOC_CON2[5]=0, SCDETECT`s active state is 1.

When config GRF_SOC_CON2[5]=1, SCDETECT`s active state is 0.

Chapter 26 EBC

26.1 Overview

EBC is the TCON module for E-ink Electronic Paper Display (EPD).

26.1.1 Features

- **System interface**
  - AHB slave for register configuration
  - AHB master for frame data transfer (DMA)
  - Interrupt output
- **EPD interface**
  - E-ink EPD compatible
  - Up to 2200x1650 resolution
  - Up to 16 level gray scale
  - Up to 256 frames every scanning
  - LUT updateable (16KB)
  - Direct mode and LUT mode, THREE_WIN_MODE, EINK_mode
  - All-update mode and Diff-update mode
  - Single-phase and multi-phase mode
  - Support window display
  - Source driver interface
  - Gate driver interface

1	10	RGB888	{8'bx, R[7:0], G[7:0], B[7:0]}
1	11	RGB565	{ R1[4:0], G1[5:0], B1[4:0], R0[4:0], G0[5:0], B0[4:0]}

26.3.2 Waveform generation mode

1. Direct mode

In direct scanning mode, the source data is just read by internal DMA and sent to the display output directly.

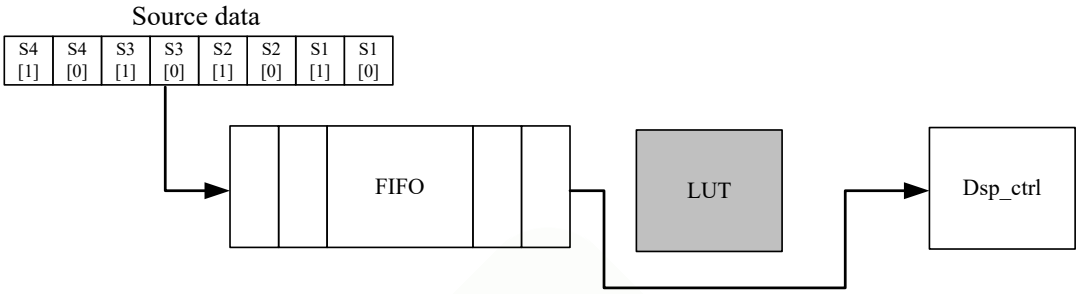

Fig.26-2 EBC Block Diagram

2. LUT mode

In LUT scanning mode, internal DMA read the original pixel data into the FIFO, then the pixel data is sent to the look-up table to be translated the EPD source data.

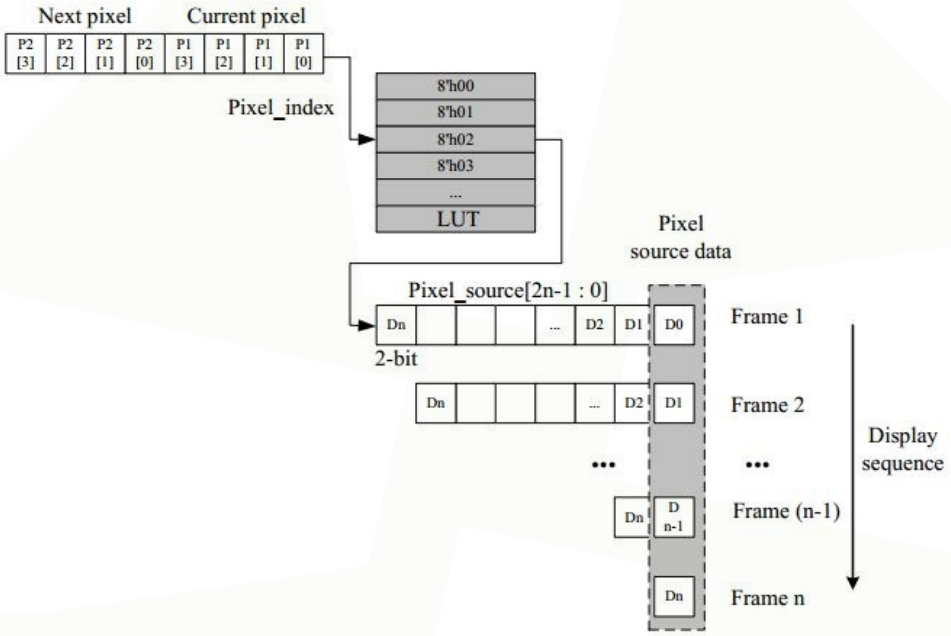

Fig.26-3 LUT mode Diagram

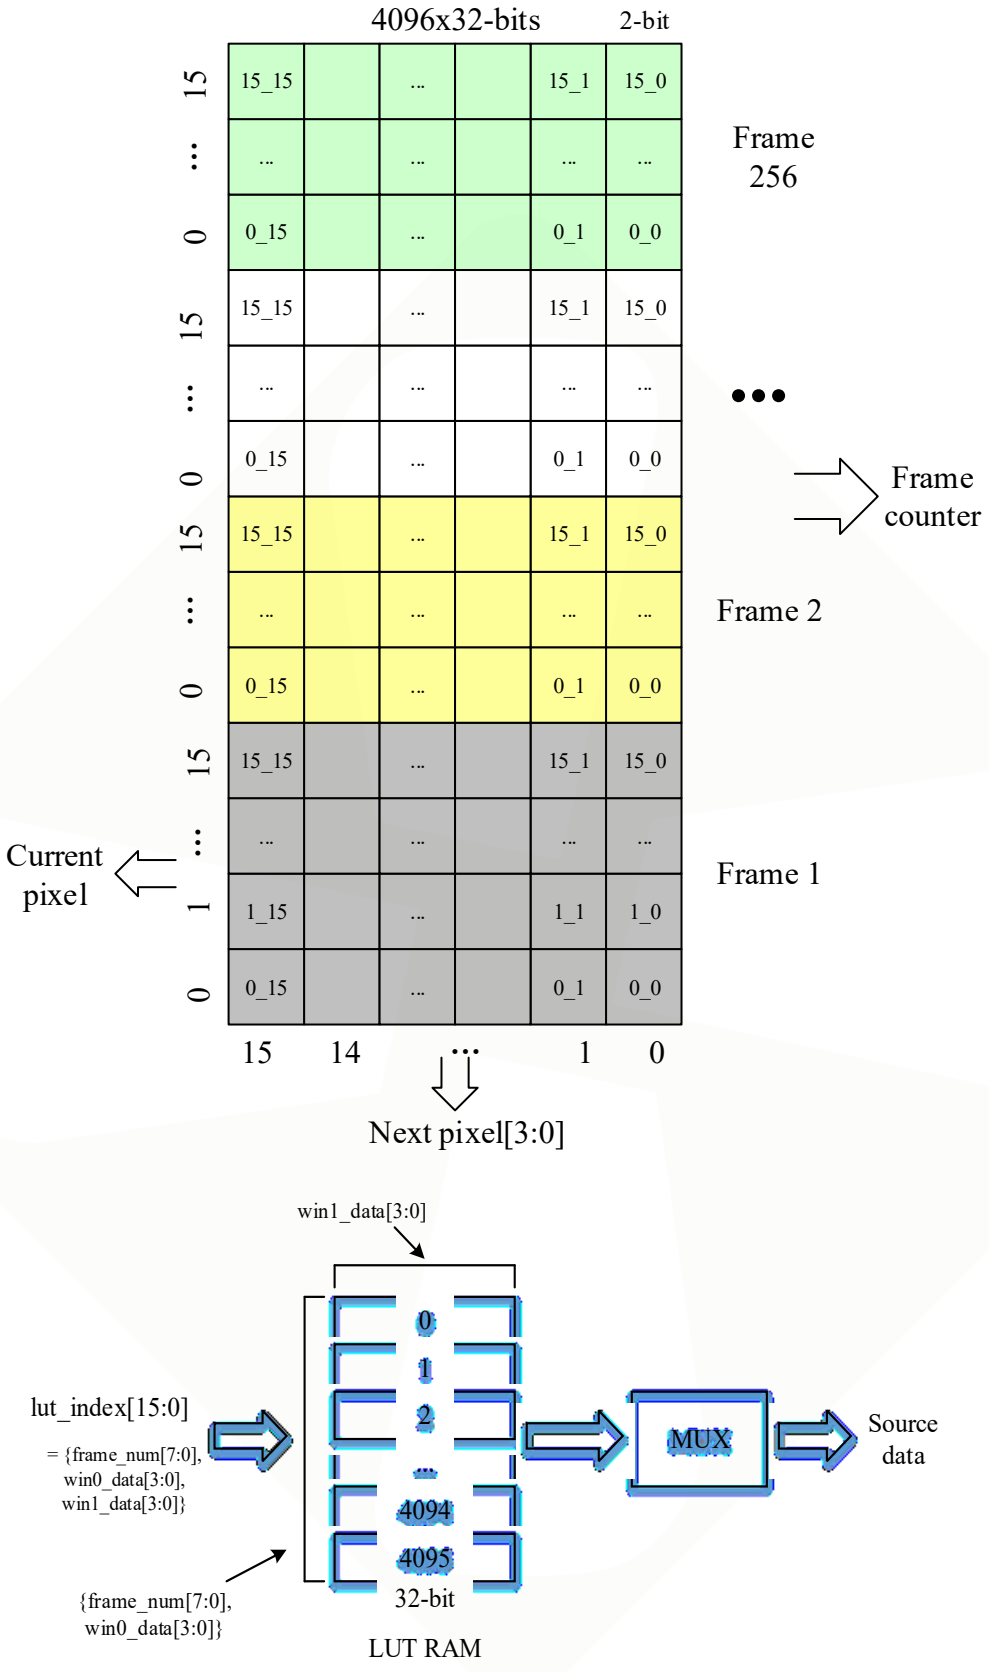

Fig.26-4 EBC LUT structure

3. 3win LUT mode

Compared with the LUT mode, in addition to the current image and the target image, the memory also contains frame number information. The frame number information in the

original LUT mode is counted by a counter, while the frame number information in 3win_mode is read from memory.

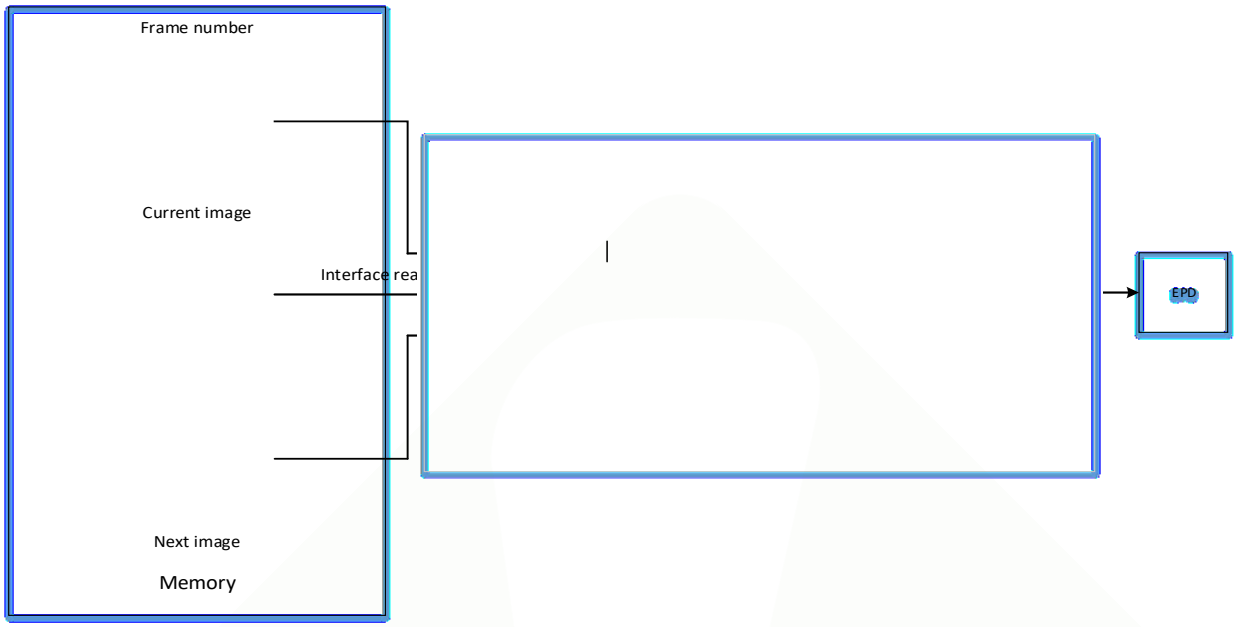

Fig.26-5 EBC 3win mode

4. EINK mode

Different from the other two look-up table modes, the data of the current image and the next image of eink_mode are stored in the same memory.

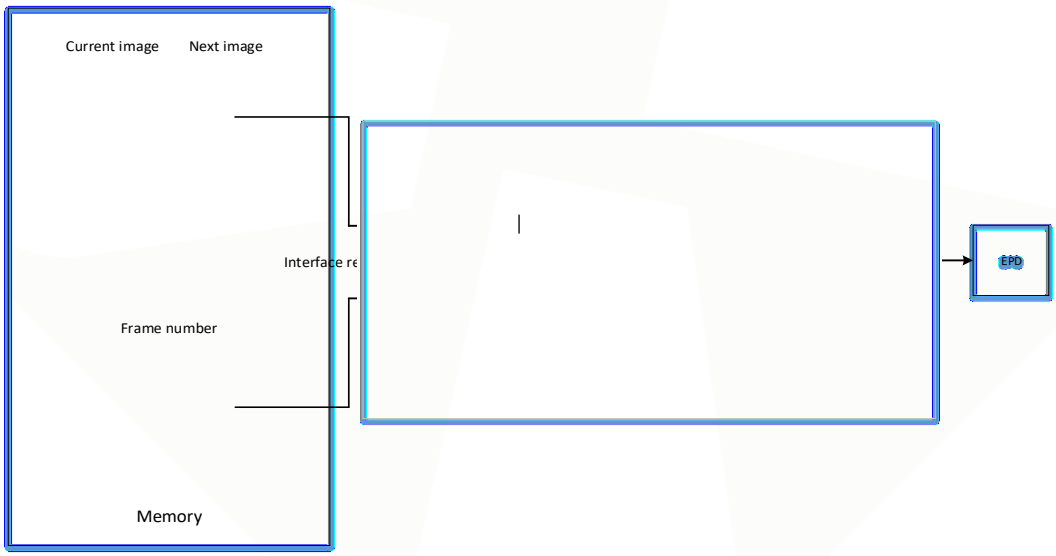

Fig.26-6 EINK mode

26.3.3 Window display mode

Window display is supported in EBC, dsp_win_width/dsp_win_height and dsp_win_st should be set to define the display window. The source value of other area is background value, which is configurable.

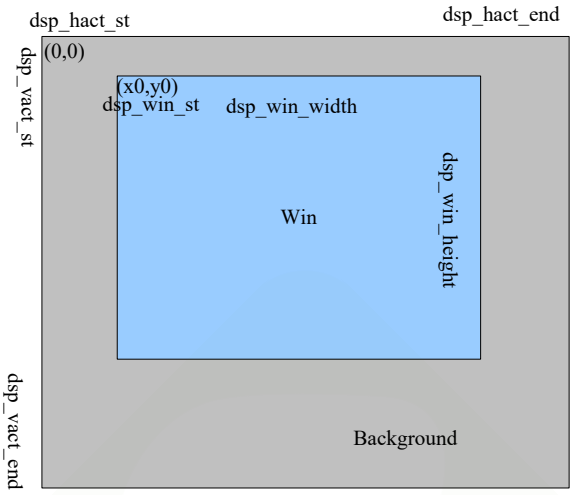

Fig.26-7 EBC window display

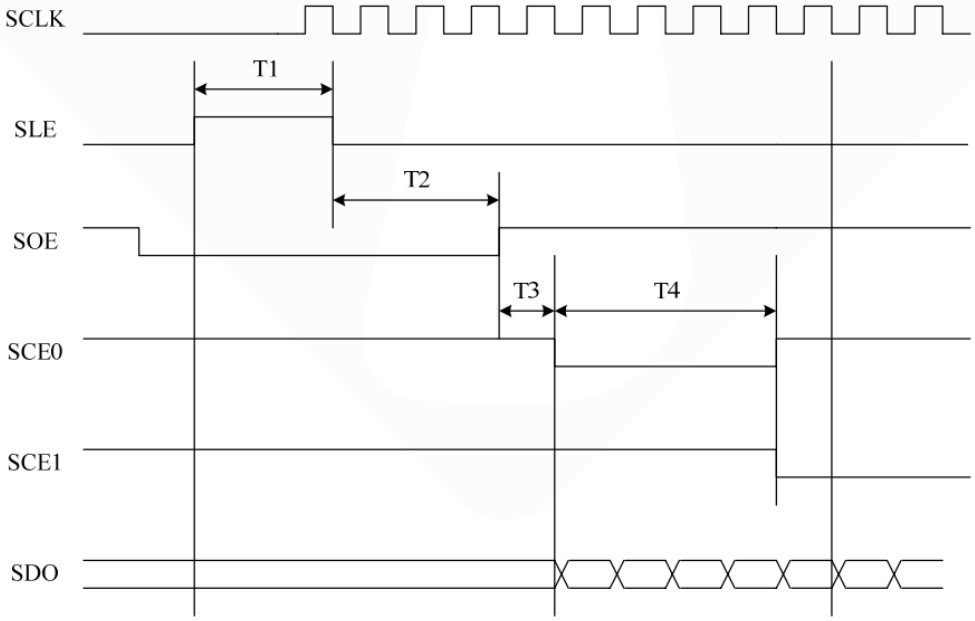
26.3.4 IO description

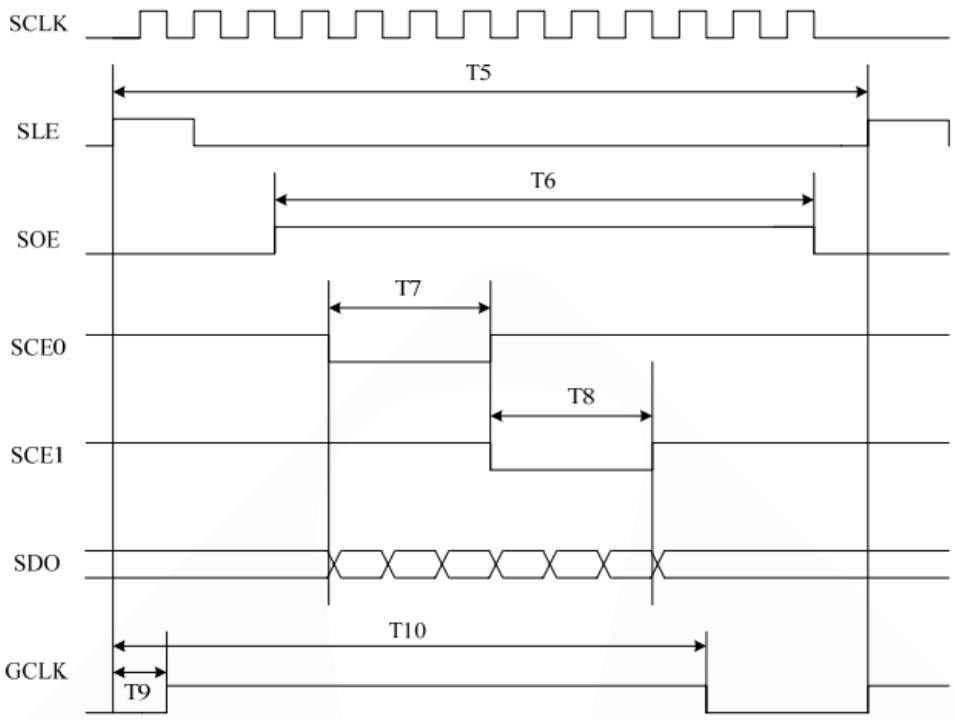
Table 26-2 EBC output pins

EINK	Description
SCLK	Source clock
SLE	Source latch data enable
SOE	Source data enable/start pulse
SCE[5:0]	
SDO[7:0]	Source data
SDIR	X scanning direction
GCLK	Gate clock
GSP	Gate start pulse
GOE	Gate output enable
GDIR	Y scanning direction
BORDER[1:0]	COM voltage
VCOM_CTRL	VCOM enable
PWR[2:0]	POWER control

26.3.5 Eink EPD driver interface

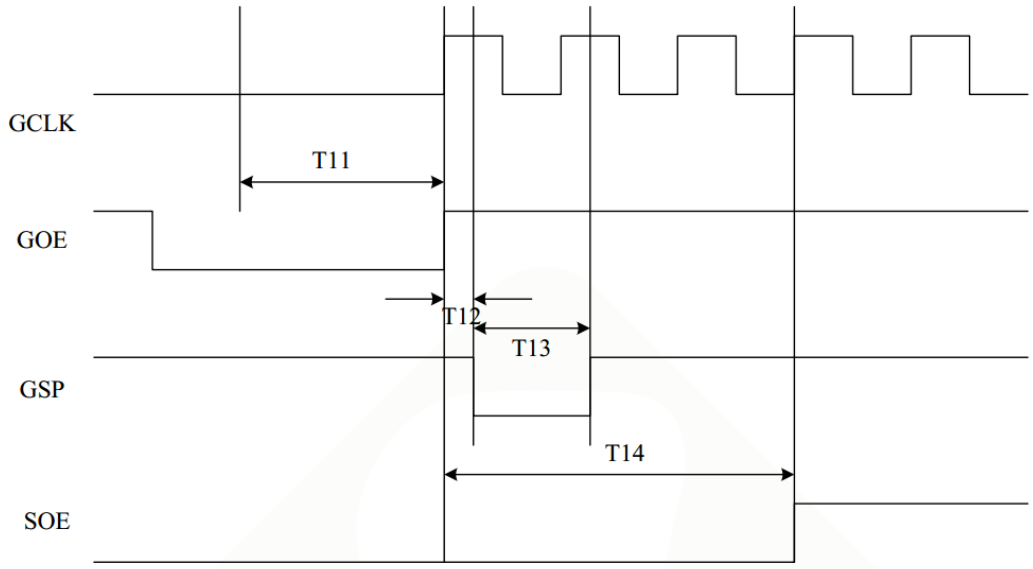
1. Source driver interface

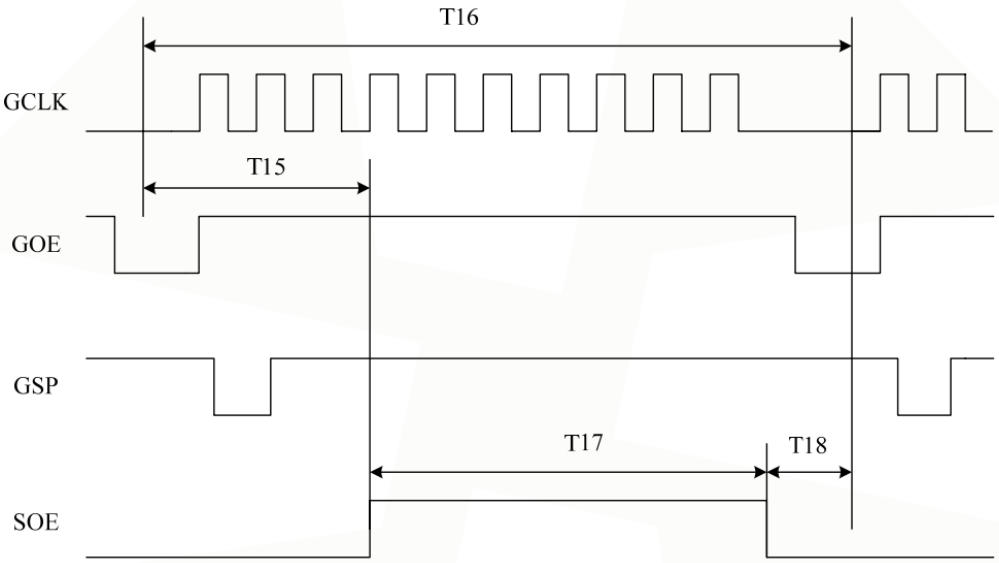




Timing	Value (6-inch 800x600)	Register setting
DCLK	33.25MHz	
SCLK	4 DCLK(8.3125 MHz)	(DSP_CLK_DIV+1)
T1	10 SCLK	DSP_HS_END
T2	3 SCLK	(DSP_HACT_ST – DSP_HS_END)
T3	1 SCLK	Fixed
T1+T2+T3	14 SCLK	DSP_WIN_XST
T4	100 SCLK	DSP_SCE_WIDTH
T5	315 SCLK	DSP_HTOTAL
T6	300 SCLK	(DSP_HACT_END – DSP_HACT_ST)
T7	100 SCLK	DSP_SCE_WIDTH
T8	100 SCLK	DSP_SCE_WIDTH
T9	0 SCLK	DSP_GCLK_ST
T10	215 SCLK	DSP_GCLK_END

2. Gate driver interface





Timing	Value (6-inch 800x600)	Register setting
GCLK	315 SCLK	DSP_HTOTAL
T11	4 GCLK	DSP_VS_END
T12	107 SCLK	(DSP_GD_END/2)
T13	1 GCLK	Fixed
T14	4 GCLK	(DSP_VACT_ST - DSP_VS_END)
T15	8 GCLK	DSP_VACT_ST
T16	619 GCLK	DSP_VTOTAL
T17	601 GCLK	(DSP_VACT_END - DSP_VACT_ST)
T18	11 GCLK	(DSP_VTOTAL - DSP_VACT_END)

26.4 Register Description

26.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
EBC_DSP_START	0x0000	W	0x00000000	Frame start register
EBC_EPD_CTRL	0x0004	W	0x00000000	EPD control register
EBC_DSP_CTRL	0x0008	W	0x00000000	display control register
EBC_DSP_HTIMING0	0x000C	W	0x00000000	panel scanning timing register(horizontal period, hsync pulse width)
EBC_DSP_HTIMING1	0x0010	W	0x00000000	panel scanning timing register(horizontal active start/end point)
EBC_DSP_VTIMING0	0x0014	W	0x00000000	panel scanning timing register(vertical period, vsync pulse width)
EBC_DSP_VTIMING1	0x0018	W	0x00000000	panel scanning timing register(vertical active start/end point)
EBC_DSP_ACT_INFO	0x001C	W	0x00000000	display width/height register
EBC_WIN_CTRL	0x0020	W	0x00000000	win data start address in memory
EBC_WIN_MST0	0x0024	W	0x00000000	current image data start address in memory
EBC_WIN_MST1	0x0028	W	0x00000000	next image data start address in memory
EBC_WIN_VIR	0x002C	W	0x00000000	win virtual width/height register
EBC_WIN_ACT	0x0030	W	0x00000000	Win active width/height register
EBC_WIN_DSP	0x0034	W	0x00000000	win display width/height register
EBC_WIN_DSP_ST	0x0038	W	0x00000000	win display start point
EBC_INT_STATUS	0x003C	W	0x00000000	Interrupt status register
EBC_VCOM0	0x0040	W	0x00000000	VCOM setting register
EBC_VCOM1	0x0044	W	0x00000000	VCOM setting register
EBC_VCOM2	0x0048	W	0x00000000	VCOM setting register
EBC_VCOM3	0x004C	W	0x00000000	VCOM setting register
EBC_CONFIG_DONE	0x0050	W	0x00000000	register config done flag
EBC_VNUM	0x0054	W	0x00000000	EBC line flag num
EBC_WIN_MST2	0x0058	W	0x00000000	Frame win memory start
EBC_LUT_ADDRESS_MAP_0	0x1000	W	0x00000000	LUT ADDRESS_0
EBC_LUT_ADDRESS_MAP_4095	0x4FFC	W	0x00000000	LUT ADDRESS_4095

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

26.4.2 Detail Register Description

EBC_DSP_START

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	dsp_out_low 1'b0: normal 1'b1: outputs are low
30:26	RO	0x00	reserved
25:16	RW	0x000	dsp_sdce_width source driver length
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13	RW	0x0	dsp_eink_mode eink mode enable 1'b0: lut mode or direct mode or 3win mode 1'b1: eink mode
12	RW	0x0	sw_burst_ctrl 1'b0: original burst 1'b1: modified burst
11:10	RO	0x0	reserved
9:2	RW	0x00	dsp_frm_total frame total number(n) frame_num = n+1.
1	RW	0x0	dsp_rst soft reset bit
0	RW	0x0	dsp_frm_st frame start bit writing '1' to trigger frame display. read this bit for hold status.

EBC_EPD_CTRL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	eink_mode_swap 1'b0: no swap 1'b1: swap
30	RW	0x0	eink_mode_frm_sel 1'b0: frame cnt 1'b1: win2 data
29:27	RO	0x0	reserved
26:16	RW	0x000	dsp_gd_end GCLK falling edge point(SCLK), which count from the falling edge of hsync
15:8	RW	0x00	dsp_gd_st GCLK rising edge point(SCLK), which count from the falling edge of hsync
7	RW	0x0	dsp_three_win_mode three win mode enable 1'b0: lut mode or direct mode 1'b1: three win mode
6	RW	0x0	dsp_sddw_mode source data output width 1'b0: 8-bit output 1'b1: 16-bit output
5	RW	0x0	epd_auo EPD panel 1'b0: Eink 1'b1: AUO
4:2	RW	0x0	epd_pwr power enable
1	RW	0x0	epd_gdrl gate scanning direction 1'b0: top to button 1'b1: button to top

Bit	Attr	Reset Value	Description
0	RW	0x0	epd_sdshr source scanning direction 1'b0: left to right 1'b1: right to left

EBC_DSP_CTRL

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	dsp_swap_mode display swap for 8bit output 2'b00: SDO[7:0] = P3,P2,P1,P0 2'b01: SDO[7:0] = P1,P0,P3,P2 2'b10: SDO[7:0] = P2,P3,P0,P1 2'b11: SDO[7:0] = P0,P1,P2,P3 for 16bit output 2'b00: SDO[15:0] = P7,P6,P5,P4,P3,P2,P1,P0 2'b01: SDO[15:0] = P4,P5,P6,P7,P0,P1,P2,P3 2'b10: SDO[15:0] = P0,P1,P2,P3,P4,P5,P6,P7 2'b11: SDO[15:0] = P3,P2,P1,P0,P7,P6,P5,P4
29	RW	0x0	dsp_diff_mode diff update mode enable 1'b0: normal update mode 1'b1: diff update mode
28	RW	0x0	dsp_lut_mode display mode 1'b0: direct mode 1'b1: LUT mode
27	RW	0x0	dsp_vcom_mode VCOM Mode 1'b0: one phase scanning mode 1'b1: multi phase scanning mode
26	RW	0x0	dsp_gdoe_pol DSP OUTPUT GOE polarity invert 1'b0: default 1'b1: invert
25	RW	0x0	dsp_gdsp_pol DSP OUTPUT GSP polarity invert 1'b0: default 1'b1: invert
24	RW	0x0	dsp_gdclk_pol DSP OUTPUT GCLK polarity invert 1'b0: default 1'b1: invert
23	RW	0x0	dsp_sdce_pol DSP OUTPUT SCE polarity invert 1'b0: default 1'b1: invert
22	RW	0x0	dsp_sdoe_pol DSP OUTPUT SOE polarity invert 1'b0: default 1'b1: invert

Bit	Attr	Reset Value	Description
21	RW	0x0	dsp_sdle_pol DSP OUTPUT SLE polarity invert 1'b0: default 1'b1: invert
20	RW	0x0	dsp_sdclk_pol DSP_OUTPUT SCLK polarity invert 1'b0: default 1'b1: invert
19:16	RW	0x0	dsp_sdclk_div SCLK divide rate SCLK = (DSP_CLK_DIV + 1) * DCLK
15:0	RW	0x0000	dsp_background SDO default value

EBC_DSP_HTIMING0

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	dsp_htotal panel display scanning horizontal period.
15:8	RO	0x00	reserved
7:0	RW	0x00	dsp_hs_end panel display scanning hsync(SLE) pulse width.

EBC_DSP_HTIMING1

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	dsp_hact_end panel display scanning horizontal active end point
15:8	RO	0x00	reserved
7:0	RW	0x00	dsp_hact_st panel display scanning horizontal active start point

EBC_DSP_VTIMING0

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	dsp_vtotal panel display scanning vertical period.
15:8	RO	0x00	reserved
7:0	RW	0x00	dsp_vs_end panel display scanning vsync(GOE) pulse width.

EBC_DSP_VTIMING1

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	dsp_vact_end panel display scanning vertical active end point
15:8	RO	0x00	reserved
7:0	RW	0x00	dsp_vact_st panel display scanning vertical active start point

EBC_DSP_ACT_INFO

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	dsp_height display height
15:12	RO	0x0	reserved
11:0	RW	0x000	dsp_width display width

EBC_WIN_CTRL

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:19	RW	0x000	win2_fifo_almost_full_level win2(frame_num) fifo almost full level
18	RW	0x0	win_en win enable
17:13	RW	0x00	ahb_incr_num_reg ahb master incr num
12:10	RW	0x0	ahb_burst_reg ahb master burst type
9:2	RW	0x00	win_fifo_almost_full_level win fifo almost full level
1:0	RW	0x0	win_fmt win source data format: 2'b00: Y-data(4bpp) 2'b01: Y-data(8bpp) 2'b10: RGB888(24bpp) 2'b11: RGB565(16bpp)

EBC_WIN_MST0

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	win_mst0 start address of current image data in memory

EBC_WIN_MST1

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	win_mst1 start address of next image data in memory

EBC_WIN_VIR

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	win_vir_height win virtual height
15:0	RW	0x0000	win_vir_width win virtual width

EBC_WIN_ACT

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	win_act_height win active height
15:12	RO	0x0	reserved
11:0	RW	0x000	win_act_width win active width

EBC_WIN_DSP

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	win_dsp_height win display height
15:12	RO	0x0	reserved
11:0	RW	0x000	win_dsp_width win display width

EBC_WIN_DSP_ST

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	win_dsp_yst win display y start point
15:12	RO	0x0	reserved
11:0	RW	0x000	win_dsp_xst win display x start point

EBC_INT_STATUS

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:12	RW	0x00	dsp_frm_int_num frame number of the scanning flag interrupt the display frame number when the flag interrupt occur, the range is (0~DSP_FRM_NUM-1).
11	RW	0x0	line_flag_int_clr line flag interrupt clear: after be set to 1, this bit will clear by itself 1 cycle later.
10	RW	0x0	dsp_frm_int_clr display frame interrupt clear: after be set to 1, this bit will clear by itself 1 cycle later.
9	RW	0x0	dsp_end_int_clr display end interrupt clear: after be set to 1, this bit will clear by itself 1 cycle later.
8	RW	0x0	frm_end_int_clr frame end interrupt clear: after be set to 1, this bit will clear by itself 1 cycle later.
7	RW	0x0	line_flag_int_msk line flag interrupt mask 1'b0: unmask 1'b1: mask

Bit	Attr	Reset Value	Description
6	RW	0x0	dsp_frm_int_msk frame flag interrupt mask: 1'b0: unmask 1'b1: mask
5	RW	0x0	dsp_end_int_msk display end interrupt mask: 1'b0: unmask 1'b1: mask
4	RW	0x0	frm_end_int_msk frame end interrupt mask: 1'b0: unmask 1'b1: mask
3	RO	0x0	line_flag_int_st line flag interrupt status
2	RO	0x0	dsp_frm_int_st frame flag interrupt status
1	RO	0x0	dsp_end_int_st display end interrupt status
0	RO	0x0	frm_end_int_st frame end interrupt status

EBC_VCOM0

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_0 VCOM[1:0] values in 0-15 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_VCOM1

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_1 VCOM[1:0] values in 16-31 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_VCOM2

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_2 VCOM[1:0] values in 32-47 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_VCOM3

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_3 VCOM[1:0] values in 48-64 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_CONFIG_DONE

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	reg_config_done in the first setting of the register, the new value was saved into the mirror register. when all the register config finish, writing this register to enable the copyright of the mirror register to real register. then register would be updated at the start of every frame.

EBC_VNUM

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	dsp_vcnt readable register for Internal line number
15:12	RO	0x0	reserved
11:0	RW	0x000	line_flag_num line number of the scanning flag interrupt the display line number when the flag interrupt occur,the range is (0~DSP_VTOTAL-1).

EBC_WIN_MST2

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	win_mst2 start address of frame data in memory

EBC_LUT_ADDRESS_MAP_0

Address: Operational Base + offset (0x1000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lut_data0 LUT_data0

EBC_LUT_ADDRESS_MAP_4095

Address: Operational Base + offset (0x4FFC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lut_data4095 LUT_data4095

26.5 Interface Description

Table 26-3 EBC Interface Description

Module Pin	Dir.	Pad Name	IOMUX Setting

Notes: I=input, O=output, I/O=input/output, bidirectional

26.6 Application Notes

We use AHB bus to configure EBC. There are four modes in EBC and the specific configuration is as follow.

26.6.1 Direct mode

Step1: set dsp_eink_mode=0, dsp_three_win_mode=0, dsp_lut_mode=0;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen;

26.6.2 LUT mode

Step1: set dsp_eink_mode=0, dsp_three_win_mode=0, dsp_lut_mode=1;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen;

26.6.3 3win LUT mode

Step1: set dsp_eink_mode=0, dsp_three_win_mode=1, dsp_lut_mode=0;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen;

26.6.4 Eink_mode

Step1: set dsp_eink_mode=1, dsp_three_win_mode=0, dsp_lut_mode=0, eink_mode_swap=1;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen.

Chapter 27 MIPI CSI HOST

27.1 Overview

The CSI-2 Host Controller is designed to receive data from a CSI-2 compliant camera sensor. A D-PHY configured as a Slave acts as the physical layer.

The MIPI CSI-2 Host Controller supports the following features:

- Compliant with MIPI Alliance Specification for CSI-2, Version 1.01.00-9 November 2010
- Interface with MIPI D-PHY following PHY Protocol Interface, as defined in "MIPI Alliance Specification for D-PHY, Version 1.1-7 November 2011"
- Up to four D-PHY RX data lanes
- Dynamically configurable multi-lane merging
- Long and Short packet decoding
- Timing accurate signaling of Frame and Line synchronization packets
- Several Frame formats
  - General Frame or Digital Interlaced Video with or without accurate sync timing
  - Data Type (Packet or Frame Level) and Virtual Channel interleaving
- 32-bit Image Data Interface delivering data formatted as recommended in CSI-2 Specification
- All primary and secondary data formats
  - RGB, YUV, and RAW color space definitions
  - From 24-bit down to 6-bit per pixel
  - Generic or user-defined byte-based data types
- Error detection and correction
  - PHY level
  - Packet level
  - Line level
  - Frame level
- Support DSI video mode/command mode

27.2 Block Diagram

The following diagram shows the MIPI CSI-2 Host Controller architecture.

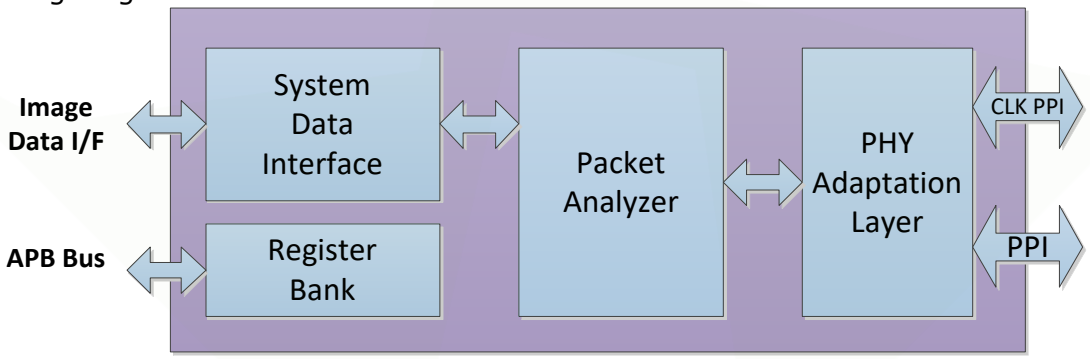

Fig. 27-1 MIPI CSI-2 Host Controller Architecture

- **PHY Adaptation Layer**: Manages the D-PHY PPI interface
- **Packet Analyzer**: Merges the data from the different lanes
- **Image Data Interface**: Reorders pixels into 32-bit data for memory storage and generates timing accurate video synchronization signals
- **AMBA-APB Register Bank**: Provides access to configuration and control registers

27.3 Function Description

27.3.1 Supported Resolutions and Frame Rates

The CSI-2 specification does not define the supported standard resolutions or frame rates. Camera sensor resolution, blanking periods, synchronization events, frame rates, and pixel color depth play a fundamental role in the required bandwidth. All these variables make it difficult to define a standard procedure to estimate the minimum lane rate and the minimum number of lanes that support a specific CSI-2 device.

Following table presents some predefined and supported camera settings, assuming the

following:

- Clock lane frequency is 500 MHz or 750 MHz that results in a bandwidth of 1 Gbps or 1.5 Gbps respectively, for each data lane.
- No significant control/reserved traffic is present on the link when pixel data is being transmitted.

The last column of following table presents the minimum number of lanes required for each configuration.

Table 27-1 Supported Camera Settings

Mega Pixels	Mega Pixels with Overhead	Refresh Rate (Hz)	Color Depth (bpp)	CSI2 BW (Mbits)	D-PHY at 1 Gbps Number of Lanes	D-PHY at 1.5Gbps Number of Lanes
2MP	2560000	15	24	922	1	1
2MP	2560000	30	24	1843	2	2
3MP	3840000	15	16	922	1	1
3MP	3840000	30	16	1843	2	2
3MP	3840000	30	24	2765	3	2
5MP	6400000	15	16	1536	2	2
5MP	6400000	15	24	2304	3	2
5MP	6400000	30	16	3072	4	3
8MP	10240000	15	16	2458	3	2
8MP	10240000	15	24	3686	4	3
8MP	10240000	30	12	3686	4	3
12MP	15360000	15	12	2765	3	2
12MP	15360000	15	16	3686	4	3
14MP	17920000	15	12	3226	4	3
16MP	20480000	15	12	3686	4	3
Video Formats						
1280x720 pixels(720p)	921600	30	24	664	1	1
1280x720 pixels(720p)	921600	60	24	1327	2	1
1920x1080 pixels(1080p)	2073600	60	24	2986	3	2

27.3.2 Error Detection

The CSI-2 Host Controller analyzes the received packets and determines if there are protocol errors. It is possible to monitor the following errors:

- Frame errors such as incorrect Frame sequence, reception of a CRC error in the most recent frame, and the mismatch between Frame Start and Frame End
- Line errors such as incorrect line sequence and mismatch between Line Start and Line End
- Packet errors such as ECC or CRC mismatch
- D-PHY errors such as synchronization pattern mismatch

Following table shows all the errors that CSI-2 Host Controller can identify.

Table 27-2 Errors Identified by the CSI-2 Host Controller

Error	Description	Level	Action
phy_errsotsynchs_*	Start of transmission error on data lane* with no synchronization achieved	PHY	Packets with this error are not delivered in IDI interface
phy_erresc_*	Escape entry error (ULPM) on data lane*	PHY	Informative only. Error is acknowledged in the register and the interrupt pin is raised.
phy_errsoths_*	Start of transmission error on data lane* but	PHY	Informative only since PHY can recover from this

Error	Description	Level	Action
	synchronization can still be achieved		error. Error is acknowledged in register and the interrupt pin is raised.
vc*_err_crc	Checksum error detected on virtual channel*	Packet	Informative only. Error is acknowledged in the register and Interrupt pin is raised.
vc*_err_crc	Header ECC contains one error detected on virtual channel*	Packet	Informative only since controller can recover the correct header. Error is acknowledged in the register and the interrupt pin is raised.
err_ecc_double	Header ECC contains two errors. Unrecoverable.	Packet	Packets with this error are not delivered in IDI.s
err_id_vc*	Unrecognized or unimplemented data type detected in virtual channel*	Packet	Informative only. Error is acknowledged in the register and the interrupt pin is raised
err_f_bndry_match_vc*	Error matching Frame Start with Frame End for virtual channel*	Frame	Informative only. Error is acknowledged in register and the interrupt pin is raised if not masked.
err_f_seq_vc*	Incorrect Frame Sequence detected in virtual channel*	Frame	Informative only. Error is acknowledged in register and the interrupt pin is raised if not masked.
err_frame_data_vc*	Last received frame, in virtual channel*, had at least one CRC error	Frame	Informative only. Error is acknowledged in the register and the interrupt pin is raised.

27.4 Register Description

27.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

27.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
CSI2HOST_VERSION	0x0000	W	0x00000000	Controller version identification
CSI2HOST_N_LANES	0x0004	W	0x00000000	Number of active data lanes
CSI2HOST_CSI2_RESETN	0x0010	W	0x00000000	CSI2 controller reset
CSI2HOST_PHY_STATE	0x0014	W	0x00000000	General settings for all blocks
CSI2HOST_DATA_IDS_1	0x0018	W	0x00000000	Data IDS for which IDI reports line boundary matching errors
CSI2HOST_DATA_IDS_2	0x001C	W	0x00000000	Data IDS for which IDI reports line boundary matching errors
CSI2HOST_ERR1	0x0020	W	0x00000000	Error state register 1
CSI2HOST_ERR2	0x0024	W	0x00000000	Error state register 2
CSI2HOST_MSK1	0x0028	W	0x00000000	Masks for errors 1
CSI2HOST_MSK2	0x002C	W	0x00000000	Masks for errors 2
CSI2HOST_CONTROL	0x0040	W	0x0C204000	Control

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

27.4.3 Detail Registers Description

CSI2HOST_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	version Version of the csi2host.

CSI2HOST_N_LANES

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	n_lanes Number of active data lanes. 2'b00: 1 data lane(lane 0) 2'b01: 2 data lanes(lane0 and 1) 2'b10: 3 data lanes(lane0,1,and 2) 2'b11: 4 data lanes(ALL) Can only be updated when the D-PHY lane is in the Stop state.

CSI2HOST_CSI2_RESETN

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	csi2_resetn CSI2 controller reset output. Active low.

CSI2HOST_PHY_STATE

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RW	0x0	bypass_2ecc_tst Payload Bypass test mode for double ECC errors.
10	RO	0x0	phy_stopstateclk Clock lane in Stop state.
9	RO	0x0	phy_rxulpsclknot This signal indicates that the clock lane module has entered the Ultra Low Power state. Active low.
8	RO	0x0	phy_rxclkactivehs Indicates that the clock lane is actively receiving a DDR clock.
7	RO	0x0	phy_stopstatedata_3 Data lane 3 in Stop state.
6	RO	0x0	phy_stopstatedata_2 Data lane 2 in Stop state.
5	RO	0x0	phy_stopstatedata_1 Data lane 1 in Stop state.
4	RO	0x0	phy_stopstatedata_0 Data lane 0 in Stop state.
3	RO	0x0	phy_rxulpsesc_3 Lane module0 has entered the Ultra Low Power mode.
2	RO	0x0	phy_rxulpsesc_2 Lane module2 has entered the Ultra Low Power mode.

Bit	Attr	Reset Value	Description
1	RO	0x0	phy_rxulpsesc_1 Lane module1 has entered the Ultra Low Power mode.
0	RO	0x0	phy_rxulpsesc_0 Lane module0 has entered the Ultra Low Power mode.

CSI2HOST_DATA_IDS_1

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	di3_vc Data ID 3 virtual channel.
29:24	RW	0x00	di3_dt Data ID 3 data type.
23:22	RW	0x0	di2_vc Data ID 2 virtual channel.
21:16	RW	0x00	di2_dt Data ID 2 data type.
15:14	RW	0x0	di1_vc Data ID 1 virtual channel.
13:8	RW	0x00	di1_dt Data ID 1 data type.
7:6	RW	0x0	di0_vc Data ID 0 virtual channel.
5:0	RW	0x00	di0_dt Data ID 0 data type.

CSI2HOST_DATA_IDS_2

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	di7_vc Data ID 7 virtual channel.
29:24	RW	0x00	di7_dt Data ID 7 data type.
23:22	RW	0x0	di6_vc Data ID 6 virtual channel.
21:16	RW	0x00	di6_dt Data ID 6 data type.
15:14	RW	0x0	di5_vc Data ID 5 virtual channel.
13:8	RW	0x00	di5_dt Data ID 5 data type.
7:6	RW	0x0	di4_vc Data ID 4 virtual channel.
5:0	RW	0x00	di4_dt Data ID 4 data type.

CSI2HOST_ERR1

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31	RW	0x0	err_ph_crc_lane2 Packet crc error of lane2 when sw_cphy_en=1.
30	RW	0x0	err_ph_crc_lane1 Packet crc error of lane1 when sw_cphy_en=1.
29	RW	0x0	err_ph_crc_lane0 Packet crc error of lane0 when sw_cphy_en=1.

Bit	Attr	Reset Value	Description
28	RO	0x0	err_ecc_double Header ECC contains 2 errors,unrecoverable.
27	RO	0x0	vc3_err_crc Checksum error detected on virtual channel 3.
26	RO	0x0	vc2_err_crc Checksum error detected on virtual channel 2.
25	RO	0x0	vc1_err_crc Checksum error detected on virtual channel 1.
24	RO	0x0	vc0_err_crc Checksum error detected on virtual channel 0.
23:16	RO	0x00	reserved
15	RO	0x0	err_frame_data_vc3 Last received frame,in virtual channel 3,had at least one CRC error.
14	RO	0x0	err_frame_data_vc2 Last received frame,in virtual channel 2,had at least one CRC error.
13	RO	0x0	err_frame_data_vc1 Last received frame,in virtual channel 1,had at least one CRC error.
12	RO	0x0	err_frame_data_vc0 Last received frame,in virtual channel 0,had at least one CRC error.
11	RO	0x0	err_f_seq_vc3 Incorrect frame sequence detected in virtual channel 3.
10	RO	0x0	err_f_seq_vc2 Incorrect frame sequence detected in virtual channel 2.
9	RO	0x0	err_f_seq_vc1 Incorrect frame sequence detected in virtual channel 1.
8	RO	0x0	err_f_seq_vc0 Incorrect frame sequence detected in virtual channel 0.
7	RO	0x0	err_f_bndry_match_vc3 Error matching frame start with frame end for virtual channel 3.
6	RO	0x0	err_f_bndry_match_vc2 Error matching frame start with frame end for virtual channel 2.
5	RO	0x0	err_f_bndry_match_vc1 Error matching frame start with frame end for virtual channel 1.
4	RO	0x0	err_f_bndry_match_vc0 Error matching frame start with frame end for virtual channel 0.
3	RO	0x0	phy_errsotsynchs_3 Start of transmission error on data lane 3.
2	RO	0x0	phy_errsotsynchs_2 Start of transmission error on data lane 2.
1	RO	0x0	phy_errsotsynchs_1 Start of transmission error on data lane 1.
0	RO	0x0	phy_errsotsynchs_0 Start of transmission error on data lane 0(no synchronization achieved).

CSI2HOST_ERR2

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved

Bit	Attr	Reset Value	Description
27	RW	0x0	phy_errcodehs_3 Lane 3 receiv error code.
26	RW	0x0	phy_errcodehs_2 Lane 2 receiv error code.
25	RW	0x0	phy_errcodehs_1 Lane 1 receiv error code.
24	RW	0x0	phy_errcodehs_0 Lane 0 receiv error code.
23:16	RO	0x00	reserved
15	RW	0x0	err_id_vc3 Unrecognized or unimplemented data type detected in virtual channel 3.
14	RW	0x0	err_id_vc2 Unrecognized or unimplemented data type detected in virtual channel 2.
13	RW	0x0	err_id_vc1 Unrecognized or unimplemented data type detected in virtual channel 1.
12	RW	0x0	err_id_vc0 Unrecognized or unimplemented data type detected in virtual channel 0.
11	RW	0x0	vc3_err_ecc_corrected Header error detected and corrected on virtual channel 3.
10	RW	0x0	vc2_err_ecc_corrected Header error detected and corrected on virtual channel 2.
9	RW	0x0	vc1_err_ecc_corrected Header error detected and corrected on virtual channel 1.
8	RW	0x0	vc0_err_ecc_corrected Header error detected and corrected on virtual channel 0.
7	RW	0x0	phy_errsoths_3 Start of transmission error on data lane 3(synchronization can still be achieved).
6	RW	0x0	phy_errsoths_2 Start of transmission error on data lane 2(synchronization can still be achieved).
5	RW	0x0	phy_errsoths_1 Start of transmission error on data lane 1(synchronization can still be achieved).
4	RW	0x0	phy_errsoths_0 Start of transmission error on data lane 0(synchronization can still be achieved).
3	RW	0x0	phy_erresc_3 Escape entry error(ULPM) on data lane 3.
2	RW	0x0	phy_erresc_2 Escape entry error(ULPM) on data lane 2.
1	RW	0x0	phy_erresc_1 Escape entry error(ULPM) on data lane 1.
0	RW	0x0	phy_erresc_0 Escape entry error(ULPM) on data lane 0.

CSI2HOST_MSK1

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31	RW	0x0	mask_err_ph_crc_lane2 Mask for err_ph_crc_lane2.
30	RW	0x0	mask_err_ph_crc_lane1 Mask for err_ph_crc_lane1.
29	RW	0x0	mask_err_ph_crc_lane0 Mask for err_ph_crc_lane0.
28	RW	0x0	mask_err_ecc_double Mask for err_ecc_double.
27	RW	0x0	mask_vc3_err_crc Mask for vc3_err_crc.
26	RW	0x0	mask_vc2_err_crc Mask for vc2_err_crc.
25	RW	0x0	mask_vc1_err_crc Mask for vc1_err_crc.
24	RW	0x0	mask_vc0_err_crc Mask for vc0_err_crc.
23:16	RO	0x00	reserved
15	RW	0x0	mask_err_frame_data_vc3 Mask for err_frame_data_vc3.
14	RW	0x0	mask_err_frame_data_vc2 Mask for err_frame_data_vc2.
13	RW	0x0	mask_err_frame_data_vc1 Mask for err_frame_data_vc1.
12	RW	0x0	mask_err_frame_data_vc0 Mask for err_frame_data_vc0.
11	RW	0x0	mask_err_f_seq_vc3 Mask for err_f_seq_vc3.
10	RW	0x0	mask_err_f_seq_vc2 Mask for err_f_seq_vc2.
9	RW	0x0	mask_err_f_seq_vc1 Mask for err_f_seq_vc1.
8	RW	0x0	mask_err_f_seq_vc0 Mask for err_f_seq_vc0.
7	RW	0x0	mask_err_f_bndry_match_vc3 Mask for err_f_bndry_match_vc3.
6	RW	0x0	mask_err_f_bndry_match_vc2 Mask for err_f_bndry_match_vc2.
5	RW	0x0	mask_err_f_bndry_match_vc1 Mask for err_f_bndry_match_vc1.
4	RW	0x0	mask_err_f_bndry_match_vc0 Mask for err_f_bndry_match_vc0.
3	RW	0x0	mask_phy_errsotsynchs_3 Mask for phy_errsotsynchs_3.
2	RW	0x0	mask_phy_errsotsynchs_2 Mask for phy_errsotsynchs_2.
1	RW	0x0	mask_phy_errsotsynchs_1 Mask for phy_errsotsynchs_1.
0	RW	0x0	mask_phy_errsotsynchs_0 Mask for phy_errsotsynchs_0.

CSI2HOST_MSK2

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved

Bit	Attr	Reset Value	Description
27	RW	0x0	mask_phy_errcodehs_3 Mask for phy_errcodehs_3.
26	RW	0x0	mask_phy_errcodehs_2 Mask for phy_errcodehs_2.
25	RW	0x0	mask_phy_errcodehs_1 Mask for phy_errcodehs_1.
24	RW	0x0	mask_phy_errcodehs_0 Mask for phy_errcodehs_0.
23:16	RO	0x00	reserved
15	RW	0x0	mask_err_id_vc3 Mask for err_id_vc3.
14	RW	0x0	mask_err_id_vc2 Mask for err_id_vc2.
13	RW	0x0	mask_err_id_vc1 Mask for err_id_vc1.
12	RW	0x0	mask_err_id_vc0 Mask for err_id_vc0.
11	RW	0x0	mask_vc3_err_ecc_corrected Mask for vc3_err_ecc_corrected.
10	RW	0x0	mask_vc2_err_ecc_corrected Mask for vc2_err_ecc_corrected.
9	RW	0x0	mask_vc1_err_ecc_corrected Mask for vc1_err_ecc_corrected.
8	RW	0x0	mask_vc0_err_ecc_corrected Mask for vc0_err_ecc_corrected.
7	RW	0x0	mask_phy_errsoths_3 Mask for phy_errsoths_3.
6	RW	0x0	mask_phy_errsoths_2 Mask for phy_errsoths_2.
5	RW	0x0	mask_phy_errsoths_1 Mask for phy_errsoths_1
4	RW	0x0	mask_phy_errsoths_0 Mask for phy_errsoths_0.
3	RW	0x0	mask_phy_erresc_3 Mask for phy_erresc_3.
2	RW	0x0	mask_phy_erresc_2 Mask for phy_erresc_2.
1	RW	0x0	mask_phy_erresc_1 Mask for phy_erresc_1.
0	RW	0x0	mask_phy_erresc_0 Mask for phy_erresc_0.

CSI2HOST_CONTROL

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:26	RW	0x03	sw_datatype_le The datatype of line end.
25:20	RW	0x02	sw_datatype_ls The datatype of line start.
19:14	RW	0x01	sw_datatype_fe The datatype of frame end.
13:8	RW	0x00	sw_datatype_fs The datatype of frame start.
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	sw_dsi_en 1'b0: For csi2 1'b1: For dsi
3:1	RO	0x0	reserved
0	RW	0x0	sw_cphy_en 1'b0: For dphy 1'b1: For cphy

27.5 Application Notes

The most important step is configuring the right CSI2HOST_N_LANES before pulling up csi_resetn. If the host is used to receive DSI data, the sw_dsi_en must be enabled, and the sw_datatype_fs, sw_datatype_fe, sw_datatype_ls, sw_datatype_le must be configured correctly. When the sw_dsi_en is enabled, those debug or error detection registers are useless.

Chapter 28 MIPI CSI DPHY

28.1 Overview

The features of MIPI CSI DPHY are as follow:

- Analog mixed-signal hard-macro LP/HS Receiver solution
- Designed to MIPI v1.2 Specifications
- Integrated PHY Protocol Interface(PPI) interfaces to DSI/CSI and UniPro MIPI protocols
- 2.5 Gbps maximum data transfer rate per lane
- Expandable to support 4 data lanes, providing up to 10 Gbps transfer rate
- HS-RX, LP-RX, LP-TX and Calibration supported
- 10Mbps per lane in low-power mode
- Unidirectional and bi-directional modes supported
- Automatic termination control for HS and LP modes
- LOW-Power dissipation: less than 1.5mA/Lane in D-PHY HS RX mode
- Buffers with tunable On-Die-Termination
- Includes embedded ESD, boundary scan and BIST
- Dual clock lanes mode supported

28.2 Block Diagram

MIPI D-PHY configuration contains one Clock Lane Module and four Data Lane Modules. Each of these PHY Lane Modules communicates via two Lines to a complementary part at the other side of the Lane Interconnect. Figure below shows a Universal Lane Module Diagram with a global overview of internal functionality of the CIL function. This Universal Module can be used for all Lane types. The requirements for the 'Control and Interface Logic'(CIL) function depend on the Lane type and Lane side.

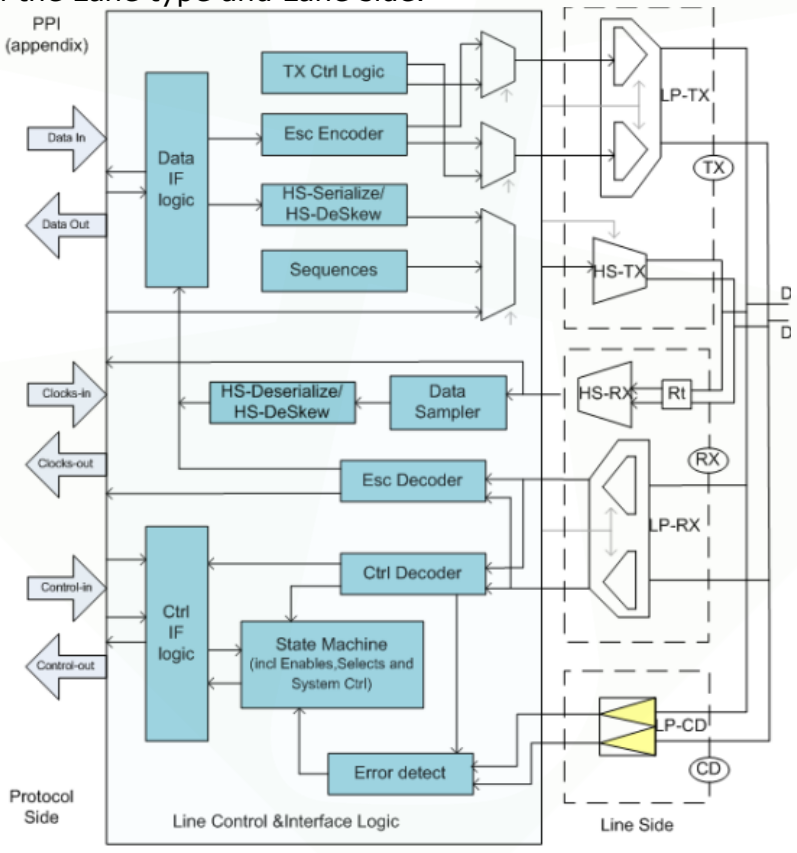

Fig. 28-1 MIPI CSI DPHY Block Diagram

28.3 Register Description

28.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

28.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
DPHYRX_LANE_EN	0x0000	W	0x00000000	Clk/data lane enable
DPHYRX_DIGITAL_CLK_PHASE	0x0034	W	0x00000000	Digital clock phase
DPHYRX_LANE_CLK_3_PHASE	0x0038	W	0x00000000	Lane clock/3 phase
DPHYRX_LANE_2_1_0_PHASE	0x003C	W	0x00000000	Data lane 2/1/0 phase
DPHYRX_DIGITAL_CLK_REVERSE	0x0048	W	0x00000000	Digital clock reverse
DPHYRX_DUAL_CLK_ENABLE	0x0080	W	0x00000001	MIPI/LVDS enable
DPHYRX_LANE_CK_MODE	0x0128	W	0x00000000	Clock lane mode
DPHYRX_LANE_CK_MSB	0x0138	W	0x00000000	MSB enable
DPHYRX_LANE_CK_TTAGO	0x0140	W	0x00000004	The value of counter for Tta-go of turnaround
DPHYRX_LANE_CK_TTASURE	0x0144	W	0x00000001	The value of counter for Tta-sure of turnaround
DPHYRX_LANE_CK_TTAWAIT	0x0148	W	0x00000032	The value of counter for Tta-wait of turnaround
DPHYRX_LANE_CK_THSSETTLE	0x0160	W	0x0000001B	The count time of the THS-SETTLE by protocol

28.3.3 Detail Registers Description

DPHYRX_LANE_EN

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_en_ck Enable D-PHY clock lane:active high.
5	RW	0x0	lane_en_3 Enable D-PHY lane3:active high.
4	RW	0x0	lane_en_2 Enable D-PHY lane2:active high.
3	RW	0x0	lane_en_1 Enable D-PHY lane1:active high.
2	RW	0x0	lane_en_0 Enable D-PHY lane0:active high.
1:0	RO	0x0	reserved

DPHYRX_DIGITAL_CLK_PHASE

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	digital_clk_phase 3'b000: Phase 0(default value) 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.

DPHYRX_LANE_CLK_3_PHASE

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x0	lane_clk_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
3:1	RW	0x0	lane_3_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
0	RW	0x0	lane_2_phase_msb See lane_2_phase for the details of the register.

DPHYRX_LANE_2_1_0_PHASE

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:6	RW	0x0	lane_2_phase {lane_2_phase_msb,lane_2_phase} 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
5:3	RW	0x0	lane_1_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
2:0	RW	0x0	lane_0_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.

DPHYRX_DIGITAL_CLK_REVERSE

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	digital_clk_reverse 1'b0: Make the digital sample clock positive(default value) 1'b1: Reverse the digital sample clock
6:0	RO	0x00	reserved

DPHYRX_DUAL_CLK_ENABLE

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	dual_clk_mode_en 1'b0: Enable single clock lane mode 1'b1: Enable dual clock lanes mode
5:1	RO	0x00	reserved
0	RW	0x1	reg_dig_rstn 1'b0: Reset 1'b1: Normal

DPHYRX_LANE_CK_MODE

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:4	RW	0x0	lane_ck_mode 2'b00: Disable continuous clock mode 2'b11: Enable continuous clock mode
3:0	RO	0x0	reserved

DPHYRX_LANE_CK_MSB

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_ck_msb MSB enable for pin_rxdatahs_* 1'b0: Disable 1'b1: Enable
5:0	RO	0x00	reserved

DPHYRX_LANE_CK_TTAGO

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_ck_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

DPHYRX_LANE_CK_TTASURE

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_ck_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

DPHYRX_LANE_CK_TTAWAIT

Address: Operational Base + offset (0x0148)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_ck_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

DPHYRX_LANE_CK_THSSETTLE

Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5:0	RW	0x1b	lane_ck_thssettle The count time of the THS-SETTLE by protocol. After the count done, D-PHY will begin to receive the high speed data. Frequency(1/UI) Value(HEX) 80-110MHz 02 110-150MHz 03 150-200MHz 06 200-250MHz 06 250-300MHz 06 300-400MHz 08 400-500MHz 0b 500-600MHz 0e 600-700MHz 10 700-800MHz 12 800-1000MHz 16 1000-1200MHz 1e 1200-1400MHz 23 1400-1600MHz 2d 1600-1800MHz 32 1800-2000MHz 37 2000-2200MHz 3c 2200-2400MHz 41 2400-2500MHz 46

DPHYRX_LANE_CK_CAL_EN

Address: Operational Base + offset (0x0168)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lane_ck_cal_en Calibration reception enable. 1'b0: Disable calibration reception 1'b1: Enable calibration reception
6:0	RO	0x00	reserved

DPHYRX_LANE_0_MSB

Address: Operational Base + offset (0x01B8)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_0_msb MSB enable for pin_rxdatahs_*. 1'b0: Disable 1'b1: Enable
5:0	RO	0x00	reserved

DPHYRX_LANE_0_TTAGO

Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_0_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

DPHYRX_LANE_0_TTASURE

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_0_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

DPHYRX_LANE_0_TTAWAIT

Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_0_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

DPHYRX_LANE_0_THSSETTLE

Address: Operational Base + offset (0x01E0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x1b	lane_0_thssettle The count time of the THS-SETTLE by protocol. After the count done, D-PHY will begin to receive the high speed data. Frequency(1/UI) Value(HEX) 80-110MHz 02 110-150MHz 03 150-200MHz 06 200-250MHz 06 250-300MHz 06 300-400MHz 08 400-500MHz 0b 500-600MHz 0e 600-700MHz 10 700-800MHz 12 800-1000MHz 16 1000-1200MHz 1e 1200-1400MHz 23 1400-1600MHz 2d 1600-1800MHz 32 1800-2000MHz 37 2000-2200MHz 3c 2200-2400MHz 41 2400-2500MHz 46

DPHYRX_LANE_0_CAL_EN

Address: Operational Base + offset (0x01E8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lane_0_cal_en Calibration reception enable. 1'b0: Disable calibration reception 1'b1: Enable calibration reception
6:0	RO	0x00	reserved

DPHYRX_LANE_1_MSB

Address: Operational Base + offset (0x0238)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_1_msb MSB enable for pin_rxdatahs_*. 1'b0: Disable 1'b1: Enable
5:0	RO	0x00	reserved

DPHYRX_LANE_1_TTAGO

Address: Operational Base + offset (0x0240)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_1_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

DPHYRX_LANE_1_TTASURE

Address: Operational Base + offset (0x0244)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_1_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

DPHYRX_LANE_1_TTAWAIT

Address: Operational Base + offset (0x0248)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_1_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

DPHYRX_LANE_1_THSSETTLE

Address: Operational Base + offset (0x0260)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5:0	RW	0x1b	lane_1_thssettle The count time of the THS-SETTLE by protocol. After the count done, D-PHY will begin to receive the high speed data. Frequency(1/UI) Value(HEX) 80-110MHz 02 110-150MHz 03 150-200MHz 06 200-250MHz 06 250-300MHz 06 300-400MHz 08 400-500MHz 0b 500-600MHz 0e 600-700MHz 10 700-800MHz 12 800-1000MHz 16 1000-1200MHz 1e 1200-1400MHz 23 1400-1600MHz 2d 1600-1800MHz 32 1800-2000MHz 37 2000-2200MHz 3c 2200-2400MHz 41 2400-2500MHz 46

DPHYRX_LANE_1_CAL_EN

Address: Operational Base + offset (0x0268)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lane_1_cal_en Calibration reception enable. 1'b0: Disable calibration reception 1'b1: Enable calibration reception
6:0	RO	0x00	reserved

DPHYRX_LANE_2_MSB

Address: Operational Base + offset (0x02B8)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_2_msb MSB enable for pin_rxdatahs_*. 1'b0: Disable 1'b1: Enable
5:0	RO	0x00	reserved

DPHYRX_LANE_2_TTAGO

Address: Operational Base + offset (0x02C0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_2_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

DPHYRX_LANE_2_TTASURE

Address: Operational Base + offset (0x02C4)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_2_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

DPHYRX_LANE_2_TTAWAIT

Address: Operational Base + offset (0x02C8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_2_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

DPHYRX_LANE_2_THSSETTLE

Address: Operational Base + offset (0x02E0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x1b	lane_2_thssettle The count time of the THS-SETTLE by protocol. After the count done, D-PHY will begin to receive the high speed data. Frequency(1/UI) Value(HEX) 80-110MHz 02 110-150MHz 03 150-200MHz 06 200-250MHz 06 250-300MHz 06 300-400MHz 08 400-500MHz 0b 500-600MHz 0e 600-700MHz 10 700-800MHz 12 800-1000MHz 16 1000-1200MHz 1e 1200-1400MHz 23 1400-1600MHz 2d 1600-1800MHz 32 1800-2000MHz 37 2000-2200MHz 3c 2200-2400MHz 41 2400-2500MHz 46

DPHYRX_LANE_2_CAL_EN

Address: Operational Base + offset (0x02E8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lane_2_cal_en Calibration reception enable. 1'b0: Disable calibration reception 1'b1: Enable calibration reception
6:0	RO	0x00	reserved

DPHYRX_LANE_3_MSB

Address: Operational Base + offset (0x0338)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_3_msb MSB enable for pin_rxdatahs_*. 1'b0: Disable 1'b1: Enable
5:0	RO	0x00	reserved

DPHYRX_LANE_3_TTAGO

Address: Operational Base + offset (0x0340)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_3_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

DPHYRX_LANE_3_TTASURE

Address: Operational Base + offset (0x0344)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_3_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

DPHYRX_LANE_3_TTAWAIT

Address: Operational Base + offset (0x0348)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_0_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

DPHYRX_LANE_3_THSSETTLE

Address: Operational Base + offset (0x0360)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5:0	RW	0x1b	lane_3_thssettle The count time of the THS-SETTLE by protocol. After the count done, D-PHY will begin to receive the high speed data. Frequency(1/UI) Value(HEX) 80-110MHz 02 110-150MHz 03 150-200MHz 06 200-250MHz 06 250-300MHz 06 300-400MHz 08 400-500MHz 0b 500-600MHz 0e 600-700MHz 10 700-800MHz 12 800-1000MHz 16 1000-1200MHz 1e 1200-1400MHz 23 1400-1600MHz 2d 1600-1800MHz 32 1800-2000MHz 37 2000-2200MHz 3c 2200-2400MHz 41 2400-2500MHz 46

DPHYRX_LANE_3_CAL_EN

Address: Operational Base + offset (0x0368)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lane_3_cal_en Calibration reception enable. 1'b0: Disable calibration reception 1'b1: Enable calibration reception
6:0	RO	0x00	reserved

DPHYRX_LANE_CK1_MODE

Address: Operational Base + offset (0x03A8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:4	RW	0x0	lane_ck1_mode 2'b00: Disable continuous clock mode 2'b11: Enable continuous clock mode
3:0	RO	0x0	reserved

DPHYRX_LANE_CK1_MSB

Address: Operational Base + offset (0x03B8)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_ck1_msb MSB enable for pin_rxdatahs_* 1'b0: Disable 1'b1: Enable
5:0	RO	0x00	reserved

DPHYRX_LANE_CK1_TTAGO

Address: Operational Base + offset (0x03C0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_ck1_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

DPHYRX_LANE_CK1_TTASURE

Address: Operational Base + offset (0x03C4)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

28.4 Application Notes

28.4.1 MIPI SINGLE CLOCK LANE Mode Application

step1: send 0x7d to register LANE_EN. Enable the D-PHY.
step2: send 0x01f001f0 to register GRF_VI_CON0.Enable the clock lane and 4 data lanes.
step3: According to data rate, write corresponding value to Ths-settle registers for lanes.

28.4.2 MIPI DUAL CLOCK LANES MODE Application

step1: send 0x7d to register LANE_EN. Enable the D-PHY.
step2: send 0x5f to register DUAL_CLK_ENABLE.Enable dual clock lanes mode.
step3: send 0x05f005f0 to register GRF_VI_CON0.Enable 2 clock lanes and 4 data lanes.
step4: According to data rate, write corresponding value to Ths-settle registers for lanes.

In dual clock lanes mode,GRF_VI_CON1 must be configured according to the following table.

	LANE0/1	LANE2/3	GRF_VI_CON1 VALUE
Connected IP	ISP	CSI2HOST	0x08800880
	CSI2HOST	ISP	0x10801080
	ISP、CSI2HOST		0x00800080
		ISP、CSI2HOST	0x18801880

Chapter 29 MIPI DSI HOST Controller

29.1 Overview

The Display Serial Interface (DSI) is part of a group of communication protocols defined by the MIPI Alliance. The MIPI DSI HOST Controller is a digital core that implements all protocol functions defined in the MIPI DSI Specification. The MIPI DSI HOST Controller provides an interface between the system and the MIPI D-PHY, allowing the communication with a DSI-compliant display. The MIPI DSI HOST Controller supports one to four lanes for data transmission with MIPI D-PHY.

The MIPI DSI HOST Controller supports the following features:

- The MIPI DSI HOST Controller conforms to the following standards
  - MIPI Alliance Specification for DSI v1.1
  - MIPI Alliance Specification for DCS v1.1
  - MIPI Alliance Standard for DPI-2
  - MIPI Alliance Specification for SDF v1.0
  - MIPI Alliance Specification for DPHY v1.2
  - AMBA 2.0 Specification(APB) from ARM
- Support the DPI interface color coding mappings into 24-bit Interface
  - 16 bits per pixel, configurations 1,2,and 3
  - 18 bits per pixel, configurations 1 and 2
  - 24 bits per pixel
- Programmable polarity of all DPI interface signals
- Maximum resolution is 1920x1080@60Hz
- Interface with MIPI D-PHY following PHY Protocol Interface (PPI), as defined in MIPI Alliance Specification for D-PHY
- Up to four D-PHY Data Lanes
- Bidirectional communication and escape mode support through data lane 0
- Transmission of all generic commands

- ECC and Checksum capabilities
- End of Transmission Packet(EOTp)
- Ultra Low-Power mode
- Fault recovery schemes

29.2 Block Diagram

The following diagram shows the MIPI DSI HOST Controller architecture.

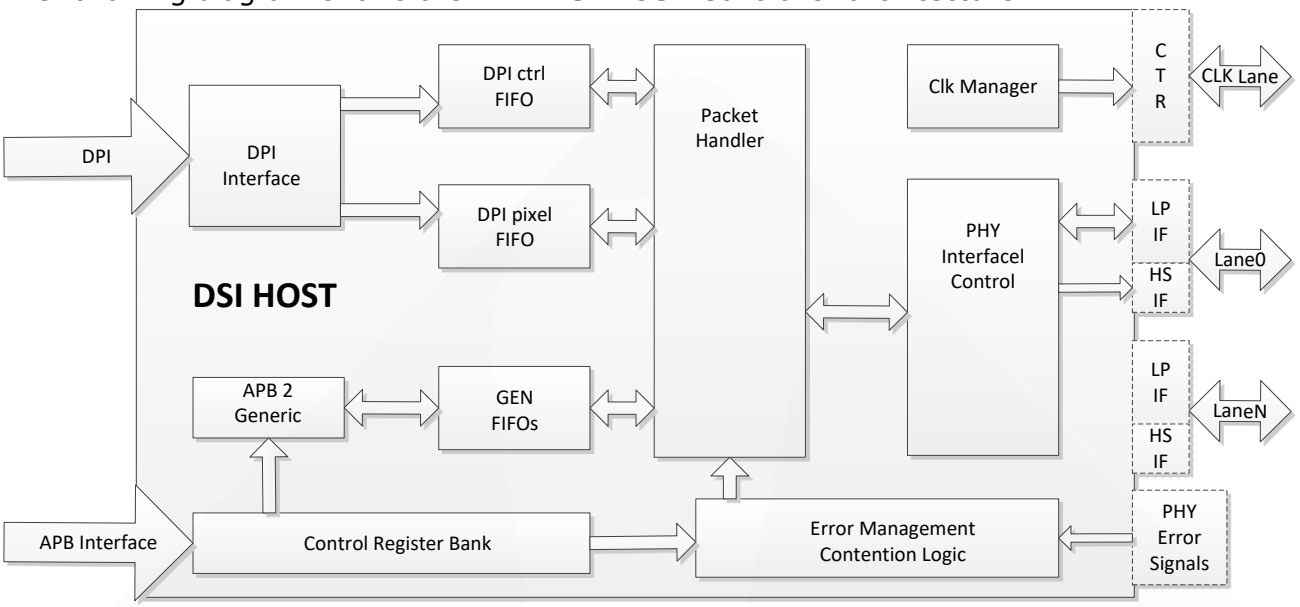

Fig. 29-1 MIPI DSI HOST Controller architecture

The DPI interface captures the data and control signals and conveys them to a FIFO for video control signals and another one for pixel data. This data is then used to build Video packets, hen in Video mode.

The Register Bank is accessible through a standard AMBA-APB slave interface, providing access to the MIPI DSI HOST Controller registers for configuration and control. There is also a fully programmable interrupt generator to inform the system about certain events.
The PHY Interface Control is responsible for managing the D-PHY PPI interface. It acknowledges the current operation and enables low-power transmission/reception or a high-speed transmission. It also performs data splitting between available D-PHY lanes for high-speed transmission.

The Packet Handler schedules the activities inside the link. It performs several functions based on the interfaces that are currently DPI and the video transmission mode that is used (burst mode or non-burst mode with sync pulse or sync events). It builds long or short packet generating correspondent ECC and CRC codes. This block also performs the following functions: Packet reception, Validation of packet header by checking the ECC, Header correction and notification for single-bit errors, Termination of reception, Multiple header error notification.

The APB-to-Generic block bridges the APB operations into FIFOs holding the Generic commands. The block interfaces with the following FIFO: Command FIFO, Write payload FIFO, Read payload FIFO.

The Error Management notifies and monitors the error conditions on the DSI link. It controls the timers used to determine if a timeout condition occurred, performing an internal soft reset and triggering an interruption notification.

29.3 Function Description

29.3.1 DPI interface function

The DPI interface follows the MIPI DPI specification with pixel data bus width up to 24 bits. It is used to transmit the information in Video mode in which the transfers from the host processor to the peripheral take the form of a real-time pixel stream. This interface allows sending ShutDown (SD) and ColorMode (CM) commands, which are triggered directly by writing to the register of VO_CON[9:8] in the GRF Module. To transfer additional commands(for example, to initialize the display), use another interface such as APB Slave Generic Interface to complement the DPI interface.

The DPI interface captures the data and control signals and conveys them to the FIFO interfaces that transmit them to the DSI link. Two different streams of data are presented at the interface; video control signals and pixel data. Depending on the interface color coding, the pixel data is disposed differently throughout the dpipixdata bus. The following table shows the Interface pixel color coding.

Table 29-1 Color table

Signal Line	**16-bit**			**18-bit**		**24bit**
Config	**Config1**	**Config2**	**Config3**	**Config1**	**Config2**	**Config1**

Dpidata1	B1	B1	B0	B1	B1	B1
Dpidata0	B0	B0	Not used	B0	B0	B0

The DPI interface can be configured to increase flexibility and promote correct usage of this interface for several systems. These configuration options are as follows:Polarity control: All the control signals are programmable to change the polarity depending on system requirements.

After the MIPI DSI HOST Controller reset, DPI waits for the first VSYNC active transition to start signal sampling, including pixel data, and preventing image transmission in the middle of a frame.

If interface pixel color coding is 18 bits and the 18-bit loosely packed stream is disabled, the number of lines programmed in the pixels per lines configuration is a multiple of four. This means that in this mode, the two LSBs in the configuration are always inferred as zero. The specification states that in this mode, the pixel line size should be a multiple of four.

29.3.2 APB Slave Generic Interface

The APB Slave interface allows the transmission of generic information in Command mode, and follows the proprietary register interface. Commands sent through this interface are not constrained to comply with the DCS specification, and can include generic commands described in the DSI specification as manufacturer-specific.

The MIPI DSI HOST Controller supports the transmission or write and read command mode packets as described in the DSI specification. These packets are built using the APB register access. The GEN_PLD_DATA register has two distinct functions based on the operation.

Writing to this register sends the data as payload when sending a Command mode packet. Reading this register returns the payload of a read back operation. The GEN_HDR register contains the Command mode packet header type and header data. Writing to this register triggers the transmission of the packet implying that for a long Command mode packet, the packet's payload needs to be written in advance in the GEN_PLD_DATA register.

The valid packets available to be transmitted through the Generic interface are as follows:
- Generic Write Short Packet 0 Parameters
- Generic Write Short Packet 1 Parameters
- Generic Write Short Packet 2 Parameter
- Generic Write Short Packet 0 Parameter
- Generic Write Short Packet 1 Parameters
- Generic Write Short Packet 2 Parameter
- Maximum Read Packet Configuration
- Generic Long Write Packet
- DCS Write Short Packet 0 Parameter
- DCS Write Short Packet 1 Parameter
- DCS Write Short Packet 0 Parameter
- DCS Write Long Packet

A set of bits in the CMD_PKT_STATUS register report the status of the FIFOs associated with APB interface support.

Generic interface packets are always transported using one of the DSI transmission modes; Video mode or Command mode. If neither of these mode are selected, the packets are not transmitted through the link and the released FIFOs eventually get overflowed.
The transfer of packets through the APB bus is based on the following conditions:
The APB protocol defines that the write and read procedure takes two clock cycles each to be executed. This means that the maximum input data rate through the APB interfaces is always half the speed of the APB clock.

The data input bus has a maximum width of 32 bits. This allows for a relation to be defined between the input APB clock frequency and maximum bi rate achievable by the APB interface.
The DSI link bit rate when using solely APB is equal to (APB clock frequency) *16 Mbps.
The bandwidth is dependent on the APB clock frequency; the available bandwidth increases with the clock frequency.

To drive the APB interface to achieve high bandwidth Command mode traffic transported by

the DSI link, the MIPI DSI HOST Controller should operate in the Command mode only and the APB interface should be the only data source that is currently in use. Thus, the APB interface has the entire bandwidth of the DSI link and does not share it with any another input interface source.

The memory write commands require maximum throughout from the APB interface, because they contain the most amount of data conveyed by the DSI link. While writing the packet information, first write the payload of a given packet into the payload FIFO using the GEN_PLD_DATA register. When the payload data is for the command parameters, place the first byte to be transmitted in the least significant byte position of the APB data bus.

After writing the payload, write the packet header into the command FIFO. For more information and it should follow the pixel to byte conversion organization referred in the Annexure A of the DCS specification. The follow figure show how the pixel data should be organized in the APB data write bus. The memory write commands are conveyed in DCS long packets. DCS long packets are encapsulated in a DSI packet. The DSI included in the diagrams.In the follow figures, the Write Memory Command can be replaced by the DCS command Write Memory Start and Write Memory Continue.

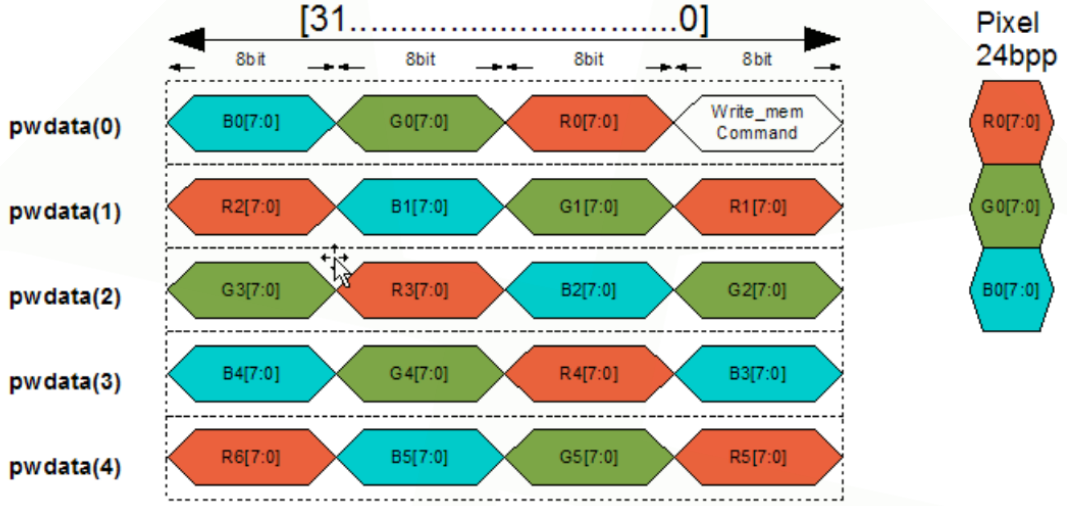

Fig 1-2 24 bpp APB Pixel to Byte Organization

29.3.3 Transmission of Commands in Video Mode

The MIPI DSI HOST Controller supports the transmission of commands, both in high-speed and low-power, while in Video mode. The DSI controller uses Blanking or Low-Power(BLLP) periods to transmit commands inserted through the APB Generic interface. Those periods correspond to the shaded areas of the following figure.

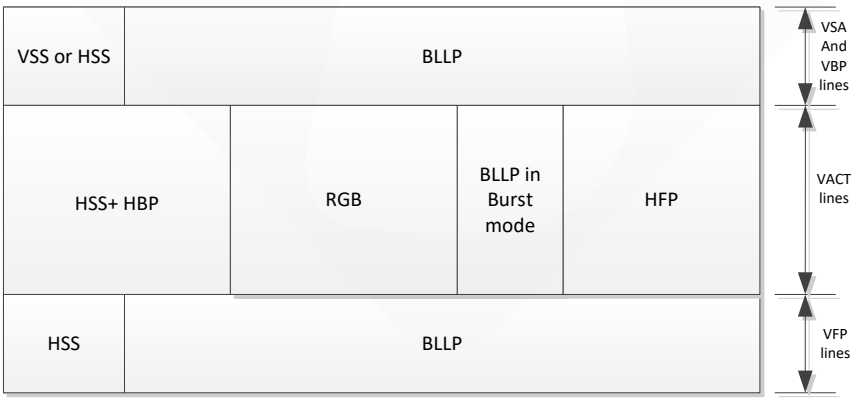

Fig. 29-3 Command Transmission Periods within the Image Area

Commands are transmitted in the blanking periods after the following packet/states:

- Bertical Sync Start (VSS) packets, if the Video Sync pulses are not enabled

- Horizontal Sync End (HSE) packets, in the VSA, VBP, and VFP regions
- Horizontal Sync Start (HSS) packets, if the Video Sync pulses are not enabled in the VSA, VBP, and VFP regions
- Horizontal Active (HACT) state

Only one command is transmitted per line, even in the case of the last line of a frame but one command is possible for each line.

The MIPI DSI HOST Controller avoids sending commands in the last line because it is possible that the last line is shorter than the other ones. For instance, the line time (tL) could be half a cycle longer than the tL on the DPI interface, that is, each line in the frame taking half a cycle from time for the last line. This results in the last line being (1/2 cycle) * (number of lines -1) shorter than tL.

The dpicolorm and dpishutdn input signals are also able to trigger the sending of command packets. The commands are DSI data types Color Mode On, Color Mode Off, Shut Down Peripheral, and Turn on Peripheral. These commands are not sent in the VACT region. If the lpcmden bit of the VID_MODE_CFG register is 1, these commands are sent in LP mode. In LP mode, the ouvact_lpcmd_time field of the LP_CMD_TIM register is used to determine if these commands can be transmitted. It is assumed that outvact_lpcmd_time is greater than or equal to 4 bytes (number of bytes in a short packet), because the DSI HOST does not transmit these commands on the last line.

If the frame_BTA_ack field is set in the VID_MODE_CFG register, a BTA is generated by DSI HOST after the last line of a frame. This may coincide with a write command or a read command. In either case, the edpihalt signal is held asserted until an acknowledge has been received (control of the DSI bus is returned to the host).

If the lpcmden bit of the VID_MODE_CFG register is set to 1, the commands are sent in low-power in Video mode. In this case, it is necessary to calculate the time available, in bytes, to transmit a command in LP mode for Horizontal Front Porch (HFP), Vertical Sync Active (VSA), Vertical Back Porch (VBP), and Vertical Front Porch(VFP) regions.

The outvact_lpcmd_time field of the LP_CMD_TIM register indicates the time available (in bytes) to transmit a command in LP mode, based on the escape clock, on a line during the VSA, VBP, and the VFP
Outvact_lpcmd_time=(tL-(Time to transmit HSS and HSE frames +tHSA+Time to enter and leave LP mode+Time to send the D-PHY LPDT command)) / escape clock period / 8 / 2
Where, tL=Line time, and tHSA=Time to send a short packet (for sync events) or time of the HAS pulse (for sync pulses).

In the above equation, division by eight is done to convert the time available to bytes and division by two is done because one bit is transmitted once in every two escape clock cycles.

The outvact_lpcmd_time filed can be compared directly with the size of the command to be transmitted to determine if there is enough time to transmit the command. The maximum size of a command that can be transmitted in LP mode is limited to 255 bytes by this field. This register must be programmed to a value greater than or equal to 4 bytes for the transmission of the DCTRL commands such as shutdown and colorm in LP mode.

Consider an example with 12.6 μs per line and assume an escape clock frequency of 15 MHz. In this case, 189 escape clock cycles are available to enter and exit LP mode and transmit command. The following are assumed:

- Sync pulses are not being transmitted
- Two lane byte clock ticks are required to transmit a short packet

$$phy\_lp2hs\_time = 16$$
$$phy\_lp2p\_time = 20$$

In this example, a 11-byte command can be transmitted as follows:

$$outvact\_lpcmd\_time = 11bytes$$

The invact_lpcmd_time field of the LP_CMD_TIM register indicates the time available (in bytes) to transmite a command in LP mode (based on the escape clock) in the Vertical Active (VACT) region. This time is calculated as follows:
Invact_lpcmd_time=((tHFP-Time to enter and leave low-power mode + Blanking period before the HFP when in Burst mode- Time to send the D-PHY LPDT command) / escape clock period) / 8. Where,

$$tHFP = line\_time - tHSA - tHBP - tHACT$$

tHACT=vid_pkt_size*bits_per_pixel*lane_byte_clock_period / num_lanes
The invact_lpcmd_time field can be compared directly with the size of the command to be transmitted to determined if there is time to transmit the command.

Consider an example where the refresh rate is 60 Hz. The number of lines is 1320 (typical). The tL in this case is 12.6µs. With a lane byte clock of 100 MHz, 1260 clock ticks are available to transmit a single frame. If 800 ticks are used for pixel data then 460 ticks (4.6µs) are available for Horizontal Sync Start (HSS), HFP, and HBP. Assuming that 2.3µs is available for HFP and the escape clock is 15MHz, only 34 LP clock ticks are available to enter LP, transmit a command, and return from LP mode. Approximately 12 escape clock ticks are required to enter and leave LP mode. Therefore, only 1 byte could be transmitted in this period.

A short packet (for example, generic short write) requires a minimum of 4 bytes. Therefore, in this exampled, commands are not sent in the VACT region. If Burst mode is enabled, more time is available to transmit commands in the VACT region. The following are assumed:
The controller is not in Burst mode:

$$phy\_lp2hs\_time = 16$$

In this example invact_lpcmd_time is calculated as follows:
Invact_lpcmd_time = (2.3µs –(16*10 ns)-(20*10 ns)-(8*66 ns)) /66 ns / 8 = 2 bytes
The outvact_lpcmd_time and invact_lpcmd_time fields allow a simple comparison to determine if a command can be transmitted in any of the BLLP periods.
Following figure illustrates the meaning of invact_lpcmd_time and outvact_lpcmd_time, matching them with the shaded areas and the VACT region.

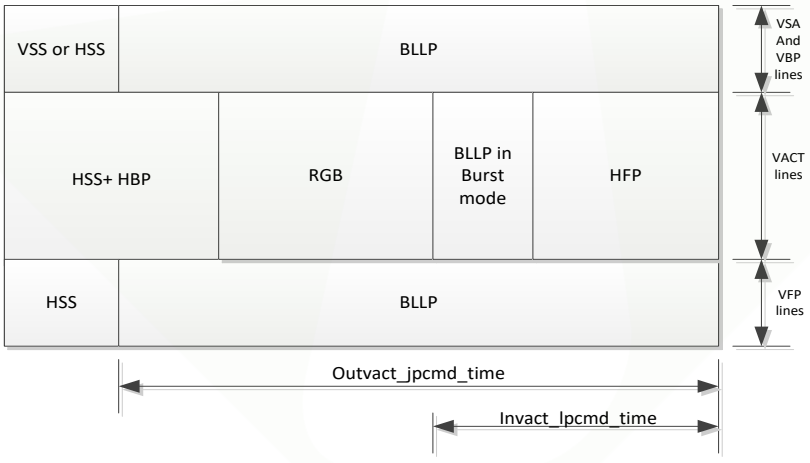

Fig. 29-4 Location in the Image Area

If the lpcmden bit of the VID_MODE_CFG register is 0, the commands are sent in high_speed in Video Mode. In this case, the DSI HOST automatically determines the area where each command can be sent and no programming or calculation is required.

On read command Transmission, the max_rd_time field of the PHY_TMR_CFG register configures the maximum amount of time required to perform a read command in lane byte clock cycles.

The maximum time required to perform a read command in Lane byte clock cycles (max_rd_time) =Time to transmit the read command in LP mode + Time to enter and leave LP mode + Time to return the read data packet from the peripheral device.
The time to return the read data packet from the peripheral depends on the number of bytes read and the escape clock frequency of the peripheral; not the escape clock of the host. The max_rd_time field is used in both HS and LP mode to determine if there is time to complete a read command in a BLLP period.

In high-speed mode (lpcmden=0), max_rd_time is calculated as follows:
max_rd_time = phy_hs2lp_time + Time to return the read data packet from the peripheral device + phy_hs2hs_time
In low-power mode (lpcmden = 1), max_rd_time is calculated as follows:
max_rd_time = phy_hs2lp_time +LPDT command time + Read command time in LP mode + Time to return the data read from the peripheral device + phy_lp2hs_time
Where,
LPDT command time = (8*Host escape clock period) / Lane byte clock period
Read command time in LP mode = (32 * host escape clock period) / lane byte clock period
It is recommended to keep the maximum number of bytes read from the peripheral to a minimum to have sufficient time available to issue the read commands on a line. Ensure that max_rd_time* Lane byte clock period is less than outvact_lpcmd_time *8*Escape clock period of the host.

Otherwise, the read commands are serviced on the last line of a frame and the edpihalt signal may be asserted. If it is necessary to read a large number of parameters (＞16), increase the max_rd_time while the read command is being executed. When the read has completed, decrease the max_rd_time to a lower value.

29.4 Register Description

29.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

29.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
MIPI_DSI_HOST_VERSION	0x0000	W	0x3133302a	Version
MIPI_DSI_HOST_PWR_UP	0x0004	W	0x00000000	Power up
MIPI_DSI_HOST_CLKMGR_CFG	0x0008	W	0x00000000	Configure the factor of the internal dividers to divide lanebyteclk
MIPI_DSI_HOST_DPI_VCID	0x000c	W	0x00000000	DPI virtual channel id
MIPI_DSI_HOST_DPI_COLOR_CODING	0x0010	W	0x00000000	DPI color coding
MIPI_DSI_HOST_DPI_CFG_POL	0x0014	W	0x00000000	Polarity of the DPI signals
MIPI_DSI_HOST_DPI_LP_CMD_TIM	0x0018	W	0x00000000	The timing for the low-power command while in video mode

Name	Offset	Size	Reset Value	Description
MIPI_DSI_HOST_PCKHDL_CFG	0x002c	W	0x00000000	Configures how EoTp,BTA,CRC and ECC are to be used , to meet the peripheral's characteristics
MIPI_DSI_HOST_GEN_VCID	0x0030	W	0x00000000	The virtual channel id of the read responses to store and return to the Generic interface
MIPI_DSI_HOST_MODE_CFG	0x0034	W	0x00000001	This register configures the mode of operation - Video mode or Command mode(Commands can be sent even in video mode too)
MIPI_DSI_HOST_VID_MODE_CFG	0x0038	W	0x00000000	Configure several aspects of the Video mode operation
MIPI_DSI_HOST_VID_PKT_SIZE	0x003c	W	0x00000000	The video packet size
MIPI_DSI_HOST_VID_NUM_CHUNKS	0x0040	W	0x00000000	The number of chunks to use
MIPI_DSI_HOST_VID_NULL_SIZE	0x0044	W	0x00000000	The size of null packets
MIPI_DSI_HOST_VID_HSA_TIME	0x0048	W	0x00000000	HSA time
MIPI_DSI_HOST_VID_HBP_TIME	0x004c	W	0x00000000	HBP time
MIPI_DSI_HOST_VID_HLINE_TIME	0x0050	W	0x00000000	The overall time for video line
MIPI_DSI_HOST_VID_VSA_LINES	0x0054	W	0x00000000	VSA period
MIPI_DSI_HOST_VID_VBP_LINES	0x0058	W	0x00000000	VBP period
MIPI_DSI_HOST_VID_VFP_LINES	0x005c	W	0x00000000	VFP period
MIPI_DSI_HOST_VID_VACTIVE_LINES	0x0060	W	0x00000000	The vertical resolution of the video
MIPI_DSI_HOST_EDPI_CMD_SIZE	0x0064	W	0x00000000	The size of eDPI packet
MIPI_DSI_HOST_CMD_MODE_CFG	0x0068	W	0x00000000	Configure several aspects of the command mode operation
MIPI_DSI_HOST_GEN_HDR	0x006c	W	0x00000000	Set the header for new packets sent using the Generic interface
MIPI_DSI_HOST_GEN_PLD_DATA	0x0070	W	0x00000000	The payload for the packet sent using the Generic interface
MIPI_DSI_HOST_CMD_PKT_STATUS	0x0074	W	0x00000000	The status of FIFOs related to the Generic interface
MIPI_DSI_HOST_TO_CNT_CFG	0x0078	W	0x00000000	The counters that trigger the timeout error

Name	Offset	Size	Reset Value	Description
MIPI_DSI_HOST_HS_RD_TO_CNT	0x007c	W	0x00000000	The Peripheral Response timeout after high-speed read operation
MIPI_DSI_HOST_LP_RD_TO_CNT	0x0080	W	0x00000000	The Peripheral Response timeout after low-power read operation
MIPI_DSI_HOST_HS_WR_TO_CNT	0x0084	W	0x00000000	The Peripheral Response timeout after high-speed write operation
MIPI_DSI_HOST_LP_WR_TO_CNT	0x0088	W	0x00000000	The Peripheral Response timeout after low-power write operation
MIPI_DSI_HOST_BTA_TO_CNT	0x008c	W	0x00000000	The Peripheral Response timeout after the Bus Turnaround completion
MIPI_DSI_HOST_SDF_3D	0x0090	W	0x00000000	The 3D control information for VSS Packets in video mode
MIPI_DSI_HOST_LPCLK_CTRL	0x0094	W	0x00000000	Using non-continuous clock in the clock lane
MIPI_DSI_HOST_PHY_TMR_LPCLK_CFG	0x0098	W	0x00000000	Set the time that the HOST assumes in calculations for the clock lane to switch between high-speed and low-power
MIPI_DSI_HOST_PHY_TMR_CFG	0x009c	W	0x00000000	Set the time that the HOST assumes in calculations for the data lanes to switch between high-speed and low-power
MIPI_DSI_HOST_PHY_RSTZ	0x00a0	W	0x00000000	The reset of the PLL and DPHY
MIPI_DSI_HOST_PHY_IF_CFG	0x00a4	W	0x00000003	The minimum time to remain in Stop state
MIPI_DSI_HOST_PHY_STATUS	0x00b0	W	0x00000000	The DPHY status
MIPI_DSI_HOST_INT_ST0	0x00bc	W	0x00000000	The status of the interrupt sources
MIPI_DSI_HOST_INT_ST1	0x00c0	W	0x00000000	The status of the interrupt sources
MIPI_DSI_HOST_INT_MSK0	0x00c4	W	0x00000000	The masks of interrupt sources
MIPI_DSI_HOST_INT_MSK1	0x00c8	W	0x00000000	The masks of interrupt sources
MIPI_DSI_HOST_INT_FORCE0	0x00d8	W	0x00000000	Force interrupts
MIPI_DSI_HOST_INT_FORCE1	0x00dc	W	0x00000000	Force interrupts
MIPI_DSI_HOST_VID_SHADOW_CTRL	0x0100	W	0x00000000	Control the DPI shadow register

Name	Offset	Size	Reset Value	Description
MIPI_DSI_HOST_DPI_VCID_ACT	0x010c	W	0x00000000	The virtual channel id for the DPI traffic
MIPI_DSI_HOST_DPI_COLOR_CODING_ACT	0x0110	W	0x00000000	DPI color coding
MIPI_DSI_HOST_DPI_LP_CMD_TIM_ACT	0x0118	W	0x00000000	The timing for low-power commands sent while in Video mode
MIPI_DSI_HOST_VID_MODE_CFG_ACT	0x0138	W	0x00000000	Configure several aspects of Video mode operation
MIPI_DSI_HOST_VID_PKT_SIZE_ACT	0x013c	W	0x00000000	Configure the video packet size
MIPI_DSI_HOST_VID_NUM_CHUNKS_ACT	0x0140	W	0x00000000	Configure the number of chunks to use
MIPI_DSI_HOST_VID_NULL_SIZE_ACT	0x0144	W	0x00000000	The size of null packets
MIPI_DSI_HOST_VID_HSA_TIME_ACT	0x0148	W	0x00000000	HSA time
MIPI_DSI_HOST_VID_HBP_TIME_ACT	0x014c	W	0x00000000	HBP time
MIPI_DSI_HOST_VID_HLINE_TIME_ACT	0x0150	W	0x00000000	The overall time for each video line
MIPI_DSI_HOST_VID_VSA_LINES_ACT	0x0154	W	0x00000000	VSA period
MIPI_DSI_HOST_VID_VBP_LINES_ACT	0x0158	W	0x00000000	VBP period
MIPI_DSI_HOST_VID_VFP_LINES_ACT	0x015c	W	0x00000000	VFP period
MIPI_DSI_HOST_VID_VACTIVE_LINES_ACT	0x0160	W	0x00000000	The vertical resolution of video
MIPI_DSI_HOST_SDF_3D_ACT	0x0190	W	0x00000000	Store 3D control information for VSS in video mode

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

29.4.3 Detail Register Description

MIPI_DSI_HOST_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x3133302a	version

MIPI_DSI_HOST_PWR_UP

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	Reserved
0	RW	0x0	shutdownz This bit configures the core either to power up or to reset. Its default value is 0. After the core configuration, to enable the DSI Host Controller, set this register to 1. 1'b0: Reset 1'b1: Power-up

MIPI_DSI_HOST_CLKMGR_CFG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	Reserved
15:8	RW	0x00	to_clk_division This field indicates the division factor for the Time Out clock used as the timing unit in the configuration of HS to LP and LP to HS transition error
7:0	RW	0x00	tx_esc_clk_division This field indicates the division factor for the TX Escape clock source (lanebyteclk). The values 0 and 1 stop the TX_ESC clock generation

MIPI_DSI_HOST_DPI_VCID

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	Reserved
1:0	RW	0x0	dpi_vcid This field configures the DPI virtual channel id that is indexed to the Video mode packets

MIPI_DSI_HOST_DPI_COLOR_CODING

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:9	RO	0x0	Reserved
8	RW	0x0	loosely18_en When set to 1, this bit activates loosely packed variant to 18-bit configurations
7:4	RO	0x0	Reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	dpi_color_coding This field configures the DPI color coding as follows: 4'b0000: 16-bit configuration 1 4'b0001: 16-bit configuration 2 4'b0010: 16-bit configuration 3 4'b0011: 18-bit configuration 1 4'b0100: 18-bit configuration 2 4'b0101: 24-bit 4'b0110: 20-bit YCbCr 4:2:2 loosely packed 4'b0111: 24-bit YCbCr 4:2:2 4'b1000: 16-bit YCbCr 4:2:2 4'b1001: 30-bit 4'b1010: 36-bit 4'b1011-4'b1111: 12-bit YCbCr 4:2:0

MIPI_DSI_HOST_DPI_CFG_POL

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:5	RO	0x0	Reserved
4	RW	0x0	colorm_active_low When set to 1, this bit configures the color mode pin (dpicolorm) as active low
3	RW	0x0	shutd_active_low When set to 1, this bit configures the shutdown pin (dpishutdn) as active low
2	RW	0x0	hsync_active_low When set to 1, this bit configures the horizontal synchronism pin (dpihsync) as active low
1	RW	0x0	vsync_active_low When set to 1, this bit configures the vertical synchronism pin (dpivsync) as active low
0	RW	0x0	dataen_active_low When set to 1, this bit configures the data enable pin (dpidataen) as active low

MIPI_DSI_HOST_DPI_LP_CMD_TIM

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:24	RO	0x0	Reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x00	outvact_lpcmd_time This field is used for the transmission of commands in low-power mode. It defines the size, in bytes, of the largest packet that can fit in a line during the VSA, VBP, and VFP regions
15:8	RO	0x0	Reserved
7:0	RW	0x00	invact_lpcmd_time This field is used for the transmission of commands in low-power mode. It defines the size, in bytes, of the largest packet that can fit in a line during the VACT region

MIPI_DSI_HOST_PCKHDL_CFG

Address: Operational Base + offset (0x002c)

Bit	Attr	Reset Value	Description
31:5	RO	0x0	Reserved
4	RW	0x0	crc_rx_en When set to 1, this bit enables the CRC reception and error reporting
3	RW	0x0	ecc_rx_en When set to 1, this bit enables the ECC reception, error correction, and reporting
2	RW	0x0	bta_en When set to 1, this bit enables the Bus Turn-Around (BTA) request
1	RW	0x0	eotp_rx_en When set to 1, this bit enables the EoTp reception
0	RW	0x0	eotp_tx_en When set to 1, this bit enables the EoTp transmission

MIPI_DSI_HOST_GEN_VCID

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	Reserved
1:0	RW	0x0	gen_vcid_rx This field indicates the Generic interface read-back virtual channel identification

MIPI_DSI_HOST_MODE_CFG

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	Reserved
0	RW	0x1	cmd_video_mode This bit configures the operation mode: 1'b0: Video mode 1'b1: Command mode

MIPI_DSI_HOST_VID_MODE_CFG

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:25	RO	0x0	Reserved
24	RW	0x0	vpg_orientation This field indicates the color bar orientation as follows: 1'b0: Vertical mode 1'b1: Horizontal mode
23:21	RO	0x0	Reserved
20	RW	0x0	vpg_mode This field is to select the pattern: 1'b0: Color bar (horizontal or vertical) 1'b1: BER pattern (vertical only)
19:17	RO	0x0	Reserved
16	RW	0x0	vpg_en When set to 1, this bit enables the video mode pattern generator
15	RW	0x0	lp_cmd_en When set to 1, this bit enables the command transmission only in lowpower mode
14	RW	0x0	frame_bta_ack_en When set to 1, this bit enables the request for an acknowledge response at the end of a frame
13	RW	0x0	lp_hfp_en When set to 1, this bit enables the return to low-power inside the Horizontal Front Porch (HFP) period when timing allows
12	RW	0x0	lp_hbp_en When set to 1, this bit enables the return to low-power inside the Horizontal Back Porch (HBP) period when timing allows
11	RW	0x0	lp_vact_en When set to 1, this bit enables the return to low-power inside the Vertical Active (VACT) period when timing allows
10	RW	0x0	lp_vfp_en When set to 1, this bit enables the return to low-power inside the Vertical Front Porch (VFP) period when timing allows
9	RW	0x0	lp_vbp_en When set to 1, this bit enables the return to low-power inside the Vertical Back Porch (VBP) period when timing allows

Bit	Attr	Reset Value	Description
8	RW	0x0	lp_vsa_en When set to 1, this bit enables the return to low-power inside the Vertical Sync Time (VSA) period when timing allows
7:2	RO	0x0	Reserved
1:0	RW	0x0	vid_mode_type This field indicates the video mode transmission type as follows: 2'b00: Non-burst with sync pulses 2'b01: Non-burst with sync events 2'b10 and 2'b11: Burst mode

MIPI_DSI_HOST_VID_PKT_SIZE

Address: Operational Base + offset (0x003c)

Bit	Attr	Reset Value	Description
31:14	RO	0x0	Reserved
13:0	RW	0x0000	vid_pkt_size This field configures the number of pixels in a single video packet. For 18-bit not loosely packed data types, this number must be a multiple of 4. For YCbCr data types, it must be a multiple of 2, as described in the DSI specification

MIPI_DSI_HOST_VID_NUM_CHUNKS

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	Reserved
12:0	RW	0x0000	vid_num_chunks This register configures the number of chunks to be transmitted during a Line period (a chunk consists of a video packet and a null packet). If set to 0 or 1, the video line is transmitted in a single packet. If set to 1, the packet is part of a chunk, so a null packet follows it if vid_null_size > 0. Otherwise, multiple chunks are used to transmit each video line

MIPI_DSI_HOST_VID_NULL_SIZE

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	Reserved
12:0	RW	0x0000	vid_null_size This register configures the number of bytes inside a null packet. Setting it to 0 disables the null packets

MIPI_DSI_HOST_VID_HSA_TIME

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	Reserved
11:0	RW	0x000	vid_hsa_time This field configures the Horizontal Synchronism Active period in lane byte clock cycles

MIPI_DSI_HOST_VID_HBP_TIME

Address: Operational Base + offset (0x004c)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	Reserved
11:0	RW	0x000	vid_hsa_time This field configures the Horizontal Synchronism Active period in lane byte clock cycles

MIPI_DSI_HOST_VID_HLINE_TIME

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	Reserved
14:0	RW	0x0000	vid_hline_time This field configures the size of the total line time (HSA+HBP+HACT+HFP) counted in lane byte clock cycles

MIPI_DSI_HOST_VID_VSA_LINES

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:10	RO	0x0	Reserved
9:0	RW	0x000	vsa_lines This field configures the Vertical Synchronism Active period measured in number of horizontal lines

MIPI_DSI_HOST_VID_VBP_LINES

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:10	RO	0x0	Reserved
9:0	RW	0x000	vbp_lines This field configures the Vertical Back Porch period measured in number of horizontal lines

MIPI_DSI_HOST_VID_VFP_LINES

Address: Operational Base + offset (0x005c)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	Reserved
0	RW	0x0	vfp_lines This field configures the Vertical Front Porch period measured in number of horizontal lines

MIPI_DSI_HOST_VID_VACTIVE_LINES

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:14	RO	0x0	Reserved
13:0	RW	0x0000	v_active_lines This field configures the Vertical Active period measured in number of horizontal lines

MIPI_DSI_HOST_EDPI_CMD_SIZE

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	Reserved
15:0	RW	0x0000	edpi_allowed_cmd_size This field configures the maximum allowed size for an eDPI write memory command, measured in pixels. Automatic partitioning of data obtained from eDPI is permanently enabled

MIPI_DSI_HOST_CMD_MODE_CFG

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:25	RO	0x0	Reserved
24	RW	0x0	max_rd_pkt_size This bit configures the maximum read packet size command transmission type: 1'b0: High-speed 1'b1: Low-power
23:20	RO	0x0	Reserved
19	RW	0x0	dcs_lw_tx This bit configures the DCS long write packet command transmission type: 1'b0: High-speed 1'b1: Low-power
18	RW	0x0	dcs_sr_0p_tx This bit configures the DCS short read packet with zero parameter command transmission type: 1'b0: High-speed 1'b1: Low-power
17	RW	0x0	dcs_sw_1p_tx This bit configures the DCS short write packet with one parameter command transmission type: 1'b0: High-speed 1'b1: Low-power

Bit	Attr	Reset Value	Description
16	RW	0x0	dcs_sw_0p_tx This bit configures the DCS short write packet with zero parameter command transmission type: 1'b0: High-speed 1'b1: Low-power
15	RO	0x0	Reserved
14	RW	0x0	gen_lw_tx This bit configures the Generic long write packet command transmission type: 1'b0: High-speed 1'b1: Low-power
13	RW	0x0	gen_sr_2p_tx This bit configures the Generic short read packet with two parameters command transmission type: 1'b0: High-speed 1'b1: Low-power
12	RW	0x0	gen_sr_1p_tx This bit configures the Generic short read packet with one parameter command transmission type: 1'b0: High-speed 1'b1: Low-power
11	RW	0x0	gen_sr_0p_tx This bit configures the Generic short read packet with zero parameter command transmission type: 1'b0: High-speed 1'b1: Low-power
10	RW	0x0	gen_sw_2p_tx This bit configures the Generic short write packet with two parameters command transmission type: 1'b0: High-speed 1'b1: Low-power
9	RW	0x0	gen_sw_1p_tx This bit configures the Generic short write packet with one parameter command transmission type: 1'b0: High-speed 1'b1: Low-power

Bit	Attr	Reset Value	Description
8	RW	0x0	gen_sw_0p_tx This bit configures the Generic short write packet with zero parameter command transmission type: 1'b0: High-speed 1'b1: Low-power
7:2	RO	0x0	Reserved
1	RW	0x0	ack_rqst_en When set to 1, this bit enables the acknowledge request after each packet transmission
0	RW	0x0	tear_fx_en When set to 1, this bit enables the tearing effect acknowledge request

MIPI_DSI_HOST_GEN_HDR

Address: Operational Base + offset (0x006c)

Bit	Attr	Reset Value	Description
31:24	RO	0x0	Reserved
23:16	RW	0x00	gen_wc_msbyte
15:8	RW	0x00	gen_wc_lsbyte This field configures the least significant byte of the header packet's Word count for long packets or data 0 for short packets
7:6	RW	0x0	gen_vc This field configures the virtual channel id of the header packet
5:0	RW	0x00	gen_dt This field configures the packet data type of the header packet

MIPI_DSI_HOST_GEN_PLD_DATA

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	gen_pld_b4 This field indicates byte 4 of the packet payload
23:16	RW	0x00	gen_pld_b3 This field indicates byte 3 of the packet payload
15:8	RW	0x00	gen_pld_b2 This field indicates byte 2 of the packet payload
7:0	RW	0x00	gen_pld_b1 This field indicates byte 1 of the packet payload

MIPI_DSI_HOST_CMD_PKT_STATUS

Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	Reserved

Bit	Attr	Reset Value	Description
14	RW	0x0	dbi_rd_cmd_busy This bit is set when a read command is issued and cleared when the entire response is stored in the FIFO
13	RO	0x0	dbi_pld_r_full This bit indicates the full status of the DBI read payload FIFO
12	RO	0x0	dbi_pld_r_empty This bit indicates the empty status of the DBI read payload FIFO
11	RO	0x0	dbi_pld_w_full This bit indicates the full status of the DBI write payload FIFO
10	RO	0x0	dbi_pld_w_empty This bit indicates the empty status of the DBI write payload FIFO
9	RO	0x0	dbi_cmd_full This bit indicates the full status of the DBI command FIFO
8	RO	0x0	dbi_cmd_empy This bit indicates the empty status of the DBI command FIFO
7	RO	0x0	Reserved
6	RO	0x0	gen_rd_cmd_busy This bit is set when a read command is issued and cleared when the entire response is stored in the FIFO
5	RO	0x0	gen_pld_r_full This bit indicates the full status of the generic read payload FIFO
4	RO	0x0	gen_pld_r_empty This bit indicates the empty status of the generic read payload FIFO
3	RO	0x0	gen_pld_w_full This bit indicates the full status of the generic write payload FIFO
2	RO	0x0	gen_pld_w_empty This bit indicates the empty status of the generic write payload FIFO
1	RO	0x0	gen_cmd_full This bit indicates the full status of the generic command FIFO
0	RO	0x0	gen_cmd_empty This bit indicates the empty status of the generic command FIFO

MIPI_DSI_HOST_TO_CNT_CFG

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	hstx_to_cnt This field configures the timeout counter that triggers a high-speed transmission timeout contention detection (measured in TO_CLK_DIVISION cycles). If using the non-burst mode and there is no sufficient time to switch from HS to LP and back in the period which is from one line data finishing to the next line sync start, the DSI link returns the LP state once per frame, then you should configure the TO_CLK_DIVISION and hstx_to_cnt to be in accordance with: hstx_to_cnt * lanebyteclkperiod * TO_CLK_DIVISION >= the time of one FRAME data transmission * (1 + 10%) In burst mode, RGB pixel packets are time-compressed, leaving more time during a can line. Therefore, if in burst mode and there is sufficient time to switch from HS to LP and back in the period of time from one line data finishing to the next line sync start, the DSI link can return LP mode and back in this time interval to save power. For this, configure the TO_CLK_DIVISION and hstx_to_cnt to be in ccordance with: hstx_to_cnt * lanebyteclkperiod * TO_CLK_DIVISION >= the time of one LINE data transmission * (1 + 10%)
15:0	RW	0x0000	lprx_to_cnt This field configures the timeout counter that triggers a low-power reception timeout contention detection (measured in TO_CLK_DIVISION cycles)

MIPI_DSI_HOST_HS_RD_TO_CNT

Address: Operational Base + offset (0x007c)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	Reserved
15:0	RW	0x0000	hs_rd_to_cnt This field sets a period for which the DSI Host Controller keeps the link still, after sending a high-speed read operation. This period is measured in cycles of lanebyteclk. The counting starts when the D-PHY enters the Stop state and causes no interrupts

MIPI_DSI_HOST_LP_RD_TO_CNT

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	Reserved

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	lp_rd_to_cnt This field sets a period for which the DSI Host Controller keeps the link still, after sending a low-power read operation. This period is measured in cycles of lanebyteclk. The counting starts when the D-PHY enters the Stop state and causes no interrupts

MIPI_DSI_HOST_HS_WR_TO_CNT

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:25	RO	0x0	Reserved
24	RW	0x0	presp_to_mode When set to 1, this bit ensures that the peripheral response timeout caused by hs_wr_to_cnt is used only once per eDPI frame, when both the following conditions are met: dpivsync_edpiwms has risen and fallen. Packets originated from eDPI have been transmitted and its FIFO is empty again. In this scenario no non-eDPI requests are sent to the D-PHY, even if there is traffic from generic or DBI ready to be sent, making it return to stop state. When it does so, PRESP_TO counter is ctivated and only when it finishes does the controller send any other traffic that is ready
23:16	RO	0x0	Reserved
15:0	RW	0x0000	hs_wr_to_cnt This field sets a period for which the DSI Host Controller keeps the link inactive after sending a high-speed write operation. This period is measured in cycles of lanebyteclk. The counting starts when the D-PHY enters the Stop state and causes no interrupts

MIPI_DSI_HOST_LP_WR_TO_CNT

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	Reserved
15:0	RW	0x0000	lp_wr_to_cnt This field sets a period for which the DSI Host Controller keeps the link still, after sending a low-power write operation. This period is measured in cycles of lanebyteclk. The counting starts when the D-PHY enters the Stop state and causes no interrupts

MIPI_DSI_HOST_BTA_TO_CNT

Address: Operational Base + offset (0x008c)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	Reserved
0	RW	0x0	bta_to_cnt This field sets a period for which the DSI Host Controller keeps the link still, after completing a Bus Turn-Around. This period is measured in cycles of lanebyteclk. The counting starts when the D-PHY enters the Stop state and causes no interrupts

MIPI_DSI_HOST_SDF_3D

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	Reserved
16	RW	0x0	send_3d_cfg When set, causes the next VSS packet to include 3D control payload in every VSS packet
15:6	RO	0x0	Reserved
5	RW	0x0	right_first This bit defines the left or right order: 1'b0: Left eye data is sent first, and then the right eye data is sent 1'b1: Right eye data is sent first, and then the left eye data is sent
4	RW	0x0	second_vsync This field defines whether there is a second VSYNC pulse between Left and Right Images, when 3D Image Format is Frame-based: 1'b0: No sync pulses between left and right data 1'b1: Sync pulse (HSYNC, VSYNC, blanking) between left and right data
3:2	RW	0x0	format_3d This field defines the 3D image format: 2'b00: Line (alternating lines of left and right data) 2'b01: Frame (alternating frames of left and right data) 2'b10: Pixel (alternating pixels of left and right data) 2'b11: Reserved
1:0	RW	0x0	mode_3d This field defines the 3D mode on/off and display orientation: 2'b00: 3D mode off (2D mode on) 2'b01: 3D mode on, portrait orientation 2'b10: 3D mode on, landscape orientation 2'b11: Reserved

MIPI_DSI_HOST_LPCLK_CTRL

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	Reserved
1	RW	0x0	auto_clklane_ctrl This bit enables the automatic mechanism to stop providing clock in the clock lane when time allows
0	RW	0x0	phy_txrequestclkhs This bit controls the D-PHY PPI txrequestclkhs signal

MIPI_DSI_HOST_PHY_TMR_LPCLK_CFG

Address: Operational Base + offset (0x0098)

Bit	Attr	Reset Value	Description
31:26	RO	0x0	Reserved
25:16	RW	0x000	phy_clkhs2lp_time This field configures the maximum time that the D-PHY clock lane takes to go from high-speed to low-power transmission measured in lane byte clock cycles
15:10	RO	0x0	Reserved
9:0	RW	0x000	phy_clklp2hs_time This field configures the maximum time that the D-PHY clock lane takes to go from low-power to high-speed transmission measured in lane byte clock cycles

MIPI_DSI_HOST_PHY_TMR_CFG

Address: Operational Base + offset (0x009c)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	phy_hs2lp_time This field configures the maximum time that the D-PHY data lanes take to go from high-speed to low-power transmission measured in lane byte clock cycles
23:16	RW	0x00	phy_lp2hs_time This field configures the maximum time that the D-PHY data lanes take to go from low-power to high-speed transmission measured in lane byte clock cycles
15	RO	0x0	Reserved
14:0	RW	0x0000	max_rd_time This field configures the maximum time required to perform a read command in lane byte clock cycles. This register can only be modified when no read command is in progress

MIPI_DSI_HOST_PHY_RSTZ

Address: Operational Base + offset (0x00a0)

Bit	Attr	Reset Value	Description
31:4	RO	0x0	Reserved
3	RW	0x0	phy_forcepll When the D-PHY is in ULPS, this bit enables the D-PHY PLL. Dependency: DSI_HOST_FPGA = 0. Otherwise, this bit is Reserved
2	RW	0x0	phy_enableclk When set to1, this bit enables the D-PHY Clock Lane module
1	RW	0x0	phy_rstz When set to 0, this bit places the digital section of the D-PHY in the reset state
0	RW	0x0	phy_shutdownz When set to 0, this bit places the D-PHY macro in power-down state

MIPI_DSI_HOST_PHY_IF_CFG

Address: Operational Base + offset (0x00a4)

Bit	Attr	Reset Value	Description
31:16	RO	0x0	Reserved
15:8	RW	0x00	phy_stop_wait_time This field configures the minimum wait period to request a high-speed transmission after the Stop state
7:2	RO	0x0	Reserved
1:0	RW	0x3	n_lanes This field configures the number of active data lanes: 2'b00: One data lane (lane 0) 2'b01: Two data lanes (lanes 0 and 1) 2'b10: Three data lanes (lanes 0, 1, and 2) 2'b11: Four data lanes (lanes 0, 1, 2, and 3)

MIPI_DSI_HOST_PHY_STATUS

Address: Operational Base + offset (0x00b0)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	Reserved
12	RO	0x0	phy_ulpsactivenot3lane This bit indicates the status of ulpsactivenot3lane D-PHY signal
11	RO	0x0	phy_stopstate3lane This bit indicates the status of phystopstate3lane D-PHY signal
10	RO	0x0	phy_ulpsactivenot2lane This bit indicates the status of ulpsactivenot2lane D-PHY signal
9	RO	0x0	phy_stopstate2lane This bit indicates the status of phystopstate2lane D-PHY signal

Bit	Attr	Reset Value	Description
8	RO	0x0	phy_ulpsactivenot1lane This bit indicates the status of ulpsactivenot1lane D-PHY signal
7	RO	0x0	phy_stopstate1lane This bit indicates the status of phystopstate1lane D-PHY signal
6	RO	0x0	phy_rxulpsesc0lane This bit indicates the status of rxulpsesc0lane D-PHY signal
5	RO	0x0	phy_ulpsactivenot0lane This bit indicates the status of ulpsactivenot0lane D-PHY signal
4	RO	0x0	phy_stopstate0lane This bit indicates the status of phystopstate0lane D-PHY signal
3	RO	0x0	phy_ulpsactivenotclk This bit indicates the status of phyulpsactivenotclk D-PHY signal
2	RO	0x0	phy_stopstateclklane This bit indicates the status of phystopstateclklane D-PHY signal
1	RO	0x0	phy_direction This bit indicates the status of phydirection D-PHY signal
0	RO	0x0	phy_lock This bit indicates the status of phylock D-PHY signal

MIPI_DSI_HOST_INT_ST0

Address: Operational Base + offset (0x00bc)

Bit	Attr	Reset Value	Description
31:21	RO	0x0	Reserved
20	RO	0x0	dphy_errors_4 This bit indicates the LP1 contention error ErrContentionLP1 from Lane 0
19	RW	0x0	dphy_errors_3 This bit indicates the LP0 contention error ErrContentionLP0 from Lane 0
18	RO	0x0	dphy_errors_2 This bit indicates the ErrControl error from Lane 0
17	RO	0x0	dphy_errors_1 This bit indicates ErrSyncEsc low-power data transmission synchronization error from Lane 0
16	RO	0x0	dphy_errors_0 This bit indicates ErrEsc escape entry error from Lane 0
15	RO	0x0	ack_with_err_15 This bit retrieves the DSI protocol violation from the Acknowledge error report
14	RO	0x0	ack_with_err_14 This bit retrieves the Reserved (specific to device) from the Acknowledge error report

Bit	Attr	Reset Value	Description
13	RO	0x0	ack_with_err_13 This bit retrieves the invalid transmission length from the Acknowledge error report
12	RO	0x0	ack_with_err_12 This bit retrieves the DSI VC ID Invalid from the Acknowledge error report
11	RO	0x0	ack_with_err_11 This bit retrieves the not recognized DSI data type from the Acknowledge error report
10	RO	0x0	ack_with_err_10 This bit retrieves the checksum error (long packet only) from the Acknowledge error report
9	RO	0x0	ack_with_err_9 This bit retrieves the ECC error, multi-bit (detected, not corrected) from the Acknowledge error
8	RO	0x0	ack_with_err_8 This bit retrieves the ECC error, single-bit (detected and corrected) from the Acknowledge error
7	RO	0x0	ack_with_err_7 This bit retrieves the Reserved (specific to device) from the Acknowledge error report
6	RO	0x0	ack_with_err_6 This bit retrieves the False Control error from the Acknowledge error report
5	RO	0x0	ack_with_err_5 This bit retrieves the Peripheral Timeout error from the Acknowledge Error report
4	RO	0x0	ack_with_err_4 This bit retrieves the LP Transmit Sync error from the Acknowledge error report
3	RO	0x0	ack_with_err_3 This bit retrieves the Escape Mode Entry Command error from the Acknowledge error report
2	RO	0x0	ack_with_err_2 This bit retrieves the EoT Sync error from the Acknowledge error report
1	RO	0x0	ack_with_err_1 This bit retrieves the SoT Sync error from the Acknowledge error report
0	RO	0x0	ack_with_err_0 This bit retrieves the SoT error from the Acknowledge error report

MIPI_DSI_HOST_INT_ST1

Address: Operational Base + offset (0x00c0)

Bit	Attr	Reset Value	Description
31:18	RO	0x0	Reserved
17	RW	0x0	dbi_ilegal_comm_err This bit indicates that an attempt to write an illegal command on the DBI interface is made and the core is blocked by transmission
16	RO	0x0	dbi_pld_recv_err This bit indicates that during a DBI read back packet, the payload FIFO becomes full and the received data is corrupted
15	RO	0x0	dbi_pld_rd_err This bit indicates that during a DCS read data, the payload FIFO goes empty and the data sent to the interface is corrupted
14	RO	0x0	dbi_pld_wr_err This bit indicates that the system tried to write the payload data through the DBI interface and the FIFO is full. Therefore, the command is not written
13	RO	0x0	dbi_cmd_wr_err This bit indicates that the system tried to write a command through the DBI but the command FIFO is full. Therefore, the command is not written
12	RO	0x0	gen_pld_recev_err This bit indicates that during a generic interface packet read back, the payload FIFO becomes full and the received data is corrupted
11	RO	0x0	gen_pld_rd_err This bit indicates that during a DCS read data, the payload FIFO becomes empty and the data sent to the interface is corrupted
10	RO	0x0	gen_pld_send_err This bit indicates that during a Generic interface packet build, the payload FIFO becomes empty and corrupt data is sent
9	RO	0x0	gen_pld_wr_err This bit indicates that the system tried to write a payload data through the Generic interface and the FIFO is full. Therefore, the payload is not written
8	RO	0x0	gen_cmd_wr_err This bit indicates that the system tried to write a command through the Generic interface and the FIFO is full. Therefore, the command is not written
7	RO	0x0	dpi_pld_wr_err This bit indicates that during a DPI pixel line storage, the payload FIFO becomes full and the data stored is corrupted
6	RO	0x0	eopt_err This bit indicates that the EoTp packet is not received at the end of the incoming peripheral transmission
5	RO	0x0	pkt_size_err This bit indicates that the packet size error is detected during the packet reception

Bit	Attr	Reset Value	Description
4	RO	0x0	crc_err This bit indicates that the CRC error is detected in the received packet payload
3	RO	0x0	ecc_multi_err This bit indicates that the ECC multiple error is detected in a received packet
2	RO	0x0	ecc_single_err This bit indicates that the ECC single error is detected and corrected in a received packet
1	RO	0x0	to_lp_rx This bit indicates that the low-power reception timeout counter reached the end and contention is detected
0	RO	0x0	to_hs_tx This bit indicates that the high-speed transmission timeout counter reached the end and contention is detected

MIPI_DSI_HOST_INT_MSK0

Address: Operational Base + offset (0x00c4)

Bit	Attr	Reset Value	Description
31:21	RO	0x0	Reserved
20	RW	0x0	dphy_errors_4 This bit indicates the LP1 contention error ErrContentionLP1 from Lane 0
19	RW	0x0	dphy_errors_3 This bit indicates the LP0 contention error ErrContentionLP0 from Lane 0
18	RW	0x0	dphy_errors_2 This bit indicates the ErrControl error from Lane 0

1	RW	0x0	to_lp_rx This bit indicates that the low-power reception timeout counter reached the end and contention is detected
0	RW	0x0	to_hs_tx This bit indicates that the high-speed transmission timeout counter reached the end and contention is detected

MIPI_DSI_HOST_VID_SHADOW_CTRL

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	Reserved
16	RW	0x0	vid_shadow_pin_req When set to 1, the video request is done by external pin. In this mode, vid_shadow_req is ignored
15:9	RO	0x0	Reserved
8	RW	0x0	vid_shadow_req When set to 1, the DPI registers are copied to the auxiliary registers. After copying, this bit is auto cleared
7:1	RO	0x0	Reserved
0	RW	0x0	vid_shadow_en When set to 1, DPI receives the active configuration from the auxiliary registers. When this bit is set along with the id_shadow_req bit, the auxiliary registers are automatically updated

MIPI_DSI_HOST_DPI_VCID_ACT

Address: Operational Base + offset (0x010c)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	Reserved
1:0	RW	0x0	dpi_vcid This field configures the DPI virtual channel id that is indexed to the Video mode packets

MIPI_DSI_HOST_DPI_COLOR_CODING_ACT

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:9	RO	0x0	Reserved
8	RW	0x0	loosely18_en When set to 1, this bit activates loosely packed variant to 18-bit configurations
7:4	RO	0x0	Reserved
3:0	RW	0x0	dpi_color_coding This field configures the DPI color coding as follows: 4'b0000: 16-bit configuration 1 4'b0001: 16-bit configuration 2 4'b0010: 16-bit configuration 3 4'b0011: 18-bit configuration 1 4'b0100: 18-bit configuration 2 4'b0101: 24-bit 4'b0110: 20-bit YCbCr 4:2:2 loosely packed 4'b0111: 24-bit YCbCr 4:2:2 4'b1000: 16-bit YCbCr 4:2:2 4'b1001: 30-bit 4'b1010: 36-bit 4'b1011-4'b1111: 12-bit YCbCr 4:2:0

MIPI_DSI_HOST_DPI_LP_CMD_TIM_ACT

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:24	RO	0x0	Reserved
23:16	RO	0x00	outvact_lpcmd_time This field is used for the transmission of commands in low-power mode. It defines the size, in bytes, of the largest packet that can fit in a line during the VSA, VBP, and VFP regions
15:8	RO	0x0	Reserved
7:0	RO	0x00	invact_lpcmd_time This field is used for the transmission of commands in low-power mode. It defines the size, in bytes, of the largest packet that can fit in a line during the VACT region

MIPI_DSI_HOST_VID_MODE_CFG_ACT

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:25	RO	0x0	Reserved
24	RW	0x0	vpg_orientation This field indicates the color bar orientation as follows: 1'b0: Vertical mode 1'b1: Horizontal mode
23:21	RO	0x0	Reserved

Bit	Attr	Reset Value	Description
20	RO	0x0	vpg_mode This field is to select the pattern: 1'b0: Color bar (horizontal or vertical) 1'b1: BER pattern (vertical only)
19:17	RO	0x0	Reserved
16	RO	0x0	vpg_en When set to 1, this bit enables the video mode pattern generator
15	RO	0x0	lp_cmd_en When set to 1, this bit enables the command transmission only in lowpower mode
14	RO	0x0	frame_bta_ack_en When set to 1, this bit enables the request for an acknowledge response at the end of a frame
13	RO	0x0	lp_hfp_en When set to 1, this bit enables the return to low-power inside the Horizontal Front Porch (HFP) period when timing allows
12	RO	0x0	lp_hbp_en When set to 1, this bit enables the return to low-power inside the Horizontal Back Porch (HBP) period when timing allows
11	RO	0x0	lp_vact_en When set to 1, this bit enables the return to low-power inside the Vertical Active (VACT) period when timing allows
10	RO	0x0	lp_vfp_en When set to 1, this bit enables the return to low-power inside the Vertical Front Porch (VFP) period when timing allows
9	RO	0x0	lp_vbp_en When set to 1, this bit enables the return to low-power inside the Vertical Back Porch (VBP) period when timing allows
8	RO	0x0	lp_vsa_en When set to 1, this bit enables the return to low-power inside the Vertical Sync Time (VSA) period when timing allows
7:2	RO	0x0	Reserved
1:0	RO	0x0	vid_mode_type This field indicates the video mode transmission type as follows: 2'b00: Non-burst with sync pulses 2'b01: Non-burst with sync events 2'b10 and 2'b11: Burst mode

MIPI_DSI_HOST_VID_PKT_SIZE_ACT
Address: Operational Base + offset (0x013c)

Bit	Attr	Reset Value	Description
31:14	RO	0x0	Reserved
13:0	RO	0x0000	vid_pkt_size This field configures the number of pixels in a single video packet. For 18-bit not loosely packed data types, this number must be a multiple of 4. For YCbCr data types, it must be a multiple of 2, as described in the DSI specification

MIPI_DSI_HOST_VID_NUM_CHUNKS_ACT

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	Reserved
12:0	RO	0x0000	vid_num_chunks This register configures the number of chunks to be transmitted during a Line period (a chunk consists of a video packet and a null packet). If set to 0 or 1, the video line is transmitted in a single packet. If set to 1, the packet is part of a chunk, so a null packet follows it if vid_null_size > 0. Otherwise, multiple chunks are used to transmit each video line

MIPI_DSI_HOST_VID_NULL_SIZE_ACT

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	Reserved
12:0	RW	0x0000	vid_null_size This register configures the number of bytes inside a null packet. Setting it to 0 disables the null packets

MIPI_DSI_HOST_VID_HSA_TIME_ACT

Address: Operational Base + offset (0x0148)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	Reserved
11:0	RO	0x000	vid_hsa_time This field configures the Horizontal Synchronism Active period in lane byte clock cycles

MIPI_DSI_HOST_VID_HBP_TIME_ACT

Address: Operational Base + offset (0x014c)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	Reserved
11:0	RW	0x000	vid_hsa_time This field configures the Horizontal Synchronism Active period in lane byte clock cycles

MIPI_DSI_HOST_VID_HLINE_TIME_ACT

Address: Operational Base + offset (0x0150)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	Reserved
14:0	RO	0x0000	vid_hline_time This field configures the size of the total line time (HSA+HBP+HACT+HFP) counted in lane byte clock cycles

MIPI_DSI_HOST_VID_VSA_LINES_ACT

Address: Operational Base + offset (0x0154)

Bit	Attr	Reset Value	Description
31:10	RO	0x0	Reserved
9:0	RO	0x000	vsa_lines This field configures the Vertical Synchronism Active period measured in number of horizontal lines

MIPI_DSI_HOST_VID_VBP_LINES_ACT

Address: Operational Base + offset (0x0158)

Bit	Attr	Reset Value	Description
31:10	RO	0x0	Reserved
9:0	RW	0x000	vbp_lines This field configures the Vertical Back Porch period measured in number of horizontal lines

MIPI_DSI_HOST_VID_VFP_LINES_ACT

Address: Operational Base + offset (0x015c)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	Reserved
0	RO	0x0	vfp_lines This field configures the Vertical Front Porch period measured in number of horizontal lines

MIPI_DSI_HOST_VID_VACTIVE_LINES_ACT

Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:14	RO	0x0	Reserved
13:0	RO	0x0000	v_active_lines This field configures the Vertical Active period measured in number of horizontal lines

MIPI_DSI_HOST_SDF_3D_ACT

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	Reserved
16	RW	0x0	send_3d_cfg When set, causes the next VSS packet to include 3D control payload in every VSS packet

Bit	Attr	Reset Value	Description
15:6	RO	0x0	Reserved
5	RO	0x0	right_first This bit defines the left or right order: 1'b0: Left eye data is sent first, and then the right eye data is sent. 1'b1: Right eye data is sent first, and then the left eye data is sent
4	RO	0x0	second_vsync This field defines whether there is a second VSYNC pulse between Left and Right Images, when 3D Image Format is Frame-based: 1'b0: No sync pulses between left and right data 1'b1: Sync pulse (HSYNC, VSYNC, blanking) between left and right data
3:2	RO	0x0	format_3d This field defines the 3D image format: 2'b00: Line (alternating lines of left and right data) 2'b01: Frame (alternating frames of left and right data) 2'b10: Pixel (alternating pixels of left and right data) 2'b11: Reserved
1:0	RO	0x0	mode_3d This field defines the 3D mode on/off and display orientation: 2'b00: 3D mode off (2D mode on) 2'b01: 3D mode on, portrait orientation 2'b10: 3D mode on, landscape orientation 2'b11: Reserved

29.5 Application Notes

Perform the following steps to configure the DPI packet transmission:

- Step1: Global configuration:
  - Configure n_lanes (PHY_IF_CFG-[1:0]) to define the number of lanes in which the controller has to perform high-speed transmissions.
- Step2: Configure the DPI Interface to define how the DPI interface interacts with the controller.
  - Configure dpi_vid (DPI_CFG-[1:0]): This field configures the virtual channel that the packet generated by the DPI interface is indexed to.
  - Configure dpi_color_coding (DPI_CFG-[4:2]): This field configures the bits per pixels that the interface transmits and also the variant configuration of each bpp. If you select 18 bpp, and the Enable_18_loosely_packed is not active, the number or pixels per line should be a multiple of four.
  - Configure dataen_active_low (DPI_CFG-[5]): This bit configures the polarity of the dpidataen signal and enables if it is active low.
  - Configure vsync_active_low (DPI_CFG-[6]): This bit configures the polarity of the dpivsync signal and enables if it is active low.
  - Configure vsync_active_low (DPI_CFG-[7]): This bit configures the polarity of the dpivsync signal and enables if it is active low.
  - Configure vsync_active_low (DPI_CFG-[8]): This bit configures the polarity of the dpishutdn signal and enables if it is active low.
  - Configure vsync_active_low (DPI_CFG-[9]): This bit configures the polarity of the dpicolorm signal and enables if it is active low.

- Configure en18_loosely (DPI_CFG-[10]): This bit configures if the pixel packing is done loosely or packed when dpi_color_coding is 18 bpp. This bit enables loosely packing.

- Step3: Select the Video Transmission Mode to define how the processor requires the video line to be transported through the DSI link.
  - Configure low-power transitions (VID_MODE_CFG-[8:3]): This defines the video line to be transported through the DSI link.
  - Configure low-power transitions (VID_MODE_CFG-[8:3]): This defines the video periods which are permitted to go to low-power if there is available time to do so.
  - Configure frame_BTA_ack (VID_MODE_CFG-[11]): This specifies if the controller should request the peripheral acknowledge message at the end of frames.
  - Burst mode: In this mode, the entire active pixel line is buffered into a FIFO and transmitted in a single packed with no interruptions. This transmission mode requires that the DPI Pixel FIFO has the capacity to store a full line of active pixel data inside it. This mode is optimally used if the difference between pixel required bandwidth and DSI link bandwidth is very different. This enables the DSI Host Controller to quickly dispatch the entire active video line in a single burst of data and then return to low-power mode.
    - Configure the register fiedl vid_mode_type (VID_MODE_CFG-[10]), num_chunks (VID_PKT_CFG-[20:11]), and null_pkt_size (VID_PKT_CFG-[30:21]) are automatically ignored by the DSI Host Controller.
  - Non-Burst mode: In this mode, the processor uses the partitioning properties of the DSI Host Controller to divide the video line transmission into several DSI packets. This is done to match th pixel required bandwidth with the DSI link bandwidth. With this mode, the controller configuration does not require a full line of pixel data to be stored inside the DPI Pixel FIFO. It requires only the content of one video packet.
    - Configure the vid_mode_type field (VID_MODE_CFG-[2:1]) with 2’b0x.
    - Configure the vid_mode_type field (VID_MODE_CFG-[2:1]) with 2’b00x to enable the transmission of sync pulses.
    - Configure the vid_mode_type field (VID_MODE_CFG-[2:1]) with 2’b01to enable the transmission of sync events.
    - Configure the vid_mode_type field (VID_MODE_CFG-[10:0]) with the number of pixels to be transmitted in a single packet.
    - Configure the en_multi_pkt field (VID_MODE_CFG-[9]) to enable the division of the active video transmission into more than one packet.
    - Configure the num_chunks field (VID_MODE_CFG-[20:11]) with the number of video chunks that the active video transmission is divided into.
    - Configure the en_null_pkt field (VID_MODE_CFG-[10]) to enable the insertion of null packets between video packets.
    - The field is effective only when en_multi_pkt field is activated, otherwise the controller ignores it and does not sent the null packets.
    - Configure the null_pkt_size field (VID_MODE_CFG-[30:21]) with the actual size of the inserted null packet.

- Step4: Define the DPI Horizontal timing configuration as follows:
  - Configure the hline_time field (TMR_LINE_CFG-[31:18]) with the time taken by a DPI video line accounted in Clock Lane bytes clock cycles (for a clock lane at 500 MHz the Lane byte clock period is 8 ns). When the DPI clock and Clock Lane clock are not multiples, the hline_time is a result of a round of a number. If the DSI Host Controller is configured to go to low-power, it is possible that the error included in a line is incremented with the next one. At the end of several lines, the DSI Host Controller can have a number of errors that can cause a malfunction of the video transmission.
  - Configure the hsa_time field (TMR_LINE_CFG-[8:0]) with the time taken by a DPI Horizontal Sync Active period accounted in Clock Lane byte clock cycles (normally a period of 8ns).
  - Configure the hbp_time field (TMR_LINE_CFG-[17:9]) with the time taken by a DPI Horizontal Sync Active period accounted in Clock Lane byte clock cycles (normally a

period of 8ns). Special attention should be given to the calculation of this parameter.

- Step5: Define the Vertical line configuration:
  - Configure the vsa_lines field (VTIMING_CFG-[3:0]) with the number of lines existing in the DPI Vertical Sync Active period.
  - Configure the vbp_lines field (VTIMING_CFG-[9:4]) with the number of lines existing in the DPI Vertical Back Porch period.
  - Configure the vfp_lines field (VTIMING_CFG-[15:10]) with the number of lines existing in the DPI Vertical Front Porch period.
  - Configure the v_active_lines field (VTIMING_CFG-[26:16]) with the number of lines existing in the DPI Vertical Active period.

Chapter 30 MIPI_TX_DPHY

30.1 Overview

The MIPI TX DPHY supports up to 2.5Gbps high speed data transmitter, plus a MIPI low-power low speed transceiver that supports data transfer in the bi-directional mode.

Features

- MIPI
  - One clock lane channel and four data channels
  - Designed to MIPI 1.2 specification
  - Data Channel 0: Bi-directional with Low-Power RX(LP-RX) and Low-Power CD(LP-CD)
  - Channel1~4: High-Speed TX(HS-TX) and a low-Power TX(LP-TX)
  - Maximum HS data rate: 2.5Gbps per lane
  - LP operation rate: 10Mbps per lane
  - Skew-Calibration supported
  - Automatic termination control for HS and LP modes
  - Low-Power dissipation: less than 16mW/lane in MIPI HS TX mode
- LVDS
  - Maximum Support data rate: 1.2Gbps per lane

30.2 Function Description

MIPI TX DPHY configuration contains one clock lane module and four data lane modules. Each of these PHY lane modules communicates via two lines to a complementary part at the other side of the lane interconnect.Figure below shows a Universal Lane Module Diagram with a global overview of internal functionality of the CIL function.

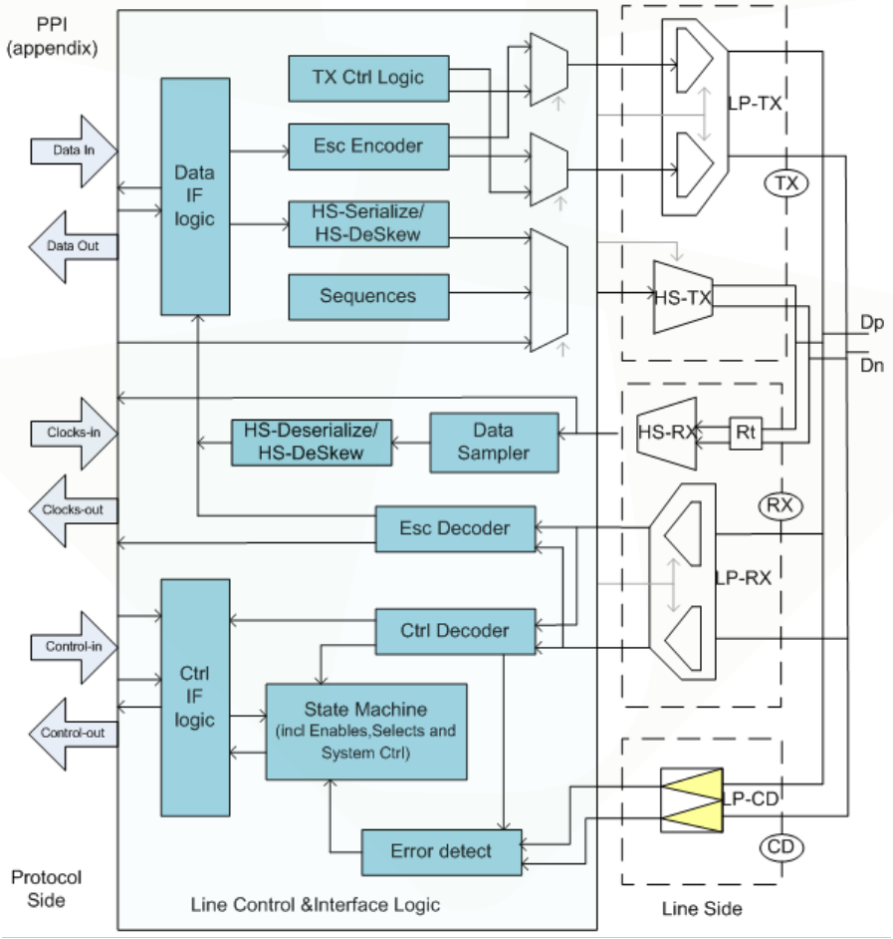

Fig. 30-1 MIPI TX DPHY Architecture

30.2.1 MIPI Mode High Speed Data Transmission

Once the initialization sequence is completed, the TX DPHY remains in control mode. From the transmitter side, high-speed mode is entered when the corresponding txrequesths input

is set high through DSI Host Controller. A burst contains the low-power initialization sequenc, the high-speed data payload,and the end of transmission sequence.

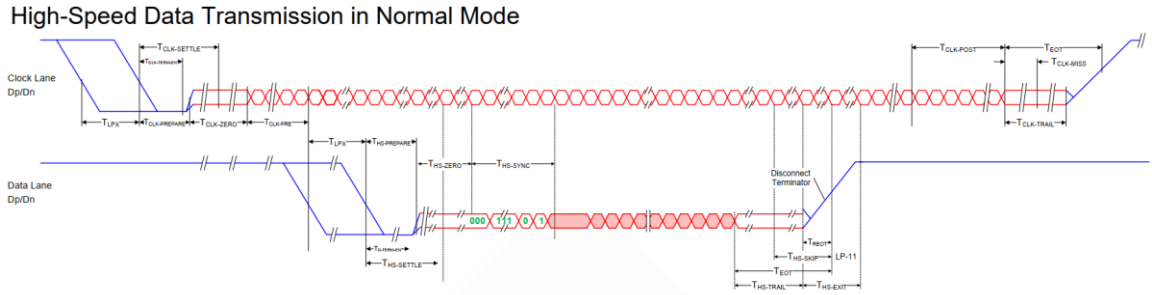

Fig. 30-2 MIPI High Speed Data Transmission in Bursts

30.2.2 LVDS Mode Data Transmission

Figure below shows the LVDS output timing.CLKP is the output clock, whose frequency is the same as the pixel clock. D0P/D0N is a pair differential serial data output.The output serial data is transmitted as MSB first. The rising edge of the output clock is at the transition of bit2 and bit1 of the pin_pdata_*[6:0].

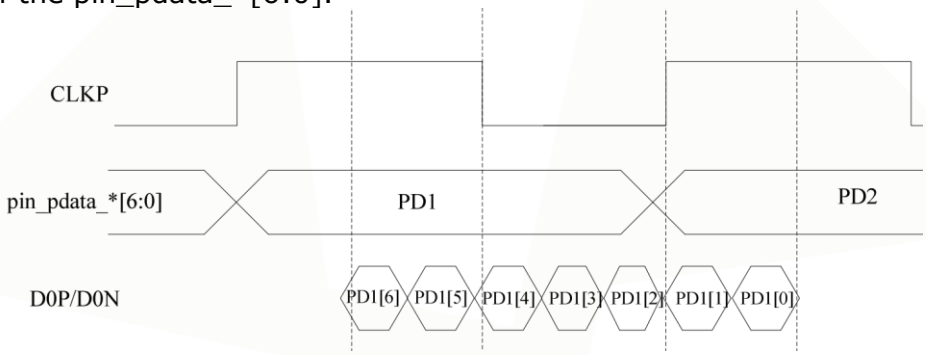

Fig. 30-3 LVDS Data Transmission

30.3 Register Description

30.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

30.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
MIPI_TX_PHY_ANALOG_REG00	0x0000	B	0x00000001	Power control and lane enable

1:0	RO	0x0	reserved

30.4 Application Notes

30.4.1 MIPI Mode Initialization

Setup Steps:

1. After power on and reset done, set the pin_enable_ck/0/1/2/3 of lanes to be used to high level and the others to low.

2. Send 8'h02 to register 8'h03. Configure PLL PREDIV.

3. Send 8'h53 to register 8'h04. Configure PLL FBDIV.

4. If disable post-divider, send 8'h4e to register 8'h08. Configure PLL POSTDIV.

5. Send 8'he4 to register 8'h01. Enable PLL and LDO.

6. Send 8'h7d to register 8'h00. Enable all lanes on analog part, enable power work, bandgap power on.

7. Send 8'he0 to register 8'h01.Reset analog.

8. Wait a period after analog has been reset.

9. Send 8'h1e to register 8'h20.Reset digital.

10. Send 8'h1f to register 8'h20.Reset digital.

11. Wait some interbal until PLL locked.

30.4.2 LVDS Mode Initialization

1. Set forcerxmode = 1 through *GRF VO_CON2*(for TX DPHY0) register.

2. Configure PLL.Write 8'h01 to the register 8'h03.Write 8'h0e to the register 8'h04.

3. Select LSB mode, default MSB mode. Write 8'h44 to the register 8'he0.(Optional)

4. Enable LVDS digital logic.Write 8'h92 to the register 8'he1.

5. Enable LVDS analog driver.Write 8'hf8 to the register 8'heb.

6. Select LVDS mode.Write 8'h02 to the register 8'he3.

7. Wait a period until PLL locked.

30.4.3 Programmable PLL

The TX DPHY PLL output frequency can be calculated using a sample formula:

$$PLL\_OUTPUT\_FREQUENCY = \frac{((\frac{FREF}{PREDIV}) \times FBDIV)}{POSTDIV}$$

Where PLL_OUTPUT_FREQUENCY equals to the (DDR-Clock-Frequence * 2)
FREF: PLL input reference frequency , 24Mhz.
PREDIV: PLL input reference clock divider which can be configured by the register of reg_prediv.
FBDIV: Integer value programmed into feedback divider which can configured by the register of reg_fbdiv.
POSTDIV: PLL post-divider 2 can be configured by the registers of reg_postdiv.If reg_postdiv is set to 1 , the POSTDIV value is 2. Otherwise, the value is 1.

Chapter 31 EDP TX Controller

31.1 Overview

This eDP TX Controller is compliant with DisplayPort standard 1.2a and eDP 1.3. DisplayPort is an industry standard to accommodate the growing broad adoption of digital display technology within the PC and consumer electronics (CE) industries. It consolidates the internal and external connection methods to reduce device complexity and cost, supports necessary features for key cross industry applications, and provides performance scalability to enable the next generation of displays featuring higher color depths, refresh rates, and display resolutions.

EDP TX Controller supports the following features:

- Compliant with DisplayPort™ Specification, Version 1.2
- Compliant with eDP™ Specification, Version 1.3
- Main link containing 4 physical lanes of 2.7/1.62 Gbps/lane
- Bi-directional auxiliary link with up to 1Mbps speed
- RGB, YCbCr 4:4:4, YCbCr 4:2:2 and 8/10 bit per component video format
- Support HDCP v1.3, integrated HDCP encryption engine for transmitting protected audio and video content
- Support I2S audio interface, the maximum number of channels is 8
- Support S/PDIF audio interface
- 24 Mhz crystal clock
- PRBS or programmable transmitter pattern for main link quality test
- Hot plug and unplug detection and link status monitor

31.2 Block Diagram

EDP TX Controller comprises with:

- Video data capture
- Audio data capture
- DP transmitter

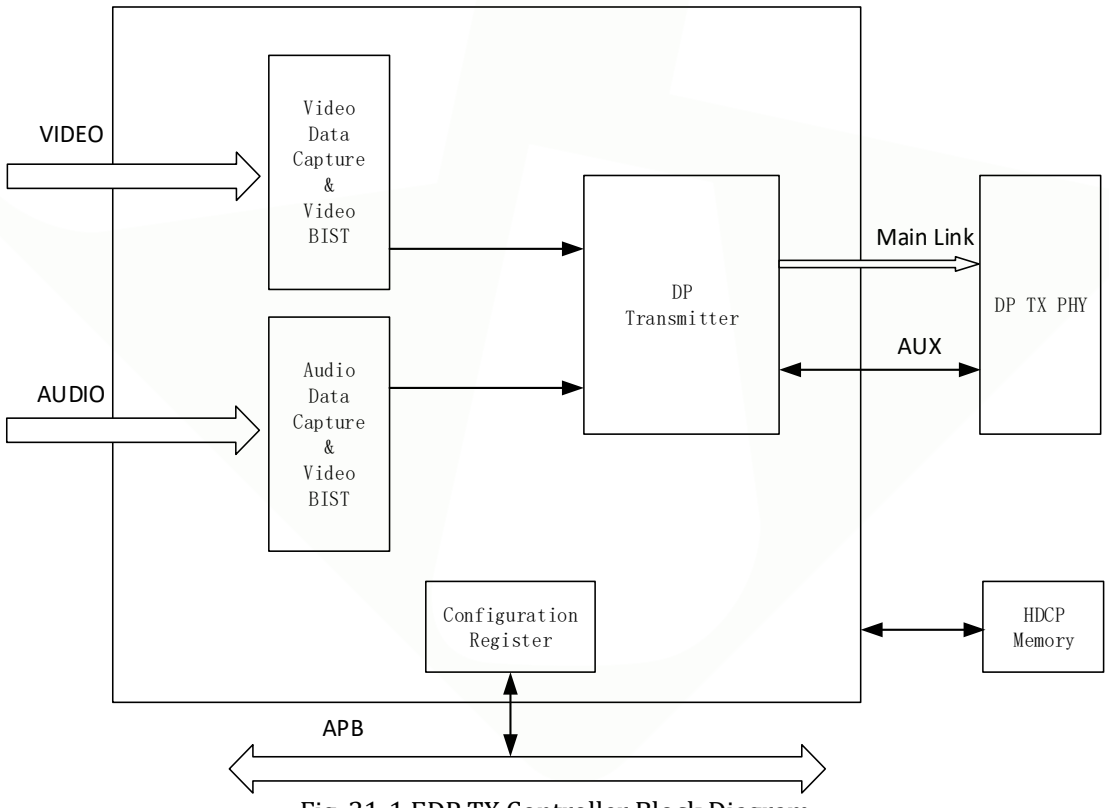

Fig. 31-1 EDP TX Controller Block Diagram

31.3 Function Description

31.3.1 Video data capture

This module capture video data from VOP.

31.3.2 Audio data capture

This module capture audio data from I2S and S/PDIF.

31.3.3 DP transmitter

This is main module in the eDP TX. It contains data packing, main link process, aux process and data process, etc.

31.4 Register Description

31.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

31.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
EDP_TX_DP_TX_VERSION	0x0010	W	0x00000060	DP_TX_VERSION

31.4.3 Detail Registers Description

EDP_TX_DP_TX_VERSION

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x60	dp_tx_version Version

EDP_TX_FUNC_EN_1

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x1	vid_cap_func_en_n Video capture functions enable. 1'b0: Normal operation 1'b1: Disable video capture
5	RW	0x1	vid_fifo_func_en_n Video FIFO functions enable. 1'b0: Normal operation 1'b1: Disable video FIFO
4	RW	0x1	aud_fifo_func_en_n Audio FIFO functions enable. 1'b0: Normal operation 1'b1: Disable Audio FIFO

Bit	Attr	Reset Value	Description
3	RW	0x1	aud_func_en_n Audio FIFO and capture module function enable. 1'b0: Normal operation 1'b1: Disable Audio FIFO and capture module If audio data (DMA or SPDIF) should be transmitted, AUD_FUNC_EN_N and AUD_FIFO_FUNC_EN_N should be set to 0 (enable).
2	RW	0x1	hdcp_func_en_n HDCP module functions enable. 1'b0: Normal operation 1'b1: Disable HDCP logic By disabling and enabling HDCP, all of registers in HDCP are cleared, except for the HDCP key inside of SPSRAM. Therefore, as an easy way to prepare re-authentication, firmware can disable and enable again to clear all HDCP registers.
1	RO	0x0	reserved
0	RW	0x1	sw_func_en_n Software defined function enable. 1'b0: Normal operation 1'b1: Disable All the function modules The bit has the highest priority, if the bit is 1, other function enable bits does not work.

EDP_TX_FUNC_EN_2

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	ssc_func_en_n SSC module enable. 1'b0: Normal mode 1'b1: Disable SSC module To apply updated SSC parameters into SSC operation, firmware must disable and enable this bit.
6:3	RO	0x0	reserved
2	RW	0x1	aux_func_en_n AUX channel module function enable. 1'b0: Normal operation 1'b1: Disable AUX channel module
1	RW	0x1	serdes_fifo_func_en_n Serdes FIFO function enable. 1'b0: Normal mode 1'b1: Disable Serdes FIFO To reset the serdes fifo, firmware must disable and enable this bit.
0	RW	0x1	ls_clk_domain_func_en_n Link symbol clock domain modules functions enable. 1'b0: Normal mode 1'b1: Disable the modules in link symbol clock domain. To reset the modules in link symbol clock domain, firmware must disable and enable this bit.

EDP_TX_VIDEO_CTL_1

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7	RW	0x0	video_en Video data input enable. 1'b0: Disable video data input. 1'b1: Enable video data input. It takes effect at next video frame.
6	RW	0x0	video_mute Video mute enable. In video mute mode, the solid color, specified in Base + 0x04A8 ~ Base + 0x04B0, is displayed. 1'b0: Disable 1'b1: Enable Output video data is changed properly as soon as this bit is configured.
5:0	RO	0x00	reserved

EDP_TX_VIDEO_CTL_2

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	in_d_range Dynamic range. This bit field is used to specify video data format in main stream attribute data. 1'b1: CEA range (16 ~ 235) 1'b0: VESA range (0 ~ 255)
6:4	RW	0x1	in_bpc Video input bit per color/ component (bpc). This bit field is used to specify video data format in main stream attribute data. Note that 6 bpc mode is invalid in YCbCr 422 mode. 3'b011: 12 bits 3'b010: 10 bits 3'b001: 8 bits 3'b000: 6 bits Other: Reserved
3:2	RO	0x0	reserved
1:0	RW	0x0	in_color_f Colorimetric format of input video. This is used to specify video data format in main stream attribute data. 2'b11: Reserved 2'b10: YCbCr444 2'b01: YcbCr422 2'b00: RGB

EDP_TX_VIDEO_CTL_3

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	in_yc_coeffi YCbCr Coefficients of input video. This is used to specify video data format in main stream attribute data. 1'b1: ITU709 1'b0: ITU601
6:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	vid_chk_update_type Select video format stability check method in video capture block. 1'b1: Check stability with the difference between adjacent frames. 1'b0: Check stability with the difference of differences between adjacent frames. Compares difference of 1st and 2nd to difference of 3rd and 4th frame.
3:0	RO	0x0	reserved

EDP_TX_VIDEO_CTL_4

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	bist_en Video BIST enable. 1'b1: Enable video BIST 1'b0: Normal operation mode
2	RW	0x0	bist_width Control display BIST color bar width. 1'b1: Each bar is 64 pixel width. 1'b0: Each bar is 32 pixel width.
1:0	RW	0x0	bist_type Display BIST type. 2'b00: Color bar 2'b01: White, gray and black bar 2'b10: Mobile white bar 2'b11: Reserved

EDP_TX_VIDEO_CTL_8

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x2	vid_hres_th Video Frame Horizontal Resolution variation threshold for video capture block. This bit field is used by CAPTURE block to determine whether STRM_VALID should be asserted.
3:0	RW	0x0	vid_vres_th Video Frame Vertical Resolution variation threshold for video capture block. This bit field is used by CAPTURE block to determine whether STRM_VALID should be asserted.

EDP_TX_VIDEO_CTL_10

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	f_sel Video format select. 1'b1: Video format information from register 1'b0: Video format information from video_capture module According to the configuration of this bit field, the values of video format status registers in Base + 0x008C~ 0x00D0 are determined, which are transferred as main stream attribute packet. Note that if BIST_EN is set to 1, F_SEL must be cleared to 0 although video format information comes from registers set by user.
3	RO	0x0	reserved
2	RW	0x0	slave_i_scan_cfg Interlace scan mode configuration. 1'b0: Progressive 1'b1: Interlace When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.
1	RW	0x0	slave_vsync_p_cfg Slave mode VSYNC polarity configuration. 1'b1: Low is active. 1'b0: High is active. When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.
0	RW	0x0	slave_hsync_p_cfg Slave mode HSYNC polarity configuration. 1'b1: Low is active. 1'b0: High is active. When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.

EDP_TX_TOTAL_LINE_CFG_L

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	total_line_cfg_l TOTAL_LINE_CFG is used to specify the number of lines in each frame. This register is TOTAL_LINE_CFG [7:0]. When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.

EDP_TX_TOTAL_LINE_CFG_H

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	total_line_cfg_h TOTAL_LINE_CFG is used to specify the number of lines in each frame. This register is TOTAL_LINE_CFG [11:8]. When F_SEL is 1, this value is sent in main stream attribute packet. When Video BIST_EN is enabled, this bit must be configured right to generate right video format.

EDP_TX_ACTIVE_LINE_CFG_L

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	active_line_cfg_l ACTIVE_LINE_CFG is used to specify the number of active lines in each frame. This register is ACTIVE_LINE_CFG [7:0]. When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.

EDP_TX_ACTIVE_LINE_CFG_H

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	active_line_cfg_h ACTIVE_LINE_CFG is used to specify the number of active lines in each frame. This register is ACTIVE_LINE_CFG [11:8]. When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.

EDP_TX_V_F_PORCH_CFG

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	v_f_porch_cfg This is used to specify the number of lines in vertical front porch part. When F_SEL is 1, this value is sent in main stream attribute packet. When BIST_EN is 1, this bit field is used to specify the BIST video stream format.

31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:0	RW	0x00	spdif_phase3_ctl_0 This register control SPDIF 3 cycle phase counter value [7:0], if bit SPDIF_PHASE3_CTL_EN is 0, the 3 cycle phase counter value [7:0] is read out. If the register SPDIF_PHASE3_CTL_EN is 1, firmware can force this value by writing data to this register. The bits can be read only when SPDIF_STREAM_DET is one. SPDIF_PHASE3_CTL should be set as 3*Fls_clk / (32*Faudio_frequency * AudioChannelNum * 2). Here 2 are for biphase encoding and 32 is for each sub frame. For example if audio_frequency is 44.1KHz, Audio Channel Number is 2 and ls_clk frequency is 135M Hz. 3*135,000,000/ (32*44,100*2*2) = 71.7. SPDIF_PHASE3_CTL should set to 72.

EDP_TX_SPDIF_PHASE3_CTL_1

Address: Operational Base + offset (0x0664)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	spdif_phase3_ctl_en This register enables force of the 3 cycle phase counter value function. 1'b0: SPDIF 3 cycle phase counter value use chip counted value. 1'b1: SPDIF 3 cycle phase counter value use the data written to register SPDIF_PHASE3_CTL_0 and SPDIF_PHASE3_CTL_1.
6:1	RO	0x00	reserved
0	RW	0x0	spdif_phase3_ctl_1 This register control SPDIF 3 cycle phase counter value [8], if bit SPDIF_PHASE3_CTL_EN is 0, the 3 cycle phase counter value [8] is read out. If the register SPDIF_PHASE3_CTL_EN is 1, firmware can force this value by writing data to this register.

31.6 Application Notes

31.6.1 START-UP Sequence for PHY

Before power up the PHY, make sure the power supply and the reference clock is ready for operation. A proposed power up sequence is like this:

- step 1

Power up the chip and do power on reset detection. There include a reset detection

function in PHY, the duration for reset detection is less than 100us.

- step 2

Write registers, load parameters, and prepare to power up.

- step 3

Make sure the reference clock source is ready for operation, release pd_pll. Before release tx_pd[N], must set tx_mode[1:0]=11, then release tx_pd[N], set tx_idle[N]=1.

- step 4

When PLL gets locked, the internal clock is ready for use, digital can send data.

- step 5

Set tx_idle[N] = 0 to start normal operation, TXPN/TXMN will change from common-mode to data-mode.

The detail of EDP TX PHY configure register is in CH5 GRF 1.11 EDP_PHY Register Description.

The tx_pd[N] means EDP_PHY_GRF_CON0 bit 7:4

The tx_idle[N] means EDP_PHY_GRF_CON0 bit 11:8

The tx_mode means EDP_PHY_GRF_CON5 bit 9:8

31.6.2 Settings About EDP TX PHY

The more detail of EDP TX PHY configure register is in CH5 GRF 1.11 EDP_PHY Register Description.

The setting of registers is below:

- Link rate 2.7GHz

The default configuration is at 2.7GHz, so it do not need configure anything.

- Link rate 1.62GHz

Set EDP_PHY_GRF_CON1 bit [14:0] = 0x4380

Set EDP_PHY_GRF_CON2 bit [5:4] = 0x1

- Power down lane

EDP_PHY_GRF_CON0 bit [7:4] can power down each lane independently.

31.6.3 Setting for HPD IO

There are HPD 0 and 1 which can be selected by IOMUX.

For HPD 0,

Set GRF_GPIO4C_IOMUX_H bit[2:0] = 0x1

Set GRF_IOFUNC_SEL0 bit [6] = 0x0

For HPD 1,

Set PMU_GRF_GPIO0C_IOMUX_L bit [10:8] = 0x2

Set GRF_IOFUNC_SEL0 bit [6] = 0x1

1.6.4.1 How to initialize DP

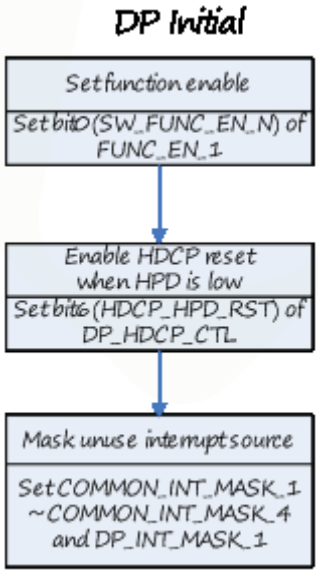

Fig. 31-2 DP Initial

1.6.4.2 How to Detect hot plug insertion

In Wait Hot plug state, chip is in power down status. System only responses to hot plug change interrupt. When a hot plug interrupt is detected, in the interrupt routine, firmware will judge whether it is a receiver plug-in or un-plug or link training request. If plug-in, chip will be powered on and system state will be set to Read and Parse EDID.

Fig. 31-11 State CHANNEL_EQ

1.6.4.7 How to setup main stream attribute data

- Attribute of Video timing

Chip hardware setups attribute of video timing automatically.

- Attribute of Color Depth

Set IN_BPC of with VIDEO_CTL_2 correct value.

- Attribute of Color Space

Set IN_COLOR_F of VIDEO_CTL_2 with correct value.

IN_YC_COEFFI of VIDEO_CTL_3 [7] also must be set.

1.6.4.8 How to do HDCP authentication and encryption

- SW HDCP State Machine

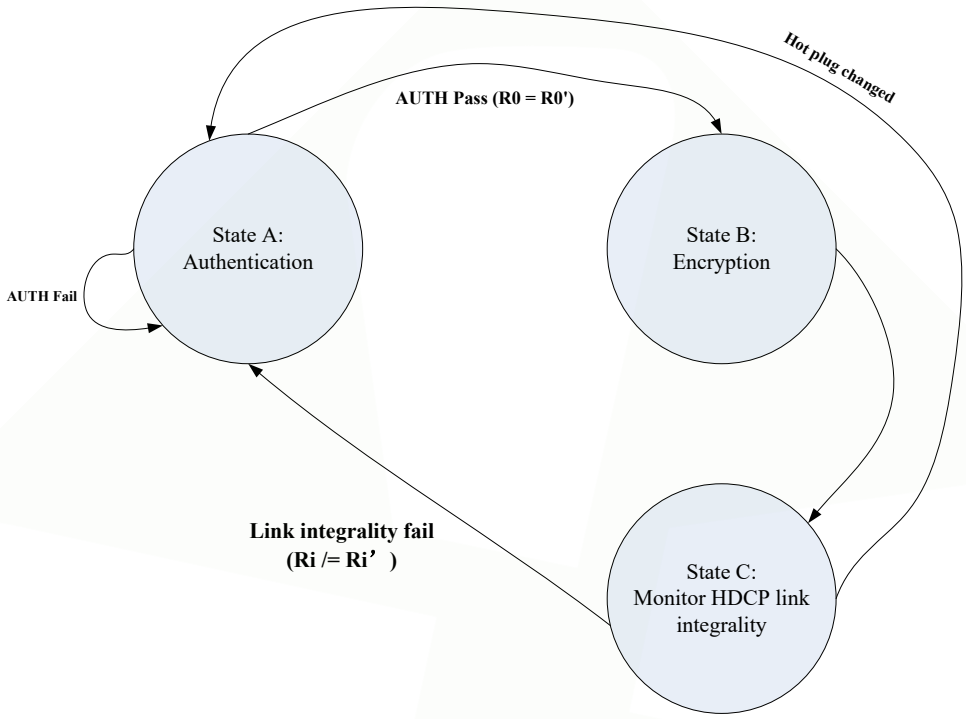

Fig. 31-12 SW HDCP State Machine

- SW HDCP Flowchart

Note that BKSV to BKSV0~BKSV4 are loaded two times in step2 and in step5 in figure 1-13. With the first BKSV writing, AKSV starts to be loaded and SW_STORE_AN function is enabled. As another function, validity of BKSV is possible by the bit filed, BKSV_VALID. In the other hand, the second BKSV writing starts the R0 calculation.

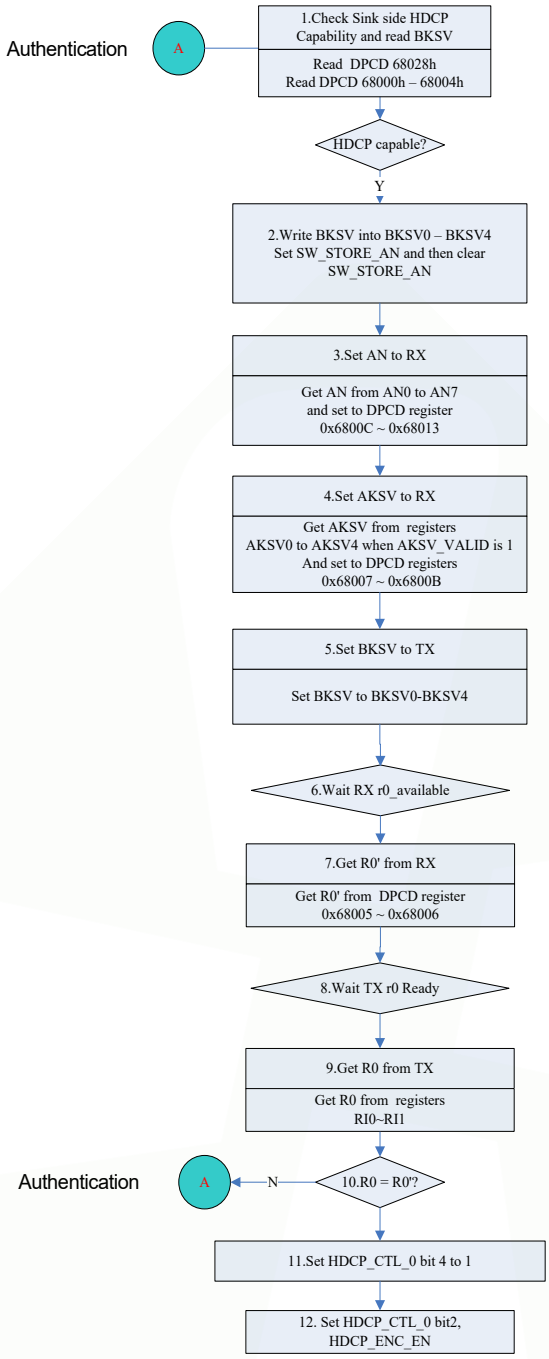

Fig. 31-13 SW HDCP Flowchart 0

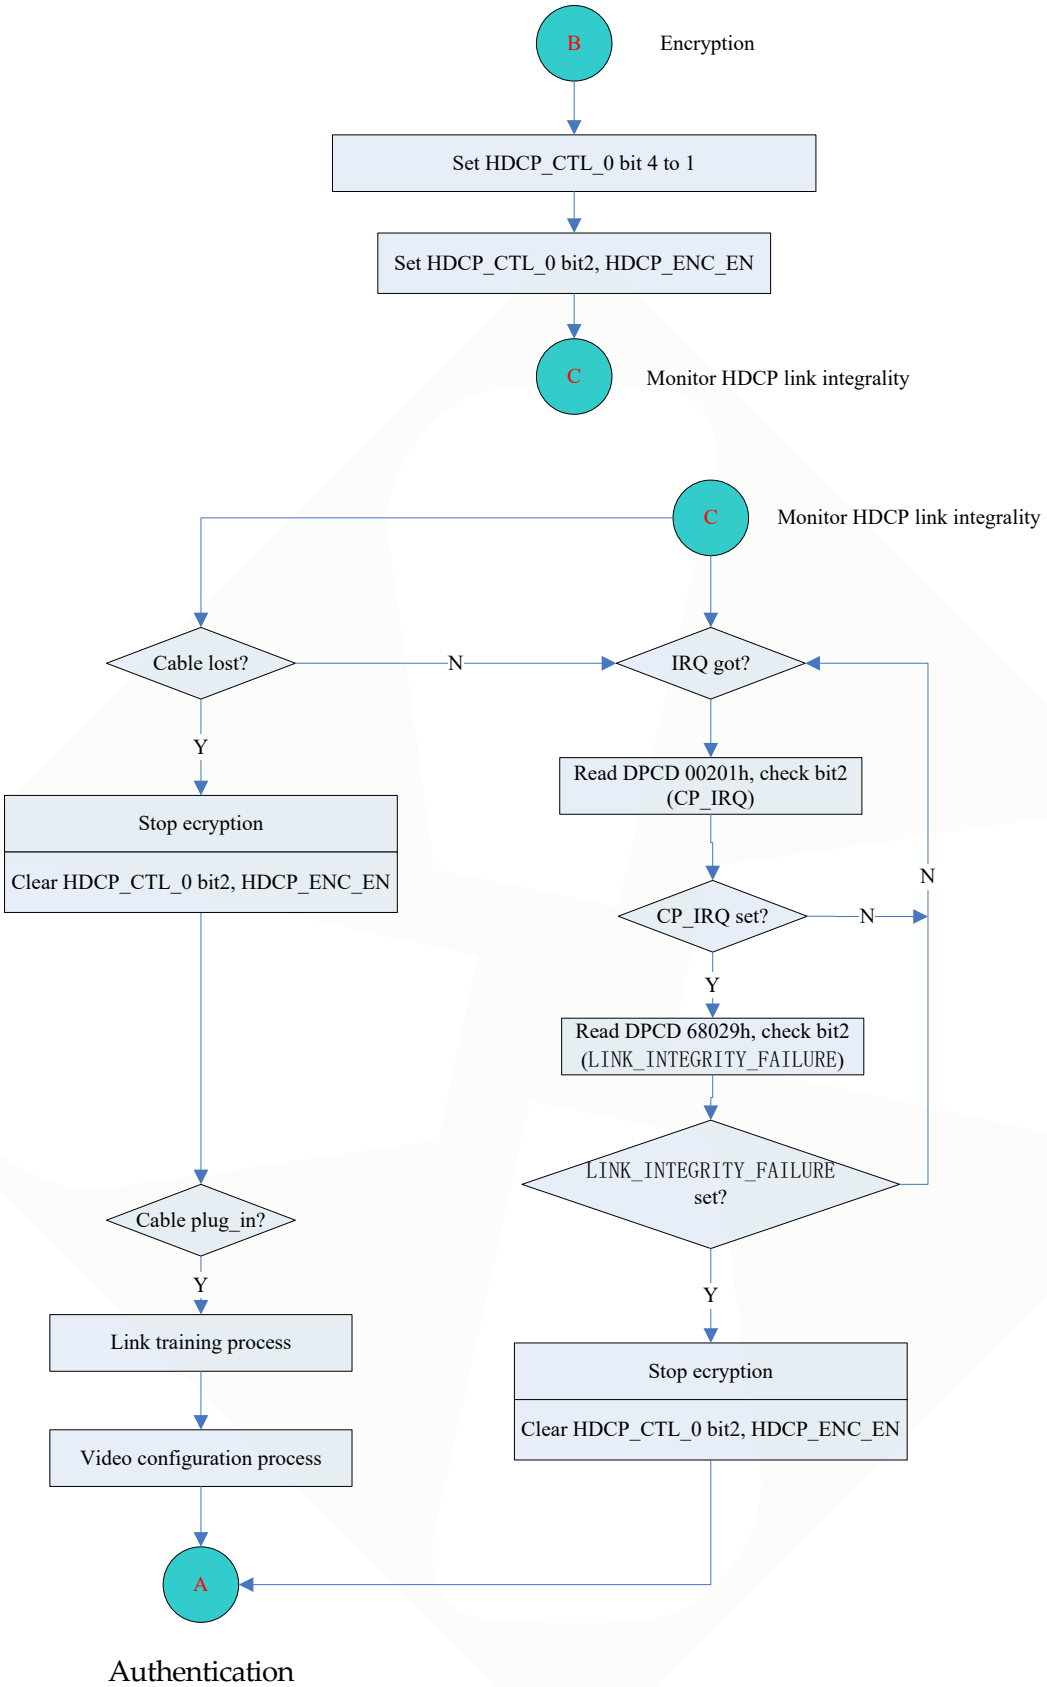

Fig. 31-14 SW HDCP Flowchart 1

1.6.4.9 How to configure video

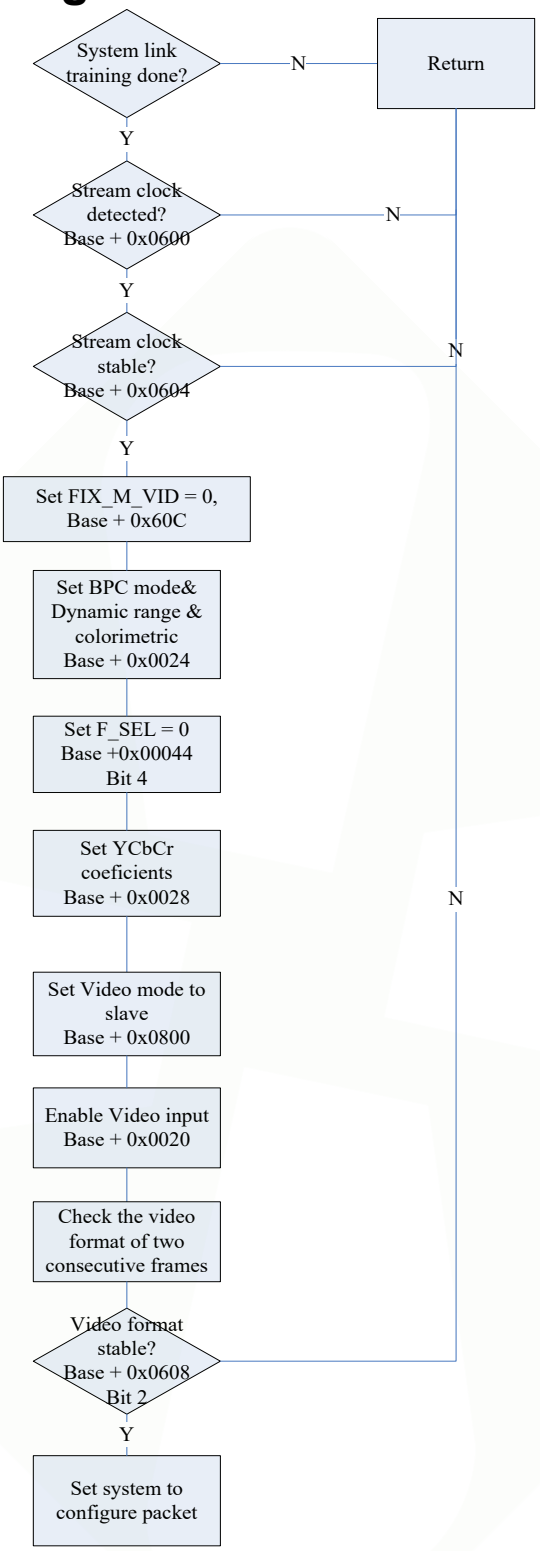

Fig. 31-15 Configure Video Flowchart

Slave mode video configuration process (M value auto-generated)

Note: Usually, you do not need to set FIX_M_VID to 1. If FIX_M_VID is 0, then the hardware calculated M_VID value is used. But, if FIX_M_VID must be set to 1 by any reason, then M_VID_0, M_VID_1 and M_VID_2 should be set by using following formula.

M_VID = FSTRM_CLK * N_VID / FLS_CLK

N_VID must be choose let the result of this equation is an integer, for example N_VID is 13500 (0x34bc) in 2.7G and 8100 (0x1fa4) in 1.62G.

2.7G: M_VID = F_STRM_CLK*0x34BC/135M

1.62G: M_VID = F_STRM_CLK*0x1FA4/81M

For example, if input is 1400x1050/108M, RGB888, 2.7G,
M_VID = 108*0x34BC/135= 0x2A30,
set M_VID_0 = 0x30, set M_VID_1 = 0x2A, set M_VID_2 = 0.

1.6.4.10 How to configure audio

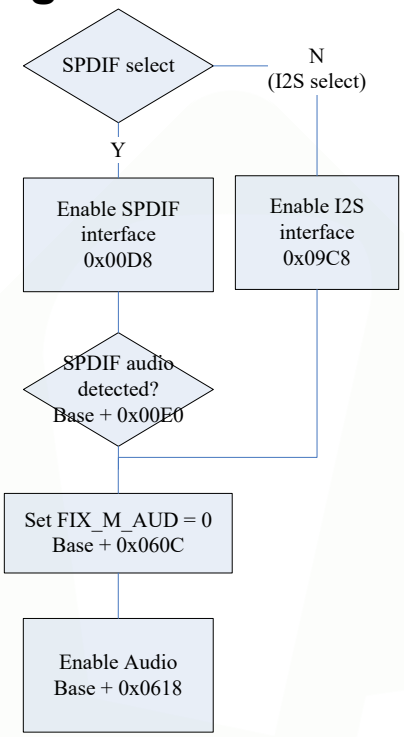

Fig. 31-16 Slave mode audio configuration process (M value auto-generated)

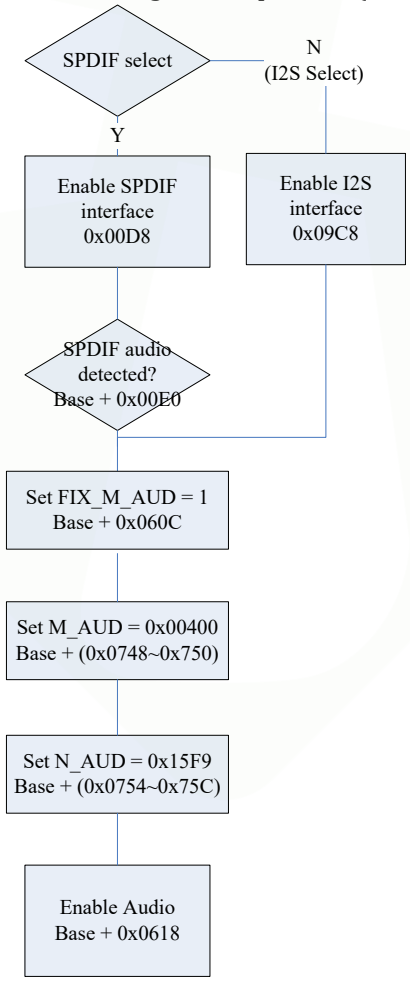

Fig. 31-17 Slave mode audio configuration process (Register defined M value, 48 KHz, 2.7 G)

Note: Usually, you do not need to set FIX_M_AUD to 1. If FIX_M_AUD is 0, then the hardware calculated M_AUD value is used. But, if FIX_M_AUD must be set to 1 by any reason, then M_AUD_0, M_AUD_1, M_AUD_2 and N_AUD_0, N_AUD_1, N_AUD_2 should be set by using following formula.

M_AUD = 512*Faud_sample* N_AUD / 2 * Fls_clk

2.7G M_AUD = 512*Faud_sample *N_AUD/270,000,000

1.62G M_AUD = 512*Faud_sample*N_AUD/162,000,000

1.6.4.11 How to PROCESS interrupt

1.6.4.12 How to Send Secondary-data Packets

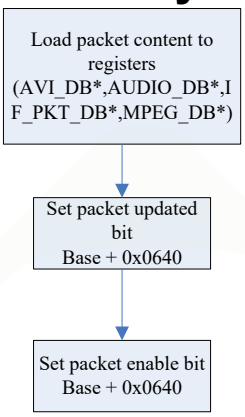

Fig. 31-19 Send Secondary-data Packets

Chapter 32 HDMI TX

32.1 Overview

HDMI TX is fully compliant with HDMI 1.4a and 2.0a specification. It offers a simple implementation for consumer electronics like DVD/player/recorder and camcorder. HDMI TX consists of one HMDI transmitter controller and one HMDI transmitter PHY.

It supports following features:

- Video formats:
  - All CEA-861-E video formats up to 1080p at 60 Hz and 720p/1080i at 120 Hz
  - HDMI 1.4b video formats
    - All CEA-861-E video formats up to 1080p at 120 Hz
    - HDMI 1.4b 4K x 2K video formats
    - HDMI 1.4b 3D video modes with up to 340 MHz (TMDS clock)
  - HDMI 2.0 video formats, All CEA-861-F video formats
- Colorimetry, 24-bit RGB 4:4:4
- Pixel clock from 13.5 MHz up to 600 MHz
- Up to 192 kHz IEC60958 audio sampling rate
- Flexible synchronous enable per clock domain to set functional power down modes
- AMBA APB 3.0 register access
- I2C DDC, EDID block read mode
- SCDC I2C DDC access
- TMDS Scrambler to enable support for 2160p@60Hz with RGB 4:4:4
- Integrated CEC hardware engine

32.2 Block Diagram

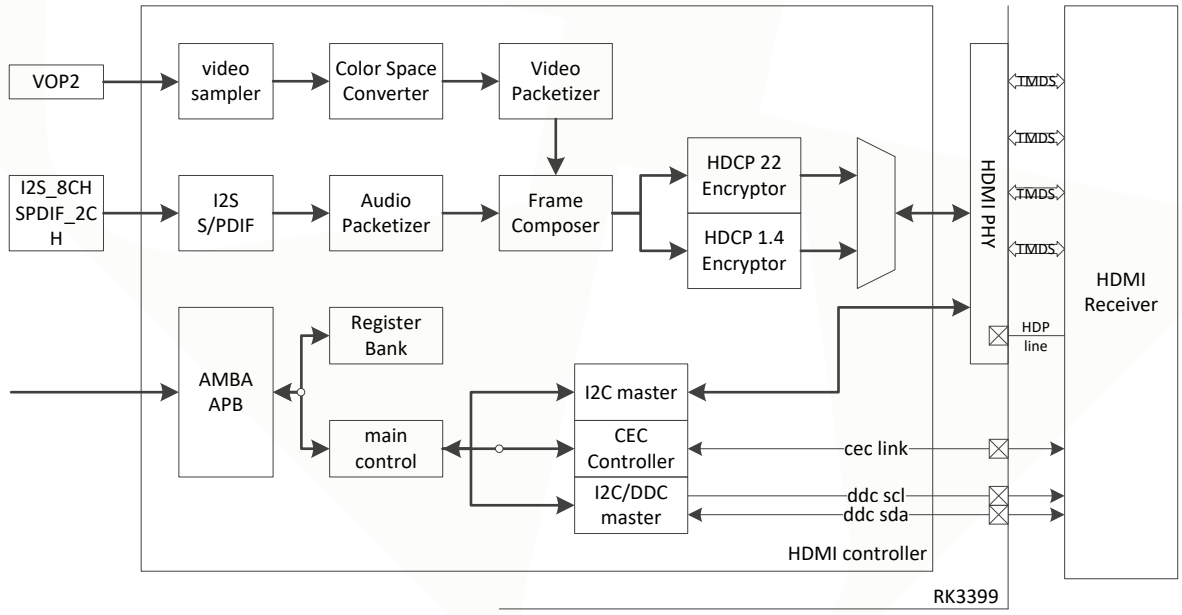

Fig. 32-1 HDMI TX Block Diagram

32.3 Function Description

32.3.1 IOMUX

Customer should notice that CEC channel use IO_HDMITXcecm0_SPI3cs1m1_VCCIO7GPIO4d1 and DDC channel use PAD IO_HDMITXscl_I2C5sclm1_VCCIO7GPIO4c7 and

IO_HDMITXsda_I2C5sdam1_VCCIO7GPIO4d0.

Note: PAD IO_HDMI_DDCCEC is Ground reference for the Hot Plug Detect signal.

32.3.2 Video Data Processing

The video processing contains video format timings, pixel encodings (RGB to YCbCr, or YCbCr to RGB), colorimetry and corresponding requirements. This function is implemented by some functional blocks, Video Capture block, Color Space Conversion block, and Deep Color block.

The input video pixels can be encoded in either RGB, YCBCR 4:4:4 or YCBCR 4:2:2 formats by Color Space Conversion block.

The input Video data can have a pixel size of 24bits. The deep color block is used to deal with different pixel size. Video at the default 24-bit color depth is carried at a TMDS clock rate equal to the pixel clock rate. Higher color depths are carried using a correspondingly higher TMDS clock rate. HDMI Transmitter support video formats with TMDS rates below 25MHz (e.g. 13.5MHz for 480i/NTSC) that can be transmitted using a pixel-repetition scheme by setting relative registers.

Color Space Conversion

HDMI Transmitter Color space conversion (CSC) is responsible for carrying out the following video color space conversion functions:

- RGB to/from YCbCr
- 4:2:2 to/from 4:4:4 up (pixel repetition or linear interpolation)/down-converter
- Limited to/from full quantization range conversion
- The CSC supports all the timings reported in the CEA-861-D specification and the following pixel modes:
- RGB 444 and YCbCr 444: 24, 30, 36, and 48 bits
- YCbCr 422: 16, 20, and 24 bits

The color space conversion matrix is ruled by the following equations listed in below figure.

$$out_1 = (X_1 \times in_1/4096 + X_2 \times in_2/4096 + X_3 \times in_3/4096 + X_4) \times 2^{scale}$$
$$out_2 = (Y_1 \times in_1/4096 + Y_2 \times in_2/4096 + Y_3 \times in_3/4096 + Y_4) \times 2^{scale}$$
$$out_3 = (Z_1 \times in_1/4096 + Z_2 \times in_2/4096 + Z_3 \times in_3/4096 + Z_4) \times 2^{scale}$$

Fig. 32-2 HDMI Color Space Conversion Matrix Equations

Note: Color Space Conversion to and from YCrCb 4:2:0 is not supported.

32.3.3 Audio Data Processing

The HDMI TX audio process contain audio clock regeneration, placement of audio samples within packets, packet timing control, audio sample rates setting, and channel/speaker assignments. This function is implemented by Audio Capture blocks

The Audio Capture support either SPDIF or four channel I2S input. SPDIF input supports audio sampling rates from 32 to 192 KHz. The I2S input supports from 2-channel to 8-channel audio up to 192 KHz.

The scheme of audio processing as shown in the figure below:

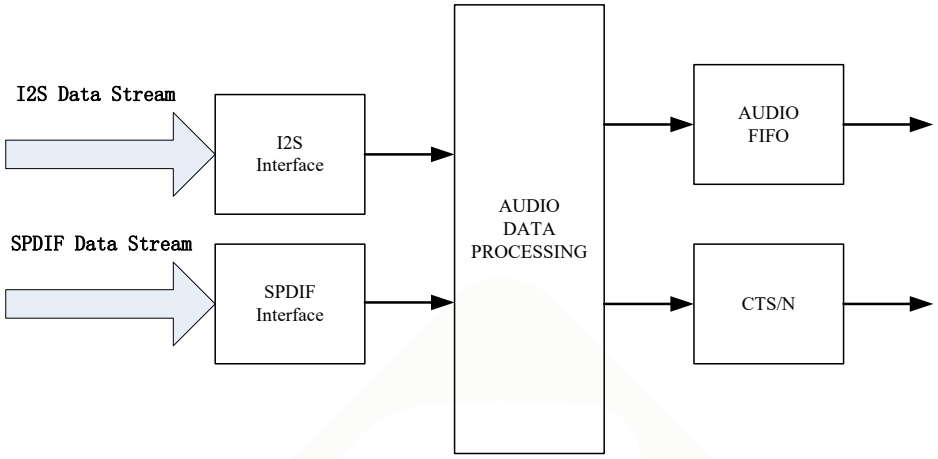

Fig. 32-3 HDMI Audio Data Processing Diagram

1.I2S

The function of this module is to implement I2S audio input feature. The incoming audio stream is captured, processed then transmitted into the TMDS link. Four I2S inputs also allow transmission of DVD-Audio and decoded Dolby Digital to A/V Receivers and high-end displays. The interface supports from 2-channel to 8-channel audio up to 192 kHz. The I2S pins must also be coherent with mclk. The appropriate registers must be configured to describe the format of audio being input. This information is passed over the HDMI link in the CEA-861D Audio Info (AI) packets. Table shows the I2S 8 channel audio formats that are supported for each of the video formats.

Table 32-1 HDMI TX I2S 2 Channel Audio Sampling Frequency

Video Format	32kHz	44.1kHz	48kHz	88.2kHz	96kHz	176.4kHz	192kHz
720x480p /720x576p	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1440x480i/ 1440x576i	Yes	Yes	Yes	Yes	Yes	Yes	Yes
720p	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1080i	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1080p	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Table 32-2 HDMI TX I2S 8 Channel Audio Sampling Frequency

Video Format	32kHz	44.1kHz	48kHz	88.2kHz	96kHz	176.4kHz	192kHz
720x480p /720x576p	Yes	Yes	Yes	No	No	No	No
1440x480i/ 1440x576i	Yes	Yes	Yes	Yes	No	No	No
720p	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1080i	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1080p	Yes	Yes	Yes	Yes	Yes	Yes	Yes

2.SPDIF

The function of this module is to implement SPDIF audio input feature. The incoming audio stream is captured, processed then transmitted into the TMDS link. SPDIF stream can carry 2-channel uncompressed PCM data (IEC 60958) or a compressed bit stream for multi-channel (IEC 61937) formats. The audio data capture logic forms the audio data into packets in accordance with the HDMI specification. SPDIF input supports audio sampling rates from 32 to 192 KHz. The following shows the SPDIF audio formats that are supported for each of the video formats

Table 32-3 HDMI SPDIF Sampling Frequency at Each Video Format

Video Format	32kHz	44.1kHz	48kHz	88.2kHz	96kHz	176.4kHz	192kHz

720x480p /720x576p	Yes	Yes	Yes	Yes	Yes	No	No
1440x480i/ 1440x576i	Yes	Yes	Yes	Yes	Yes	No	No
720p	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1080i	Yes	Yes	Yes	Yes	Yes	Yes	Yes
1080p	Yes	Yes	Yes	Yes	Yes	Yes	Yes

3.Audio Sample Clock Capture and Regeneration

Audio data is carried across the HDMI link, which is driven by a TMDS clock running at a rate corresponding to the video pixel rate, does not retain the original audio sample clock. The task of recreating this clock at the Sink is called Audio Clock Regeneration.

The HDMI Transmitter determine the fractional relationship between the TMDS clock and an audio reference clock (128 audio sample rate [fs]) and pass the numerator and denominator of that fraction to the HDMI Sink across the HDMI link. The Sink then re-create the audio clock from the TMDS clock by using a clock divider and a clock multiplier.

The exact relationship between the two clocks will be.

$128 \cdot f_s = f_{TMDS\_clock} * N / CTS$.

The scheme of the Audio Sample Clock Capture and Regeneration as shown below:

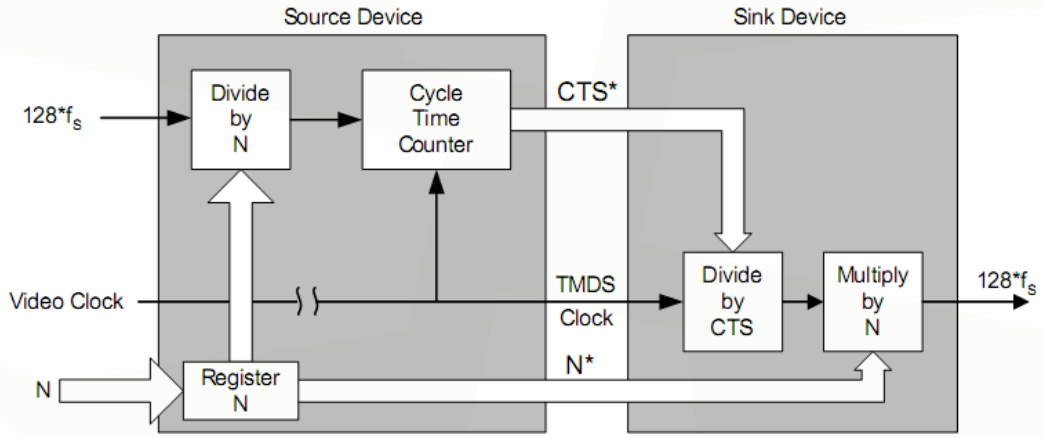

Fig. 32-4 HDMI Audio Clock Regeneration Model

Because there is no audio clock carried through the HDMI link, only the TMDS clock is used. Software sets the CTS/N with a value taken form the below table, which shows the CTS and N value for the supported standard. All other TMDS clocks are not supported; The TMDS clocks divided or multiplied by 1,001 coefficients are not supported.

Table 32-4 HDMI CTS and N table

	TMDS Clock (MHz)													
	25.2		27		54		74.25		148.5		297		597	
Fs (kHZ)	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS
32	4096	25200	4096	27000	4096	54000	4096	74250	4096	148500	3072	222750	3072	445500
44.1	6272	28000	6272	30000	6272	60000	6272	82500	6272	165000	4704	247500	9408	990000

192	24576	25200	24576	27000	24576	54000	24576	74250	24576	148500	20480	247500	24576	4950000

32.3.4 DDC

The DDC functional block is used for configuration and status exchange between the HDMI Source and HDMI Sink. HMDI Transmitter Controller has I2C Master Interface for DDC transactions. It enables for host controller to read EDID, HDCP authentication by issuing simple register access. The I2C bus speed is limited by DDC specification. DDC bus access frequency can be controlled.

32.3.5 EDID

Extended Display Identification Data (EDID) was created by VESA to enable plug and play capabilities of monitors. This data, which is stored in the sink device, describes video formats that the DTV Monitor is capable of receiving and rendering. The information is supplied to the source device, over the interface, upon the request of the source device. The source device then chooses its output format, taking into account the format of the original video stream and the formats supported by the DTV Monitor. The function of this module is to implement EDID feature.

32.3.6 HDCP

HDMI Transmitter has a capability for HDCP authentication by hardware. The function of this module is to implement HDCP encryption feature. This feature can be turned on or off depending on register setting.

It supports up to HDCP 2.2. HDCP 1.4 is done by HDMI Transmitter itself. HDCP22 is descripted in another chapter.

32.3.7 Hot Plug Detect

HDMI Transmitter has a capability for detecting the Sink plug in or plug out, and launch an interrupt and registers state indicating for software controlling.

32.3.8 TMDS encoder

The TMDS encoder converts the 2/4/8 bits data into the 10 bit DC-balanced TMDS data.

HDMI TX put the TMDS encoding on the audio /video /aux data received from the HDCP XOR mask. This data is output onto three TMDS differential data lines along with a TMDS differential clock.

32.3.9 CEC

The CEC functional block provides high-level control functions between all of the various audiovisual products in a user's environment through one line.

32.4 HDMI PHY

The HDMI Tx PHY is the physical layer of an HDMI digital transmitter (source), capable of encoding and transmitting high-speed data streams carrying RGB video, audio, and control information.

The HDMI Tx PHY includes one PLL that synthesizes the high-speed serial bit clock (required by the transmitter) from a reference pixel clock with a frequency that can vary between 13.5-600 MHz for HDMI operation. The transmitter is capable of transmitting up to 18 Gbps using three lanes for HDMI operation.The HDMI Tx PHY has one i2c config bus,which is driven by hdmitx controller.

The HDMI Tx PHY drives audio and video across the TMDS data channels. For HDMI operation, each serial TMDS link has a data-rate range of 0.25-6 Gbps. The HDMI Tx PHY also drives the TMDS clock at 1/10th of the serial data rate with a frequency range of 25-340 MHz for data rates below 3.4Gbps. For a serial data rate between 3.4Gbps and 6Gbps, the HDMI Tx PHY drives the TMDS clock at 1/40th of the serial data rate.

Within the HDMI Tx PHY, additional support blocks exist:

- Bandgap block (for blocks biasing)
- Resistor Calibration block
- ADC
- Analog test bus
- Built-in Self-Test(BIST)

An external, 1.62-kΩ reference resistor (connected to ground) is required for precise current and biasing (within each block).

32.4.1 I2C interface

The HDMI Tx PHY's status and configuration is accessed through internal I2C interface. The internal I2C interface is mapped to PHY Configuration Registers in HDMI TX registers at address 0x3000. Customers can access these registers though HDMI controller's Register. Operating to these register can trigger one i2c write process or i2c read process.

32.4.2 PLL Operation

The PLL is responsible for the generation of the high-speed serialization clocks, as well as for the other clocks involved on the data transmission (clocks on the TMDS lanes) or involved on the supported testability.

The PLL can be configured for the video modes required for each of the supported modes of operation. For additional information about the PLL configuration, please refer "PHY MPLL Configuration".

32.4.3 HPD/RXSENSE Operation

For HDMI operation, to detect the presence of an HDMI sink system, the HDMI Tx PHY supports two different mechanisms to determine whether a Hot Plug Detect (HPD) signal is available and whether HDMI sink terminations are present and powered.

If voltage is present on the HPD line provided by the HDMI sink system, the HPD circuit identifies and asserts the SNKDET signal on the PHY's digital interface, provided the voltage level is 2.4-5.3 V, as specified by the HDMI specification. The HPD circuit enables the HDMI Tx PHY to identify whether the HDMI sink system is connected and is providing a correct HPD voltage level.

The RXSENSE circuit determines, for each TMDS data and clock lane for the HDMI operation, whether the HDMI sink terminations are present. Users can observe RXSENSE that reflects the state of the TMDS lanes evaluated from phy_stat0 in HDMI controller register.

32.4.4 Power Collapsing

The HDMI Tx PHY supports power collapsing. This feature enables the HDMI Tx PHY to stay—in any given combination of power supply availability (present, floating, or grounded)—in a known state with low current consumption. This low current consumption remains similar to, or below, the current consumption in power-down mode.

Power collapsing provides customers who require control over the power lines with independent control of the PHY power supplies.

32.4.5 Operating Modes

The HDMI Tx PHY can be placed in two different operating modes: Power-Down and Active. Customers can assert a soft reset through the HDMI control registers 0x302a,with configuration 0. This soft reset clears all system FSMs except I2C, JTAG, and control registers.

For each separate video mode in which the HDMI Tx PHY is set to transmit, due to different operating frequency, color depth and pixel repetition that characterizes each one, you need to configure the HDMI Tx PHY block for correct operation and optimized performance. It is recommended for the PHY configuration through the I2C or JTAG interface to be done while the PHY is in power-down mode.

Configuration involves programming the PLL dividers and analog configuration as well as the analog drivers' source termination value, signals voltage level, pre-emphasis and slope boosting. This programming is done through the I2C interface.

32.5 Register Description

The address offset of the HDMI TX is 0xff9480000,it contains 16 address section. The offset of the table of Register Summary must multiple with 4 when software configure it。Like the Interrupt registers，its base address is 0x0100.If we want to configure it, its real address is 0xff980000+0x0100*4.

32.5.1 Register Summary

Name	Offset	Size	Reset Value	Description
Identification Registers	0x0000	B		Identification releated registers
Interrupt registers	0x0100	B		Interrupt releated registers
Video Sampler registers	0x0200	B		Video Sampler registers
Video Packetizer registers	0x0800	B		Video Packetizer registers
Frame Composer Registers	0x1000	B		Frame Composer Registers
HDMI Source PHY Registers	0x3000	B		HDMI Source PHY Registers
I2C Master PHY Registers	0x3020	B		I2C Master PHY Registers
Audio Sampler Registers	0x3100	B		Audio Sampler Registers

Name	Offset	Size	Reset Value	Description
Main Controller Registers	0x4000	B		Main Controller Registers
Color Space Converter Registers	0x4100	B		Color Space Converter Registers
HDCP Encryption Engine Registers	0x5000	B		HDCP Encryption Engine Registers
HDCP BKSV Registers	0x7800	B		HDCP BKSV Registers
HDCP AN Registers	0x7805	B		HDCP AN Registers
Encrypted DPK Embedded Storage Registers	0x780E	B		Encrypted DPK Embedded Storage Registers
CEC Engine Registers	0x7D00	B		CEC Engine Registers
I2C Master Registers	0x7E00	B		I2C Master Registers for E-DDC/SCDC

Identification Registers

Identification Registers. Follow the link for the register to see a detailed description of the register.

Registers for Address Block: Identification

Register		Description
design_id		Design Identification
revision_id		Revision Identification
product_id0		Product Identification
product_id1		Product Identification
config0_id		Configuration
config1_id		Configuration
config2_id		Configuration
config3_id		Configuration

design_id

Description: Design Identification Register

Size: 8 bits

Offset: 0x0

Bits	Name	Attr	Description
7:0	design_id	R	Design ID code fixed by HDMI that Identifies the instantiated DWC_hdmi_tx controller. For example, DWC_hdmi_tx 2.11a, DESIGN_ID = 21 Value After Reset: 0x21

revision_id

Description: Revision Identification Register
Size: 8 bits
Offset: 0x1

Bits	Name	Attr	Description
7:0	revision_id	R	Revision ID code fixed by HDMI that Identifies the instantiated DWC_hdmi_tx controller. Value After Reset: 0x1a

product_id0

Description: Product Identification Register 0
Size: 8 bits
Offset: 0x2

Bits	Name	Attr	Description
7:0	product_id0	R	This one byte fixed code Identifies HDMI 's product line ("A0h" for DWC_hdmi_tx products). Value After Reset: 0xa0

product_id1

Description: Product Identification Register 1
Size: 8 bits
Offset: 0x3

Bits	Name	Attr	Description
7:6	product_id1_hdcp	R	These bits identify a HDMI Controller with HDCP encryption according to HDMI product line. Value After Reset: "(HDCP== 1) ? 3 : 0"
5:2			Reserved for future use.
1	product_id1_rx	R	This bit Identifies HDMI 's DWC_hdmi_rx Controller according to HDMI product line. Value After Reset: 0x0
0	product_id1_tx	R	This bit Identifies H Controller according to HDMI product line. Value After Reset: 0x1

config0_id

Description: Configuration Identification Register 0
Size: 8 bits
Offset: 0x4

Bits	Name	Attr	Description
7	prepen	R	Indicates if it is possible to use internal pixel repetition Value After Reset: "(HDMI_TX_INTPREPEN== 1) ? 1 : 0"
6			Reserved for future use.
5	audspdif	R	Indicates if the SPDIF audio interface is present Value After Reset: "(SPDIFPORTS== 1) ? 1 : 0"
4	audi2s	R	Indicates if I2S interface is present Value After Reset: "(I2SPORTS== 1) ? 1 : 0"

Bits	Name	Attr	Description
3	hdmi14	R	Indicates if HDMI 1.4 features are present Value After Reset: "(HDMI_TX_14== 1) ? 1 : 0"
2	csc	R	Indicates if Color Space Conversion block is present Value After Reset: "(CSC== 1) ? 1 : 0"
1	cec	R	Indicates if CEC is present Value After Reset: "(CEC== 1) ? 1 : 0"
0	hdcp	R	Indicates if HDCP is present Value After Reset: "(HDCP== 1) ? 1 : 0"

config1_id

Description: Configuration Identification Register 1

Size: 8 bits

Offset: 0x5

Bits	Name	Attr	Description
7	hdcp22_snps	R	Indicates if HDCP 2.2 SNPS solution is present Value After Reset: (HTX_HDCP22_SNPS== 1) ? 1 : 0
6	hdcp22_ext	R	Indicates if external HDCP 2.2 interface support is present Value After Reset: "(HTX_HDCP22_EXTERNAL== 1) ? 1 : 0"
5	hdmi20	R	Indicates if HDMI 2.0 features are present Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0"
4:2			Reserved for future use.
1	confapb	R	Indicates that configuration interface is APB interface Value After Reset: 0x1
0			Reserved for future use.

config2_id

Description: Configuration Identification Register 2

Size: 8 bits

Offset: 0x6

Bits	Name	Attr	Description
7:0	phytype	R	Indicates the type of PHY interface selected: 0x00: Legacy PHY (HDMI Tx PHY) 0xF2: PHY GEN2 (HDMI 3D TX PHY) 0xE2: PHY GEN2 (HDMI 3D TX PHY) + HEAC PHY 0xC2: PHY MHL COMBO (MHL+HDMI 2.0 TX PHY) 0xB2: PHY MHL COMBO (MHL+HDMI 2.0 TX PHY) + HEAC PHY 0xF3: PHY HDMI 20 (HDMI 2.0 TX PHY) 0xE3: PHY HDMI 20 (HDMI 2.0 TX PHY) + HEAC PHY 0xFE: External PHY Value After Reset: "(PHY_HDMI20==1) ? ((HDMI_HEAC_PHY_EN==1)? 0xE3 : 0xF3) : (PHY_MHL_COMBO==1)

Bits	Name	Attr	Description
			? ((HDMI_HEAC_PHY_EN==1)? 0xB2 : 0xC2) : (PHY_GEN2==1) ? ((HDMI_HEAC_PHY_EN==1)? 0xE2 : 0xF2) : (PHY_EXTERNAL==1)? 0xFE : 0x00"

config3_id

Description: Configuration Identification Register 3

Size: 8 bits

Offset: 0x7

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	confahbauddma	R	Indicates that the audio interface is AHB AUD DMA Value After Reset: "(AHBAUDDMAIF== 1) ? 1 : 0"
0	confgpaud	R	Indicates that the audio interface is Generic Parallel Audio (GPAUD) Value After Reset: "(GPAUDPORTS== 1) ? 1 : 0"

Interrupt Registers

Interrupt Registers. Follow the link for the register to see a detailed description of the register.

Registers for Address Block: Interrupt

Register	Offset	Description
ih_fc_stat0	0x100	Frame Composer Interrupt Status Register 0 (Packet Interrupts)
ih_fc_stat1	0x101	Frame Composer Interrupt Status Register 1 (Packet Interrupts)
ih_fc_stat2	0x102	Frame Composer Interrupt Status Register 2 (Packet Interrupts)
ih_as_stat0	0x103	Audio Sampler Interrupt Status Register (FIFO Threshold, Underflow and Overflow Interrupts)
ih_phy_stat0	0x104	PHY Interface Interrupt Status Register (RXSENSE, PLL Lock and HPD Interrupts)
ih_i2cm_stat0	0x105	E-DDC I2C Master Interrupt Status Register (Done and Error Interrupts)
ih_cec_stat0	0x106	CEC Interrupt Status Register (Functional Operation Interrupts)
ih_vp_stat0	0x107	Video Packetizer Interrupt Status Register (FIFO Full and Empty Interrupts)
ih_i2cmphy_stat0	0x108	PHY GEN2 I2C Master Interrupt Status Register (Done and Error Interrupts)
ih_ahbdmaaud_stat0	0x109	AHB Audio DMA Interrupt Status Register (Functional Operation, Buffer Full and Empty...
ih_decode	0x170	Interruption Handler Decode Assist Register
ih_mute_fc_stat0	0x180	Frame Composer Interrupt Mute Control Register 0
ih_mute_fc_stat1	0x181	Frame Composer Interrupt Mute Control Register 1

Register	Offset	Description
ih_mute_fc_stat2	0x182	Frame Composer Interrupt Mute Control Register 2
ih_mute_as_stat0	0x183	Audio Sampler Interrupt Mute Control Register
ih_mute_phy_stat0	0x184	PHY Interface Interrupt Mute Control Register
ih_mute_i2cm_stat0	0x185	E-DDC I2C Master Interrupt Mute Control Register
ih_mute_cec_stat0	0x186	CEC Interrupt Mute Control Register
ih_mute_vp_stat0	0x187	Video Packetizer Interrupt Mute Control Register
ih_mute_i2cmphy_stat0	0x188	PHY GEN2 I2C Master Interrupt Mute Control Register
ih_mute_ahbdmaaud_stat0	0x189	AHB Audio DMA Interrupt Mute Control Register
ih_mute	0x1ff	Global Interrupt Mute Control Register

ih_fc_stat0

Description: Frame Composer Interrupt Status Register 0 (Packet Interrupts)
Size: 8 bits
Offset: 0x100

Bits	Name	Attr	Description
7	AUDI	R/W1C	Active after successful transmission of an Audio InfoFrame packet. Value After Reset: 0x0
6	ACP	R/W1C	Active after successful transmission of an Audio Content Protection packet. Value After Reset: 0x0
5	HBR	R/W1C	Active after successful transmission of an Audio HBR packet. Value After Reset: 0x0
4	MAS	R/W1C	Active after successful transmission of an MultiStream Audio packet Value After Reset: 0x0
3	NVBI	R/W1C	Active after successful transmission of an NTSC VBI packet Value After Reset: 0x0
2	AUDS	R/W1C	Active after successful transmission of an Audio Sample packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer. Value After Reset: 0x0
1	ACR	R/W1C	Active after successful transmission of an Audio Clock Regeneration (N/ CTS transmission) packet. Value After Reset: 0x0
0	NULL	R/W1C	Active after successful transmission of an Null packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer. Value After Reset: 0x0

ih_fc_stat1

Description: Frame Composer Interrupt Status Register 1 (Packet Interrupts)

Size: 8 bits

Offset: 0x101

Bits	Name	Attr	Description
7	GMD	R/W1C	Active after successful transmission of an Gamut metadata packet. Value After Reset: 0x0
6	ISCR1	R/W1C	Active after successful transmission of an International Standard Recording Code 1 packet. Value After Reset: 0x0
5	ISCR2	R/W1C	Active after successful transmission of an International Standard Recording Code 2 packet Value After Reset: 0x0
4	VSD	R/W1C	Active after successful transmission of an Vendor Specific Data InfoFrame packet. Value After Reset: 0x0
3	SPD	R/W1C	Active after successful transmission of an Source Product Descriptor InfoFrame packet. Value After Reset: 0x0
2	AMP	R/W1C	Active after successful transmission of an Audio Metadata packet Value After Reset: 0x0
1	AVI	R/W1C	Active after successful transmission of an AVI InfoFrame packet. Value After Reset: 0x0
0	GCP	R/W1C	Active after successful transmission of an General Control Packet. Value After Reset: 0x0

ih_fc_stat2

Description: Frame Composer Interrupt Status Register 2 (Packet Interrupts)

Size: 8 bits

Offset: 0x102

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	DRM	R/W1C	Active after successful transmission of an DRM packet Value After Reset: 0x0
1	LowPriority_overflow	R/W1C	Frame Composer low priority packet queue descriptor overflow indication Value After Reset: 0x0
0	HighPriority_overflow	R/W1C	Frame Composer high priority packet queue descriptor overflow indication Value After Reset: 0x0

ih_as_stat0

Description: Audio Sampler Interrupt Status Register (FIFO Threshold, Underflow and Overflow Interrupts)

Size: 8 bits

Offset: 0x103

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	fifo_underrun	R/W1C	Indicates an underrun on the audio FIFO Value After Reset: 0x0
3	fifo_overrun	R/W1C	Indicates an overrun on the audio FIFO. Value After Reset: 0x0
2	Aud_fifo_underflow_thr	R/W1C	Audio Sampler audio FIFO empty threshold (four samples) indication for the legacy HBR audio interface. For AHB_DMA, this bit indicates that the number of samples in the FIFO is equal to (or less) than the number of active audio channels. This bit is not relevant for I2S, SPDIF, and GPA interfaces. Value After Reset: 0x0
1	Aud_fifo_underflow	R/W1C	Audio Sampler audio FIFO empty indication. Value After Reset: 0x0
0	Aud_fifo_overflow	R/W1C	Audio Sampler audio FIFO full indication. Value After Reset: 0x0

ih_phy_stat0

Description: PHY Interface Interrupt Status Register (RXSENSE, PLL Lock and HPD Interrupts)

Size: 8 bits

Offset: 0x104

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	RX_SENSE_3	R/W1C	TX PHY RX_SENSE indication for driver 3. You may need to mask or change polarity of this interrupt after it has become active. Value After Reset: 0x0
4	RX_SENSE_2	R/W1C	TX PHY RX_SENSE indication for driver 2. You may need to mask or change polarity of this interrupt after it has become active. Value After Reset: 0x0
3	RX_SENSE_1	R/W1C	TX PHY RX_SENSE indication for driver 1. You may need to mask or change polarity of this interrupt after it has become active. Value After Reset: 0x0
2	RX_SENSE_0	R/W1C	TX PHY RX_SENSE indication for driver 0. You may need to mask or change polarity of this interrupt

Bits	Name	Attr	Description
			after it has become active. Value After Reset: 0x0
1	TX_PHY_LOCK	R/W1C	TX PHY PLL lock indication. Value After Reset: 0x0
0	HPD	R/W1C	HDMI Hot Plug Detect indication. You may need to mask or change polarity of this interrupt after it has become active. Value After Reset: 0x0

ih_i2cm_stat0

Description: E-DDC I2C Master Interrupt Status Register (Done and Error Interrupts)

Size: 8 bits

Offset: 0x105

Bits	Name	Attr	Description
7:3			Reserved for future use.
2	scdc_readreq	R/W1C	I2C Master SCDC read request indication. Value After Reset: 0x0
1	I2Cmasterdone	R/W1C	I2C Master done indication Value After Reset: 0x0
0	I2Cmastererror	R/W1C	I2C Master error indication Value After Reset: 0x0

ih_cec_stat0

Description: CEC Interrupt Status Register (Functional Operation Interrupts)

Size: 8 bits

Offset: 0x106

Bits	Name	Attr	Description
7			Reserved for future use.
6	WAKEUP	R/W1C	CEC Wake-up indication Value After Reset: 0x0
5	ERROR_FOLLOW	R/W1C	CEC Error Follow indication Value After Reset: 0x0
4	ERROR_INITIATOR	R/W1C	CEC Error Initiator indication Value After Reset: 0x0
3	ARB_LOST	R/W1C	CEC Arbitration Lost indication Value After Reset: 0x0
2	NACK	R/W1C	CEC Not Acknowledge indication Value After Reset: 0x0
1	EOM	R/W1C	CEC End of Message Indication Value After Reset: 0x0
0	DONE	R/W1C	CEC Done Indication Value After Reset: 0x0

ih_vp_stat0

Description: Video Packetizer Interrupt Status Register (FIFO Full and Empty Interrupts)

Size: 8 bits

Offset: 0x107

Bits	Name	Attr	Description
7	fifofullrepet	R/W1C	Video Packetizer pixel repeater FIFO full interrupt Value After Reset: 0x0
6	fifoemptyrepet	R/W1C	Video Packetizer pixel repeater FIFO empty

			interrupt Value After Reset: 0x0
5	fifofullpp	R/W1C	Video Packetizer pixel packing FIFO full interrupt Value After Reset: 0x0
4	fifoemptypp	R/W1C	Video Packetizer pixel packing FIFO empty interrupt Value After Reset: 0x0
3	fifofullremap	R/W1C	Video Packetizer pixel YCC 422 re-mapper FIFO full interrupt Value After Reset: 0x0
2	fifoemptyremap	R/W1C	Video Packetizer pixel YCC 422 re-mapper FIFO empty interrupt Value After Reset: 0x0
1:0		R/W1C	Reserved and read as zero

ih_i2cmphy_stat0

Description: PHY GEN2 I2C Master Interrupt Status Register (Done and Error Interrupts)
Size: 8 bits
Offset: 0x108

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	I2Cmphydone	R/W1C	I2C Master PHY done indication Value After Reset: 0x0
0	I2Cmphyerror	R/W1C	I2C Master PHY error indication Value After Reset: 0x0

ih_ahbdmaaud_stat0

Description: AHB Audio DMA Interrupt Status Register (Functional Operation, Buffer Full and Empty Interrupts)
Size: 8 bits
Offset: 0x109

Bits	Name	Attr	Description
7			Reserved for future use.
6	ahbdmaaud_intbuffoverrun	R/W1C	AHB audio DMA Buffer overrun interruption Value After Reset: 0x0
5	ahbdmaaud_interror	R/W1C	AHB audio DMA error interrupt Value After Reset: 0x0
4	ahbdmaaud_intlostownership	R/W1C	AHB audio DMA lost ownership interrupt Value After Reset: 0x0
3	ahbdmaaud_intretrysplit	R/W1C	AHB audio DMA RETRY/SPLIT interrupt Value After Reset: 0x0
2	ahbdmaaud_intdone	R/W1C	AHB audio DMA done interrupt Value After Reset: 0x0
1	ahbdmaaud_intbufffull	R/W1C	AHB audio DMA Buffer full interrupt Value After Reset: 0x0

Bits	Name	Attr	Description
0	ahbdmaaud_intbuffempty	R/W1C	AHB audio DMA Buffer empty interrupt Value After Reset: 0x0

ih_decode

Description: Interruption Handler Decode Assist Register

Size: 8 bits

Offset: 0x170

Bits	Name	Attr	Description
7	ih_fc_stat0	R	Interruption active at the ih_fc_stat0 register Value After Reset: 0x0
6	ih_fc_stat1	R	Interruption active at the ih_fc_stat1 register Value After Reset: 0x0
5	ih_fc_stat2_vp	R	Interruption active at the ih_fc_stat2 or ih_vp_stat0 register Value After Reset: 0x0
4	ih_as_stat0	R	Interruption active at the ih_as_stat0 register Value After Reset: 0x0
3	ih_phy	R	Interruption active at the ih_phy_stat0 or ih_i2cmphy_stat0 register Value After Reset: 0x0
2	ih_i2cm_stat0	R	Interruption active at the ih_i2cm_stat0 register Value After Reset: 0x0
1	ih_cec_stat0	R	Interruption active at the ih_cec_stat0 register Value After Reset: 0x0
0	ih_ahbdmaaud_stat0	R	Interruption active at the ih_ahbdmaaud_stat0 register Value After Reset: 0x0

ih_mute_fc_stat0

Description: Frame Composer Interrupt Mute Control Register 0

Size: 8 bits

Offset: 0x180

Bits	Name	Attr	Description
7	AUDI	R/W	When set to 1, mutes ih_fc_stat0[7] Value After Reset: 0x0
6	ACP	R/W	When set to 1, mutes ih_fc_stat0[6] Value After Reset: 0x0
5	HBR	R/W	When set to 1, mutes ih_fc_stat0[5] Value After Reset: 0x0
4	MAS	R/W	When set to 1, mutes ih_fc_stat0[4]. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0"
3	NVBI	R/W	When set to 1, mutes ih_fc_stat0[3]. Otherwise, this field is a "spare" bit with no associated

Bits	Name	Attr	Description
			functionality. Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0"
2	AUDS	R/W	When set to 1, mutes ih_fc_stat0[2] Value After Reset: 0x0
1	ACR	R/W	When set to 1, mutes ih_fc_stat0[1] Value After Reset: 0x0
0	NULL	R/W	When set to 1, mutes ih_fc_stat0[0] Value After Reset: 0x0

ih_mute_fc_stat1

Description: Frame Composer Interrupt Mute Control Register 1

Size: 8 bits

Offset: 0x181

Bits	Name	Attr	Description
7	GMD	R/W	When set to 1, mutes ih_fc_stat1[7] Value After Reset: 0x0
6	ISCR1	R/W	When set to 1, mutes ih_fc_stat1[6] Value After Reset: 0x0
5	ISCR2	R/W	When set to 1, mutes ih_fc_stat1[5] Value After Reset: 0x0
4	VSD	R/W	When set to 1, mutes ih_fc_stat1[4] Value After Reset: 0x0
3	SPD	R/W	When set to 1, mutes ih_fc_stat1[3] Value After Reset: 0x0
2	AMP	R/W	When set to 1, mutes ih_fc_stat1[2]. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0" Exists: HDMI_TX_20==1
1	AVI	R/W	When set to 1, mutes ih_fc_stat1[1] Value After Reset: 0x0
0	GCP	R/W	When set to 1, mutes ih_fc_stat1[0] Value After Reset: 0x0

ih_mute_fc_stat2

Description: Frame Composer Interrupt Mute Control Register 2

Size: 8 bits

Offset: 0x182

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	DRM	R/W	When set to 1, mutes ih_fc_stat2[4]. Value After Reset: (HDMI_TX_20== 1) ? 1 : 0
3:2			Reserved for future use
1	LowPriority_overflow	R/W	When set to 1, mutes ih_fc_stat2[1] Value After Reset: 0x0

0	HighPriority_overflow	R/W	When set to 1, mutes ih_fc_stat2[0] Value After Reset: 0x0

ih_mute_as_stat0

Description: Audio Sampler Interrupt Mute Control Register

Size: 8 bits

Offset: 0x183

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	fifo_underrun	R/W	When set to 1, mutes ih_as_stat0[4] Value After Reset: 0x1
3	fifo_overrun	R/W	When set to 1, mutes ih_as_stat0[3] Value After Reset: 0x1
2	Aud_fifo_underflow_thr	R/W	When set to 1, mutes ih_as_stat0[2] Value After Reset: 0x0
1	Aud_fifo_underflow	R/W	When set to 1, mutes ih_as_stat0[1] Value After Reset: 0x0
0	Aud_fifo_overflow	R/W	When set to 1, mutes ih_as_stat0[0] Value After Reset: 0x0

ih_mute_phy_stat0

Description: PHY Interface Interrupt Mute Control Register

Size: 8 bits

Offset: 0x184

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	RX_SENSE_3	R/W	When set to 1, mutes ih_phy_stat0[5] Value After Reset: 0x0
4	RX_SENSE_2	R/W	When set to 1, mutes ih_phy_stat0[4] Value After Reset: 0x0
3	RX_SENSE_1	R/W	When set to 1, mutes ih_phy_stat0[3] Value After Reset: 0x0
2	RX_SENSE_0	R/W	When set to 1, mutes ih_phy_stat0[2] Value After Reset: 0x0
1	TX_PHY_LOCK	R/W	When set to 1, mutes ih_phy_stat0[1] Value After Reset: 0x0
0	HPD	R/W	When set to 1, mutes ih_phy_stat0[0] Value After Reset: 0x0

ih_mute_i2cm_stat0

Description: E-DDC I2C Master Interrupt Mute Control Register

Size: 8 bits

Offset: 0x185

Bits	Name	Attr	Description
7:3			Reserved for future use.
2	scdc_readreq	R/W	When set to 1, mutes ih_i2cm_stat0[2]

			Value After Reset: 0x1
1	I2Cmasterdone	R/W	When set to 1, mutes ih_i2cm_stat0[1] Value After Reset: 0x0
0	I2Cmastererror	R/W	When set to 1, mutes ih_i2cm_stat0[0] Value After Reset: 0x0

ih_mute_cec_stat0

Description: CEC Interrupt Mute Control Register

Size: 8 bits

Offset: 0x186

Bits	Name	Attr	Description

1	ahbdmaaud_intbufffull	R/W	When set to 1, mutes ih_ahbdmaaud_stat0[1] Value After Reset: 0x0
0	ahbdmaaud_intbuffempty	R/W	When set to 1, mutes ih_ahbdmaaud_stat0[0] Value After Reset: 0x0

ih_mute

Description: Global Interrupt Mute Control Register

Size: 8 bits

Offset: 0x1ff

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	mute_wakeup_interrupt	R/W	When set to 1, mutes the main interrupt output port. The sticky bit interrupts continue with their state accessible through the configuration bus,

			only the main interrupt line is muted. Value After Reset: 0x1
0	mute_all_interrupt	R/W	When set to 1, mutes the main interrupt line (where all interrupts are ORed). The sticky bit interrupts continue with their state; only the main interrupt line is muted. Value After Reset: 0x1

VideoSampler Registers

Video Sampler Registers. Follow the link for the register to see a detailed description of the register.

Registers for Address Block: VideoSampler

Register	Offset	Description
tx_invid0	0x200	Video Input Mapping and Internal Data Enable Configuration Register
tx_instuffing	0x201	Video Input Stuffing Enable Register
tx_gydata0	0x202	Video Input gy Data Channel Stuffing Register 0
tx_gydata1	0x203	Video Input gy Data Channel Stuffing Register 1
tx_rcrdata0	0x204	Video Input rcr Data Channel Stuffing Register 0
tx_rcrdata1	0x205	Video Input rcr Data Channel Stuffing Register 1
tx_bcbdata0	0x206	Video Input bcb Data Channel Stuffing Register 0
tx_bcbdata1	0x207	Video Input bcb Data Channel Stuffing Register 1

tx_invid0

Description: Video Input Mapping and Internal Data Enable Configuration Register

Size: 8 bits

Offset: 0x200

Bits	Name	Attr	Description
7	internal_de_generator	R/W	Internal data enable (DE) generator enable. If data enable is not available for the input video, set this bit to one to activate the internal data enable generator. Attention: This feature only works for input video modes that have native repetition (such as, all CEA videos). No desired pixel repetition can be used with this feature because these configurations only affect the Frame Composer and not this block. The DE Generator does not work for the following conditions: Transmission of video with CEA VIC 39 Transmission of 3D video using the field alternative structure Value After Reset: 0x0
6:5			Reserved for future use.
4:0	video_mapping	R/W	Video Input mapping (color space/color depth): 0x01: RGB 4:4:4/8 bits

Bits	Name	Attr	Description
			0x03: RGB 4:4:4/10 bits 0x05: RGB 4:4:4/12 bits 0x07: RGB 4:4:4/16 bits 0x09: YCbCr 4:4:4 or 4:2:0/8 bits 0x0B: YCbCr 4:4:4 or 4:2:0/10 bits 0x0D: YCbCr 4:4:4 or 4:2:0/12 bits 0x0F: YCbCr 4:4:4 or 4:2:0/16 bits 0x16: YCbCr 4:2:2/8 bits 0x14: YCbCr 4:2:2/10 bits 0x12: YCbCr 4:2:2/12 bits 0x17: YCbCr 4:4:4 (IPI)/8 bits 0x18: YCbCr 4:4:4 (IPI)/10 bits 0x19: YCbCr 4:4:4 (IPI)/12 bits 0x1A: YCbCr 4:4:4 (IPI)/16 bits 0x1B: YCbCr 4:2:2 (IPI)/12 bits 0x1C: YCbCr 4:2:0 (IPI)/8 bits 0x1D: YCbCr 4:2:0 (IPI)/10 bits 0x1E: YCbCr 4:2:0 (IPI)/12 bits 0x1F: YCbCr 4:2:0 (IPI)/16 bits Value After Reset: 0x1

tx_instuffing

Description: Video Input Stuffing Enable Register

Size: 8 bits

Offset: 0x201

Bits	Name	Attr	Description
7:3			Reserved for future use.
2	bcbdata_stuffing	R/W	0b: When the dataen signal is low, the value in the bcbdata[15:0] output is the one sampled from the corresponding input data. 1b: When the dataen signal is low, the value in the bcbdata[15:0] output is given by the values in the TX_BCBDTA0 and TX_BCBDATA1 registers. Value After Reset: 0x0
1	rcrdata_stuffing	R/W	0b: When the dataen signal is low, the value in the rcrdata[15:0] output is the one sampled from the corresponding input data. 1b: When the dataen signal is low, the value in the rcrdata[15:0] output is given by the values in TX_RCRDTA0 and TX_RCRDATA1 registers. Value After Reset: 0x0
0	gydata_stuffing	R/W	0b: When the dataen signal is low, the value in the gydata[15:0] output is the one sampled from the corresponding input data. 1b: When the dataen signal is low, the value in the gydata[15:0] output is given by the values in TX_GYDTA0 and TX_GYDATA1 registers.

Bits	Name	Attr	Description
			Value After Reset: 0x0

tx_gydata0

Description: Video Input gy Data Channel Stuffing Register 0

Size: 8 bits

Offset: 0x202

Bits	Name	Attr	Description
7:0	gydata	R/W	This register defines the value of gydata[7:0] when TX_INSTUFFING[0] (gydata_stuffing) is set to 1b. Value After Reset: 0x0

tx_gydata1

Description: Video Input gy Data Channel Stuffing Register 1

Size: 8 bits

Offset: 0x203

Bits	Name	Attr	Description
7:0	gydata	R/W	This register defines the value of gydata[15:8] when TX_INSTUFFING[0] (gydata_stuffing) is set to 1b. Value After Reset: 0x0

tx_rcrdata0

Description: Video Input rcr Data Channel Stuffing Register 0

Size: 8 bits

Offset: 0x204

Bits	Name	Attr	Description
7:0	rcrdata	R/W	This register defines the value of rcrydata[7:0] when TX_INSTUFFING[1] (rcrdata_stuffing) is set to 1b. Value After Reset: 0x0

tx_rcrdata1

Description: Video Input rcr Data Channel Stuffing Register 1

Size: 8 bits

Offset: 0x205

Bits	Name	Attr	Description
7:0	rcrdata	R/W	This register defines the value of rcrydata[15:8] when TX_INSTUFFING[1] (rcrdata_stuffing) is set to 1b. Value After Reset: 0x0

tx_bcbdata0

Description: Video Input bcb Data Channel Stuffing Register 0

Size: 8 bits

Offset: 0x206

Bits	Name	Attr	Description

7:0	bcbdata	R/W	This register defines the value of bcbdata[7:0] when TX_INSTUFFING[2] (bcbdata_stuffing) is set to 1b. Value After Reset: 0x0

tx_bcbdata1

Description: Video Input bcb Data Channel Stuffing Register 1

Size: 8 bits

Offset: 0x207

Bits	Name	Attr	Description
7:0	bcbdata	R/W	This register defines the value of bcbdata[15:8] when TX_INSTUFFING[2] (bcbdata_stuffing) is set to 1b. Value After Reset: 0x0

VideoPacketizer Registers

Video Packetizer Registers. Follow the link for the register to see a detailed description of the register.

Register	Offset	Description
vp_status	0x800	Video Packetizer Packing Phase Status Register
vp_pr_cd	0x801	Video Packetizer Pixel Repetition and Color Depth Register
vp_stuff	0x802	Video Packetizer Stuffing and Default Packing Phase Register
vp_remap	0x803	Video Packetizer YCC422 Remapping Register
vp_conf	0x804	Video Packetizer Output and Enable Configuration Register
vp_mask	0x807	Video Packetizer Interrupt Mask Register

vp_status

Description: Video Packetizer Packing Phase Status Register

Size: 8 bits

Offset: 0x800

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	packing_phase	R	Read only register that holds the "packing phase" output of the Video Packetizer block. Value After Reset: 0x0

vp_pr_cd

Description: Video Packetizer Pixel Repetition and Color Depth Register

Size: 8 bits

Offset: 0x801

Bits	Name	Attr	Description
7:4	color_depth	R/W	The Color depth configuration is described as the following, with the action stated corresponding to color_depth[3:0]: 0000b: 24 bits per pixel video (8 bits per component). 8-bit packing mode. 0001b-0011b: Reserved. Not used. 0100b: 24 bits per pixel video (8 bits per

Bits	Name	Attr	Description
			component). 8-bit packing mode. 0101b: 30 bits per pixel video (10 bits per component). 10-bit packing mode. 0110b: 36 bits per pixel video (12 bits per component). 12-bit packing mode. 0111b: 48 bits per pixel video (16 bits per component). 16-bit packing mode. Other: Reserved. Not used. Value After Reset: 0x0
3:0	desired_pr_factor	R/W	Desired pixel repetition factor configuration. The configured value sets H13T PHY PLL to multiply pixel clock by the factor in order to obtain the desired repetition clock. For the CEA modes some are already defined with pixel repetition in the input video. So for CEA modes this shall be always 0. Shall only be used if the user wants to do pixel repetition using H13TCTRL controller. The action is stated corresponding to desired_pr_factor[3:0]: 0000b: No pixel repetition (pixel sent only once) 0001b: Pixel sent two times (pixel repeated once) 0010b: Pixel sent three times 0011b: Pixel sent four times 0100b: Pixel sent five times 0101b: Pixel sent six times 0110b: Pixel sent seven times 0111b: Pixel sent eight times 1000b: Pixel sent nine times 1001b: Pixel sent 10 times Other: Reserved. Not used Value After Reset: 0x0

vp_stuff

Description: Video Packetizer Stuffing and Default Packing Phase Register

Size: 8 bits

Offset: 0x802

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	idefault_phase	R/W	Controls the default phase packing machine used according to HDMI 1.4b specification: "If the transmitted video format has timing such that the phase of the first pixel of every Video Data Period corresponds to pixel packing phase 0 (e.g. 10P0, 12P0, 16P0), the Source may set the Default_Phase bit in the GCP. The Sink may use this bit to optimize its filtering or handling of the PP field."

Bits	Name	Attr	Description
			This means that for 10-bit mode the Htotal must be dividable by 4; for 12- bit mode, the Htotal must be divisible by 2. Value After Reset: 0x0
4	ifix_pp_to_last	R/W	Reserved. Controls packing machine strategy Value After Reset: 0x0
3	icx_goto_p0_st	R/W	Reserved. Controls packing machine strategy Value After Reset: 0x0
2	ycc422_stuffing	R/W	YCC 422 remap stuffing control. For horizontal blanking, the action is stated corresponding to ycc422_stuffing: 0b: YCC 422 remap block in direct mode (input blanking data goes directly to output). 1b: YCC 422 remap block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00. Value After Reset: 0x0
1	pp_stuffing	R/W	Pixel packing stuffing control. The action is stated corresponding to pp_stuffing: 0b: Pixel packing block in direct mode (input blanking data goes directly to output). 1b: Pixel packing block in stuffing mode. When "de_rep" goes to low the outputs are fixed to 0x00. Value After Reset: 0x0

Fields for Register: vp_stuff (Continued)

Bits	Name	Attr	Description
0	pr_stuffing	R/W	Pixel repeater stuffing control. The action is stated corresponding to pp_stuffing: 0b: Pixel repeater block in direct mode (input blanking data goes directly to output). 1b: Pixel repeater block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00. Value After Reset: 0x0

vp_remap

Description: Video Packetizer YCC422 Remapping Register

Size: 8 bits

Offset: 0x803

Bits	Name	Attr	Description
7:2			Reserved for future use.
1:0	ycc422_size	R/W	YCC 422 remap input video size ycc422_size[1:0] 00b: YCC 422 16-bit input video (8 bits per component) 01b: YCC 422 20-bit input video (10 bits per component) 10b: YCC 422 24-bit input

			video (12 bits per component) 11b: Reserved. Not used Value After Reset: 0x0

vp_conf

Description: Video Packetizer Output and Enable Configuration Register

Size: 8 bits

Offset: 0x804

Bits	Name	Attr	Description
7			Reserved for future use.
6	bypass_en	R/W	When set to 1'b1, Pixel packing enable. When set to 1b'0, the pixel packing block is controlled by pp_en. Value After Reset: 0x0
5	pp_en	R/W	Pixel packing enable. When set to 0, the pixel packing block is disabled if bypass_en is 1’b0. Value After Reset: 0x1
4	pr_en	R/W	Pixel repeater enable. When set to 0, the pixel repetition block is disabled. Value After Reset: 0x0
3	ycc422_en	R/W	YCC 422 select enable. Disabling forces bypass module to output always zeros. Value After Reset: 0x0
2	bypass_select	R/W	bypass_select 0b: Data from pixel repeater block 1b: Data from input of Video Packetizer block Value After Reset: 0x1
1	output_selector	R/W	When set to 1'b1, Data from pixel packing block. Value After Reset: 0x0
0	output_selector_0	R/W	Video Packetizer output selection 0b: Data from pixel packing block 1b: Data from YCC422 remap block Value After Reset: 0x0

vp_mask

Description: Video Packetizer Interrupt Mask Register

Size: 8 bits

Offset: 0x807

Bits	Name	Attr	Description
7	ointfullrepet	R/W	Mask bit for Video Packetizer pixel repeater FIFO full Value After Reset: 0x0
6	ointemptyrepet	R/W	Mask bit for Video Packetizer pixel repeater FIFO empty Value After Reset: 0x0
5	ointfullpp	R/W	Mask bit for Video Packetizer pixel packing FIFO full

			Value After Reset: 0x0
4	ointemptypp	R/W	Mask bit for Video Packetizer pixel packing FIFO empty Value After Reset: 0x0
3	ointfullremap	R/W	Mask bit for Video Packetizer pixel YCC 422 re-mapper FIFO full Value After Reset: 0x0
2	ointemptyremap	R/W	Mask bit for Video Packetizer pixel YCC 422 re-mapper FIFO empty Value After Reset: 0x0
1	spare_2	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0
0	spare_1	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0

FrameComposer Registers

Frame Composer Registers. Follow the link for the register to see a detailed description of the register.

Registers for Address Block: FrameComposer

Register	**Offset**	**Description**
fc_invidconf	0x1000	Frame Composer Input Video Configuration and HDCP Keepout Register

fc_invidconf

Description: Frame Composer Input Video Configuration and HDCP Keepout Register

Size: 8 bits

Offset: 0x1000

Bits	Name	Attr	Description
7	HDCP_keepout	R/W	Start/stop HDCP keepout window generation 1b: Active Value After Reset: 0x0
6	vsync_in_polarity	R/W	Vsync input polarity 1b: Active high 0b: Active low Value After Reset: 0x1
5	hsync_in_polarity	R/W	Hsync input polarity 1b: Active high 0b: Active low Value After Reset: 0x1
4	de_in_polarity	R/W	Data enable input polarity 1b: Active high 0b: Active low Value After Reset: 0x1
3	DVI_modez	R/W	Active low 0b: DVI mode selected 1b: HDMI mode selected Value After Reset: 0x0
2			Reserved for future use.
1	r_v_blank_in_osc	R/W	Used for CEA861-D modes with fractional Vblank (for example, modes 5, 6, 7, 10, 11, 20, 21, and 22). For more modes, see the CEA861-D specification. Note: Set this field to 1 for video mode 39, although there is no Vblank oscillation. 1b: Active high Value After Reset: 0x0

Fields for Register: fc_invidconf (Continued)

Bits	Name	Attr	Description
0	in_I_P	R/W	Input video mode: 1b: Interlaced 0b: Progressive Value After Reset: 0x0

fc_inhactiv0

Description: Frame Composer Input Video HActive Pixels Register 0

Size: 8 bits

Offset: 0x1001

Bits	Name	Attr	Description
7:0	H_in_activ	R/W	Input video Horizontal active pixel region width. Number of Horizontal active pixels [0...8191]. Value After Reset: 0x0

fc_inhactiv1

Description: Frame Composer Input Video HActive Pixels Register 1

Size: 8 bits

Offset: 0x1002

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	H_in_activ_13	R/W	Input video Horizontal active pixel region width (0 .. 16383) If the configuration parameter HDMI_TX_20 = True (1), this bit field holds bit 13. Value After Reset: 0x0

Fields for Register: fc_inhactiv1 (Continued)

Bits	Name	Attr	Description
4	H_in_activ_12	R/W	Input video Horizontal active pixel region width (0 . . 8191) If configuration parameter HDMI_TX_14 = True (1), this bit field holds bit 12. Value After Reset: 0x0
3:0	H_in_activ	R/W	Input video Horizontal active pixel region width Value After Reset: 0x0

fc_inhblank0

Description: Frame Composer Input Video HBlank Pixels Register 0

Size: 8 bits

Offset: 0x1003

Bits	Name	Attr	Description
7:0	H_in_blank	R/W	Input video Horizontal blanking pixel region width. Number of Horizontal blanking pixels [0...4095]. Value After Reset: 0x0

fc_inhblank1

Description: Frame Composer Input Video HBlank Pixels Register 1

Size: 8 bits
Offset: 0x1004

Bits	Name	Attr	Description
7:5			Reserved for future use.
4:2	H_in_blank_12	R/W	Input video Horizontal blanking pixel region width If configuration parameter HDMI_TX_14 = True (1), this bit field holds bit 12:10 of number of horizontal blanking pixels. Value After Reset: 0x0
1:0	H_in_blank	R/W	Input video Horizontal blanking pixel region width this bit field holds bits 9:8 of number of Horizontal blanking pixels. Value After Reset: 0x0

fc_invactiv0
Description: Frame Composer Input Video VActive Pixels Register 0
Size: 8 bits
Offset: 0x1005

Bits	Name	Attr	Description
7:0	V_in_activ	R/W	Input video Vertical active pixel region width. This bit field holds bits 7:0 of number of Vertical active pixels. Value After Reset: 0x0

fc_invactiv1
Description: Frame Composer Input Video VActive Pixels Register 1
Size: 8 bits
Offset: 0x1006

Bits	Name	Attr	Description
7:5			Reserved for future use.
4:3	V_in_activ_12_11	R/W	Input video Vertical active pixel region width. If the configuration parameter HDMI_TX_14 = True (1), this bit field holds bits 12:10 of number of Vertical active pixels. Value After Reset: 0x0
2:0	V_in_activ	R/W	Input video Vertical active pixel region width. This bit field holds bits 9:8 of number of Vertical active pixels. Value After Reset: 0x0

fc_invblank
Description: Frame Composer Input Video VBlank Pixels Register
Size: 8 bits
Offset: 0x1007

Bits	Name	Attr	Description
7:0	V_in_blank	R/W	Input video Vertical blanking pixel region width.

			Number of Vertical blanking lines [0...255]. Value After Reset: 0x0

fc_hsyncindelay0

Description: Frame Composer Input Video HSync Front Porch Register 0

Size: 8 bits

Offset: 0x1008

Bits	Name	Attr	Description
7:0	H_in_delay	R/W	Input video Hsync active edge delay. Integer number of pixel clock cycles from "de" non active edge of the last "de" valid period [0...4095]. Value After Reset: 0x0

fc_hsyncindelay1

Description: Frame Composer Input Video HSync Front Porch Register 1

Size: 8 bits

Offset: 0x1009

Bits	Name	Attr	Description
7:5			Reserved for future use.
4:3	H_in_delay_12	R/W	Input video Horizontal active edge delay. If configuration parameter HDMI_TX_14 = True (1), this bit field holds bit 12. Integer number of pixel clock cycles from "de" non-active edge of the last "de" valid period [0...8191]. Value After Reset: 0x0
2:0	H_in_delay	R/W	Input video Horizontal active edge delay. Value After Reset: 0x0

fc_hsyncinwidth0

Description: Frame Composer Input Video HSync Width Register 0

Size: 8 bits

Offset: 0x100a

Bits	Name	Attr	Description
7:0	H_in_width	R/W	Input video Hsync active pulse width. Integer number of pixel clock cycles [0...511]. Value After Reset: 0x0

fc_hsyncinwidth1

Description: Frame Composer Input Video HSync Width Register 1

Size: 8 bits

Offset: 0x100b

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	H_in_width_9	R/W	Input video Hsync active pulse width. If configuration parameter HDMI_TX_14 = True (1), then this bit field holds bit 9. Number of

			Horizontal active pixels [0...1024]. Value After Reset: 0x0
0	H_in_width	R/W	Input video Hsync active pulse width. Value After Reset: 0x0

fc_vsyncindelay

Description: Frame Composer Input Video VSync Front Porch Register

Size: 8 bits

Offset: 0x100c

Bits	Name	Attr	Description
7:0	V_in_delay	R/W	Input video Vsync active edge delay. Integer number of Hsync pulses from "de" non active edge of the last "de" valid period. [0...255]. Value After Reset: 0x0

fc_vsyncinwidth

Description: Frame Composer Input Video VSync Width Register

Size: 8 bits

Offset: 0x100d

Bits	Name	Attr	Description
7:6			Reserved for future use.
5:0	V_in_width	R/W	Description: Input video Vsync active pulse width. Integer number of video lines [0...63]. Value After Reset: 0x0

fc_infreq0

Description: Frame Composer Input Video Refresh Rate Register 0

Size: 8 bits

Offset: 0x100e

Bits	Name	Attr	Description
7:0	infreq	R/W	Video refresh rate in Hz*1E3 format. This register is provided for debug and informative purposes. The Hdmi_tx does not write any data to this register; the data written by software is not used by the Hdmi_tx. Value After Reset: 0x0

fc_infreq1

Description: Frame Composer Input Video Refresh Rate Register 1

Size: 8 bits

Offset: 0x100f

Bits	Name	Attr	Description
7:0	infreq	R/W	Video refresh rate in Hz*1E3 format. This register is provided for debug and informative purposes. The Hdmi_tx does not write any data to this register; the data written by software is not used

			by the Hdmi_tx. Value After Reset: 0x0

fc_infreq2

Description: Frame Composer Input Video Refresh Rate Register 2

Size: 8 bits

Offset: 0x1010

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	infreq	R/W	Video refresh rate in Hz*1E3 format. This register is provided for debug and informative purposes. The Hdmi_tx does not write any data to this register; the data written by software is not used by the Hdmi_tx. Value After Reset: 0x0

fc_ctrldur

Description: Frame Composer Control Period Duration Register

Size: 8 bits

Offset: 0x1011

Bits	Name	Attr	Description
7:0	ctrlperiodduration	R/W	Configuration of the control period minimum duration (minimum of 12 pixel clock cycles; refer to HDMI 1.4b specification). Integer number of pixel clocks cycles [0..223]. Value After Reset: 0x0

fc_exctrldur

Description: Frame Composer Extended Control Period Duration Register

Size: 8 bits

Offset: 0x1012

Bits	Name	Attr	Description
7:0	exctrlperiodduration	R/W	Configuration of the extended control period minimum duration (minimum of 32 pixel clock cycles; refer to HDMI 1.4b specification). Integer number of pixel clocks cycles [0..223]. Value After Reset: 0x0

fc_exctrlspac

Description: Frame Composer Extended Control Period Maximum Spacing Register

Size: 8 bits

Offset: 0x1013

Bits	Name	Attr	Description
7:0	exctrlperiodspacing	R/W	Configuration of the maximum spacing between consecutive extended control periods (maximum of 50ms; refer to the applicable HDMI specification).

			When using the HDMI 2.0 supported features (HDMI_TX_20 = 1): generated spacing = (1/freq tmds clock)*256*512*(extctrlperiodspacing +1) else generated spacing = (1/freq tmds clock)*256*256*(extctrlperiodspacing +1) Value After Reset: 0x0

fc_ch0pream

Description: Frame Composer Channel 0 Non-Preamble Data Register

Size: 8 bits

Offset: 0x1014

Bits	Name	Attr	Description
7:0	ch0_preamble_filter	R/W	When in control mode, configures 8 bits that fill the channel 0 data lines not used to transmit the preamble (for more clarification, refer to the HDMI 1.4b specification). Value After Reset: 0x0

fc_ch1pream

Description: Frame Composer Channel 1 Non-Preamble Data Register

Size: 8 bits

Offset: 0x1015

Bits	Name	Attr	Description
7:6			Reserved for future use.
5:0	ch1_preamble_filter	R/W	When in control mode, configures 6 bits that fill the channel 1 data lines not used to transmit the preamble (for more clarification, refer to the HDMI 1.4b specification). Value After Reset: 0x0

fc_ch2pream

Description: Frame Composer Channel 2 Non-Preamble Data Register

Size: 8 bits

Offset: 0x1016

Bits	Name	Attr	Description
7:6			Reserved for future use.
5:0	ch2_preamble_filter	R/W	When in control mode, configures 6 bits that fill the channel 2 data lines not used to transmit the preamble (for more clarification, refer to the HDMI 1.4b specification). Value After Reset: 0x0

fc_aviconf3

Description: Frame Composer AVI Packet Configuration Register 3

Size: 8 bits
Offset: 0x1017

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:2	YQ	R/W	YCC Quantization range according to the CEA specification Value After Reset: 0x0
1:0	CN	R/W	IT content type according to CEA the specification Value After Reset: 0x0

fc_gcp
Description: Frame Composer GCP Packet Configuration Register
Size: 8 bits
Offset: 0x1018

Bits	Name	Attr	Description
7:3			Reserved for future use.
2	default_phase	R/W	Value of "default_phase" in the GCP packet. This data must be equal to the default phase used at Video Packetizer packing machine. Value After Reset: 0x0
1	set_avmute	R/W	Value of "set_avmute" in the GCP packet Once the AVmute is set, the frame composer schedules the GCP packet with AVmute set in the packet scheduler to be sent once (may only be transmitted between the active edge of VSYNC and 384 pixels following this edge). Value After Reset: 0x0
0	clear_avmute	R/W	Value of "clear_avmute" in the GCP packet Value After Reset: 0x0

fc_aviconf0
Description: Frame Composer AVI Packet Configuration Register 0
Size: 8 bits
Offset: 0x1019

Bits	Name	Attr	Description
7	rgc_ycc_indication_2	R/W	Y2, Bit 2 of rgc_ycc_indication Value After Reset: 0x0
6	active_format_present	R/W	Active format present Value After Reset: 0x0
5:4	scan_information	R/W	Scan information Value After Reset: 0x0
3:2	bar_information	R/W	Bar information data valid Value After Reset: 0x0
1:0	rgc_ycc_indication	R/W	Y1,Y0 RGB or YCC indicator Value After Reset: 0x0

fc_aviconf1
Description: Frame Composer AVI Packet Configuration Register 1
Size: 8 bits

Offset: 0x101a

Bits	Name	Attr	Description
7:6	Colorimetry	R/W	Colorimetry Value After Reset: 0x0
5:4	picture_aspect_ratio	R/W	Picture aspect ratio Value After Reset: 0x0
3:0	active_aspect_ratio	R/W	Active aspect ratio Value After Reset: 0x0

fc_aviconf2

Description: Frame Composer AVI Packet Configuration Register 2

Size: 8 bits

Offset: 0x101b

Bits	Name	Attr	Description
7	it_content	R/W	IT content Value After Reset: 0x0
6:4	extended_colorimetry	R/W	Extended colorimetry Value After Reset: 0x0
3:2	quantization_range	R/W	Quantization range Value After Reset: 0x0
1:0	non_uniform_picture_scaling	R/W	Non-uniform picture scaling Value After Reset: 0x0

fc_avivid

Description: Frame Composer AVI Packet VIC Register

Size: 8 bits

Offset: 0x101c

Bits	Name	Attr	Description
7	fc_avivid_7	R/W	Bit 7 of fc_avivid register Value After Reset: 0x0
6:0	fc_avivid	R/W	Configures the AVI InfoFrame Video Identification code. For more information, refer to the CEA-861-E specification. Value After Reset: 0x0

fc_avietb[0:1]

Description: Frame Composer AVI Packet End of Top Bar Register Array

Size: 8 bits

Offset: 0x101d + (i * 0x1)

Bits	Name	Attr	Description
7:0	fc_avietb	R/W	Defines the AVI InfoFrame End of Top Bar value. For more information, refer to the CEA-861-E specification. Value After Reset: 0x0

fc_avisbb[0:1]

Description: Frame Composer AVI Packet Start of Bottom Bar Register Array

Size: 8 bits

Offset: 0x101f + (i * 0x1)

Bits	Name	Attr	Description

7:0	fc_avisbb	R/W	This register defines the AVI InfoFrame Start of Bottom Bar value. For more information, refer to the CEA-861-E specification. Value After Reset: 0x0

fc_avielb[0:1]

Description: Frame Composer AVI Packet End of Left Bar Register Array

Size: 8 bits

Offset: 0x1021 + (i * 0x1)

Bits	Name	Attr	Description
7:0	fc_avielb	R/W	This register defines the AVI InfoFrame End of Left Bar value. For more information, refer to the CEA-861-E specification. Value After Reset: 0x0

fc_avisrb[0:1]

Description: Frame Composer AVI Packet Start of Right Bar Register Array

Size: 8 bits

Offset: 0x1023 + (i * 0x1)

Bits	Name	Attr	Description
7:0	fc_avisrb	R/W	This register defines the AVI InfoFrame Start of Right Bar value. For more information, refer to the CEA-861-E specification. Value After Reset: 0x0

fc_audiconf0

Description: Frame Composer AUD Packet Configuration Register 0

Size: 8 bits

Offset: 0x1025

Bits	Name	Attr	Description
7			Reserved for future use.
6:4	CC	R/W	Channel count Value After Reset: 0x0
3:0	CT	R/W	Coding Type Value After Reset: 0x0

fc_audiconf1

Description: Frame Composer AUD Packet Configuration Register 1

Size: 8 bits

Offset: 0x1026

Bits	Name	Attr	Description
7:6			Reserved for future use.
5:4	SS	R/W	Sampling size Value After Reset: 0x0
3			Reserved for future use.
2:0	SF	R/W	Sampling frequency Value After Reset: 0x0

fc_audiconf2

Description: Frame Composer AUD Packet Configuration Register 2

Size: 8 bits

Offset: 0x1027

Bits	Name	Attr	Description
7:0	CA	R/W	Channel allocation Value After Reset: 0x0

fc_audiconf3

Description: Frame Composer AUD Packet Configuration Register 3

Size: 8 bits

Offset: 0x1028

Bits	Name	Attr	Description
7			Reserved for future use.
6:5	LFEPBL	R/W	LFE playback information LFEPBL1, LFEPBL0 LFE playback level as compared to the other channels. Value After Reset: 0x0
4	DM_INH	R/W	Down mix enable Value After Reset: 0x0

fc_datman

Description: Frame Composer Data Island Manual Packet Request Register
Requests to the Frame Composer the data island packet insertion for NULL, SPD, VSD, ISRC2, ISRC1 and ACP packets when FC_DATAUTO0 bit is in manual mode for the packet requested.
Size: 8 bits
Offset: 0x10b6

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	null_tx	W	Null packet Value After Reset: 0x0
4	spd_tx	W	SPD packet

			Value After Reset: 0x0
3	vsd_tx	W	VSD packet Value After Reset: 0x0
2	iscr2_tx	W	ISRC2 packet Value After Reset: 0x0
1	iscr1_tx	W	ISRC1 packet Value After Reset: 0x0
0	acp_tx	W	ACP packet Value After Reset: 0x0

fc_datauto3

Description: Frame Composer Data Island Auto Packet Scheduling Register 3
Configures the Frame Composer Automatic(1)/RDRB(0) data island packet insertion for AVI, GCP, AUDI and ACR packets. In Automatic mode, the packet is inserted on Vblanking when first line with active Vsync appears.
Size: 8 bits
Offset: 0x10b7

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	nvbi_auto	R/W	Enables NTSC VBI packet insertion Value After Reset: 0x1
4	amp_auto	R/W	Enables AMP packet insertion Value After Reset: 0x1
3	avi_auto	R/W	Enables AVI packet insertion Value After Reset: 0x1
2	gcp_auto	R/W	Enables GCP packet insertion Value After Reset: 0x1
1	audi_auto	R/W	Enables AUDI packet insertion Value After Reset: 0x1
0	acr_auto	R/W	Enables ACR packet insertion Value After Reset: 0x1

fc_rdrb0

Description: Frame Composer Round Robin ACR Packet Insertion Register 0
Configures the Frame Composer (FC) RDRB frame interpolation for ACR packet insertion on data island when FC is on RDRB mode for this packet.
Size: 8 bits
Offset: 0x10b8

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	ACRframeinterpolation	R/W	ACR Frame interpolation Value After Reset: 0x0

fc_rdrb1

Description: Frame Composer Round Robin ACR Packet Insertion Register 1
Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the ACR packet insertion on data island when FC is on RDRB mode this packet.
Size: 8 bits
Offset: 0x10b9

Bits	Name	Attr	Description
7:4	ACRpacketsinframe	R/W	ACR packets in frame Value After Reset: 0x0
3:0	ACRpacketlinespacing	R/W	ACR packet line spacing Value After Reset: 0x0

fc_rdrb2

Description: Frame Composer Round Robin AUDI Packet Insertion Register 2
Configures the Frame Composer (FC) RDRB frame interpolation for AUDI packet insertion on data island when FC is on RDRB mode for this packet.
Size: 8 bits
Offset: 0x10ba

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	AUDIframeinterpolation	R/W	Audio frame interpolation Value After Reset: 0x0

fc_rdrb3

Description: Frame Composer Round Robin AUDI Packet Insertion Register 3
Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AUDI packet insertion on data island when FC is on RDRB mode this packet.
Size: 8 bits
Offset: 0x10bb

Bits	Name	Attr	Description
7:4	AUDIpacketsinframe	R/W	Audio packets per frame Value After Reset: 0x0
3:0	AUDIpacketlinespacing	R/W	Audio packets line spacing Value After Reset: 0x0

fc_rdrb4

Description: Frame Composer Round Robin GCP Packet Insertion Register 4
Configures the Frame Composer (FC) RDRB frame interpolation for GCP packet insertion on data island when FC is on RDRB mode for this packet.
Size: 8 bits
Offset: 0x10bc

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	GCPframeinterpolation	R/W	Frames interpolated between GCP packets Value After Reset: 0x0

fc_rdrb5

Description: Frame Composer Round Robin GCP Packet Insertion Register 5
Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the GCP packet insertion on data island when FC is on RDRB mode this packet.
Size: 8 bits
Offset: 0x10bd

Bits	Name	Attr	Description
7:4	GCPpacketsinframe	R/W	GCP packets per frame Value After Reset: 0x0
3:0	GCPpacketlinespacing	R/W	GCP packets line spacing Value After Reset: 0x0

fc_rdrb6

Description: Frame Composer Round Robin AVI Packet Insertion Register 6
Configures the Frame Composer (FC) RDRB frame interpolation for AVI packet insertion on data island when FC is on RDRB mode for this packet.
Size: 8 bits
Offset: 0x10be

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	AVIframeinterpolation	R/W	Frames interpolated between AVI packets Value After Reset: 0x0

fc_rdrb7
Description: Frame Composer Round Robin AVI Packet Insertion Register 7
Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AVI packet insertion on data island when FC is on RDRB mode this packet.
Size: 8 bits
Offset: 0x10bf

Bits	Name	Attr	Description
7:4	AVIpacketsinframe	R/W	AVI packets per frame Value After Reset: 0x0
3:0	AVIpacketlinespacing	R/W	AVI packets line spacing Value After Reset: 0x0

fc_rdrb8
Description: Frame Composer Round Robin AMP Packet Insertion Register 8
Size: 8 bits
Offset: 0x10c0

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	AMPframeinterpolation	R/W	AMP frame interpolation Value After Reset: 0x0

fc_rdrb9
Description: Frame Composer Round Robin AMP Packet Insertion Register 9
Size: 8 bits
Offset: 0x10c1

Bits	Name	Attr	Description
7:4	AMPpacketsinframe	R/W	AMP packets per frame Value After Reset: 0x0
3:0	AMPpacketlinespacing	R/W	AMP packets line spacing Value After Reset: 0x0

fc_rdrb10
Description: Frame Composer Round Robin NTSC VBI Packet Insertion Register 10
Size: 8 bits
Offset: 0x10c2

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	NVBIframeinterpolation	R/W	NTSC VBI frame interpolation Value After Reset: 0x0

fc_rdrb11
Description: Frame Composer Round Robin NTSC VBI Packet Insertion Register 11

Size: 8 bits
Offset: 0x10c3

Bits	Name	Attr	Description
7:4	NVBIpacketsinframe	R/W	NTSC VBI packets per frame Value After Reset: 0x0
3:0	NVBIpacketlinespacing	R/W	NTSC VBI packets line spacing Value After Reset: 0x0

fc_rdrb12
Description: Frame Composer Round Robin DRM Packet Insertion Register 12
Size: 8 bits
Offset: 0x10c4

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	DRMframeinterpolation	R/W	Description: DRM frame interpolation Value After Reset: 0x0

fc_rdrb13
Description: Frame Composer Round Robin DRM Packet Insertion Register 13
Size: 8 bits
Offset: 0x10c5

Bits	Name	Attr	Description
7:4	DRMpacketsinframe	R/W	DRM packets per frame Value After Reset: 0x0
3:0	DRMpacketlinespacing	R/W	DRM packets line spacing Value After Reset: 0x0

fc_mask0
Description: Frame Composer Packet Interrupt Mask Register 0
Size: 8 bits
Offset: 0x10d2

Bits	Name	Attr	Description
7	AUDI	R/W	Mask bit for FC_INT0.AUDI interrupt bit Value After Reset: 0x0
6	ACP	R/W	Mask bit for FC_INT0.ACP interrupt bit Value After Reset: 0x0
5	HBR	R/W	Mask bit for FC_INT0.HBR interrupt bit Value After Reset: 0x1
4	MAS	R/W	Mask bit for FC_INT0.MAS interrupt bit. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0"
3	NVBI	R/W	Mask bit for FC_INT0.NVBI interrupt bit. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0"
2	AUDS	R/W	Mask bit for FC_INT0.AUDS interrupt bit Value After Reset: 0x1
1	ACR	R/W	Mask bit for FC_INT0.ACR interrupt bit

Bits	Name	Attr	Description
			Value After Reset: 0x0
0	NULL	R/W	Mask bit for FC_INT0.NULL interrupt bit Value After Reset: 0x1

fc_mask1

Description: Frame Composer Packet Interrupt Mask Register 1

Size: 8 bits

Offset: 0x10d6

Bits	Name	Attr	Description
7	GMD	R/W	Mask bit for FC_INT1.GMD interrupt bit Value After Reset: 0x0
6	ISCR1	R/W	Mask bit for FC_INT1.ISRC1 interrupt bit Value After Reset: 0x0
5	ISCR2	R/W	Mask bit for FC_INT1.ISRC2 interrupt bit Value After Reset: 0x0
4	VSD	R/W	Mask bit for FC_INT1.VSD interrupt bit Value After Reset: 0x0
3	SPD	R/W	Mask bit for FC_INT1.SPD interrupt bit Value After Reset: 0x0
2	AMP	R/W	Mask bit for FC_INT1.AMP interrupt bit. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: "(HDMI_TX_20== 1) ? 1 : 0"
1	AVI	R/W	Mask bit for FC_INT1.AVI interrupt bit Value After Reset: 0x0
0	GCP	R/W	Mask bit for FC_INT1.GCP interrupt bit Value After Reset: 0x0

fc_mask2

Description: Frame Composer High/Low Priority Overflow and DRM Interrupt Mask Register 2

Size: 8 bits

Offset: 0x10da

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	DRM	R/W	Mask bit for FC_INT2.DRM interrupt bit. Value After Reset: (HDMI_TX_20== 1) ? 1 : 0
3:2			Reserved for future use.
1	LowPriority_overflow	R/W	Mask bit for FC_INT2.LowPriority_overflow interrupt bit Value After Reset: 0x0
0	HighPriority_overflow	R/W	Mask bit for FC_INT2.HighPriority_overflow interrupt bit Value After Reset: 0x0

fc_prconf

Description: Frame Composer Pixel Repetition Configuration Register

Size: 8 bits

Offset: 0x10e0

Bits	Name	Attr	Description
7:4	incoming_pr_factor	R/W	Configures the input video pixel repetition. For CEA modes, this value must be extracted from the CEA specification for the video mode being input. incoming_pr_factor[3:0] 0000b: No action. Not used. 0001b: No pixel repetition (pixel sent only once) 0010b: Pixel sent two times (pixel repeated once) 0011b: Pixel sent three times 0100b: Pixel sent four times 0101b: Pixel sent five times 0110b: Pixel sent six times 0111b: Pixel sent seven times 1000b: Pixel sent eight times 1001b: Pixel sent nine times 1010b: Pixel sent 10 times Other: Reserved. Not used Value After Reset: 0x1
3:0	output_pr_factor	R/W	Configures the video pixel repetition ratio to be sent on the AVI InfoFrame. This value must be valid according to the HDMI specification. The output_pr_factor = incoming_pr_factor * (desired_pr_factor + 1) – 1. output_pr_factor[3:0] 0000b: No action. Not used. 0001b: Pixel sent two times (pixel repeated once) 0010b: Pixel sent three times 0011b: Pixel sent four times 0100b: Pixel sent five times 0101b: Pixel sent six times 0110b: Pixel sent seven times 0111b: Pixel sent eight times 1000b: Pixel sent nine times 1001b: Pixel sent 10 times Other: Reserved. Not used Note: When working in YCC422 video, the actual repetition of the stream is Incoming_pr_factor * (desired_pr_factor + 1). This calculation is done internally in the H13TCTRL and no hardware overflow protection is available. Care must be taken to avoid this result passes the maximum number of 10 pixels repeated because no HDMI support is available for this in the specification and the H13TPHY does not support this higher repetition values. Value After Reset: 0x0

fc_scrambler_ctrl

Description: Frame Composer Scrambler Control

Size: 8 bits

Offset: 0x10e1

Bits	Name	Attr	Description

7:5			Reserved for future use.
4	scrambler_ucp_line	R/W	Debug register. When active (1'b1), the Unscrambled Control Period is generated after each active video line (non-compliant behavior). This is quasi-static field which requires a a mc_swrstzreq.tmdsswrst_req reset request to be performed after the change of this configuration bit. Value After Reset: 0x0
3:1			Reserved for future use.
0	scrambler_on	R/W	When set (1'b1), this field activates the HDMI 2.0 scrambler feature. When disabled (1'b0) the scrambler feature is bypassed, placing Hdmi_tx in HDMI 1.4b compatible mode. To activate the scrambler feature, you must ensure that the quasi-static configuration bit fc_invidconf.HDCP_keepout is set (1'b1) at configuration time, before the required mc_swrstzreq.tmdsswrst_req reset request is issued. This is field can be changed in runtime. Value After Reset: 0x0

fc_multistream_ctrl

Description: Frame Composer Multi-Stream Audio Control

Size: 8 bits

Offset: 0x10e2

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	fc_mas_packet_en	R/W	This field, when set (1'b1), activates the HDMI 2.0 Multi- Stream support. The audio stream present at the input of the Hdmi_tx controller is transported using Multi-Stream Audio Sample Packets. Value After Reset: 0x0

fc_packet_tx_en

Description: Frame Composer Packet Transmission Control

Size: 8 bits

Offset: 0x10e3

Bits	Name	Attr	Description
7	drm_tx_en	R/W	DRM transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x0
6	nvbi_tx_en	R/W	NTSC VBI transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x0
5	amp_tx_en	R/W	AMP transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x0

4	aut_tx_en	R/W	ACP, SPD, VSIF, ISRC1, and SRC2 packet transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x1
3	audi_tx_en	R/W	AUDI packet transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x1
2	avi_tx_en	R/W	AVI packet transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x1
1	gcp_tx_en	R/W	GCP transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x1
0	acr_tx_en	R/W	ACR packet transmission control 1b: Transmission enabled 0b: Transmission disabled Value After Reset: 0x1

fc_actspc_hdlr_cfg

Description: Frame Composer Active Space Control

Size: 8 bits

Offset: 0x10e8

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	actspc_hdlr_tgl	R/W	Active Space handler control 1b: Active space 1 value is different from Active Space 2 value. Refer to Figure 8-4: 3D Structure of the HDMI 1.4b specification. 0b: Active space not oscillating Value After Reset: 0x0
0	actspc_hdlr_en	R/W	Active Space Handler Control 1b: Fixed active space value mode enabled. During active space, a fixed value of 0xAA is applied to all TMDS channels. 0b: Fixed active space value mode disabled Value After Reset: 0x0

fc_invact_2d_0

Description: Frame Composer Input Video 2D VActive Pixels Register 0

Size: 8 bits

Offset: 0x10e9

Bits	Name	Attr	Description
7:0	fc_invact_2d_0	R/W	2D Input video vertical active pixel region width. Number of 2D video vertical active lines [7:0]. Value After Reset: 0x0

fc_invact_2d_1

Description: Frame Composer Input Video VActive pixels Register 1

Size: 8 bits

Offset: 0x10ea

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	fc_invact_2d_1	R/W	2D Input video vertical active pixel region width. Number of 2D video vertical active lines [11:8]. Value After Reset: 0x0

fc_gmd_stat

Description: Frame Composer GMD Packet Status Register

Gamut metadata packet status bit information for no_current_gmd, next_gmd_field, gmd_packet_sequence and current_gamut_seq_num. For more information, refer to the HDMI 1.4b specification.

Size: 8 bits

Offset: 0x1100

Bits	Name	Attr	Description
7	igmdno_crnt_gbd	R	Gamut scheduling: No current gamut data Value After Reset: 0x0
6	igmddnext_field	R	Gamut scheduling: Gamut Next field Value After Reset: 0x0
5:4	igmdpacket_seq	R	Gamut scheduling: Gamut packet sequence Value After Reset: 0x0
3:0	igmdcurrent_gamut_seq_num	R	Gamut scheduling: Current Gamut packet sequence number Value After Reset: 0x0

fc_gmd_en

Description: Frame Composer GMD Packet Enable Register

This register enables Gamut metadata (GMD) packet transmission. Packets are inserted in the incoming frame, starting in the line where active Vsync indication starts. After enable of GMD packets the outgoing packet is sent with no_current_gmd active indication until update GMD request is performed in the controller.

Size: 8 bits

Offset: 0x1101

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	gmdenabletx	R/W	Gamut Metadata packet transmission enable (1b) Value After Reset: 0x0

fc_gmd_up

Description: Frame Composer GMD Packet Update Register

This register performs an GMD packet content update according to the configured packet body (FC_GMD_PB0 to FC_GMD_PB27) and packet header (FC_GMD_HB). This active high auto clear register reflects the body and header configurations on the GMD packets sent arbitrating the current_gamut_seq_num, gmd_packet_sequence and next_gmd_field bits on packet to correctly indicate to source the Gamut change to be performed. After enable GMD packets the first update request is also responsible for deactivating the no_current_gmd

indication bit.
Attention packet update request must only be done after correct configuration of GMD packet body and header registers. Correct affected_gamut_seq_num and gmd_profile configuration is user responsibility and must convey with HDMI 1.4b standard gamut rules.
Size: 8 bits
Offset: 0x1102

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	gmdupdatepacket	W	Gamut Metadata packet update Value After Reset: 0x0

fc_gmd_conf
Description: Frame Composer GMD Packet Schedule Configuration Register
This register configures the number of GMD packets to be inserted per frame (starting always in the line where the active Vsync appears) and the line spacing between the transmitted GMD packets.
Note that for profile P0 (refer to the HDMI 1.4b specification) this register should only indicate one GMD packet to be inserted per video field.
Size: 8 bits
Offset: 0x1103

Bits	Name	Attr	Description
7:4	gmdpacketsinframe	R/W	Number of GMD packets per frame or video field (profile P0) Value After Reset: 0x1
3:0	gmdpacketlinespacing	R/W	Number of line spacing between the transmitted GMD packets Value After Reset: 0x0

fc_gmd_hb
Description: Frame Composer GMD Packet Profile and Gamut Sequence Configuration Register
This register configures the GMD packet header affected_gamut_seq_num and gmd_profile bits. For more information, refer to the HDMI 1.4b specification.
Size: 8 bits
Offset: 0x1104

Bits	Name	Attr	Description
7			Reserved for future use.
6:4	gmdgbd_profile	R/W	GMD profile bits. Hdmi_tx only supports Profile 0 (P0) of the Gamut Boundary Description Metadata Profiles described in the HDMI 1.4 Specification (which defines four profiles, P0-P4). Value After Reset: 0x0
3:0	gmdaffected_gamut_seq_num	R/W	Affected gamut sequence number Value After Reset: 0x0

fc_gmd_pb[0:27]

Description: Frame Composer GMD Packet Body Register Array Configures the GMD packet body of the GMD packet.
Size: 8 bits
Offset: 0x1105 + (i * 0x1)

Bits	Name	Attr	Description
7:0	fc_gmd_pb	R/W	Frame Composer GMD Packet Body Register Array Value After Reset: 0x0

fc_amp_hb1
Description: Frame Composer AMP Packet Header Register 1
Size: 8 bits
Offset: 0x1128

Bits	Name	Attr	Description

Bits	Name	Attr	Description
7:0	fc_drm_pb	R/W	Frame Composer DRM Packet Body Register Array Value After Reset: 0x0

fc_dbgforce

Description: Frame Composer video/audio Force Enable Register

This register allows to force the controller to output audio and video data the values configured in the FC_DBGAUD and FC_DBGTMDS registers.

Size: 8 bits

Offset: 0x1200

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	forceaudio	R/W	Force fixed audio output with FC_DBGAUDxCHx register contents. Value After Reset: 0x0
3:1			Reserved for future use.
0	forcevideo	R/W	Force fixed video output with FC_DBGTMDSx register contents. Value After Reset: 0x0

fc_dbgaud0ch0

Description: Frame Composer Audio Data Channel 0 Register 0

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

Size: 8 bits

Offset: 0x1201

Bits	Name	Attr	Description
7:0	fc_dbgaud0ch0	R/W	Frame Composer Audio Data Channel 0 Register 0 Value After Reset: 0x0

fc_dbgaud1ch0

Description: Frame Composer Audio Data Channel 0 Register 1

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

Size: 8 bits

Offset: 0x1202

Bits	Name	Attr	Description
7:0	fc_dbgaud1ch0	R/W	Frame Composer Audio Data Channel 0 Register 1 Value After Reset: 0x0

fc_dbgaud2ch0

Description: Frame Composer Audio Data Channel 0 Register 2

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

Size: 8 bits

Offset: 0x1203

Bits	Name	Attr	Description
7:0	fc_dbgaud2ch0	R/W	Frame Composer Audio Data Channel 0 Register 2 Value After Reset: 0x0

fc_dbgaud0ch1

Description: Frame Composer Audio Data Channel 1 Register 0

Configures the audio fixed data to be used in channel 1 when in fixed audio selection.

Size: 8 bits

Offset: 0x1204

Bits	Name	Attr	Description
7:0	fc_dbgaud0ch1	R/W	Frame Composer Audio Data Channel 1 Register 0 Value After Reset: 0x0

fc_dbgaud1ch1

Description: Frame Composer Audio Data Channel 1 Register 1

Configures the audio fixed data to be used in channel 1 when in fixed audio selection.

Size: 8 bits

Offset: 0x1205

Bits	Name	Attr	Description
7:0	fc_dbgaud1ch1	R/W	Frame Composer Audio Data Channel 1 Register 1 Value After Reset: 0x0

fc_dbgaud2ch1

Description: Frame Composer Audio Data Channel 1 Register 2

Configures the audio fixed data to be used in channel 1 when in fixed audio selection.

Size: 8 bits

Offset: 0x1206

Bits	Name	Attr	Description
7:0	fc_dbgaud2ch1	R/W	Frame Composer Audio Data Channel 1 Register 2 Value After Reset: 0x0

fc_dbgaud0ch2

Description: Frame Composer Audio Data Channel 2 Register 0

Configures the audio fixed data to be used in channel 2 when in fixed audio selection.

Size: 8 bits

Offset: 0x1207

Bits	Name	Attr	Description
7:0	fc_dbgaud0ch2	R/W	Frame Composer Audio Data Channel 2 Register 0 Value After Reset: 0x0

fc_dbgaud1ch2

Description: Frame Composer Audio Data Channel 2 Register 1

Configures the audio fixed data to be used in channel 2 when in fixed audio selection.

Size: 8 bits Offset: 0x1208

Bits	Name	Attr	Description
7:0	fc_dbgaud1ch2	R/W	Frame Composer Audio Data Channel 2 Register 1 Value After Reset: 0x0

fc_dbgaud2ch2

Description: Frame Composer Audio Data Channel 2 Register 2

Configures the audio fixed data to be used in channel 2 when in fixed audio selection.

Size: 8 bits

Offset: 0x1209

Bits	Name	Attr	Description
7:0	fc_dbgaud2ch2	R/W	Frame Composer Audio Data Channel 2 Register 2 Value After Reset: 0x0

fc_dbgaud0ch3

Description: Frame Composer Audio Data Channel 3 Register 0
Configures the audio fixed data to be used in channel 3 when in fixed audio selection.
Size: 8 bits
Offset: 0x120a

Bits	Name	Attr	Description
7:0	fc_dbgaud0ch3	R/W	Frame Composer Audio Data Channel 3 Register 0 Value After Reset: 0x0

fc_dbgaud1ch3
Description: Frame Composer Audio Data Channel 3 Register 1
Configures the audio fixed data to be used in channel 3 when in fixed audio selection.
Size: 8 bits
Offset: 0x120b

Bits	Name	Attr	Description
7:0	fc_dbgaud1ch3	R/W	Frame Composer Audio Data Channel 3 Register 1 Value After Reset: 0x0

fc_dbgaud2ch3
Description: Frame Composer Audio Data Channel 3 Register 2
Configures the audio fixed data to be used in channel 3 when in fixed audio selection.
Size: 8 bits
Offset: 0x120c

Offset: 0x1218

Bits	Name	Attr	Description
7:0	fc_dbgaud2ch7	R/W	Frame Composer Audio Data Channel 7 Register 2 Value After Reset: 0x0

fc_dbgtmds[0:2]

Description: Frame Composer TMDS Data Channel Register Array

Configures the video fixed data to be used in TMDS channel x (where x is 0 to 2) when in fixed video selection.

For Channel 0, this equals to set B pixel component value in RGB video or Cb pixel component value in YCbCr.

For Channel 1, this equals set G pixel component value in RGB video or Y pixel component value in YCbCr.

For Channel 2, this equals to set R pixel component value in RGB video or Cr pixel component value in YCbCr.

Size: 8 bits

Offset: 0x1219 + (i * 0x1)

Bits	Name	Attr	Description
7:0	fc_dbgtmds	R/W	Frame Composer TMDS Data Channel 0 Register Value After Reset: 0x0

phy_conf0

Description: PHY Configuration Register

This register holds the power down, data enable polarity, and interface control of the HDMI Source PHY control.

Size: 8 bits

Offset: 0x3000

Bits	Name	Attr	description

7	PDZ	R/W	Power-down enable (active low 0b). Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
6	ENTMDS	R/W	Enable TMDS drivers, bias, and TMDS digital logic. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
5	svsret	R/W	PHY SVSRET signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
4	pddq	R/W	PHY PDDQ signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: "(PHY_MHL_COMBO== 1) ? 1 : 0"
3	txpwron	R/W	PHY TXPWRON signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
2	enhpdrxsense	R/W	PHY ENHPDRXSENSE signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x1
1	seldataenpol	R/W	Select data enable polarity. Value After Reset: 0x1
0	seldipif	R/W	Select interface control. Value After Reset: 0x0

phy_tst0

Description: PHY Test Interface Register 0

PHY TX mapped test interface (control).

Size: 8 bits

Offset: 0x3001

Bits	Name	Attr	Description
7:6	spare_2	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0
5	testclr	R/W	Test Clear signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
4	testen	R/W	Test Enable signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
3:1	spare_1	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0
0	testclk	R/W	Test Clock signal. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0

phy_tst1

Description: PHY Test Interface Register 1
PHY TX mapped text interface (data in).
Size: 8 bits
Offset: 0x3002

Bits	Name	Attr	Description
7:0	testdin	R/W	Test Data input Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0

phy_tst2
Description: PHY Test Interface Register 2
PHY TX mapped text interface (data out).
Size: 8 bits
Offset: 0x3003

Bits	Name	Attr	Description
7:0	testdout	R	Test Data output. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0

phy_stat0
Description: PHY RXSENSE, PLL Lock, and HPD Status Register
This register contains the following active high packet sent status indications.
Size: 8 bits
Offset: 0x3004

Bits	Name	Attr	Description
7	RX_SENSE_3	R	Status bit. TX PHY RX_SENSE indication for TMDS channel 3 driver. You may need to mask or change polarity of this interrupt after it has became active. Value After Reset: 0x0
6	RX_SENSE_2	R	Status bit. TX PHY RX_SENSE indication for TMDS channel 2 driver. You may need to mask or change polarity of this interrupt after it has became active. Value After Reset: 0x0
5	RX_SENSE_1	R	Status bit. TX PHY RX_SENSE indication for TMDS channel 1 driver. You may need to mask or change polarity of this interrupt after it has became active. Value After Reset: 0x0
4	RX_SENSE_0	R	Status bit. TX PHY RX_SENSE indication for TMDS channel 0 driver. You may need to mask or change polarity of this interrupt after it has became active. Value After Reset: 0x0
3:2			Reserved for future use.
1	HPD	R	Status bit. HDMI Hot Plug Detect indication. You may need to mask or change polarity of this interrupt after it has became active. Value After Reset: 0x0

Bits	Name	Attr	Description
0	TX_PHY_LOCK	R	Status bit. TX PHY PLL lock indication. You may need to mask or change polarity of this interrupt after it has became active. Value After Reset: 0x0

phy_int0

Description: PHY RXSENSE, PLL Lock, and HPD Interrupt Register

This register contains the interrupt indication of the PHY_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All these interrupts are forwarded to the Interrupt Handler sticky bit register ih_phy_stat0 and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

Size: 8 bits

Offset: 0x3005

Bits	Name	Attr	Description
7	RX_SENSE_3	R	Interrupt indication bit. TX PHY RX_SENSE indication interruption for TMDS CLK driver. Value After Reset: 0x0
6	RX_SENSE_2	R	Interrupt indication bit. TX PHY RX_SENSE indication interruption for TMDS channel 2 driver. Value After Reset: 0x0
5	RX_SENSE_1	R	Interrupt indication bit. TX PHY RX_SENSE indication interruption for TMDS channel 1 driver. Value After Reset: 0x0
4	RX_SENSE_0	R	Interrupt indication bit. TX PHY RX_SENSE indication interruption for TMDS channel 0 driver. Value After Reset: 0x0
3:2			Reserved for future use.
1	HPD	R	Interrupt indication bit. HDMI Hot Plug Detect indication interrupt. Value After Reset: 0x0
0	TX_PHY_LOCK	R	Interrupt indication bit. TX PHY PLL lock indication interrupt. Value After Reset: 0x0

phy_mask0

Description: PHY RXSENSE, PLL Lock, and HPD Mask Register Mask register for generation of PHY_INT0 interrupts.

Size: 8 bits

Offset: 0x3006

Bits	Name	Attr	Description
7	RX_SENSE_3	R/W	Mask bit for PHY_INT0.RX_SENSE[3] interrupt bit Value After Reset: 0x0

6	RX_SENSE_2	R/W	Mask bit for PHY_INT0.RX_SENSE[2] interrupt bit Value After Reset: 0x0
5	RX_SENSE_1	R/W	Mask bit for PHY_INT0.RX_SENSE[1] interrupt bit Value After Reset: 0x0
4	RX_SENSE_0	R/W	Mask bit for PHY_INT0.RX_SENSE[0] interrupt bit Value After Reset: 0x0
3:2			Reserved for future use.
1	HPD	R/W	Mask bit for PHY_INT0.HPD interrupt bit Value After Reset: 0x0
0	TX_PHY_LOCK	R/W	Mask bit for PHY_INT0.TX_PHY_LOCK interrupt bit Value After Reset: 0x0

phy_pol0

Description: PHY RXSENSE, PLL Lock, and HPD Polarity Register Polarity register for generation of PHY_INT0 interrupts.

Size: 8 bits

Offset: 0x3007

Bits	Name	Attr	Description
7	RX_SENSE_3	R/W	Polarity bit for PHY_INT0.RX_SENSE[3] interrupt bit Value After Reset: 0x1
6	RX_SENSE_2	R/W	Polarity bit for PHY_INT0.RX_SENSE[2] interrupt bit Value After Reset: 0x1
5	RX_SENSE_1	R/W	Polarity bit for PHY_INT0.RX_SENSE[1] interrupt bit Value After Reset: 0x1
4	RX_SENSE_0	R/W	Polarity bit for PHY_INT0.RX_SENSE[0] interrupt bit Value After Reset: 0x1
3:2			Reserved for future use.
1	HPD	R/W	Polarity bit for PHY_INT0.HPD interrupt bit Value After Reset: 0x1
0	TX_PHY_LOCK	R/W	Polarity bit for PHY_INT0.TX_PHY_LOCK interrupt bit Value After Reset: 0x1

PHY_PCLFREQ0

Description: PHY Test Interface Register 0

Size: 8 bits

Offset: 0x3008

Bits	Name	Attr	Description
7:0	pclk_freq	R/W	Pixel Clock Frequency (pclk_freq[7:0]). Value After Reset: 0x32

PHY_PCLFREQ1

Description: PHY Test Interface Register 1

Size: 8 bits

Offset: 0x3009

Bits	Name	Attr	Description

7:2			Reserved for future use.
1:0	pclk_freq	R/W	Pixel Clock Frequency (pclk_freq[9:8]). Value After Reset: 0x0

PHY_PLLCFGFREQ0

Description: PHY PLL Test Interface Register 0

Size: 8 bits

Offset: 0x300a

Bits	Name	Attr	Description
7:0	pllcfgfreq	R/W	PLL Configuration Frequency (pllcfgfreq[7:0]). Value After Reset: 0x20

PHY_PLLCFGFREQ1

Description: PHY PLL Test Interface Register 1

Size: 8 bits

Offset: 0x300b

Bits	Name	Attr	Description
7:0	pllcfgfreq	R/W	PLL Configuration Frequency (pllcfgfreq[15:8]). Value After Reset: 0x27

PHY_PLLCFGFREQ2

Description: PHY PLL Test Interface Register 2

Size: 8 bits

Offset: 0x300c

Bits	Name	Attr	Description
7:0	pllcfgfreq	R/W	PLL Configuration Frequency (pllcfgfreq[23:16]). Value After Reset: 0x0

phy_i2cm_slave

Description: PHY I2C Slave Address Configuration Register

Size: 8 bits

Offset: 0x3020

Bits	Name	Attr	Description
7			Reserved for future use.
6:0	slaveaddr	R/W	Slave address to be sent during read and write operations. PHY Gen2 slave address: 7'h69 HEAC PHY slave address: 7'h49 Value After Reset: 0x0

phy_i2cm_address

Description: PHY I2C Address Configuration Register

This register writes the address for read and write operations.

Size: 8 bits

Offset: 0x3021

Bits	Name	Attr	Description

7:0	address	R/W	Register address for read and write operations Value After Reset: 0x0

phy_i2cm_datao_1
Description: PHY I2C Data Write Register 1
Size: 8 bits
Offset: 0x3022

Bits	Name	Attr	Description
7:0	datao	R/W	Data MSB (datao[15:8]) to be written on register pointed by phy_i2cm_address [7:0]. Value After Reset: 0x0

phy_i2cm_datao_0
Description: PHY I2C Data Write Register 0
Size: 8 bits
Offset: 0x3023

Bits	Name	Attr	Description
7:0	datao	R/W	Data LSB (datao[7:0]) to be written on register pointed by phy_i2cm_address [7:0]. Value After Reset: 0x0

phy_i2cm_datai_1
Description: PHY I2C Data Read Register 1
Size: 8 bits
Offset: 0x3024

Bits	Name	Attr	Description
7:0	datai	R	Data MSB (datai[15:8]) read from register pointed by phy_i2cm_address[7:0]. Value After Reset: 0x0

phy_i2cm_datai_0
Description: PHY I2C Data Read Register 0
Size: 8 bits
Offset: 0x3025

Bits	Name	Attr	Description
7:0	datai	R	Data LSB (datai[7:0]) read from register pointed by phy_i2cm_address[7:0]. Value After Reset: 0x0

phy_i2cm_operation
Description: PHY I2C RD/RD_EXT/WR Operation Register
This register requests read and write operations from the I2C Master PHY. This register can only be written; reading this register always results in 00h. Writing 1'b1 simultaneously to read and write requests is considered a read request.
Size: 8 bits

Offset: 0x3026

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	wr	W	Write operation request Value After Reset: 0x0
3:1			Reserved for future use.
0	rd	W	Read operation request Value After Reset: 0x0

phy_i2cm_int

Description: PHY I2C Done Interrupt Register

This register contains and configures I2C master PHY done interrupt.

Size: 8 bits

Offset: 0x3027

Bits	Name	Attr	Description
7:4			Reserved for future use.
3	done_pol	R/W	Done interrupt polarity configuration Value After Reset: 0x1
2	done_mask	R/W	Done interrupt mask signal Value After Reset: 0x0
1	done_interrupt	R	Operation done interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleared after it. {done_interrupt = (done_mask==0b) && (done_status==done_pol)} Value After Reset: 0x0
0	done_status	R	Operation done status bit. Marks the end of a read or write operation. Value After Reset: 0x0

phy_i2cm_ctlint

Description: PHY I2C error Interrupt Register

This register contains and configures the I2C master PHY error interrupts.

Size: 8 bits

Offset: 0x3028

Bits	Name	Attr	Description
7	nack_pol	R/W	Not acknowledge error interrupt polarity configuration Value After Reset: 0x1
6	nack_mask	R/W	Not acknowledge error interrupt mask signal Value After Reset: 0x0
5	nack_interrupt	R	Not acknowledge error interrupt bit. Only lasts for one SFR clock cycle and is auto cleared after it. {nack_interrupt = (nack_mask==0b) && (nack_status==nack_pol)}. Note: This bit field is read by the sticky bits present on the ih_i2cmphy_stat0 register. Value After Reset: 0x0
4	nack_status	R	Not acknowledge error status bit. Error on I2C not acknowledge. Note: This bit field is read by the sticky

Bits	Name	Attr	Description
			bits present on the ih_i2cmphy_stat0 register. Value After Reset: 0x0
3	arbitration_pol	R/W	Arbitration error interrupt polarity configuration. Value After Reset: 0x1
2	arbitration_mask	R/W	Arbitration error interrupt mask signal. Value After Reset: 0x0
1	arbitration_interrupt	R	Arbitration error interrupt bit {arbitration_interrupt = (arbitration_mask==0b) && (arbitration_status==arbitration_pol)} Note: This bit field is read by the sticky bits present on the ih_i2cmphy_stat0 register. Value After Reset: 0x0

Fields for Register: phy_i2cm_ctlint (Continued)

Bits	Name	Attr	Description
0	arbitration_status	R	Arbitration error status bit. Error on master I2C protocol arbitration. Only lasts for one SFR clock cycle and is auto cleared after it. Note: This bit field is read by the sticky bits present on the ih_i2cmphy_stat0 register. Value After Reset: 0x0

phy_i2cm_div

Description: PHY I2C Speed control Register

This register wets the I2C Master PHY to work in either Fast or Standard mode.

Size: 8 bits

Offset: 0x3029

Bits	Name	Attr	Description
7:4			Reserved for future use.
3	fast_std_mode	R/W	Sets the I2C Master to work in Fast Mode or Standard Mode: 1: Fast Mode 0: Standard Mode Value After Reset: 0x1
2:0	spare	R/W	Reserved as "spare" register with no associated functionality. Value After Reset: 0x3

phy_i2cm_softrstz

Description: PHY I2C SW reset control register

This register sets the I2C Master PHY software reset.

Size: 8 bits

Offset: 0x302a

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	i2c_softrstz	R/W	I2C Master Software Reset. Active by writing a zero and auto cleared to one in the following cycle.

Bits	Name	Attr	Description
			Value After Reset: 0x1

phy_i2cm_ss_scl_hcnt_1_addr

Description: PHY I2C Slow Speed SCL High Level Control Register 1

Size: 8 bits

Offset: 0x302b

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_hcnt1	R/W	PHY I2C Slow Speed SCL High Level Control Register 1 Value After Reset: 0x0

phy_i2cm_ss_scl_hcnt_0_addr

Description: PHY I2C Slow Speed SCL High Level Control Register 0

Size: 8 bits

Offset: 0x302c

Bits	Name	Attr	Description

phy_i2cm_ss_scl_lcnt_1_addr

Description: PHY I2C Slow Speed SCL Low Level Control Register 1

Size: 8 bits

Offset: 0x302d

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_lcnt1	R/W	PHY I2C Slow Speed SCL Low Level Control Register 1 Value After Reset: 0x0

phy_i2cm_ss_scl_lcnt_0_addr

Description: PHY I2C Slow Speed SCL Low Level Control Register 0

Size: 8 bits

Offset: 0x302e

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_lcnt0	R/W	PHY I2C Slow Speed SCL Low Level Control Register 0 Value After Reset: 0x7f

phy_i2cm_fs_scl_hcnt_1_addr

Description: PHY I2C Fast Speed SCL High Level Control Register 1

Size: 8 bits

Offset: 0x302f

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_hcnt1	R/W	PHY I2C Fast Speed SCL High Level Control Register 1

			Value After Reset: 0x0

phy_i2cm_fs_scl_hcnt_0_addr
Description: PHY I2C Fast Speed SCL High Level Control Register 0
Size: 8 bits
Offset: 0x3030

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_hcnt0	R/W	PHY I2C Fast Speed SCL High Level Control Register 0 Value After Reset: 0x11

phy_i2cm_fs_scl_lcnt_1_addr
Description: PHY I2C Fast Speed SCL Low Level Control Register 1
Size: 8 bits
Offset: 0x3031

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_lcnt1	R/W	PHY I2C Fast Speed SCL Low Level Control Register 1 Value After Reset: 0x0

phy_i2cm_fs_scl_lcnt_0_addr
Description: PHY I2C Fast Speed SCL Low Level Control Register 0
Size: 8 bits
Offset: 0x3032

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_lcnt0	R/W	PHY I2C Fast Speed SCL Low Level Control Register 0 Value After Reset: 0x24

phy_i2cm_sda_hold
Description: PHY I2C SDA HOLD Control Register
Size: 8 bits
Offset: 0x3033

Bits	Name	Attr	Description
7:0	osda_hold	R/W	Defines the number of SFR clock cycles to meet tHD:DAT (300 ns) osda_hold = round_to_high_integer (300 ns / (1/ isfrclk_frequency)) Value After Reset: 0x9

jtag_phy_config
Description: PHY I2C/JTAG I/O Configuration Control Register
Size: 8 bits
Offset: 0x3034

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	i2c_jtagz	R/W	Configures the JTAG PHY interface output pin I2C_JTAGZ to select the PHY configuration interface

Bits	Name	Attr	Description
			when in internal control mode (iphy_ext_ctrl=1'b0) or ophyext_jtag_i2c_jtagz when PHY_EXTERNAL=1. 1'b0: JTAG configuration Interface 1'b1: I2C configuration Interface Value After Reset: 0x1
3:1			Reserved for future use.
0	jtag_trst_n	R/W	Configures the JTAG PHY interface output pin JTAG_TRST_N when in internal control mode (iphy_ext_ctrl=1'b0) or ophyext_jtag_trst_n when PHY_EXTERNAL=1. Value After Reset: 0x1

jtag_phy_tap_tck

Description: PHY JTAG Clock Control Register

Size: 8 bits

Offset: 0x3035

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	jtag_tck	R/W	Configures the JTAG PHY interface pin JTAG_TCK when in internal control mode (iphy_ext_ctrl=1'b0) or ophyext_jtag_tck when PHY_EXTERNAL=1. Value After Reset: 0x0

jtag_phy_tap_in

Description: PHY JTAG TAP In Control Register

Size: 8 bits

Offset: 0x3036

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	jtag_tms	R/W	Configures the JTAG PHY interface pin JTAG_TMS when in internal control mode (iphy_ext_ctrl=1'b0) or ophyext_jtag_tms when PHY_EXTERNAL=1. Value After Reset: 0x1
3:1			Reserved for future use.
0	jtag_tdi	R/W	Configures the JTAG PHY interface pin JTAG_TDI when in internal control mode (iphy_ext_ctrl=1'b0) or ophyext_jtag_tdi when PHY_EXTERNAL=1. Value After Reset: 0x0

jtag_phy_tap_out

Description: PHY JTAG TAP Out Control Register

Size: 8 bits

Offset: 0x3037

Bits	Name	Attr	Description
7:5			Reserved for future use.

Bits	Name	Attr	Description
4	jtag_tdo_en	R	Read JTAG PHY interface input pin JTAG_TDO_EN when in internal control mode (iphy_ext_ctrl=1'b0) or iphyext_jtag_tdo_en when PHY_EXTERNAL=1 Value After Reset: 0x0
3:1			Reserved for future use.
0	jtag_tdo	R	Read JTAG PHY interface input pin JTAG_TDO when in internal control mode (iphy_ext_ctrl=1'b0) or iphyext_jtag_tdo when PHY_EXTERNAL=1 Value After Reset: 0x0

jtag_phy_addr

Description: PHY JTAG Address Control Register

Size: 8 bits

Offset: 0x3038

Bits	Name	Attr	Description
7:0	jtag_addr	R/W	Configures the JTAG PHY interface pin JTAG_ADDR[7:0] when in internal control mode (iphy_ext_ctrl=1'b0) or iphyext_jtag_addr[7:0] when PHY_EXTERNAL=1 Value After Reset: 0x0

AudioSample Registers

Audio Sample Registers. Follow the link for the register to see a detailed description of the register.

aud_int1	0x3104	I2S Mask Interrupt Register This register masks the interrupts present in the I2S module.

aud_conf0

Description: Audio I2S Software FIFO Reset, Select, and Enable Control Register 0

This register configures the I2S input enable that indicates which input I2S channels have valid data. It also allows the system processor to reset audio FIFOs upon underflow/overflow error detection.

Size: 8 bits

Offset: 0x3100

Bits	Name	Attr	Description
7	sw_audio_fifo_rst	R/W	Audio FIFOs software reset Writing 0b: no action taken Writing 1b: Resets all audio FIFOs Reading from this register always returns 0b. Note: If a FIFO reset request (via SFR command) lands in the middle of an I2S transaction, the samples become misaligned (left-right sequence lost). As a solution, for each FIFO reset, an associated I2S reset must be issued (writing 8'hF7 to MC_SWRSTZ register). Value After Reset: 0x0
6	spare_2	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0
5	i2s_select	R/W	1b: Selects I2S Audio Interface 0b: Selects the second (SPDIF/GPA) interface, in configurations with more that one audio interface (DOUBLE/GDOUBLE) Value After Reset: 0x1
4	spare_1	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0
3:0	I2S_in_en	R/W	Action I2S_in_en[0] - I2Sdata[0] enable I2S_in_en[1] - I2Sdata[1] enable I2S_in_en[2] - I2Sdata[2] enable I2S_in_en[3] - I2Sdata[3] enable Value After Reset: 0xf

aud_conf1

Description: Audio I2S Width Configuration Register 1 This register configures the data width of the input data.

Size: 8 bits

Offset: 0x3101

Bits	Name	Attr	Description
7:5			Reserved for future use.
4:0	I2S_width	R/W	I2S input data width I2S_width[4:0] | Action 00000b-01111b | Not used 10000b | 16 bit data samples at input 10001b | 17 bit data samples at input 10010b | 18 bit data samples at input 10011b | 19 bit data samples at input 10100b | 20 bit data samples at input 10101b | 21 bit data samples at input 10110b | 22 bit data samples at input 10111b | 23 bit data samples at input 11000b | 24 bit data samples at input 11001b-11111b

			| Not Used Value After Reset: 0x18

aud_int

Description: I2S FIFO status and interrupts.

This register configures the I2S FIFO status and interrupts.

Size: 8 bits

Offset: 0x3102

Bits	Name	Attr	Description
7:4			Reserved for future use.
3	fifo_empty_mask	R/W	FIFO empty mask. Value After Reset: 0x0
2	fifo_full_mask	R/W	FIFO full mask. Value After Reset: 0x0
1:0			Reserved for future use.

aud_conf2

Description: Audio I2S PCUV, NLPCM and HBR configuration Register 2

This register configures the I2S Audio Data mapping. By default, audio data mapping is the standard I2S Linear PCM (L-PCM) mapping. You can choose to use the I2S interface to transport HBR or Non- Linear PCM (NL-PCM) audio, by setting the relevant bit in this register.

Size: 8 bits

Offset: 0x3103

Bits	Name	Attr	Description
7:3			Reserved for future use.
2	insert_pcuv	R/W	When set (1'b1), this bit enables the insertion of the PCUV (Parity, Channel Status, User bit and Validity) bits on the incoming audio stream (support limited to Linear PCM audio). If disabled, the incoming audio stream must contain the PCUV bits, mapped according to Databook. Value After Reset: 0x1
1	NLPCM	R/W	I2S NLPCM Mode Enable. When enabled, this bit assumes that PCUV data is included on the I2S audio stream according to the description located in the "I2S Interface" section of Chapter 2, "Functional Description." Value After Reset: 0x0
0	HBR	R/W	I2S HBR Mode Enable. When enabled, the I2S audio stream is transmitted using HBR packets. Value After Reset: 0x0

aud_int1

Description: I2S Mask Interrupt Register

This register masks the interrupts present in the I2S module.

Size: 8 bits

Offset: 0x3104

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	fifo_overrun_mask	R/W	FIFO overrun mask Value After Reset: 0x1
3:0			Reserved for future use.

AudioPacketizer Registers

Audio Packetizer Registers. Follow the link for the register to see a detailed description of the register.

aud_inputclkfs	0x3206	Audio Input Clock FS Factor Register
aud_cts_dither	0x3207	Audio CTS Dither Register

aud_n1

Description: Audio Clock Regenerator N Value Register 1 For N expected values, refer to the HDMI 1.4b specification.

Size: 8 bits

Offset: 0x3200

Bits	Name	Attr	Description
7:0	AudN	R/W	HDMI Audio Clock Regenerator N value Value After Reset: 0x0

aud_n2

Description: Audio Clock Regenerator N Value Register 2 For N expected values, refer to the HDMI 1.4b specification.

Size: 8 bits

Offset: 0x3201

Bits	Name	Attr	Description
7:0	AudN	R/W	HDMI Audio Clock Regenerator N value Value After Reset: 0x0

aud_n3

Description: Audio Clock Regenerator N Value Register 3 For N expected values, refer to the HDMI 1.4b specification.
Size: 8 bits
Offset: 0x3202

Bits	Name	Attr	Description
7	ncts_atomic_write	R/W	When set, the new N and CTS values are only used when aud_n1 register is written. If clear, N and CTS data is updated each time a new N or CTS byte is written. The following write sequence is recommended: aud_n3 (set bit ncts_atomic_write if desired) aud_cts3 (set CTS_manual and CTS value if desired/enabled) aud_cts2 (required in CTS_manual) aud_cts1 (required in CTS_manual) aud_n3 (bit ncts_atomic_write with same value as in step 1.) aud_n2 aud_n1 For dynamic N/CTS changes, perform only steps from 2-7 or 5-7 depending on the state of CTS_manual. Value After Reset: 0x0
6:4			Reserved for future use.
3:0	AudN	R/W	HDMI Audio Clock Regenerator N value Value After Reset: 0x0

aud_cts1
Description: Audio Clock Regenerator CTS Value Register 1 For CTS expected values, refer to the HDMI 1.4b specification.
Size: 8 bits
Offset: 0x3203

Bits	Name	Attr	Description
7:0	AudCTS	R/W	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism. Value After Reset: 0x0

aud_cts2
Description: Audio Clock Regenerator CTS Register 2
For CTS expected values, refer to the HDMI 1.4b specification.
Size: 8 bits
Offset: 0x3204

Bits	Name	Attr	Description
7:0	AudCTS	R/W	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual

			(AUD_CTS3) mechanism. Value After Reset: 0x0

aud_cts3

Description: Audio Clock Regenerator CTS value Register 3. For CTS expected values, refer to the HDMI 1.4b specification.

Size: 8 bits

Offset: 0x3205

Bits	Name	Attr	Description
7:5	Spare_bits	R/W	Reserved as "spare" bits with no associated functionality. Value After Reset: 0x0
4	CTS_manual	R/W	If the CTS_manual bit equals 0b, this registers contains audCTS[19:0] generated by the Cycle time counter according to the specified timing. If the CTS_manual bit equals 1b, this register is configured with the audCTS[7:0] value that is output by the Audio Packetizer. Note: When the General Parallel Audio Interface (GPAUD) is enabled (AUDIO_IF = 6) or the AHB DMA Audio Interface is enabled (AUDIO_IF = 8), writing to these bits has no effect; reading these bits always return 0. Value After Reset: 0x0
3:0	AudCTS	R/W	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism. Value After Reset: 0x0

aud_inputclkfs

Description: Audio Input Clock FS Factor Register

Size: 8 bits

Offset: 0x3206

Bits	Name	Attr	Description
7:3			Reserved for future use.
2:0	ifsfactor	R/W	Fs factor configuration: ifsfactor[2:0] | Audio Clock | Action 0 | 128xFs | If you select the Bypass SPDIF DRU unit in coreConsultant, the input audio clock (either I2S or SPDIF according to configuration) is used at the audio packetizer to calculate the CTS value and ACR packet insertion rate. | 256xFs | The input audio clock (I2S only) is divided by 2 and then used at audio packetizer to calculate the CTS value and ACR packet insertion rate. | 512xFs | The input audio clock (either I2S or

Bits	Name	Attr	Description
			SPDIF according to configuration) used divided by 4 and then used at the audio packetizer to calculate the CTS value and ACR packet insertion rate. Note: When the SPDIF interface is receiving an HBR audio stream ("Support for HBR over SDPIF" parameter must be enabled), it is required that the selected IFSFACTOR to be set at 512xFs in order to comply with the HDMI ACR requirements for HBR audio streams. | Reserved | 64xFs | The input audio clock (I2S only) is multiplied by 2 and then used at the audio packetizer to calculate the CTS value and ACR packet insertion rate. others | 128xFs | If you select the Bypass SPDIF DRU unit in coreConsultant, the input audio clock (either I2S or SPDIF according to configuration) is used at the audio packetizer to calculate the CTS value and ACR packet insertion rate. The SPDIF interface, for non HBR audio, requires that the configured oversampling value to be 128xFs when HTX_SPDIFBYPDRU is enabled and 512xFs if not. When the SPDIF interface is receiving HBR audio (HBR_ON_SPDIF must be enabled), in order to comply with the HDMI ACR requirements for HBR audio streams. Value After Reset: 0x0

aud_cts_dither

Description: Audio CTS Dither Register

Size: 8 bits

Offset: 0x3207

Bits	Name	Attr	Description
7:4	divisor	R/W	Dither divisor (4'd1 if no CTS Dither). This field should be configured with the value of divisor from the HDMI specification. Value After Reset: 0x1
3:0	dividend	R/W	Dither dividend (4'd1 if no CTS Dither). This field should be configured with the value of dividend from the HDMI specification. Value After Reset: 0x1

aud_spdif0

Description: Audio SPDIF Software FIFO Reset Control Register 0

This register allows the system processor to reset audio FIFOs upon underflow/overflow error detection.

Size: 8 bits

Offset: 0x3300

Bits	Name	Attr	Description
7	sw_audio_fifo_rst	R/W	Audio FIFOs software reset Writing 0b: no action taken Writing 1b: Resets all audio FIFOs Reading from this register always returns 0b. Note: If a FIFO reset request (via register write command) lands in the middle of an SPDIF audio transaction, the samples become misaligned (left-right sequence lost). As a solution, for each FIFO reset, an associated SPDIF reset must be issued (writing 8'hEF to MC_SWRSTZ register). Value After Reset: 0x0
6:0	spare	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0xf

aud_spdif1

Description: Audio SPDIF NLPCM and Width Configuration Register 1 This register configures the SPDIF data width.

Size: 8 bits

Offset: 0x3301

Bits	Name	Attr	Description
7	setnlpcm	R/W	Select Non-Linear (1b) / Linear (0b) PCM mode Value After Reset: 0x0
6	spdif_hbr_mode	R/W	When set to 1'b1, this bit field indicates that the input stream has a High Bit Rate (HBR) to be transmitted in HDMI HBR packets. When clear (1b'0), the audio is

			transmitted in HDMI AUDS packets.Note:< Otherwise, this field is a "spare" bit with no associated functionality.

aud_spdifint

Description: Audio SPDIF FIFO Empty/Full Mask Register

Size: 8 bits

Offset: 0x3302

Bits	Name	Attr	Description
7:4			Reserved for future use.
3	spdif_fifo_empty_mask	R/W	Description: SPDIF FIFO empty mask Value After Reset: 0x0
2	spdif_fifo_full_mask	R/W	Description: SPDIF FIFO full mask Value After Reset: 0x0
1:0			Reserved for future use.

aud_spdifint1

Description: Audio SPDIF Mask Interrupt Register 1

This register masks interrupts present in the SPDIF module.

Size: 8 bits

Offset: 0x3303

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	fifo_overrun_mask	R/W	FIFO overrun mask Value After Reset: 0x1
3:0			Reserved for future use.

aud_spdif2

Description: Audio SPDIF Enable Confiiguration Register 2

This register configures the SPDIF input enable that indicates which input SPDIF channels have valid data.

Size: 8 bits

Offset: 0x3304

Bits	Name	Attr	Description
7:4			Reserved for future use.
3:0	SPDIF_in_en	R/W	Action SPDIF_in_en[0] - ispdifdata[0] enable SPDIF_in_en[1] - ispdifdata[1] enable SPDIF_in_en[2] - ispdifdata[2] enable SPDIF_in_en[3] - ispdifdata[3] enable Value After Reset: 0x1

AudioSampleGP Registers

Audio Sample GP Registers. Follow the link for the register to see a detailed description of the register.

Register	Offset	Description
gp_conf0	0x3500	Audio GPA Software FIFO Reset Control Register 0
gp_conf1	0x3501	Audio GPA Channel Enable Configuration Register 1

gp_conf2	0x3502	Audio GPA HBR Enable Register 2
gp_mask	0x3506	Audio GPA FIFO Full and Empty Mask Interrupt Register

gp_conf0

Description: Audio GPA Software FIFO Reset Control Register 0

Size: 8 bits

Offset: 0x3500

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	sw_audio_fifo_rst	R/W	Audio FIFOs software reset Writing 0b: no action taken Writing 1b: Resets all audio FIFOs Reading from this register always returns 0b. Note: If a FIFO reset request (via register write command) lands in the middle of an GPAUD audio transaction, the samples become misaligned (left-right sequence lost). As a solution, for each FIFO reset, an associated SPDIF reset must be issued (writing 8'h7F to MC_SWRSTZ register). Value After Reset: 0x0

gp_conf1

Description: Audio GPA Channel Enable Configuration Register 1

Size: 8 bits

Offset: 0x3501

Bits	Name	Attr	Description
7:0	ch_in_en	R/W	Each bit controls the enabling of the respective audio channel. For instance, bit 1, when set (1'b1), the audio Channel 1 is enabled. When cleared, the referred channel is disabled. Value After Reset: 0x0

gp_conf2

Description: Audio GPA HBR Enable Register 2

Size: 8 bits

Offset: 0x3502

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	insert_pcuv	R/W	When set (1'b1), this bit enables the insertion of the PCUV (Parity, Channel Status, User bit and Validity) bits on the incoming audio stream (support limited to Linear PCM audio). If disabled, the incoming audio stream must contain the PCUV bits, mapped according to 2.6.4.2 Data Mapping Examples.

			Value After Reset: 0x0
0	HBR	R/W	HBR packets enable. The Hdmi_tx sends the HBR packets. This bit is enabled when the audio frequency is higher than 192 kHz. If this bit is enabled, the number of channels configured in GP_CONF1 must be set to 8'hFF. Value After Reset: 0x0

gp_mask

Description: Audio GPA FIFO Full and Empty Mask Interrupt Register

Size: 8 bits

Offset: 0x3506

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	fifo_overrun_mask	R/W	FIFO overrun mask Value After Reset: 0x1
3:2			Reserved for future use.
1	fifo_empty_mask	R/W	FIFO empty flag mask Value After Reset: 0x0
0	fifo_full_mask	R/W	FIFO full flag mask Value After Reset: 0x0

ahb_dma_conf0

Description: Audio DMA SW FIFO reset and DMA Configuration Register 0

This register contains the software reset bit for the audio FIFOs. It also configures operating modes of the AHB master.

Size: 8 bits

Offset: 0x3600

Bits	Name	Attr	Description
7	sw_fifo_rst	R/W	This is the software reset bit for the audio and FIFO clear. Writing 0'b does not result in any action. Writing 1'b to this register resets all audio FIFOs. Reading from this register always returns 0'b. Value After Reset: 0x0
6	insert_pcuv	R/W	Enables the insertion of PCUV data Value After Reset: 0x0
5			Reserved for future use.
4	hbr	R/W	HBR packet enable The Hdmi_tx sends the HBR packets. This bit must be enabled when transmitting non-linear audio of frequency higher than 192 kHz. If this bit is enabled, the number of channels configured in AHB_DMA_CONF1 is always 8. Value After Reset: 0x0
3	enable_hlock	R/W	Enable request of locked burst AHB mechanism. 1'b: Enables the usage of hlock for master request to arbiter of a locked complete burst. 0'b: Disables request of locked burst AHB mechanism Value After Reset: 0x0
2:1	incr_type	R/W	Selects the preferred burst length size

			00'b: Corresponds to INCR4 fixed four beat, incremental AHB burst mode. Only valid when burst_mode is high. 01'b: Corresponds to INCR8 fixed eight beat incremental AHB burst mode. Only valid when burst_mode is high. 10'b: Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high. 11'b: Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high. Value After Reset: 0x0
0	burst_mode	R/W	1'b: Forces the burst mode to be fixed beat, incremental burst mode designated by the incr_type[1:0] signal. 0'b: Normal operation is unspecified length, incremental burst. It corresponds to INCR AHB burst mode. Value After Reset: 0x0

ahb_dma_start

Description: Audio DMA Start Register

The start_dma_transaction bit field signals the AHB audio DMA to start accessing system memory in order to fetch data samples to store in the FIFO. After the operation starts, a new request for a DMA start is ignored until the DMA is stopped or it reaches the end address. Only in one of these situations is a new start request acknowledged.

The first DMA burst request after start_dma_transaction configuration uses initial_addr[31:0] as ohaddr[31:0] value; mburstlength[8:0] is set to the maximum admissible value. This maximum value is constrained by the size of buffer provided, the instantiated FIFO depth, or/and the number of words up to the next 1 Kbyte boundary.

Size: 8 bits

Offset: 0x3601

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	start_dma_transaction	R/W	Start DMA transaction This register is auto-cleared when the transfer operation is completed (done). Value After Reset: 0x0

ahb_dma_stop

Description: Audio DMA Stop Register

The stop_dma_transaction bit field signals the AHB audio DMA to stop current Attr. After it stops, if a new start DMA operation is requested, the DMA engine restarts the Attr using the initial_addr[31:0], which is programmed at ahb_dma_straddr0 to ahb_dma_straddr3.

Size: 8 bits

Offset: 0x3602

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	stop_dma_transaction	R/W	Stop DMA transaction This register is auto-cleared when the transfer operation is stopped (done).

			Value After Reset: 0x0

ahb_dma_thrsld

Description: Audio DMA FIFO Threshold Register

This register defines the FIFO medium threshold occupation value.

After the AHB master completes a burst transaction successfully, the FIFO may remain full till the data fetch interface requests samples. Each data fetch operation reduces the number of samples stored in the FIFO by the number of channels enabled.

Therefore, the fifo_threshold[7:0] is the medium number of samples that should be available in the audio FIFO across the DMA operation.

As soon as the number of samples in the FIFO drops lower than the fifo_threshold[7:0], the DMA engine requests a new burst of samples for the AHB master. The length is constrained by the size of buffer provided, the instantiated FIFO depth minus fifo_threshold[7:0], and/or the number of words up to the next 1 kbyte boundary.

Size: 8 bits

Offset: 0x3603

Bits	Name	Attr	Description
7:0	fifo_threshold	R/W	FIFO medium threshold occupation value Value After Reset: 0x0

ahb_dma_straddr_set0[0:3]

Description: Audio DMA Start Address Set0 Register Array Address offset: i = 0 to 3

These registers define the initial_addr[31:0] used to initiate the DMA burst read transactions upon start_dma_transaction configuration.

Size: 8 bits

Offset: 0x3604 + (i * 0x1)

Bits	Name	Attr	Description
7:0	initial_addr	R/W	Defines init_addr[7:0] to initiate DMA burst transactions Value After Reset: 0x0

ahb_dma_stpaddr_set0[0:3]

Description: Audio DMA Stop Address Set0 Register Array Address offset: i = 0 to 3

This registers define the final_addr[31:0] used as the final point to the DMA burst read transactions.

Upon start_dma_transaction configuration, the DMA engine starts requesting burst reads from the external system memory. Each burst read can have a maximum theoretical length of 256 words (due to the AMBA AHB specification 1 Kbyte boundary burst limitation).

The DMA engine is responsible for incrementing the burst starting address and defining its corresponding burst length to reach the final_addr[31:0] address. The last burst request issued by the DMA engine takes into account that it should only request data until the final_addr[31:0] address (included) and for that should calculate the correct burst length.

After reaching the final_addr[31:0] address, the done interrupt is active to signal completion of DMA operation.

Size: 8 bits

Offset: 0x3608 + (i * 0x1)

Bits	Name	Attr	Description

7:0	final_addr	R/W	Defines final_addr[7:0] to end DMA burst transactions Value After Reset: 0x0

ahb_dma_bstraddr[0:3]

Description: Audio DMA Burst Start Address Register Array Address offset: i = 0 to 3

These read-only registers compose the start address of the current burst operation.

burst_start_addr[31:0] = haddr[31:0] = initial_addr[31:0] + 16.

Size: 8 bits

Offset: 0x360c + (i * 0x1)

Bits	Name	Attr	Description
7:0	burst_addr	R	Start address for the current burst operation Value After Reset: 0x0

ahb_dma_mblength0

Description: Audio DMA Burst Length Register 0

This registers holds the length of the current burst operation. As an example, if the first burst transaction of the AHB audio DMA is a length of 8, then the second burst should start at address ohaddr[31:0] = initial_addr[31:0] + 32.

Size: 8 bits

Offset: 0x3610

Bits	Name	Attr	Description
7:0	mburstlength	R	Requested burst length (mburstlength[7:0]) Value After Reset: 0x0

ahb_dma_mblength1

Description: Audio DMA Burst Length Register 1

This registers holds the length of the current burst operation. As an example, if the first burst transaction of the AHB audio DMA is a length of 8, then the second burst should start at address ohaddr[31:0] = initial_addr[31:0] + 32.

Size: 8 bits

Offset: 0x3611

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	mburstlength	R	Requested burst length Value After Reset: 0x0

ahb_dma_mask

Description: Audio DMA Mask Interrupt Register

This register masks each of the interrupts present in the AHB audio DMA module.

Size: 8 bits

Offset: 0x3614

Bits	Name	Attr	Description
7	done_mask	R/W	DMA end of operation interrupt mask. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated. Value After Reset: 0x1
6	retrysplit_mask	R/W	Retry/split interrupt mask. Active when AHB master receives a RETRY or SPLIT response from slave.

			Value After Reset: 0x1
5	lostownership_mask	R/W	Master lost ownership interrupt mask when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer. Value After Reset: 0x1
4	error_mask	R/W	Error interrupt mask. Active when slave indicates error through the isresp[1:0]. Value After Reset: 0x1
3			Reserved for future use.
2	fifo_thrempty_mask	R/W	Audio FIFO empty interrupt mask when audio FIFO has less than the number of enabled audio channels. Value After Reset: 0x1
1	fifo_full_mask	R/W	Audio FIFO full interrupt mask. Value After Reset: 0x1
0	fifo_empty_mask	R/W	Audio FIFO empty interrupt mask. Value After Reset: 0x1

ahb_dma_conf1

Description: Audio DMA Channel Enable Configuration Register 1

In AUDS packet configuration with layout 0 selected, the maximum number of active channels is 2.

Size: 8 bits

Offset: 0x3616

Bits	Name	Attr	Description
7:0	ch_in_en	R/W	Each bit controls the enabling of the respective audio channel. For instance, when bit 1 is set (1'b1) the audio Channel 1 is enabled. When cleared, the referred channel is disabled. Value After Reset: 0x0

ahb_dma_buffmask

Description: Audio DMA Buffer Mask Interrupt Register

Size: 8 bits

Offset: 0x3619

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	mask_fifo_overrun	R/W	Buffer overrun flag mask Value After Reset: 0x1
3:2			Reserved for future use.
1	mask_buff_full	R/W	Buffer full flag mask Value After Reset: 0x1
0	mask_buff_empty	R/W	Buffer empty flag mask Value After Reset: 0x1

ahb_dma_mask1

Description: Audio DMA Mask Interrupt Register 1

This register masks interrupts present in the AHB audio DMA module.

Size: 8 bits

Offset: 0x361b

Bits	Name	Attr	Description

7:2			Reserved for future use.
1	fifo_underrun_mask	R/W	AHB DMA FIFO underrun mask Value After Reset: 0x1
0	fifo_overrun_mask	R/W	AHB DMA FIFO overrun mask Value After Reset: 0x1

ahb_dma_status

Description: Audio DMA Status

Size: 8 bits

Offset: 0x361c

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	autostart_status	R	Indicates the set of start and stop addresses currently used by the AHB audio DMA. If cleared (1'b0), the start and stop addresses configured in the address range 0x3604 to 0x360B are being used. When set (1'b1), the configurations at address range 0x3620 to 0x3627 are being used. This bit is always at zero when autostart_enable is cleared (1'b0). Value After Reset: 0x0

ahb_dma_conf2

Description: Audio DMA Configuration Register 2

Size: 8 bits

Offset: 0x361d

Bits	Name	Attr	Description
7:2			Reserved for future use.
1	autostart_loop	R/W	Enables the AHB audio DMA auto-start loop mode Value After Reset: 0x1
0	autostart_enable	R/W	Enables the AHB audio DMA auto-start feature Value After Reset: 0x0

ahb_dma_straddr_set1[0:3]

Description: Audio DMA Start Address Set 1 Register Array Address offset: i = 0 to 3

These registers define the initial_addr_1[31:0] used to initiate the DMA burst read transactions upon start_dma_transaction configuration.

Size: 8 bits

Offset: 0x3620 + (i * 0x1)

Bits	Name	Attr	Description
7:0	initial_addr_1	R/W	Defines init_addr_1[7:0] to initiate DMA burst transactions Value After Reset: 0x0

ahb_dma_stpaddr_set1[0:3]

Description: Audio DMA Stop Address Set 1 Register Array Address offset: i = 0 to 3

These registers define the final_addr_1[31:0] used as the final point to the DMA burst read

transactions. Upon start_dma_transaction configuration, the DMA engine starts requesting burst reads from the external system memory. Each burst read can have a maximum theoretical length of 256 words (due to the AMBA AHB specification 1 Kbyte boundary burst limitation).
The DMA engine is responsible for incrementing the burst starting address and defining its corresponding burst length to reach the final_addr[31:0] address. The last burst request issued by the DMA engine takes into account that it should only request data until the final_addr[31:0] address (included) and for that should calculate the correct burst length. After reaching the final_addr_1[31:0] address, the done interrupt is active to indicate completion of the DMA operation.
Size: 8 bits
Offset: 0x3624 + (i * 0x1)

Bits	Name	Attr	Description
7:0	final_addr_1	R/W	Defines final_addr_1[7:0] to end DMA burst transactions Value After Reset: 0x0

mc_clkdis
Description: Main Controller Synchronous Clock Domain Disable Register
Size: 8 bits
Offset: 0x4001

Bits	Name	Attr	Description
7	h22sclk_disable	R/W	HDCP22 clock synchronous disable signal. When active (1b), simultaneously bypasses HDCP22. Value After Reset: 0x0
6	hdcpclk_disable	R/W	HDCP clock synchronous disable signal. When active

Bits	Name	Attr	Description
			(1b), simultaneously bypasses HDCP. Value After Reset: 0x0
5	cecclk_disable	R/W	CEC Engine clock synchronous disable signal. Value After Reset: 0x0
4	cscclk_disable	R/W	Color Space Converter clock synchronous disable signal. Value After Reset: 0x0
3	audclk_disable	R/W	Audio Sampler clock synchronous disable signal. Value After Reset: 0x0
2	prepclk_disable	R/W	Pixel Repetition clock synchronous disable signal. Value After Reset: 0x0
1	tmdsclk_disable	R/W	TMDS clock synchronous disable signal. It is required to perform a write action on one of the following registers: fc_invidconf, fc_inhactiv0, fc_inhactiv1, fc_inhblank0, fc_inhblank1, fc_invactiv0 fc_invactiv1, fc_invblank, fc_hsyncindelay0, fc_hsyncindelay1, fc_hsyncinwidth0 fc_hsyncinwidth1, fc_vsyncindelay, fc_vsyncinwidth, fc_ctrldur, fc_exctrldur, fc_exctrlspac Value After Reset: 0x0
0	pixelclk_disable	R/W	Pixel clock synchronous disable signal. Value After Reset: 0x0

mc_swrstzreq

Description: Main Controller Software Reset Register

Main controller software reset request per clock domain. Writing zero to a bit of this register results in an NRZ signal toggle at sfrclk rate to an output signal that indicates a software reset request. This toggle must be used to generate a synchronized reset to de corresponding domain, with at least 1 clock cycle.

Size: 8 bits

Offset: 0x4002

Bits	Name	Attr	Description
7	igpaswrst_req	R/W	GPAUD interface soft reset request. This bit is enabled when the Generic Parallel Audio (GPAUD) interface is enabled (AUDIO_IF = 6). Otherwise, this bit returns zero. Value After Reset: 0x1
6	cecswrst_req	R/W	CEC software reset request. Defaults back to 1b after reset request. Note: After you configure cecswrst_req, set the value of the bit csc_clk_disable of the register mc_clkdis to 1, 0, and then 1 again. Value After Reset: 0x1
5			Reserved for future use.
4	ispdifswrst_req	R/W	SPDIF audio software reset request.

			Value After Reset: 0x1
3	ii2sswrst_req	R/W	I2S audio software reset request. Value After Reset: 0x1
2	prepswrst_req	R/W	Pixel Repetition software reset request. Value After Reset: 0x1
1	tmdsswrst_req	R/W	TMDS software reset request. It is required to perform a write action on one of the following registers: fc_invidconf, fc_inhactiv0, fc_inhactiv1, fc_inhblank0, fc_inhblank1, fc_invactiv0 fc_invactiv1, fc_invblank, fc_hsyncindelay0, fc_hsyncindelay1, fc_hsyncinwidth0 fc_hsyncinwidth1, fc_vsyncindelay, fc_vsyncinwidth, fc_ctrldur, fc_exctrldur, fc_exctrlspac Value After Reset: 0x1
0	pixelswrst_req	R/W	Pixel software reset request. Value After Reset: 0x1

mc_opctrl

Description: Main Controller HDCP Bypass Control Register

Size: 8 bits

Offset: 0x4003

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	h22s_ovr_val	R/W	HDCP SNPS 2.2 versus 1.4 switch override value 1'b0: The switch is routed to HDCP 1.4 signals when hdcp22snps_switch_lock is not set to 1'b1. 1'b1: The switch is routed to HDCP 2.2 SNPS signals when hdcp22snps_switch_lock is not set to 1'b1. Value After Reset: 0x1
4	h22s_switch_lck	R/W	HDCP 2.2 SNPS switch lock 1'b0: Enables you to change the direction of the HDCP 2.2 SNPS versus 1.4 switch by using the hdcp22snps_ovr_val. 1'b1: You can still write to hdcp22snps_ovr_val but has no effect over the HDCP 2.2 SNPS versus 1.4 switch, that keeps as it was configured by hdcp22snps_ovr_val at the time the 1'b1 was written to this bit field. Once you set the value to 1'b1, you can change the value back to 1'b0 only by issuing a master reset to the Hdmi_tx. Value After Reset: 0x0
3:1			Reserved for future use.
0	hdcp_block_byp	R/W	Block HDCP bypass mechanism 1'b0: This is the default value. You can write to the hdcp_clkdisable bit of the register mc_clkdis and bypass

Bits	Name	Attr	Description
			HDCP by acting on the register mc_clkdis bit 6 (hdcp_clkdisable) 1'b1: You can still write to the hdcp_clkdisable bit of the register mc_clkdis but this action disables the HDCP module and blocks the bypass mechanism. The output data is frozen and the HDMI Tx and RX fail authentication. Once you set the value to 1'b1, you can change the value back to 1'b0 only by issuing a master reset to the Hdmi_tx. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0

mc_flowctrl

Description: Main Controller Feed Through Control Register

Size: 8 bits

Offset: 0x4004

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	Feed_through_off	R/W	Video path Feed Through enable bit: 1b: Color Space Converter is in the video data path. 0b: Color Space Converter is bypassed (not in the video data path). Value After Reset: 0x0

mc_phyrstz

Description: Main Controller PHY Reset Register

Size: 8 bits

Offset: 0x4005

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	phyrstz	R/W	HDMI Source PHY active low reset control for PHY GEN1, active high reset control for PHY GEN2. Value After Reset: "(PHY_GEN2== 1) ? 1 : 0"

mc_lockonclock

Description: Main Controller Clock Present Register

Size: 8 bits

Offset: 0x4006

Bits	Name	Attr	Description
7	igpaclk	R/W1C	GPAUD interface clock status. This bit is enabled when the Generic Parallel Audio (GPAUD) interface is enabled (AUDIO_IF = 6). Otherwise, this bit returns zero. This bit indicates the clock is present in the system. It is cleared by writing 1 to this bit.

			Value After Reset: 0x0
6	pclk	R/W1C	Pixel clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0
5	tclk	R/W1C	TMDS clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0
4	prepclk	R/W1C	Pixel Repetition clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0
3	i2sclk	R/W1C	I2S clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0
2	audiospdifclk	R/W1C	SPDIF clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0
1			Reserved for future use.
0	cecclk	R/W1C	CEC clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0

mc_heacphy_rst

Description: Main Controller HEAC PHY Reset Register

Size: 8 bits

Offset: 0x4007

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	heacphyrst	R/W	HEAC PHY reset (active high) Value After Reset: 0x1

mc_lockonclock_2

Description: Main Controller Clock Present Register 2

Size: 8 bits

Offset: 0x4009

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	ahbdmaclk	R/W1C	AHB audio DMA clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position. Value After Reset: 0x0

mc_swrstzreq_2

Description: Main Controller Software Reset Register 2

Main controller software reset request per clock domain. Writing zero to a bit of this register results in a signal toggle that indicates a software reset request. This toggle is used to generate a synchronized reset to the corresponding domain, with one or more clock cycles.

Size: 8 bits

Offset: 0x400a

Bits	Name	Attr	Description

7:1			Reserved for future use.
0	ahbdmaswrst_req	R/W	AHB audio DMA software reset request. Writing 1'b1 does not result in any action. Writing 1'b0 to this register resets all AHB audio logic. Value After Reset: 0x0

mc_opsts

Description: Main Controller Status Register

This register contains the information regarding the status of the HDCP SNPS 2.2 versus 1.4 switch.

Size: 8 bits

Offset: 0x4010

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	h22s_switch_sts	R	HDCP SNPS 2.2 versus 1.4 switch value status. 1'b0: HDCP 1.4 selected 1'b1: HDCP 2.2 selected Value After Reset: 0x1

base_sfrdivlow

Description: SFR Clock Base Time Register Low

Size: 8 bits

Offset: 0x4018

Bits	Name	Attr	Description
7:0	base_sfrdiv_lo	R/W	SFR clock divider Low This register must be configured with the 8 least-significant bits of the value sfrclk frequency divided by 1000 (for example, for 27 MHz base_sfrdiv[14:0] = 27027). The configured data is used to generate a reference pulse of 1ms period that is needed by several timers within the controller. Value After Reset: 0x93

base_sfrdivhigh

Description: SFR Clock Base Time Register High

Size: 8 bits

Offset: 0x4019

Bits	Name	Attr	Description
7			Reserved for future use.
6:0	base_sfrdiv_hi	R/W	SFR clock divider High This register must be configured with the 7 most-significant bits of the value sfrclk frequency divided by 1000 (for example, for 27 MHz base_sfrdiv[14:0] = 27027). The configured data is used to generate a reference pulse of 1ms period that is needed by several timers within the controller. Value After Reset: 0x69

csc_cfg

Description: Color Space Converter Interpolation and Decimation Configuration Register
Size: 8 bits
Offset: 0x4100

Bits	Name	Attr	Description
7	csc_limit	R/W	When set (1'b1), the range limitation values defined in registers csc_mat_uplim and csc_mat_dnlim are applied to the output of the Color Space Conversion matrix. This feature ensures that the video output range is always respected, independently of the matrix coefficient configuration or of the video input stream. Value After Reset: 0x0
6	spare_2	R/W	Reserved as "spare" register with no associated functionality. Value After Reset: 0x0
5:4	intmode	R/W	Chroma interpolation configuration: intmode[1:0] | Chroma Interpolation 00 | interpolation disabled 01 | Hu (z) =1 + z^(-1) 10 | Hu(z)=1/ 2 + z^(-11)+1/2 z^(-2) 11 | interpolation disabled Value After Reset: 0x0
3:2	spare_1	R/W	Reserved as "spare" register with no associated functionality.

			Value After Reset: 0x0
1:0	decmode	R/W	Chroma decimation configuration: decmode[1:0] | Chroma Decimation 00 | decimation disabled 01 | Hd (z) =1 10 | Hd(z)=1/ 4 + 1/2z^(-1)+1/4 z^(-2) 11 | Hd(z)x2^(11)= -5+12z^(-2) - 22z^(-4)+39z^(-8) +109z^(-10) -204z^(-12)+648z^(-14) + 1024z^(-15) +648z^(-16) - 204z^(-18) +109z^(-20)- 65z^(-22) +39z^(-24) - 22z^(-26) +12z^(- 28)-5z^(-30) Value After Reset: 0x0

csc_scale

Description: Color Space Converter Scale and Deep Color Configuration Register

Size: 8 bits

Offset: 0x4101

Bits	Name	Attr	Description
7:4	csc_color_depth	R/W	Color space converter color depth configuration: csc_colordepth[3:0] | Action 0000 | 24 bit per pixel video (8 bit per component). 0001-0011 | Reserved. Not used. 0100 | 24 bit per pixel video (8 bit per component). 0101 | 30 bit per pixel video (10 bit per component). 0110 | 36 bit per pixel video (12 bit per component). 0111 | 48 bit per pixel video (16 bit per component). other | Reserved. Not used. Value After Reset: 0x0
3:2	spare	R/W	The is a Reserved as "spare" register with no associated functionality. Value After Reset: 0x0
1:0	cscscale	R/W	Defines the cscscale[1:0] scale factor to apply to all coefficients in Color Space Conversion. This scale factor is expressed in the number of left shifts to apply to each of the coefficients, ranging from 0 to 2. Value After Reset: 0x1

csc_coef_a1_msb

Description: Color Space Converter Matrix A1 Coefficient Register MSB Notes:
The coefficients used in the CSC matrix use only 15 bits for the internal computations.
Coefficients are represented in 2's complementary format and stored in two registers:
csc_coef_*_lsb[7:0]: coefficient bits 7 to 0
csc_coef_*_msb[7]: spare bit
csc_coef_*_msb[6:0]: coefficient bits 14 to 8
Examples for standard ITU601 and ITU709 RGB/YCC conversion CSC coefficients exist in the Video Datapath Application Note.
Size: 8 bits
Offset: 0x4102

Bits	Name	Attr	Description
7:0	csc_coef_a1_msb	R/W	Color Space Converter Matrix A1 Coefficient Register MSB Value After Reset: 0x20

csc_coef_a1_lsb

Description: Color Space Converter Matrix A1 Coefficient Register LSB Notes:
The coefficients used in the CSC matrix use only 15 bits for the internal computations.
Coefficients are represented in 2's complementary format and stored in two registers:
csc_coef_*_lsb[7:0]: coefficient bits 7 to 0
csc_coef_*_msb[7]: spare bit
csc_coef_*_msb[6:0]: coefficient bits 14 to 8
Examples for standard ITU601 and ITU709 RGB/YCC conversion CSC coefficients exist in the Video Datapath Application Note.
Size: 8 bits
Offset: 0x4103

Bits	Name	Attr	Description
7:0	csc_coef_a1_lsb	R/W	Color Space Converter Matrix A1 Coefficient Register LSB Value After Reset: 0x0

a_hdcpcfg0

Description: HDCP Enable and Functional Control Configuration Register 0

Size: 8 bits

Offset: 0x5000

Bits	Name	Attr	Description
7	ELVena	R/W	Enables the Enhanced Link Verification from the transmitter's side Value After Reset: 0x0
6	I2Cfastmode	R/W	Enable the I2C fast mode option from the transmitter's side. Value After Reset: 0x0

5	bypencryption	R/W	Bypasses all the data encryption stages Value After Reset: "(HDMI_HDCP_BYPASS== 1) ? 1 : 0"
4	syncricheck	R/W	Configures if the Ri check should be done at every 2s even or synchronously to every 128 encrypted frame. Value After Reset: 0x0
3	avmute	R	This register holds the current AVMUTE state of the Hdmi_tx controller, as expected to be perceived by the connected HDMI/HDCP sink device. Value After Reset: 0x0
2	rxdetect	R/W	Information that a sink device was detected connected to the HDMI port Value After Reset: 0x0
1	en11feature	R/W	Enable the use of features 1.1 from the transmitter's side Value After Reset: 0x0
0	hdmidvi	R/W	Configures the transmitter to operate with a HDMI capable device or with a DVI device. Value After Reset: 0x0

a_hdcpcfg1

Description: HDCP Software Reset and Functional Control Configuration Register 1

Size: 8 bits

Offset: 0x5001

Bits	Name	Attr	Description
7:5	spare	R/W	Reserved as "spare" register with no associated functionality. Value After Reset: 0x0
4	hdcp_lock	R/W	Lock the HDCP bypass and encryption disable mechanisms: 1'b0: The default 1'b0 value enables you to bypass HDCP through bit 5 (bypencryption) of the A_HDCPCFG0 register or to disable the encryption through bit 1 (encryptiondisable) of A_HDCPCFG1. 1'b1: You can still write to the bit bypencryption of A_HDCPCFG0 or encryptiondisable bit of A_HDCPCFG1 but you cannot enable the bypass. Once you set the value to 1'b1, you can change the value back to 1'b0 only by issuing a master reset to the Hdmi_tx. Value After Reset: 0x0
3	dissha1check	R/W	Disables the request to the API processor to verify the SHA1 message digest of a received KSV List Value After Reset: 0x0
2	ph2upshftenc	R/W	Enables the encoding of packet header in the

Bits	Name	Attr	Description
			tmdsch0 bit[0] with cipher[2] instead of the tmdsch0 bit[2] Note: This bit must always be set to 1 for all PHYs. Value After Reset: 0x0
1	encryptiondisable	R/W	Disable encryption without losing authentication Value After Reset: 0x0
0	swreset	R/W	Software reset signal, active by writing a zero and auto cleared to 1 in the following cycle. Value After Reset: 0x1

a_hdcpobs0

Description: HDCP Observation Register 0

5:3	STATEE	R	Observability register informs in which state the

			cipher machine is on. Value After Reset: 0x0
2:0	STATEEEG	R	Observability register informs in which state the EESS machine is on. Value After Reset: 0x0

a_hdcpobs3

Description: HDCP Observation Register 3

Size: 8 bits

Offset: 0x5005

Bits	Name	Attr	Description
7	HDMI_RESERVED_1	R	Register read from attached sink device: Bcap(0x40) bit 7. Value After Reset: 0x0
6	REPEATER	R	Register read from attached sink device: Bcap(0x40) bit 6. Value After Reset: 0x0
5	KSV_FIFO_READY	R	Register read from attached sink device: Bcap(0x40) bit 5. Value After Reset: 0x0
4	FAST_I2C	R	Register read from attached sink device: Bcap(0x40) bit 4. Value After Reset: 0x0
3	HDMI_RESERVED_2	R	Register read from attached sink device: Bstatus(0x41) bit 13. Value After Reset: 0x0
2	HDMI_MODE	R	Register read from attached sink device: Bstatus(0x41) bit 12. Value After Reset: 0x0
1	FEATURES_1_1	R	Register read from attached sink device: Bcap(0x40) bit 1. Value After Reset: 0x0
0	FAST_REAUTHENTICATION	R	Register read from attached sink device: Bcap(0x40) bit 0. Value After Reset: 0x0

a_apiintclr

Description: HDCP Interrupt Clear Register

Write only register, active high and auto cleared, cleans the respective interruption in the interrupt status register.

Size: 8 bits

Offset: 0x5006

Bits	Name	Attr	Description
7	HDCP_engaged	W	Clears the interruption related to HDCP authentication process successful. Value After Reset: 0x0

6	HDCP_failed	W	Clears the interruption related to HDCP authentication process failed. Value After Reset: 0x0
5	KSVsha1calcdoneint	W	Clears the interruption related to SHA1 verification has been done Value After Reset: 0x0
4	I2Cnack	W	Clears the interruption related to I2C NACK reception. Value After Reset: 0x0
3	Lostarbitration	W	Clears the interruption related to I2C arbitration lost. Value After Reset: 0x0
2	Keepouterrorint	W	Clears the interruption related to keep out window error. Value After Reset: 0x0
1	KSVsha1calcint	W	Clears the interruption related to KSV list update in memory that needs to be SHA1 verified. Value After Reset: 0x0
0	KSVaccessint	W	Clears the interruption related to KSV Attr grant for Read-Write access. Value After Reset: 0x0

a_apiintstat

Description: HDCP Interrupt Status Register

Read only register, reports the interruption which caused the activation of the interruption output pin.

Size: 8 bits

Offset: 0x5007

Bits	Name	Attr	Description
7	HDCP_engaged	R	Notifies that the HDCP authentication process was successful Value After Reset: 0x0
6	HDCP_failed	R	Notifies that the HDCP authentication process was failed. Value After Reset: 0x0
5	KSVsha1calcdoneint	R	Notifies that the HDCP13TCTRL controller SHA1 verification has been done. The status ready to be read. Value After Reset: 0x0
4	I2Cnack	R	Notifies that the I2C received a NACK from slave device. Value After Reset: 0x0
3	Lostarbitration	R	Notifies that the I2C lost the arbitration to communicate. Another master gained arbitration. Value After Reset: 0x0
2	Keepouterrorint	R	Notifies that during the keep out window, the

Bits	Name	Attr	Description
			ctlout[3:0] bus was used besides control period. Value After Reset: 0x0
1	KSVsha1calcint	R	Notifies that the HDCP13TCTRL controller as updated a KSV list in memory that needs to be SHA1 verified. Value After Reset: 0x0
0	KSVaccessint	R	Notifies that the KSV Attr as been guaranteed for Read-Write access. Value After Reset: 0x0

a_apiintmsk

Description: HDCP Interrupt Mask Register

The configuration of this register mask a given setup of interruption, disabling them from generating interruption pulses in the interruption output pin.

Size: 8 bits

Offset: 0x5008

Bits	Name	Attr	Description
7	HDCP_engaged	R/W	Masks the interruption related to HDCP authentication process successful. Value After Reset: 0x0
6	HDCP_failed	R/W	Masks the interruption related to HDCP authentication process failed. Value After Reset: 0x0
5	KSVsha1calcdoneint	R/W	Masks the interruption related to SHA1 verification has been done Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
4	I2Cnack	R/W	Masks the interruption related to I2C NACK reception. Value After Reset: 0x0
3	Lostarbitration	R/W	Masks the interruption related to I2C arbitration lost. Value After Reset: 0x0
2	Keepouterrorint	R/W	Masks the interruption related to keep out window error. Value After Reset: 0x0
1	KSVsha1calcint	R/W	Masks the interruption related to KSV list update in memory that needs to be SHA1 verified. Otherwise, this field is a "spare" bit with no associated functionality. Value After Reset: 0x0
0	KSVaccessint	R/W	Masks the interruption related to KSV Attr grant for Read-Write access. Value After Reset: 0x0

a_vidpolcfg

Description: HDCP Video Polarity Configuration Register

Size: 8 bits

Offset: 0x5009

Bits	Name	Attr	Description
7			Reserved for future use.
6:5	unencryptconf	R/W	Configuration of the color sent when sending unencrypted video data Value After Reset: 0x0
4	dataenpol	R/W	Configuration of the video data enable polarity Value After Reset: 0x0
3	vsyncpol	R/W	Configuration of the video Vertical synchronism polarity Value After Reset: 0x0
2	spare_2	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0
1	hsyncpol	R/W	Configuration of the video Horizontal synchronism polarity. Value After Reset: 0x0
0	spare_1	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x0

a_oesswcfg

Description: HDCP OESS WOO Configuration Register

Pulse width of the encryption enable (CTL3) signal in the HDCP OESS mode. The window of opportunity for the Original Encryption Status Signaling starts at the active edge of the Vertical synchronism and stops after oesswindowoffset[7:0]*4 clock cycles of TMDS clock. According to the HDCP specification, the CTL3 signal must be asserted at least for eight TMDS clock cycles (oesswindowoffset[7:0] must be greater than 1), and it is recommended to transmit a larger pulse width for enhanced link reliability.

Size: 8 bits

Offset: 0x500a

a_ksvmemctrl

Description: HDCP KSV Memory Control Register

The KSVCTRLupd bit is a notification flag. This flag changes polarity whenever the register is written. This flag acts as a trigger to other blocks that processes this data. Upon reset the flag returns to low default value.

Size: 8 bits

Offset: 0x5016

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	KSVsha1status	R	Notification whether the KSV list message digest is correct from the controller: 1'b1 if digest message verification failed 1'b0 if digest message verification succeeded Value After Reset: 0x0
3	SHA1fail	R/W	Notification whether the KSV list message digest is correct. Value After Reset: 0x0
2	KSVCTRLupd	R/W	Set to inform that the KSV list in memory has been analyzed and the response to the Message Digest has been updated if on configurations on software SHA-1 calculation. Value After Reset: 0x0
1	KSVMEMaccess	R	Notification that the KSV Attr as been guaranteed. Value After Reset: 0x0
0	KSVMEMrequest	R/W	Request access to the KSV memory; must be de-asserted after the access is completed by the system. Value After Reset: 0x0

hdcp_bstatus[0:1]

Description: HDCP BStatus Register Array

Size: 8 bits

Offset: 0x5020 + (i * 0x1)

Bits	Name	Attr	Description
7:0	bstatus	R/W	HDCP BSTATUS[15:0]. If Attr has not been granted (see register a_ksvmemctrl), the value read will be 8'hff. Value After Reset: 0xff

hdcp_m0[0:7]

Description: HDCP M0 Register Array

Size: 8 bits

Offset: 0x5022 + (i * 0x1)

Bits	Name	Attr	Description
7:0	M0	R/W	HDCP M0[32:0]. If Attr has not been granted (see register a_ksvmemctrl) , the value read will be 8'hff. These values are only available on a configuration that has the SHA1 calculation by software. Value After Reset: 0xff

hdcp_ksv[0:634]

Description: HDCP KSV Registers.

Size: 8 bits

Offset: 0x502a + (i * 0x1)

Bits	Name	Attr	Description
7:0	hdcp_ksv_byte	R/W	Sink KSV FIFO byte, ordered in little endian (byte at address 0x502a belongs to byte 0 of KSV0). If Attr has not been granted (see register a_ksvmemctrl), the value read is 8'hff. In this address space, 635 KSV FIFO bytes are mapped, which allow for 127 KSV values, each with 5 bytes (40 bits). Value After Reset: 0xff

hdcp_vh[0:19]

Description: HDCP SHA-1 VH Registers.

Size: 8 bits

Offset: 0x52a5 + (i * 0x1)

Bits	Name	Attr	Description
7:0	hdcp_vh_byte	R/W	Sink VH' byte, ordered in little endian (byte at address 0x525a belongs to byte 0 of VH0). If Attr has not been granted (see register a_ksvmemctrl), the value read is 8'hff. In this address space 20 VH bytes are mapped, which allow for 5 VH values, each with 4 bytes (32bits). Value After Reset: 0xff

hdcp_revoc_size_0

Description: HDCP Revocation KSV List Size Register 0

Size: 8 bits

Offset: 0x52b9

Bits	Name	Attr	Description

7:0	hdcp_revoc_size_0	R/W	Register containing the LSB of KSV list size (ksv_list_size[7:0]). If Attr has not been granted (see register a_ksvmemctrl), the value read is 8'hff. Value After Reset: 0xff

hdcp_revoc_size_1

Description: HDCP Revocation KSV List Size Register 1

Size: 8 bits

Offset: 0x52ba

Bits	Name	Attr	Description
7:0	hdcp_revoc_size_1	R/W	Register containing the MSB of KSV list size (ksv_list_size[15:8]). If Attr has not been granted (see register a_ksvmemctrl), the value read is 8'hff. Value After Reset: 0xff

hdcp_revoc_list[0:5059]

Description: HDCP Revocation KSV Registers.

Size: 8 bits

Offset: 0x52bb + (i * 0x1)

Bits	Name	Attr	Description
7:0	hdcp_revoc_list_ksv_byte	R/W	Revocation KSV byte, ordered in little endian (byte at address 0x52bb belongs to byte 0 of the first revoked KSV). If Attr has not been granted (see register a_ksvmemctrl), the value read is 8'hff. In this address space 5060 revoked KSV bytes are mapped, which allow for 1012 KSV values, each with 5 bytes (40 bits). Value After Reset: 0xff

hdcpreg_bksv0

Description: HDCP KSV Status Register 0

Size: 8 bits

Offset: 0x7800

Bits	Name	Attr	Description
7:0	hdcpreg_bksv0	R	Contains the value of BKSV[7:0]. Value After Reset: 0x0

hdcpreg_bksv1

Description: HDCP KSV Status Register 1

Size: 8 bits

Offset: 0x7801

Bits	Name	Attr	Description
7:0	hdcpreg_bksv1	R	Description: Contains the value of BKSV[15:8]. Value After Reset: 0x0

hdcpreg_bksv2

Description: HDCP KSV Status Register 2
Size: 8 bits
Offset: 0x7802

Bits	Name	Attr	Description
7:0	hdcpreg_bksv2	R	Contains the value of BKSV[23:16]. Value After Reset: 0x0

hdcpreg_bksv3
Description: HDCP KSV Status Register 3
Size: 8 bits
Offset: 0x7803

Bits	Name	Attr	Description
7:0	hdcpreg_bksv3	R	Contains the value of BKSV[31:24]. Value After Reset: 0x0

hdcpreg_bksv4
Description: HDCP KSV Status Register 4
Size: 8 bits
Offset: 0x7804

Bits	Name	Attr	Description
7:0	hdcpreg_bksv4	R	Contains the value of BKSV[39:32]. Value After Reset: 0x0

hdcpreg_anconf
Description: HDCP AN Bypass Control Register
Size: 8 bits
Offset: 0x7805

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	oanbypass	R/W	When oanbypass=1, the value of AN used in the HDCP engine comes from the hdcpreg_an0 to hdcpreg_an7 registers. When oanbypass=0, the value of AN used in the HDCP engine comes from the random number input. Value After Reset: 0x0

hdcpreg_an0
Description: HDCP Forced AN Register 0
Size: 8 bits
Offset: 0x7806

Bits	Name	Attr	Description
7:0	hdcpreg_an0	R/W	Contains the value of AN[7:0] Value After Reset: 0x0

hdcpreg_an1
Description: HDCP Forced AN Register 1

Size: 8 bits
Offset: 0x7807

Bits	Name	Attr	Description
7:0	hdcpreg_an1	R/W	Contains the value of AN[15:8] Value After Reset: 0x0

hdcpreg_an2
Description: HDCP forced AN Register 2
Size: 8 bits
Offset: 0x7808

Bits	Name	Attr	Description
7:0	hdcpreg_an2	R/W	Contains the value of AN[23:16] Value After Reset: 0x0

hdcpreg_an3
Description: HDCP Forced AN Register 3
Size: 8 bits
Offset: 0x7809

Bits	Name	Attr	Description
7:0	hdcpreg_an3	R/W	Contains the value of AN[31:24] Value After Reset: 0x0

hdcpreg_an4
Description: HDCP Forced AN Register 4
Size: 8 bits
Offset: 0x780a

Bits	Name	Attr	Description
7:0	hdcpreg_an4	R/W	Contains the value of AN[39:32] Value After Reset: 0x0

hdcpreg_an5
Description: HDCP Forced AN Register 5
Size: 8 bits
Offset: 0x780b

Bits	Name	Attr	Description
7:0	hdcpreg_an5	R/W	Contains the value of AN[47:40] Value After Reset: 0x0

hdcpreg_an6
Description: HDCP Forced AN Register 6
Size: 8 bits
Offset: 0x780c

Bits	Name	Attr	Description
7:0	hdcpreg_an6	R/W	Contains the value of AN[55:48] Value After Reset: 0x0

hdcpreg_an7

Description: HDCP Forced AN Register 7

Size: 8 bits

Offset: 0x780d

Bits	Name	Attr	Description
7:0	hdcpreg_an7	R/W	Contains the value of BKSV[63:56] Value After Reset: 0x0

hdcpreg_rmlctl

Description: HDCP Encrypted Device Private Keys Control Register

This register is the control register for the software programmable encrypted DPK embedded storage feature. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."

Size: 8 bits

Offset: 0x780e

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	odpk_decrypt_enable	R/W	When set (1'b1), this bit activates the decryption of the Device Private keys. Value After Reset: 0x0

hdcpreg_rmlsts

Description: HDCP Encrypted DPK Status Register

The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."

Size: 8 bits

Offset: 0x780f

Bits	Name	Attr	Description
7			Reserved for future use.
6	idpk_wr_ok_sts	R	When high (1'b1), it indicates that a DPK write is allowed. Value After Reset: 0x0
5:0	idpk_data_index	R	Current Device Private Key being written plus one. Position 0 is occupied by the AKSV. Value After Reset: 0x0

hdcpreg_seed0

Description: HDCP Encrypted DPK Seed Register 0

This register contains a byte of the HDCP Encrypted DPK seed value used to encrypt the Device Private Keys. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."

Size: 8 bits

Offset: 0x7810

Bits	Name	Attr	Description

7:0	hdcpreg_seed0	W	Least significant byte of the decryption seed value (dpk_decrypt_seed[7:0]). Value After Reset: 0x0

hdcpreg_seed1

Description: HDCP Encrypted DPK Seed Register 1

This register contains a byte of the HDCP Encrypted DPK seed value used to encrypt the Device Private Keys. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."

Size: 8 bits

Offset: 0x7811

Bits	Name	Attr	Description
7:0	hdcpreg_seed1	W	Most significant byte of the decryption seed value (dpk_decrypt_seed[15:8]). Value After Reset: 0x0

hdcpreg_dpk0

Description: HDCP Encrypted DPK Data Register 0

This register contains an HDCP DPK byte. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."

Size: 8 bits

Offset: 0x7812

Bits	Name	Attr	Description
7:0	dpk_data	W	Byte of the encrypted DPK value. dpk[7:0] When this byte is written, a strobe signal is generated that triggers the decryption and/or storage of the DPK word on the DPK internal RAM memory. Value After Reset: 0x0

hdcpreg_dpk1

Description: HDCP Encrypted DPK Data Register 1

This register contains an HDCP DPK byte. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."

Size: 8 bits

Offset: 0x7813

Bits	Name	Attr	Description
7:0	dpk_data	W	Byte of the encrypted DPK value. dpk[15:8] Value After Reset: 0x0

hdcpreg_dpk2

Description: HDCP Encrypted DPK Data Register 2

This register contains an HDCP DPK byte. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter,

Section 3.2.4, "Configure HDCP."
Size: 8 bits
Offset: 0x7814

Bits	Name	Attr	Description
7:0	dpk_data	W	Byte of the encrypted DPK value. dpk[23:16] Value After Reset: 0x0

hdcpreg_dpk3
Description: HDCP Encrypted DPK Data Register 3
This register contains an HDCP DPK byte. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."
Size: 8 bits
Offset: 0x7815

Bits	Name	Attr	Description
7:0	dpk_data	W	Byte of the encrypted DPK value. dpk[31:24] Value After Reset: 0x0

hdcpreg_dpk4
Description: HDCP Encrypted DPK Data Register 4
This register contains an HDCP DPK byte.
Size: 8 bits
Offset: 0x7816

Bits	Name	Attr	Description
7:0	dpk_data	W	Byte of the encrypted DPK value. dpk[39:32] Value After Reset: 0x0

hdcpreg_dpk5
Description: HDCP Encrypted DPK Data Register 5
This register contains an HDCP DPK byte. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."
Size: 8 bits
Offset: 0x7817

Bits	Name	Attr	Description
7:0	dpk_data	W	Contains the value of DPK[x][47:40] Value After Reset: 0x0

hdcpreg_dpk6
Description: HDCP Encrypted DPK Data Register 6
This register contains an HDCP DPK byte. The required software configuration sequence is documented in the Cores HDMI Transmitter User Guide in the "Programming" chapter, Section 3.2.4, "Configure HDCP."
Size: 8 bits
Offset: 0x7818

Bits	Name	Attr	Description

7:0	dpk_data	W	Contains the value of DPK[x][55:48] Value After Reset: 0x0

HDCP22 Registers

HDCP22 Registers. Follow the link for the register to see a detailed description of the register.

Register	Offset	Description
hdcp22reg_id	0x7900	HDCP 2.2 Identification Register
hdcp22reg_ctrl	0x7904	HDCP 2.2 Control Register
hdcp22reg_ctrl1	0x7905	HDCP 2.2 Control Register 1
hdcp22reg_sts	0x7908	HDCP 2.2 Status Register
hdcp22reg_mask	0x790c	HDCP 2.2 Interrupt Mask Register
hdcp22reg_stat	0x790d	HDCP 2.2 interrupt Sticky Bit Status Register
hdcp22reg_mute	0x790e	HDCP 2.2 Interrupt Mute Vector

hdcp22reg_id

Description: HDCP 2.2 Identification Register
Size: 8 bits
Offset: 0x7900

Bits	Name	Attr	Description
7:3			Reserved for future use.
2	hdcp22_3rdparty	R	Indicates that External HDCP 2.2 interface is present and 3rd party HDCP 2.2 module is connected to this interface. Value After Reset: "(HTX_HDCP22_EXTERNAL_ELLP== 1) ? 1 : 0"
1	hdcp22_externalif	R	Indicates that External HDCP 2.2 interface is present. Value After Reset: "(HTX_HDCP22_EXTERNAL_NONE== 1) ? 1 : 0"
0			Reserved for future use.

hdcp22reg_ctrl

Description: HDCP 2.2 Control Register
Size: 8 bits
Offset: 0x7904

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	hpd_ovr_val	R/W	HPD Override Value 1'b0: If hpd_ovr_en is 1'b1 the HPD value to the HDCP 2.2 external interface is set to 1'b0. 1'b1: If hpd_ovr_en is 1'b1 the HPD value to the HDCP 2.2 external interface is set to 1'b1. Value After Reset: 0x0
4	hpd_ovr_en	R/W	HPD Override enable

Bits	Name	Attr	Description
			1'b0: The HPD value to the HDCP 2.2 external interface comes from the PHY as in phy_stat0.HPD. 1'b1: The HPD value to the HDCP 2.2 external interface comes from hpd_ovr_val bit field. Value After Reset: 0x0
3			Reserved for future use.
2	hdcp22_ovr_val	R/W	HDCP 2.2 versus 1.4 switch override value 1'b0: The switch is routed to HDCP 1.4 signals when hdcp22_ovr_en is 1'b1 and hdcp22_switch_lock is not set to 1'b1. 1'b1: The switch is routed to HDCP 2.2 signals when hdcp22_ovr_en is 1'b1 and hdcp22_switch_lock is not set to 1'b1. Value After Reset: 0x0
1	hdcp22_ovr_en	R/W	HDCP 2.2 versus 1.4 switch override enable 1'b0: The switch is automatically controlled by the HDCP 2.2 controller using the ist_hdcp2_capable and ist_hdcp2_not_capable status level indications. If the HDCP 2.2 controller indicates ist_hdcp2_capable at 1'b1, the switch is routed to HDCP 2.2 signals. If the HDCP 2.2 controller indicates ist_hdcp2_not_capable at 1'b1, the switch is routed to HDCP 1.4 signals. 1'b1: The HDCP 2.2 ist_hdcp2_capable and ist_hdcp2_not_capable values are ignored, and the direction of the HDCP 2.2 versus 1.4 switch is directly controlled by the hdcp22_ovr_val. Value After Reset: 0x0
0	hdcp22_switch_lck	R/W	HDCP 2.2 switch lock 1'b0: Enables you to change the direction of the HDCP 2.2 versus 1.4 switch by using the hdcp22_ovr_en and hdcp22_ovr_val. 1'b1: You can still write to hdcp22_ovr_en and hdcp22_ovr_val but has no effect over the HDCP 2.2 versus 1.4 switch, that keeps as it was configured by hdcp22_ovr_en and hdcp22_ovr_val at the time the 1'b1 was written to this bit field. Once you set the value to 1'b1, you can change the value back to 1'b0 only by issuing a master reset to the Hdmi_tx. Value After Reset: 0x0

hdcp22reg_ctrl1

Description: HDCP 2.2 Control Register 1

Size: 8 bits
Offset: 0x7905

Bits	Name	Attr	Description
7:4	hdcp22_cd_ovr_val	R/W	HDCP color depth override value, which is sent through the HDCP 2.2 external interface when hdcp22reg_ctrl1.hdcp22_cd_ovr_en is set. For reference on the HDMI allowed values consult the HDMI 1.4b specification, Table 6-1. Value After Reset: 0x0
3	hdcp22_cd_ovr_en	R/W	HDCP 2.2 versus 1.4 color depth override enable: 1'b0: The default 1'b0 value indicates that the color depth sent to the external interface is the one configured in the vp_pr_cd.color_depth register field. 1'b1: Although the used color depth for pixel encoding is defined by the field vp_pr_cd.color_depth register, the color depth sent to the external interface is the one defined in register field hdcp22reg_ctrl1.hdcp22_cd_ovr_val. Value After Reset: 0x0
2			Reserved for future use.
1	hdcp22_avmute_ovr_val	R/W	HDCP AV_MUTE override value, which is sent through the HDCP 2.2 external interface when hdcp22reg_ctrl1.hdcp22_avmute_ovr_en is set. Value After Reset: 0x0
0	hdcp22_avmute_ovr_en	R/W	HDCP 2.2 versus 1.4 avmute override enable 1'b0: The default 1'b0 value indicates that the AVMUTE sent to the external interface is the one configured through register fields fc_gcp.set_avmute and fc_gcp.clear_avmute. 1'b1: Although the GCP packet sends the set_avmute or clear_avmute as configured in register fc_gcp, the AV_MUTE sent to the external interface is the one defined in register field hdcp22reg_ctrl1.hdcp22_avmute_ovr_val. Value After Reset: 0x0

hdcp22reg_sts

Description: HDCP 2.2 Status Register
Size: 8 bits
Offset: 0x7908

Bits	Name	Attr	Description
7:4			Reserved for future use.
3	hdcp_decrypted_sts	R	Value of HDCP 2.2 ist_hdcp_decrypted line. Provided for debug only

Bits	Name	Attr	Description
			Value After Reset: 0x0
2	hdcp22_switch_sts	R	HDCP 2.2 HDCP 2.2 versus 1.4 switch status after lock mechanism (hdcp22reg_ctrl.hdcp22_switch_lock, hdcp22reg_ctrl.hdcp22_ovr_en and hdcp22reg_ctrl.hdcp22_ovr_val). 1'b0: HDCP 1.4 selected 1'b1: HDCP 2.2 selected Value After Reset: 0x0
1	hdcp_avmute_sts	R	HDCP 2.2 AVMUTE external interface status. 1'b0: External HDCP used AVMUTE is clear 1'b1: External HDCP AVMUTE is set (audio/video should be muted) Value After Reset: 0x0
0	hdmi_hpd_sts	R	HDCP 2.2 HPD external interface status after lock mechanism (hdcp22reg_ctrl.hdcp22_switch_lock, hdcp22reg_ctrl.hdcp22_ovr_en and hdcp22reg_ctrl.hdcp22_ovr_val). 1'b0: Sink not detected (HPD line clear) 1'b1: Sink detected (HPD line set) Value After Reset: 0x0

hdcp22reg_mask

Description: HDCP 2.2 Interrupt Mask Register

Size: 8 bits

Offset: 0x790c

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	mask_hdcp_decrypted_chg	R/W	Active high interrupt mask to HDCP 2.2 decrypted value change interrupt status Value After Reset: 0x1
4	mask_hdcp_authentication_fail	R/W	Active high interrupt mask to HDCP 2.2 authentication fail interrupt status Value After Reset: 0x1
3	mask_hdcp_authenticated	R/W	Active high interrupt mask to HDCP 2.2 authenticated interrupt status Value After Reset: 0x1
2	mask_hdcp_authentication_lost	R/W	Active high interrupt mask to HDCP 2.2 authentication lost interrupt status Value After Reset: 0x1
1	mask_hdcp2_not_capable	R/W	Active high interrupt mask to HDCP 2.2 not capable rise interrupt status Value After Reset: 0x1
0	mask_hdcp2_capable	R/W	Active high interrupt mask to HDCP 2.2 capable rise interrupt status Value After Reset: 0x1

hdcp22reg_stat

Description: HDCP 2.2 interrupt Sticky Bit Status Register

Size: 8 bits

Offset: 0x790d

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	st_hdcp_decrypted_chg	R/W1C	HDCP 2.2 decrypted value change interrupt status sticky bit. Clear by Write 1 to this bit field Value After Reset: 0x0
4	st_hdcp_authentication_fail	R/W1C	HDCP 2.2 authentication fail interrupt status sticky bit. Clear by Write 1 to this bit field Value After Reset: 0x0
3	st_hdcp_authenticated	R/W1C	HDCP 2.2 authenticated interrupt status sticky bit. Clear by Write 1 to this bit field Value After Reset: 0x0
2	st_hdcp_authentication_lost	R/W1C	HDCP 2.2 authentication lost interrupt status sticky bit. Clear by Write 1 to this bit field Value After Reset: 0x0
1	st_hdcp2_not_capable	R/W1C	HDCP 2.2 not capable rise interrupt status sticky bit. Clear by Write 1 to this bit field Value After Reset: 0x0
0	st_hdcp2_capable	R/W1C	HDCP 2.2 capable rise interrupt status sticky bit. Clear by Write 1 to this bit field Value After Reset: 0x0

hdcp22reg_mute

Description: HDCP 2.2 Interrupt Mute Vector

Size: 8 bits

Offset: 0x790e

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	mute_hdcp_decrypted_chg	R/W	Active high interrupt mute to HDCP 2.2 decrypted value change interrupt status Value After Reset: 0x1
4	mute_hdcp_authentication_fail	R/W	Active high interrupt mute to HDCP 2.2 authentication fail interrupt status Value After Reset: 0x1
3	mute_hdcp_authenticated	R/W	Active high interrupt mute to HDCP 2.2 authenticated interrupt status Value After Reset: 0x1
2	mute_hdcp_authentication_lost	R/W	Active high interrupt mute to HDCP 2.2 authentication lost interrupt status Value After Reset: 0x1
1	mute_hdcp2_not_capable	R/W	Active high interrupt mute to HDCP 2.2 not capable rise interrupt status

Bits	Name	Attr	Description
			Value After Reset: 0x1
0	mute_hdcp2_capable	R/W	Active high interrupt mute to HDCP 2.2 capable rise interrupt status Value After Reset: 0x1

CEC Registers

cec_ctrl

Description: CEC Control Register

This register handles the main control of the CEC initiator.

Size: 8 bits

Offset: 0x7d00

Bits	Name	Attr	Description
7:5			Reserved for future use.
4	standby	R/W	1: CEC controller responds with a NACK to all messages and generates a wakeup status for opcode. It only responds with a NACK when the EOM is received. This means only the last block of a frame responds with NACK. The follower sends an ACK to the message when there is only one head block pointed to the follower, if the follower is in the standby mode. 0: CEC controller responds the ACK to all messages.

Bits	Name	Attr	Description
			Value After Reset: 0x0
3	bc_nack	R/W	1'b1: Set by software to NACK the received broadcast message. This bit holds until software resets. The broadcasts is answered with 1'b0, indicating the follower reject the message. 1'b0: Reset by software to ACK the received broadcast message. Value After Reset: 0x0
2:1	frame_typ	R/W	2'b00: Signal Free Time = 3-bit periods. Previous attempt to send frame is unsuccessful. 2'b01: Signal Free Time = 5-bit periods. New initiator wants to send a frame. 2'b10: Signal Free Time = 7-bit periods. Present initiator wants to send another frame immediately after its previous frame. (specification CEC 9.1). 2'b11: Illegal value. If software writes this value, hardware sets the value to the default 2'b01. Value After Reset: 0x1
0	send	R/W	1'b1: Set by software to trigger CEC sending a frame as an initiator. This bit keeps at 1'b1 while the transmission is going on. 1'b0: Reset to 1'b0 by hardware when the CEC transmission is done (no matter successful or failed). It can also work as an indicator checked by software to see whether the transmission is finished. Value After Reset: 0x0

cec_mask

Description: CEC Interrupt Mask Register

This read/write register masks/unmasks the interrupt events. When the bit is set to 1 (masked), the corresponding event does not trigger an interrupt signal at the system interface. When the bit is reset to 0, the interrupt event is unmasked.

Size: 8 bits

Offset: 0x7d02

Bits	Name	Attr	Description
7			Reserved for future use.
6	wakeup	R/W	Follower wake-up signal mask Value After Reset: 0x0
5	error_flow	R/W	An error is notified by a follower. Abnormal logic data bit error (for follower) Value After Reset: 0x0
4	error_initiator	R/W	An error is detected on a CEC line (for initiator only). Value After Reset: 0x0
3	arb_lost	R/W	The initiator losses the CEC line arbitration to a second initiator. (specification CEC 9) Value After Reset: 0x0

Bits	Name	Attr	Description
2	nack	R/W	A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only) Value After Reset: 0x0
1	eom	R/W	EOM is detected so that the received data is ready in the receiver data buffer (for follower only) Value After Reset: 0x0
0	done	R/W	The current transmission is successful (for initiator only) Value After Reset: 0x0

cec_addr_l

Description: CEC Logical Address Register Low

This register indicates the logical address(es) allocated to the CEC device.

This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

Size: 8 bits

Offset: 0x7d05

Bits	Name	Attr	Description
7	cec_addr_l_7	R/W	Logical address 7 - Tuner 3 Value After Reset: 0x0
6	cec_addr_l_6	R/W	Logical address 6 - Tuner 2 Value After Reset: 0x0
5	cec_addr_l_5	R/W	Logical address 5 - Audio System Value After Reset: 0x0
4	cec_addr_l_4	R/W	Logical address 4 - Playback Device 1 Value After Reset: 0x0
3	cec_addr_l_3	R/W	Logical address 3 - Tuner 1 Value After Reset: 0x0
2	cec_addr_l_2	R/W	Logical address 2 - Recording Device 2 Value After Reset: 0x0
1	cec_addr_l_1	R/W	Logical address 1 - Recording Device 1 Value After Reset: 0x0
0	cec_addr_l_0	R/W	Logical address 0 - Device TV Value After Reset: 0x0

cec_addr_h

Description: CEC Logical Address Register High

This register indicates the logical address(es) allocated to the CEC device.

This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

Size: 8 bits

Offset: 0x7d06

Bits	Name	Attr	Description
7	cec_addr_h_7	R/W	Logical address 15 - Unregistered (as initiator address), Broadcast (as destination address) Value After Reset: 0x1

6	cec_addr_h_6	R/W	Logical address 14 - Free use Value After Reset: 0x0
5	cec_addr_h_5	R/W	Logical address 13 - Reserved Value After Reset: 0x0
4	cec_addr_h_4	R/W	Logical address 12 - Reserved Value After Reset: 0x0
3	cec_addr_h_3	R/W	Logical address 11 - Playback Device 3 Value After Reset: 0x0
2	cec_addr_h_2	R/W	Logical address 10 - Tuner 4 Value After Reset: 0x0
1	cec_addr_h_1	R/W	Logical address 9 - Playback Device 3 Value After Reset: 0x0
0	cec_addr_h_0	R/W	Logical address 8 - Playback Device 2 Value After Reset: 0x0

cec_tx_cnt

Description: CEC TX Frame Size Register

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the transmitter data buffer.

Note: When the value is zero, the CEC controller ignores the send command triggered by software. When the transmission is done (no matter success or not), the current value is held until it is overwritten by software.

Size: 8 bits

Offset: 0x7d07

Bits	Name	Attr	Description
7:5			Reserved for future use.
4:0	cec_tx_cnt	R/W	CEC Transmitter Counter register 5'd0: No data needs to be transmitted 5'd1: Frame size is 1 byte 5'd16: Frame size is 16 bytes Value After Reset: 0x0

cec_rx_cnt

Description: CEC RX Frame Size Register

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the receiver data buffer.

Note: Only after the whole receiving process is finished successfully, the counter is refreshed to the value which indicates the total number of data bytes in the Receiver Data Register.

Size: 8 bits

Offset: 0x7d08

Bits	Name	Attr	Description
7:5			Reserved for future use.
4:0	cec_rx_cnt	R	CEC Receiver Counter register: 5'd0: No data received 5'd1: 1-byte data is received 5'd16: 16-byte data is received Value After Reset: 0x0

cec_tx_data[0:15]

Description: CEC TX Data Register Array Address offset: i = 0 to 15

These registers (8 bits each) are the buffers used for storing the data waiting for transmission (including header and data blocks).

Size: 8 bits

Offset: 0x7d10 + (i * 0x1)

Bits	Name	Attr	Description
7:0	databyte	R/W	Data byte[x], where x is 0 to 15 Value After Reset: 0x0

cec_rx_data[0:15]

Description: CEC RX Data Register Array Address offset: i =0 to 15

These registers (8 bit each) are the buffers used for storing the received data (including header and data blocks).

Size: 8 bits

Offset: 0x7d20 + (i * 0x1)

Bits	Name	Attr	Description
7:0	databyte	R	Data byte[x], where x is 0 to 15 Value After Reset: 0x0

cec_lock

Description: CEC Buffer Lock Register

Size: 8 bits

Offset: 0x7d30

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	locked_buffer	R/W	When a frame is received, this bit would be active. The CEC controller answers to all the messages with NACK until the CPU writes it to '0'. Value After Reset: 0x0

cec_wakeupctrl

Description: CEC Wake-up Control Register

After receiving a message in the CEC_RX_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status:

Wakeupstatus is 1 when:

received opcode is 0x04 and opcode0x04en is 1 or

received opcode is 0x0D and opcode0x0Den is 1 or

received opcode is 0x41 and opcode0x41en is 1 or

received opcode is 0x42 and opcode0x42en is 1 or

received opcode is 0x44 and opcode0x44en is 1 or

received opcode is 0x70 and opcode0x70en is 1 or

received opcode is 0x82 and opcode0x82en is 1 or

received opcode is 0x86 and opcode0x86en is 1

Wakeupstatus is 0 when none of the previous conditions are true.

This formula means that the wake-up status (on CEC_STAT[6] register) is only '1' if the opcode[7:0] received is equal to one of the defined values and the corresponding enable bit of that defined value is set to '1'.

Size: 8 bits

Offset: 0x7d31

Bits	Name	Attr	Description
7	opcode0x86en	R/W	OPCODE 0x86 wake up enable Value After Reset: 0x1
6	opcode0x82en	R/W	OPCODE 0x82 wake up enable

Bits	Name	Attr	Description
			Value After Reset: 0x1
5	opcode0x70en	R/W	OPCODE 0x70 wake up enable Value After Reset: 0x1
4	opcode0x44en	R/W	OPCODE 0x44 wake up enable Value After Reset: 0x1
3	opcode0x42en	R/W	OPCODE 0x42 wake up enable Value After Reset: 0x1
2	opcode0x41en	R/W	OPCODE 0x41 wake up enable Value After Reset: 0x1
1	opcode0x0Den	R/W	OPCODE 0x0D wake up enable Value After Reset: 0x1
0	opcode0x04en	R/W	OPCODE 0x04 wake up enable Value After Reset: 0x1

EDDC Registers

E-DDC Registers. Follow the link for the register to see a detailed description of the register.

i2cm_slave

Description: I2C DDC Slave address Configuration Register

Size: 8 bits

Offset: 0x7e00

Bits	Name	Attr	Description
7			Reserved for future use.
6:0	slaveaddr	R/W	Slave address to be sent during read and write normal operations. Value After Reset: 0x0

i2cm_address

Description: I2C DDC Address Configuration Register

Size: 8 bits

Offset: 0x7e01

Bits	Name	Attr	Description
7:0	address	R/W	Register address for read and write operations Value After Reset: 0x0

i2cm_datao

Description: I2C DDC Data Write Register

Size: 8 bits

Offset: 0x7e02

Bits	Name	Attr	Description
7:0	datao	R/W	Data to be written on register pointed by address[7:0]. Value After Reset: 0x0

i2cm_datai

Description: I2C DDC Data read Register

Size: 8 bits
Offset: 0x7e03

Bits	Name	Attr	Description
7:0	datai	R	Data read from register pointed by address[7:0]. Value After Reset: 0x0

i2cm_operation

Description: I2C DDC RD/RD_EXT/WR Operation Register
Read and write operation request. This register can only be written; reading this register always results in 00h. Writing 1'b1 simultaneously to rd, rd_ext and wr requests is considered as a read (rd) request.
Size: 8 bits
Offset: 0x7e04

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	busclear	W	Bus clear operation request. Value After Reset: 0x0
4	wr	W	Single byte write operation request. Value After Reset: 0x0
3	rd8_ext	W	Extended sequential read operation request. Eight bytes are read starting at the address defined in register field i2cm_address.address and stored in registers i2cm_read_buffx. Value After Reset: 0x0
2	rd8	W	Sequential read operation request. Eight bytes are read starting at the address defined in the i2cm_address.address register field and stored in the i2cm_read_buffx registers. Value After Reset: 0x0
1	rd_ext	W	After writing 1'b1 to rd_ext bit a extended data read operation is started (E-DDC read operation). Value After Reset: 0x0
0	rd	W	Single byte read operation request Value After Reset: 0x0

i2cm_int

Description: I2C DDC Done Interrupt Register This register configures the I2C master interrupts.
Size: 8 bits
Offset: 0x7e05

Bits	Name	Attr	Description
7			Reserved for future use.
6	read_req_mask	R/W	Read request interruption mask signal. Value After Reset: 0x1
5:3			Reserved for future use.
2	done_mask	R/W	Done interrupt mask signal. Value After Reset: 0x0
1:0			Reserved for future use.

i2cm_ctlint

Description: I2C DDC error Interrupt Register

This register configures the I2C master arbitration lost and not acknowledge error interrupts.

Size: 8 bits

Offset: 0x7e06

Bits	Name	Attr	Description
7			Reserved for future use.
6	nack_mask	R/W	Not acknowledge error interrupt mask signal. Value After Reset: 0x0
5:3			Reserved for future use.
2	arbitration_mask	R/W	Arbitration error interrupt mask signal. Value After Reset: 0x0
1:0			Reserved for future use.

i2cm_div

Description: I2C DDC Speed Control Register

This register configures the division relation between master and scl clock.

Size: 8 bits

Offset: 0x7e07

Bits	Name	Attr	Description
7:4			Reserved for future use.
3	fast_std_mode	R/W	Sets the I2C Master to work in Fast Mode or Standard Mode: 1: Fast Mode 0: Standard Mode Value After Reset: 0x1
2:0	spare	R/W	Reserved as "spare" bit with no associated functionality. Value After Reset: 0x3

i2cm_segaddr

Description: I2C DDC Segment Address Configuration Register

This register configures the segment address for extended R/W destination and is used for EDID reading operations, particularly for the Extended Data Read Operation for Enhanced DDC.

Size: 8 bits

Offset: 0x7e08

Bits	Name	Attr	Description
7			Reserved for future use.
6:0	seg_addr	R/W	I2C DDC Segment Address Configuration Register Value After Reset: 0x0

i2cm_softrstz

Description: I2C DDC Software Reset Control Register This register resets the I2C master.

Size: 8 bits

Offset: 0x7e09

Bits	Name	Attr	Description
7:1			Reserved for future use.
0	i2c_softrstz	R/W	I2C Master Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value After Reset: 0x1

i2cm_segptr

Description: I2C DDC Segment Pointer Register

This register configures the segment pointer for extended RD/WR request.

Size: 8 bits

Offset: 0x7e0a

Bits	Name	Attr	Description
7:0	segptr	R/W	I2C DDC Segment Pointer Register Value After Reset: 0x0

i2cm_ss_scl_hcnt_1_addr

Description: I2C DDC Slow Speed SCL High Level Control Register 1

Size: 8 bits

Offset: 0x7e0b

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_hcnt1	R/W	I2C DDC Slow Speed SCL High Level Control Register 1 Value After Reset: 0x0

i2cm_ss_scl_hcnt_0_addr

Description: I2C DDC Slow Speed SCL High Level Control Register 0

Size: 8 bits

Offset: 0x7e0c

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_hcnt0	R/W	I2C DDC Slow Speed SCL High Level Control Register 0 Value After Reset: 0x6c

i2cm_ss_scl_lcnt_1_addr

Description: I2C DDC Slow Speed SCL Low Level Control Register 1

Size: 8 bits

Offset: 0x7e0d

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_lcnt1	R/W	I2C DDC Slow Speed SCL Low Level Control Register 1 Value After Reset: 0x0

i2cm_ss_scl_lcnt_0_addr

Description: I2C DDC Slow Speed SCL Low Level Control Register 0

Size: 8 bits

Offset: 0x7e0e

Bits	Name	Attr	Description
7:0	i2cmp_ss_scl_lcnt0	R/W	I2C DDC Slow Speed SCL Low Level Control Register 0 Value After Reset: 0x7f

i2cm_fs_scl_hcnt_1_addr

Description: I2C DDC Fast Speed SCL High Level Control Register 1

Size: 8 bits

Offset: 0x7e0f

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_hcnt1	R/W	I2C DDC Fast Speed SCL High Level Control Register 1 Value After Reset: 0x0

i2cm_fs_scl_hcnt_0_addr

Description: I2C DDC Fast Speed SCL High Level Control Register 0

Size: 8 bits

Offset: 0x7e10

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_hcnt0	R/W	I2C DDC Fast Speed SCL High Level Control Register 0 Value After Reset: 0x11

i2cm_fs_scl_lcnt_1_addr

Description: I2C DDC Fast Speed SCL Low Level Control Register 1

Size: 8 bits

Offset: 0x7e11

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_lcnt1	R/W	I2C DDC Fast Speed SCL Low Level Control Register 1 Value After Reset: 0x0

i2cm_fs_scl_lcnt_0_addr

Description: I2C DDC Fast Speed SCL Low Level Control Register 0

Size: 8 bits

Offset: 0x7e12

Bits	Name	Attr	Description
7:0	i2cmp_fs_scl_lcnt0	R/W	I2C DDC Fast Speed SCL Low Level Control Register 0 Value After Reset: 0x24

i2cm_sda_hold

Description: I2C DDC SDA Hold Register

Size: 8 bits

Offset: 0x7e13

Bits	Name	Attr	Description
7:0	osda_hold	R/W	Defines the number of SFR clock cycles to meet tHD;DAT (300 ns) osda_hold = round_to_high_integer (300 ns / (1 / isfrclk_frequency)) Value After Reset: 0x9

i2cm_scdc_read_update

Description: SCDC Control Register

This register configures the SCDC update status read through the I2C master interface.
Size: 8 bits
Offset: 0x7e14

Bits	Name	Attr	Description
7:6			Reserved for future use.
5	updtrd_vsyncpoll_en	R/W	Update read polling enabled. When active (1'b1), an SCDC Update Read is performed at the fall of the active edge of the vertical sync pulse. Value After Reset: 0x0
4	read_request_en	R/W	Read request enabled. When active (1'b1) an SCDC Update Read shall be performed whenever a SCDC read request is detected. Value After Reset: 0x0
3:1			Reserved for future use.
0	read_update	W	When set to 1'b1, a SCDC Update Read is performed and the read data loaded into registers i2cm_scdc_update0 and i2cm_scdc_update1. Value After Reset: 0x0

i2cm_read_buff0
Description: I2C Master Sequential Read Buffer Register 0
Size: 8 bits
Offset: 0x7e20

Bits	Name	Attr	Description
7:0	i2cm_read_buff0	R	Byte 0 of a I2C read buffer sequential read (from address i2cm_address) Value After Reset: 0x0

i2cm_read_buff1
Description: I2C Master Sequential Read Buffer Register 1
Size: 8 bits
Offset: 0x7e21

Bits	Name	Attr	Description
7:0	i2cm_read_buff1	R	Byte 1 of a I2C read buffer sequential read (from address i2cm_address+1) Value After Reset: 0x0

i2cm_read_buff2
Description: I2C Master Sequential Read Buffer Register 2
Size: 8 bits
Offset: 0x7e22

Bits	Name	Attr	Description
7:0	i2cm_read_buff2	R	Byte 2 of a I2C read buffer sequential read (from address i2cm_address+2) Value After Reset: 0x0

i2cm_read_buff3

Description: I2C Master Sequential Read Buffer Register 3

Size: 8 bits

Offset: 0x7e23

Bits	Name	Attr	Description
7:0	i2cm_read_buff3	R	Byte 3 of a I2C read buffer sequential read (from address i2cm_address+3) Value After Reset: 0x0

i2cm_read_buff4

Description: I2C Master Sequential Read Buffer Register 4

Size: 8 bits

Offset: 0x7e24

Bits	Name	Attr	Description
7:0	i2cm_read_buff4	R	Byte 4 of a I2C read buffer sequential read (from address i2cm_address+4) Value After Reset: 0x0

i2cm_read_buff5

Description: I2C Master Sequential Read Buffer Register 5

Size: 8 bits

Offset: 0x7e25

Bits	Name	Attr	Description
7:0	i2cm_read_buff5	R	Byte 5 of a I2C read buffer sequential read (from address i2cm_address+5) Value After Reset: 0x0

i2cm_read_buff6

Description: I2C Master Sequential Read Buffer Register 6

Size: 8 bits

Offset: 0x7e26

Bits	Name	Attr	Description
7:0	i2cm_read_buff6	R	Byte 6 of a I2C read buffer sequential read (from address i2cm_address+6) Value After Reset: 0x0

i2cm_read_buff7

Description: I2C Master Sequential Read Buffer Register 7

Size: 8 bits

Offset: 0x7e27

Bits	Name	Attr	Description
7:0	i2cm_read_buff7	R	Byte 7 of a I2C read buffer sequential read (from address i2cm_address+7) Value After Reset: 0x0

i2cm_scdc_update0

Description: I2C SCDC Read Update Register 0
Size: 8 bits
Offset: 0x7e30

Bits	Name	Attr	Description
7:0	i2cm_scdc_update0	R	Byte 0 of a SCDC I2C update sequential read Value After Reset: 0x0

i2cm_scdc_update1
Description: I2C SCDC Read Update Register 1
Size: 8 bits
Offset: 0x7e31

Bits	Name	Attr	Description
7:0	i2cm_scdc_update1	R	Byte 1 of a SCDC I2C update sequential read Value After Reset: 0x0

32.5.2 Initial Operation

The default HDMI transmitter is configured to 24bit RGB 1080P resolution video with 8 channel 48K sample I2S format audio input. It is easily for customer to turn on HDMI transmitter without doing more complex operation. Just do the step, reset the HDMI TX.

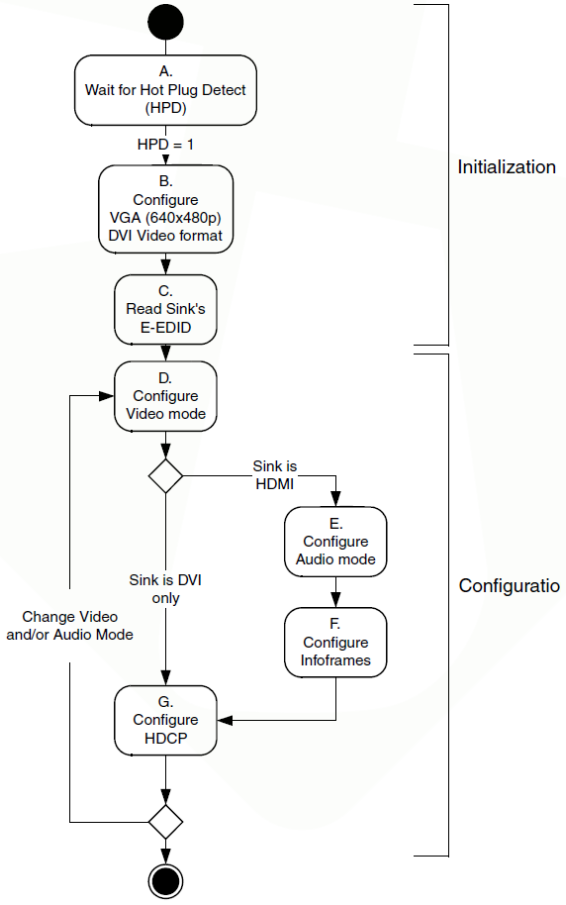

Fig. 32-5 HDMI programming sequence

32.5.3 Step A: Hot Plug Detection

The Hot Plug Detect information notifies the HDMI TX controller when the cable is plugged into a Sink (Receiver) device and when the device is ready to receive video content.

The Hot-Plug Detection indication is a +5V signal on the HDMI cable. The HDMI TX PHY performs level-shifting to a low-level digital signal.

For this step, registers are used on the HDMI TX PHY.

To check the Hot Plug Detect status, the following steps have to be followed:

1. Power-on the HDMI TX PHY HPD Detector. Write 1'b1 in the phy_conf0.enhpdrxsense bit field register.

2. Check the HPD status bit.

- Read the phy_stat0.HPD bit field register.
  - If HPD = 0, the Hot Plug signal is low (no Sink (Receiver) detected).
  - If HPD = 1, the Hot Plug signal is high (Sink (Receiver) detected).

Note: Some receivers may turn off the Hot-Plug Detect indication when the HDMI input is not selected, even when the cable is plugged in.

You can control this function by using the interrupt signal and proper registers from the HDMI transmitter with few operations.

32.5.4 Step B: Configure Video Mode

Once a receiver is detected, it is necessary to start sending video content in DVI mode. Because some receivers need to receive a video signal (TMDS clock more precisely), it is important to clock all the digital logic and be able to reply on an E-EDID read access (Step C). Following flow is a configuration example of VGA (640x480p).

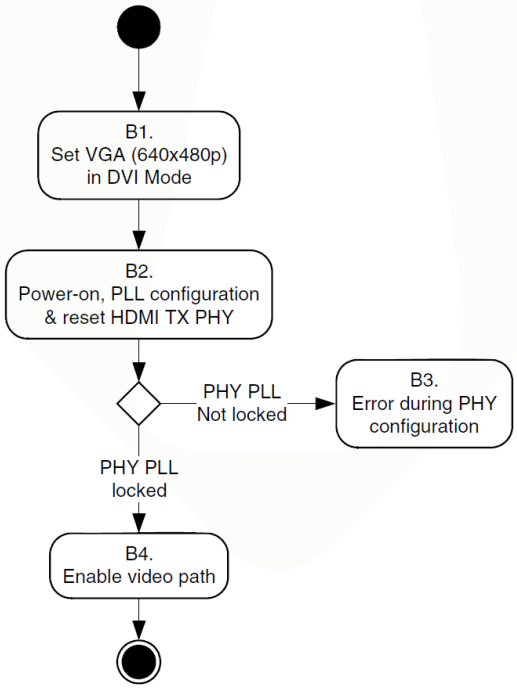

Fig. 32-6 Configure Video Mode

The VGA (640x480p) mode is mandatory for all receivers and transmitters, because it requires the lowest data rate possible on the HDMI specification.

1. Set VGA (640x480p) in DVI mode.

- To select the Video Mapping input RGB444, 8-bits per color components (24-bits RGB), write "1" in the tx_invid0.video_mapping register.
- To configure VGA timing information (CEA mode 1):
  - Write "0" in the fc_invidconf.vsync_in_polarity register.
  - Write "0" in the fc_invidconf.hsync_in_polarity register.
  - Write "1" in the fc_invidconf.de_in_polarity register.
  - Write "0" in the fc_invidconf.r_v_blank_in_osc register.
  - Write "0" in the fc_invidconf.in_I_P register.
  - 640 H active pixels: 0x280
    - Write "2" in the fc_inhactiv1.H_in_activ register.
    - Write "0x80" in the fc_inhactiv0.H_in_activ register.
  - 480 V active pixels: 0x1E0
    - Write "1" in the fc_invactiv1.V_in_activ register.
    - Write "0xE0" in the fc_invactiv0.V_in_activ register.
  - 160 H blanking pixels: 0xA0

    Write "0xA0" in thefc_inhblank0.H_in_blank.
  - 45 V blanking pixels: 0x2D

    Write "0x2D" in the fc_invblank.V_in_blank register.
  - 16 Sync offset: 0x10

    Write "0x10" in the fc_hsyncindelay0.H_in_delay register.
  - 10 Vsync offset: 0x0A

    Write "0x0A" in the fc_vsyncindelay0.V_in_delay register.
  - 96 HSync pulse width: 0x60

    Write "0x60" in the fc_hsyncinwidth0.H_in_width register.
  - 2 VSync pulse width: 0x02

    Write "0x02" in the fc_vsyncinwidth0.V_in_width register.
- To select the HDMI mode:

  Write "1" in the fc_invidconf.DVI_modez register.

2. Power-on, configure the PLL, and reset the HDMI TX PHY.

The HDMI TX PHY has an internal PLL that generates TMDS clock from Pixel clock input. The

power-on sequence and PLL configuration is part of the HDMI TX PHY documentation.

To configure HDMI TX PHY, you are generally required to:

a. Place the PHY in reset by writing 0x01 in the mc_phyrstz register.

b. Write the desired color depth and the pixel repetition in the vp_pr_cd register.

c. After a PHY-dependent time, it is required to lift the reset by writing 0x00 to the mc_phyrstz register.

d. Clear the pddq, txpwron configuration bits, define the data enable polarity and clear the interface control selection by writing these values in the phy_cfg0 register.

e. Set the PHY slave address by writing 0x69 in the phy_i2cm_slave register.

f. You are required to look up the configuration for your intended video mode and write those values on the PHY I2C interface. The baseline flow to write to the PHY through the I2C interface is:

- Write register address in the phy_i2cm_address register.
- Write data in the phy_i2cm_datao_1 (MSB, [15:8]) and phy_i2cm_datao_0 (LSB, [7:0]) registers.
- Initialize the write operation by writing 8'h10 in the phy_i2cm_operation register.
- Wait for a done interruption from the I2C master.

g. After all of the required PHY I2C registers have been configured, you now need to set the txpwron bit in the PHY_CONF0 register, leaving the remaining bits in the state defined previously.

3. Handle errors during PHY configuration.

If the PHY is not correctly configured, the PLL does not lock and no activity can happen on the HDMI output.

4. Enable the video path.

a. Set default parameters in the HDMI TX Controller, Control period duration: 12: 0x0C.

Write "0x0C" in the fc_ctrldur.ctrlperiodduration bit field register.

b. Set default parameters in the HDMI TX Controller, Extended Control period duration: 32: 0x20.

Write "0x20" in the fc_exctrldur.exctrlperiodduration bit field register.

c. Set default parameters in the HDMI TX Controller, Max spacing between extended Control period duration: 1: 0x1.

Write "0x01" in the fc_exctrlspac.exctrlperiodspacing bit field register.

d. Set default parameters in the HDMI TX Controller, Preamble filters to fill TMDS data channels.

- Write "0x0B" in the fc_ch0pream.ch0_preamble_filter bit field register.
- Write "0x16" in the fc_ch1pream.ch1_preamble_filter bit field register.
- Write "0x21" in the fc_ch2pream.ch2_preamble_filter bit field register.

e. Enable pixel clock data path:

Write "0" in the mc_clkdis.pixelclk_disable bit field register.

f. Enable TMDS clock data path:

i. Write "0" in the mc_clkdis.tmdsclk_disable bit field register.

ii. Re-Write the VSync pulse width in the fc_vsyncinwidth0.V_in_width bit field register.

After these steps, it is expected to observe a video picture in VGA mode on the receiver side.

32.5.5 Step C: Reading E-EDID

The E-EDID is a memory present on the receiver side. It contains the video and audio capabilities of the receiver. It is important to read this information and parse it in order to configure the transmitter system in accordance to what the receiver supports. The E-EDID is read using the E-DDC channel present on the HDMI cable.

The E-DDC channel protocol is based on I2C, with segment pointer addressing extension (such as, Extended Read). The hdmi tx controller has an I2C Master controller for this purpose.

1. To perform a "normal" read operation

- Set I2C slave address.

  Write i2cm_slave.slaveaddr[6:0] bit field register.

- Set I2C register address.

  Write i2cm_address.address[7:0] bit field register.

- Activate Read operation.

  Write "1" in the i2cm_operation.rd bit field register.

- Wait for interruption.

  Wait for the ii2cmasterdone interrupt in the ih_i2cm_stat0 register.

- Read data result.

  Read data in the i2cm_datai.datai[7:0] bit field.

2. To perform an E-DDC extended read operation

- Set I2C slave address.

  Write i2cm_slave.slaveaddr[6:0] bit field register.

- Set I2C segment address.

  Write the i2cm_segaddr.seg_addr bit field register.

- Set I2C segment pointer.

  Write i2cm_segptr.segptr bit field register.

- Activate Read operation.

Write "1"in the i2cm_operation.rd_ext bit field register.

- Wait for interruption.

  Wait for the ii2cmasterdone interrupt in the ih_i2cm_stat0 register.

- Read data result.

  Read data in the i2cm_datai.datai[7:0] bit field register.

32.5.6 Step D: Configure Video Mode

The video mode selected has to match what is supported by the source of the video (Transmitter side) and the sink of the video (receiver side). The video capabilities of the receiver are extracted from the E-EDID information (refer to step C).

To configure any video mode, a similar procedure in step B has to be followed.

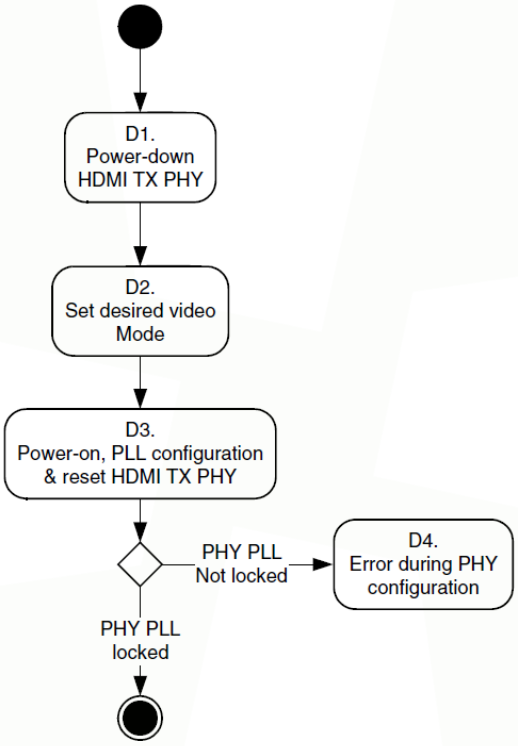

Fig. 32-7 Video Mode Configuration

Before any change is made on the video modes, is it recommended you power-down the HDMI TX PHY to avoid any unexpected behavior on the receiver side.

1. Power-down HDMI TX PHY Detector

- Place the PHY in reset by writing 0x01 in the mc_phyrstz register.
- Then proceed to set SVSRET_MODEZ to 1'b0, PDDQ to 1'b1 and TX_PWRON to 1b0, by writing 2'h12 in the phy_conf0 register.

2. Set desired video mode.

- To select the Video Mapping input mode (RGB444, YCC444, YCC422). Write the video code in the tx_invid0.video_mapping bit field register.
- Set video timing information configuration:
  - Write the fc_invidconf.vsync_in_polarity register.
  - Write the fc_invidconf.hsync_in_polarity register.

- Write the fc_invidconf.de_in_polarity register.
- Write the fc_invidconf.r_v_blank_in_osc register.
- Write the fc_invidconf.in_I_P register.
- H active pixels

  - Write the fc_inhactiv1.H_in_activ register.

  - Write the fc_inhactiv0.H_in_activ register.

- V active pixels

  If the desired video mode is 3D, the fc_invact_2d_1, fc_invact_2d_0, and all registers in the following table must be written.

Table 32-5 HDMI 3D structure table

3D STRUCTURE	fc_actspc_hdlr_cfg	
	fc_actspc_hdlr_tgl	fc_actspc_hdlr_en
Frame Packing for interlaced format	1	1
Frame Packing for progressive format	0	1
Field alternative	0	0
Line Alternative	0	0
Side-by-Side(FULL)	0	0
L+depth	0	1
L+depth+graphics +graphics-depth	0	1
Top-and-Bottom	0	0
Reserved for Future Use	0	0
Side-by-Side(FULL)	0	0
Reserved for Future Use	0	0
Not in use	0	0

  - Write the fc_invact_2D_1 register with the 2D Vertical video active[11:8].

  - Write the fc_invact_2D_0 register with the 2D Vertical video active[7:0]

  The following registers must always be written with the full V active of the desired video

  regardless of the type of the video mode.

  - Write the fc_invactiv1.V_in_activ register.

  - Write the fc_invactiv0.V_in_activ register.

  ■ H blanking pixels

  Write the fc_inhblank0.H_in_blank register.

■ V blanking pixels

Write the fc_invblank.V_in_blank register.

■ HSync offset

Write the fc_hsyncindelay0.H_in_delay register.

■ VSync offset

Write the fc_vsyncindelay0.V_in_delay register.

■ HSync pulse width

Write the fc_hsyncinwidth0.H_in_width register.

■ VSync pulse width

Write the fc_vsyncinwidth0.V_in_width register.

- Select DVI or HDMI mode:

  Write "1" for HDMI in the fc_invidconf.DVI_modez bit field register.

3. Power-on, configure the PLL, and reset the HDMI TX PHY (same as Step B2).

The HDMI TX PHY has an internal PLL that generates TMDS clock from Pixel clock input. All the power-on sequence and PLL configuration is part of the HDMI TX PHY documentation.

The HDMI TX Controller provides all registers necessary for the PHY sequence implementation, which are presented in the "HDMI PHY Registers".

- Place the PHY in reset by writing 0x01 in the mc_phyrstz register.
- Write in the desired color depth and the pixel repetition in the vp_pr_cd register.
- After a PHY-dependent time, it is required to lift the reset by writing 0x00 to the mc_phyrstz register.
- Clear the pddq, txpwron configuration bits, define the data enable polarity and clear the interface control selection by writing these values in the phy_conf0 register.
- Set the PHY slave address by writing 0x69 to the phy_i2cm_slave register.
- Look up the configuration for your intended video mode and write those values on the PHY I2C interface. The baseline flow to write in the PHY through the I2C interface is

  ■ Write the register address in the phy_i2cm_address register.

  ■ Write data into phy_i2cm_datao_1 (MSB, [7:0]) and phy_i2cm_datao_0 (LSB, [7:0]) registers.

  ■ Initialize the write operation by writing 8'h10 in the phy_i2cm_operation register.

  ■ Wait for a done interrupt signal I2Cmphydone which in register ih_i2cmphy_stat0 bit 1 from the I2C master.

- After all of the required PHY I2C registers have been configured, you now need to set the phy_conf0.txpwron register, leaving the remaining bits in the state defined previously.

32.5.7 Step E: Audio input configuration

HDMI transmitter audio support either SPDIF or four channel I2S input. SPDIF input

supports audio sampling rates from 32 to 192 KHz. The I2S input supports from 2-channel to 8-channel audio up to 192 KHz. The default audio format is I2S input with 8 channels. The audio sample rate is 48K.

- Configure Audio Input Format with I2S Steps:
  - ■ Select I2S input.
  Write "1" in the aud_conf0.i2s_select bit field register.
  - ■ Enable I2S inputs:
  Write "1" in the aud_conf0.i2s_in_en[3:0] bit field register.
  - ■ Set I2S Mode [Standard | Right-justified | Left-justified | Burst1 | Burst2]:
  Write the aud_conf1.i2s_mode[2:0] bit field register.
  - ■ Set I2S data width [16 bits up to 24 bits]:
  Write the aud_conf1.i2s_width[4:0] bit field.
- Configure Audio Input Format with SPDIF Steps:
  - ■ Select SPDIF input.
  Write "0" in the aud_conf0.i2s_select bit field register.
  - ■ Set S/PDIF Linear-PCM or Non-Linear PCM audio samples:
  Write the aud_spdif1.setnlpcm bit field register.
  - ■ Set SPDIF data width [16 bits up to 24 bits]:
  Write the aud_spdif1.spdif_width[4:0] bit field.
- Configure Audio Parameters Steps:
  - ■ Set Audio input frequency clock FS ratio factor [128 Fs | 256 Fs |512 Fs]:
  Write the aud_inputclkfs.lfsfactor bit field register.
  - ■ Set Audio fixed N factor for Audio Clock Regeneration. This factor depends on the audio sampling rate and video mode.
  Write the aud_n1.audN, aud_n2.audN, and aud_n3.audN bit field registers.
  - ■ Set Audio CTS factor for Audio Clock Regeneration. This factor can be generated automatically or manually.
  For Automatic CTS generation
  Write "0" on the bit field "CTS_manual", Register 0x3205: AUD_CTS3
  For Manual CTS setting
  Write "1" in the aud_cts3.CTS_manual register bit field.
  Write the aud_cts1.audCTS, aud_cts2.audCTS, aud_cts3.audCTS bit field registers.
  - ■ Enable Audio sampler block:
  Write "0" in the mc_clkdis.audclk_disable bit field register.

32.5.8 Step F: Configure Infoframes

This step is only relevant when the HDMI TX controller is configured in HDMI mode (refer to "Step D: Configure Video Mode"). In DVI mode, no Infoframes are transmitted. The configuration of the Infoframes is essential to correctly inform the HDMI Receiver about the content of the video and audio format been transmitted. All the detailed information is provided in the HDMI 1.4b Specification.

32.5.9 Step G: Configure HDCP 1.4

Following flow is an initialization of HDCP 1.4. To detect if the HDMI TX Controller is HDCP capable:

1. Read the product_id1.product_id1 bit field register:

- If product_id1 = 01, HDCP is not present.
- If product_id1 = C1, HDCP is present.

2. Select HDMI mode:

- Write "1" for HDMI in the a_hdcpcfg0.hdmidvi bit field register.

3. Set the Data enable, Hsync and VSync polarity:

Write the dataenpol, vsyncpol, and hsyncpol bit fields of the a_vidpolcfg register.

4. Set encryption on:

- Write "64 (0x40)" for "OesswindowSize" in the a_oesswcfg register.
- Write "0" for "no HDCP bypass" a_hdcpcfg0.BypassEncryption bit field register.
- Write "0" for "HDCP enable" in the a_hdcpcfg1.encryptiondisable bit field register.

5. Reset HDCP engine:

- Write "0" in the a_hdcpcfg1.swreset bit field register.

6. Configure Device Private Keys, which is illustrated in the flow chart Figure 3-6

7. Enable the encryption:

- Write "1" in the a_hdcpcfg0.rxdetect bit field register.

8. When connected to a repeater the SHA-1 calculation is needed to be done by software, which are indicated in the following steps

a. Wait for an interrupt to be triggered (a_apiintstat.KSVSha1calcint).

b. Request access to KSV memory through setting a_ksvmemctrl.KSVMEMrequest to 1'b1 and pool a_ksvmemctrl.KSVMEMaccess until this value is 1'b1 (access granted).

c. Read VH', M0, Bstatus, and the KSV FIFO.

The data is stored in the revocation memory.

d. Calculate the SHA-1 checksum (VH) over M0, Bstatus, and the KSV FIFO.

e. If the calculated VH equals the VH`, set a_ksvmemctrl.SHA1fail to 0 and set a_ksvmemctrl.KSVCTRLupd to 1. If the calculated VH is different from VH` then set a_ksvmemctrl.SHA1fail to 1 and set a_ksvmemctrl.KSVCTRLupd to 1, forcing the controller to re-authenticate from the beginning.

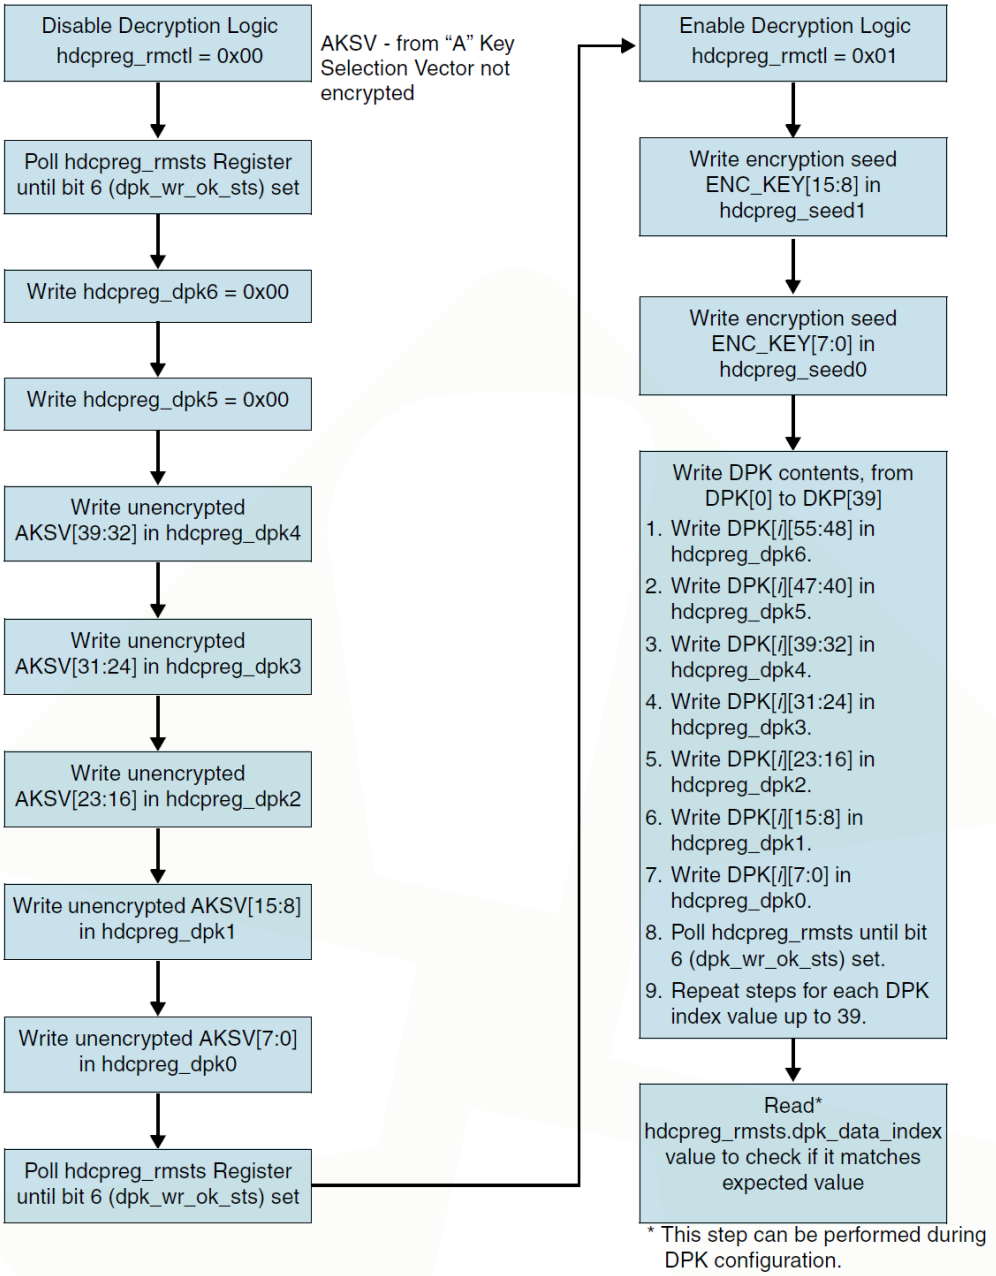

Fig. 32-8 Configuring Device Protection Key Process

32.5.10 CEC OPERATION

The CEC line is used for high-level user control of HDMI-connected devices.The HDMI TX contain CEC TX operations and CEC RX operations.

You can control this function by using the interrupt signal and proper registers from the HDMI transmitter with few operations. The register offset is from 0x7D00.

- Configure The CEC Step:
  - ■ Write the CEC logical address to cec_addr_l,cec_addr_h register
  - ■ Write the size of the frame in bytes which are available in the transmitter data buffer to cec_tx_cnt register

■ Write the desired CEC data(including header and data blocks) to cec_tx_data0 to cec_tx_data15

■ Write 1 to cec_ctrl.send register, to start the cec transmit.

32.5.11 HDMI PHY MPLL configuration

Table 32-6 HDMI PHY MPLL Generic Configuration Settings

				Divider Settings				Op Mode		Divider Settings								MPLL Charge Pump Settings								
				0x06														0x10						0x15

Chapter 33 HDCP22 Controller

33.1 Overview

The HDCP22 controller is an Embedded Security Module (ESM). This module is a self-contained module that can be integrated with HDMI cores to ensure DCP robustness rules for HDCP.

The ESM has a small MCU inside. It reads ESM Image for operation through the AXI interface.

The HDCP22 Controller supports following features:

- Supports HDCP Revision 2.2
- Bus Interface Features:
  - An AXI port for instruction fetch and shared R/W memory
  - An Identity Interface for secret keys used to secure the ESM
  - An Entropy Interface to a true random number generator
  - A Host Port Interface for an external host processor to send commands and get status from the ESM.
    (APB Interface)
- The Tx ports contain interfaces to a HDMI controller, where each port is factory configurable for HDMI support. The HDMI portion of the port contains the following interfaces:
  - HDMI video data and associated control
  - I2C interface for access to the remote end of the HDCP link
  - A GPIO interface for direct hardware signaling between the ESM and the controller
- MMU:
  - 4k/64k page size
  - TLB pre-fetch

33.2 Block Diagram

The following figure illustrates the HDMI controller connections with external interfaces. The ESM executes firmware from system memory external to the ESM which must be processed with the supplied tools as the firmware image is encrypted to the keys you created to present on the ID Interface. A host library (supplied in source code) is compiled with your application software running on the host processor to send commands to the ESM and monitor its status for results.

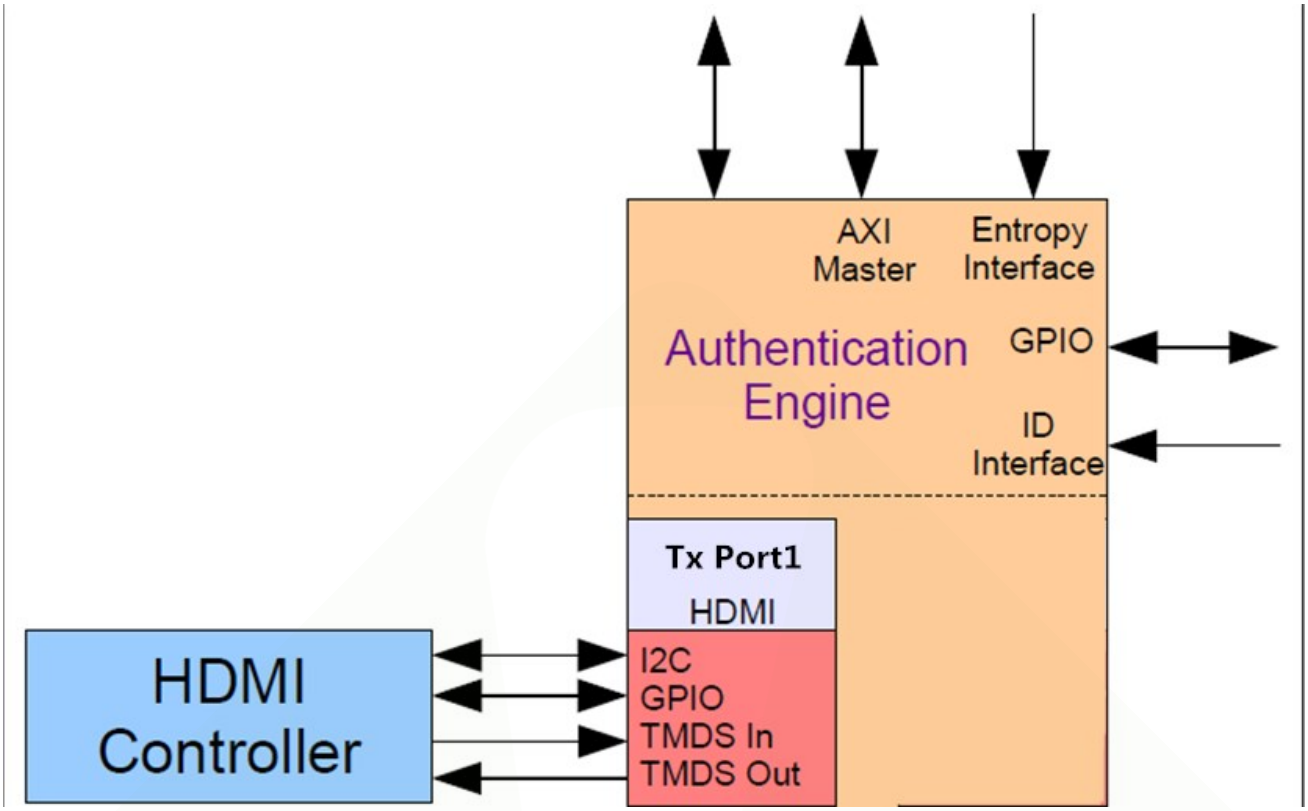

Fig. 33-1 hdcp22 Controller Block Diagram

The embedded security module is composed of two parts:

- The Authentication Engine (AE) contains a controller that runs the HDCP authentication process.
- The Content Encryption Engine (CEE) is an ESM component that encrypts data for the HDCP transmitter.

The following figure represents how the ESM is typically integrated in a SoC.

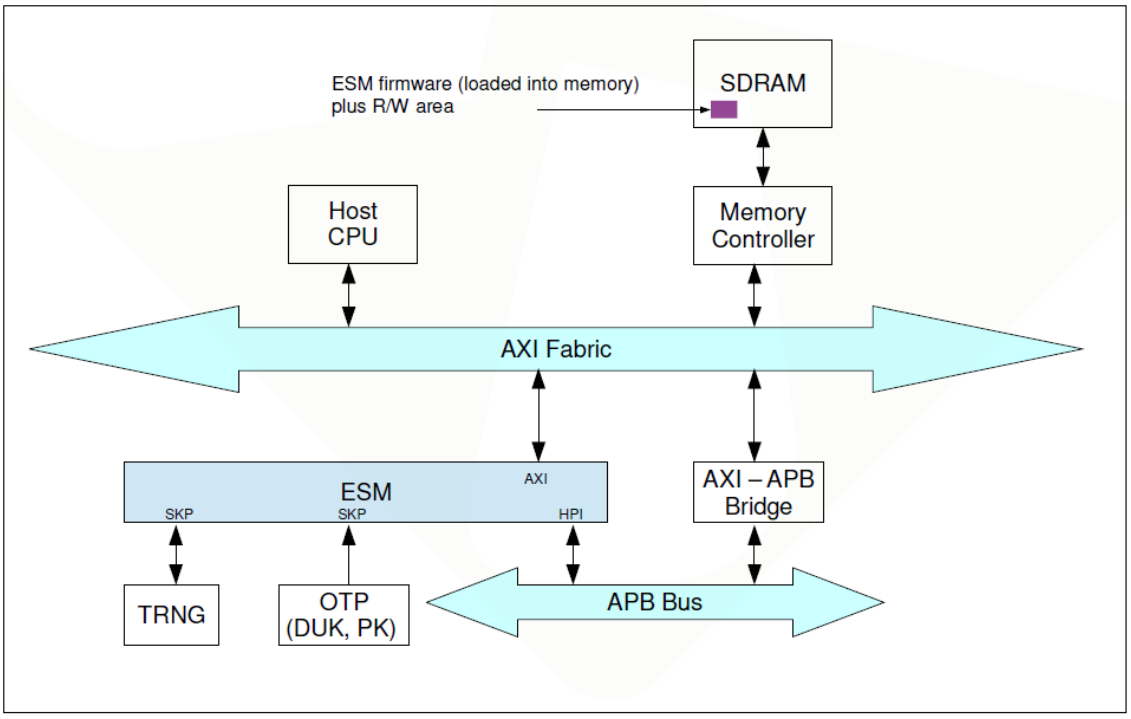

Fig. 33-2 Typical ESM Integration in a SoC

33.3 Function Description

33.3.1 AXI interface

The ESM requires continuous access to its firmware for operation, which is accessed through

the AXI interface and usually placed a reserved portion of SDRAM. It also uses this interface for communicating messages with the external host processor to pass content such as SRM data, pairing information, and debug/logging information.
The ESM requires access to relatively fast and low latency external memory as it randomly accesses its firmware periodically to perform operations. For AXI transactions the average initial access latency may be up to 1000ns.
Note: *The ESM still functions in higher latency systems; however, the ESM may experience intermittent errors, such as failing to authenticate, as there are fixed timeout requirements during the authentication process which must be met. A system with persistent high latency memory accesses may prevent the ESM from fetching its firmware in a timely fashion resulting in protocol timeouts.Following Table summarizes the various requirements the ESM places on the RK3399's memory, assuming an AXI interface clock of 261 MHz and an average latency of 1000 ns.*

Table 33-1 ESM average memory bandwidth usage

Phase	Duration (ms)	Appropriate Bandwidth (Mbytes/sec)	Description
Bootup	100 (maximum)	5.0	Initial startup of ESM to Idle state.
Tx Authentication	525ms	1.5	ESM transmitter authentication phase including capability check.
Rx Authentication	525 ms	1.0	ESM receiver authentication phase.
Idle, authenticated	n/a	< 1.0, 4.0	ESM is either in the Idle state waiting to start authentication or in the authenticated state. The second number is when the ESM has debug logging enabled.

The external host memory required by the ESM must be physically contiguous and allocated before the ESM can be started. The ESM Image and R/W memory buffer addresses must be 4K aligned otherwise the ESM cannot properly access the memory. Following table describes the requirements.

Table 33-2 ESM average memory bandwidth usage

Size (bytes)	ESM Access	Purpose
~256K	Read Only	Contains the ESM firmware. This size varies depending on the particular configuration of the ESM you are using.
16K + p*n*256 (Tx) (p is the number of transmitters and n is the number of paired devices supported)	Read / Write	Bidirectional communication buffer to exchange data with the Host. Messages such as SRM updates, pairing data, and logging information are placed in this area by the host and the ESM. The number of pairs supported by this parameter is defined in the configuration file.

In RK3399 the provided ESM host application library allocates a small amount of the processor's memory space, which is accessible by the ESM. Communication with this interface is provided by the ESM host application library.

33.3.2 HPI Interface

The external host issues commands to the ESM through the HPI which supports a limited set of commands such as:

- Enabling and disabling of security on the link

- Enabling debugging/logging
- Retrieving pairing information
- Updating the SRM
- ESM status

Communication with this interface is provided by the ESM host application library.

33.3.3 APB interface (HPI)

The external host issues commands to the ESM through the HPI. The ESM supports a limited set of commands such as:

- Enabling and disabling of security on the link
- Enabling debugging/logging
- Retrieving pairing information
- Updating the SRM
- ESM status

The external host must issue a SRM list to the ESM when one is available, according to the requirements of DCP LLC.

Communication with this interface is provided by the ESM host application library.

33.3.4 Identity Interface

This interface contains the secret keys the ESM requires to implement its security. The KPf and

DUK signals on this interface must be secure from tampering and external user observation as it is used by the ESM to create session keys and other cryptographic secrets required for operation.

When integrating the ESM into your design, you must take to ensure that these requirements are met otherwise the operation of the ESM can be compromised.

Table 33-3 Secure Key for ESM

Description	Purpose
Platform Key (PKf)	A customer created secret random key used to decrypt the ESM firmware. The KPf is intended to be common across a deployed model of a product.
Device Unique Key (DUK)	A customer created secret random key used to decrypt the DCP key data and to encrypt and decrypt content unique to the ESM such as the pairing message content. It is strongly recommended this value should be unique for every unit.
Device Number (Devnum)	This is a non-secret device number and is currently not used.

Note: *The PKf and DUK must be kept confidential as exposing either one compromises the security of the ESM.*

33.3.5 Entropy Interface

This interface connects to a True Random Number Generator (TRNG). The nonce data on this interface must be secure from tampering and external user observation as it is used by the ESM to create session keys and other cryptographic secrets required for operation.

Table 33-4 Entropy Interface

Description	Purpose
Entropy Valid	This is the nonce data from the TRNG. The value is used to seed the ESM's PRNG which is used to generate keys for the authentication process and session keys. The value must be truly random and not generated by another PRNG, as per the HDCP for HDMI specification, Section 2.13 (Random Number Generation).

33.3.6 GPIO Interface

This interface contains a number of general purpose inputs and outputs which can be used by the host to monitor the status of the ESM.

33.3.7 HDMI Interface

The HDMI interface contains logic to apply content protection to the Data and Video Islands as the TMDS data passes through the ESM.

Table 33-5 Entropy Interface

Description	Purpose
I2C	A standard I2C serial interface for HDCP protocol communication with the remote device, mapped by the controller onto the DDC interface.
GPIO	Direct signals between the controller and the ESM to indicate the status of the ESM to the controller, and to signal the ESM
TMDS In	TMDS data output from the controller. For a Tx this is the unencrypted data, for the Rx this is the encrypted data.
TMDS Out	TMDS data input to the controller. For a Tx this is the encrypted data, for the Rx this is the decrypted data.

33.3.8 HDCP22 Controller Behavior

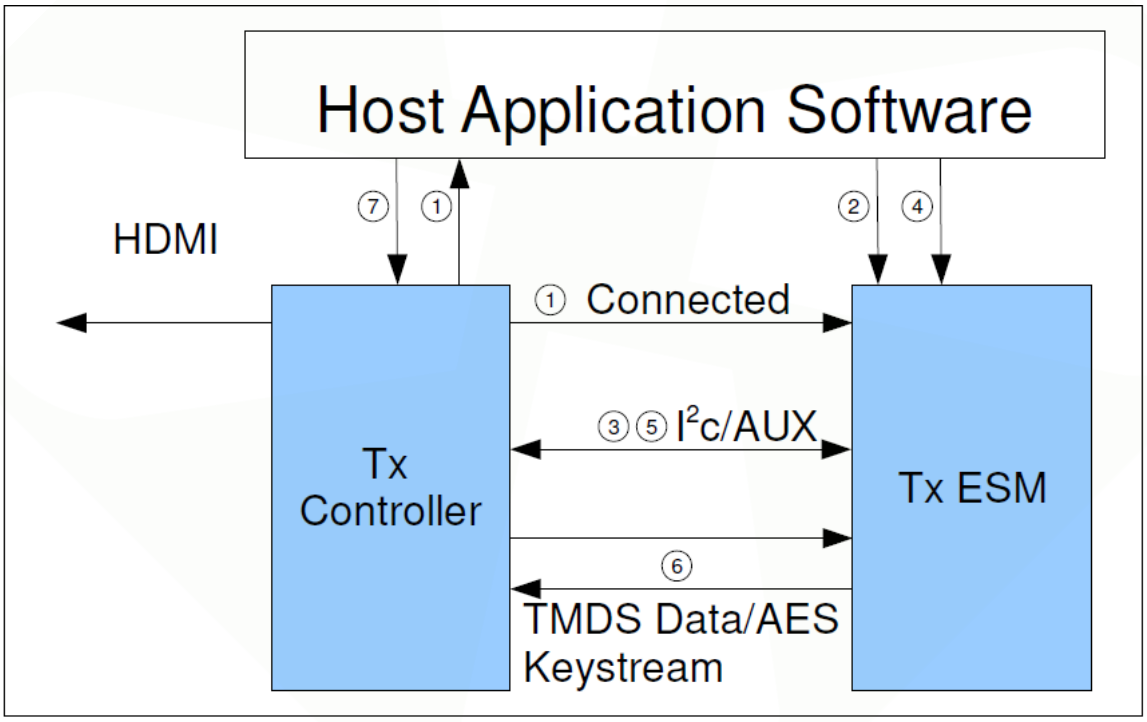

Fig. 33-3 Transmitter Authentication

Hdcp22 controller in RK3399 is a transmitter, it works as following steps:

1. The controller asserts the Connected signal to the ESM. The application software1 receives the notification from the controller. For HDMI operation the ESM outputs a fixed pattern (the BSOD value) on the TMDS data output.
2. The application software issues the HLC_HDCPTX_SetCapability() command which causes the ESM to perform a capability check with the receiver. Before this point in time the ESM does not know the capability of the Rx so the port's capable GPIO output signal is not asserted.
3. The ESM queries the receiver. If the receiver does not support HDCP 2.2 then the port's not_capable GPIO output is asserted. The application software should then check if the

receiver supports HDCP 1.4 (or no link protection) and take appropriate action; the ESM is no longer required. If the receiver supports HDCP 2.2 then the capable GPIO output is asserted and the ESM transitions to a pre-authorized state. For HDMI operation this means unencrypted low value content is permitted on the video path (TMDS interface).
4. If the receiver supports HDCP 2.2 the application software issues the HLC_HDCP_Authenticate() command to the ESM. As a security feature the ESM enforces a timeout (set in the configuration file) after the receiver indicates it is HDCP 2.2 capable to the time the HLC_HDCP_Authenticate() command must be issued. If you exceed this timeout you must repeat the process from step #2. (When the port is configured for HDMI it will switch its TMDS output back to the fixed pattern output).
5. The ESM initiates authentication with the receiver and successfully completes authentication (or not). The application software and the HDMI controller are appropriately notified (authenticated and authentication_failed outputs asserted accordingly).
6. If authentication is successful the ESM starts to encrypt the TMDS data (HDMI).
7. The application software can now send high value content securely on the link.
Following successful authentication the ESM periodically checks the status of the connected receiver. If a response is not received, or the receiver requests re-authentication the ESM immediately outputs a fixed pattern on the TMDS output (HDMI), asserts the outputs authentication_failed along with a reath_req, and returns to the Idle state. To re-authenticate you must call HLC_HDCP_Authenticate() to drop authentication and then call the function again to start authentication.

33.3.9 HDCP22 Software Initialization

An external host controller (ARM Core or MCU) allocates memory, initializes the ESM, and enables the ESM controller. The general reset and startup sequence is:

a. Configure clocks for hdcp controller.
b. Load PKF & DUK from effuse to gasket.
c. The ESM reset is de-asserted and the ESM enters a reset state.
d. The host allocates contiguous memory for the firmware and R/W areas. The buffers are 4K aligned.
e. The host configures the ESM's HPI interface, defining the physical memory pointer for the
ESM firmware.
f. The host copies the ESM firmware from persistent storage to the firmware memory location.
g. The host enables the ESM controller, putting it in a running state. At this point the ESM initiates transactions on the AXI bus to fetch its firmware.
h. ESM asserts a GPIO to indicate it is booted to indicate it can accept commands. The status
can also be monitored from the HPI interface.

The ESM host application library provides the startup sequence from steps d through h.

33.3.10 Autostart

The autostart feature is an option which permits a transmitter or receiver port (configurable per port) on the ESM to autonomously take over the detection of a connection and run through the authentication process without intervention from the external host. In the event of an error the port automatically retries up to a specified number of attempts (configuration based) before idling requiring intervention from the host.
For a transmitter this feature automates the capability checking and authentication along with any reauthentication which may be required due to link errors. For a receiver this feature enables the port to immediately respond to authentication requests without host

intervention.

33.3.11 Key Usage

There are two secret, 128 bit keys you are responsible for creating for use by the ESM.
The Platform Key (KPf) is used by the ESM to decrypt its firmware. It is recommended this key be common for all ESMs deployed for a particular product as it permits a common (encrypted) firmware image to be deployed.
The Device Unique Key (DUK) is used by the ESM to protect secrets unique to the device such as HDCP receiver keys and locally generated data such as pairing information. Although it is not required, it is strongly recommended this key be unique for every different unit deployed in a product so that if the kPf is and DUK are compromised, device specific secrets for only that unit are exposed. Using a common DUK for all devices could permit device specific secrets for all devices to be exposed.
As shipped from the factory, the firmware cannot be used as-is and must be processed with tools that are provided with the ESM software package. Figure 1-3 illustrates the tools and the flow that are required to produce encrypted ESM firmware. You edit the firmware.aic file supplied with the firmware image and replace the factory test/simulation values with your secret KPf and DUK keys.

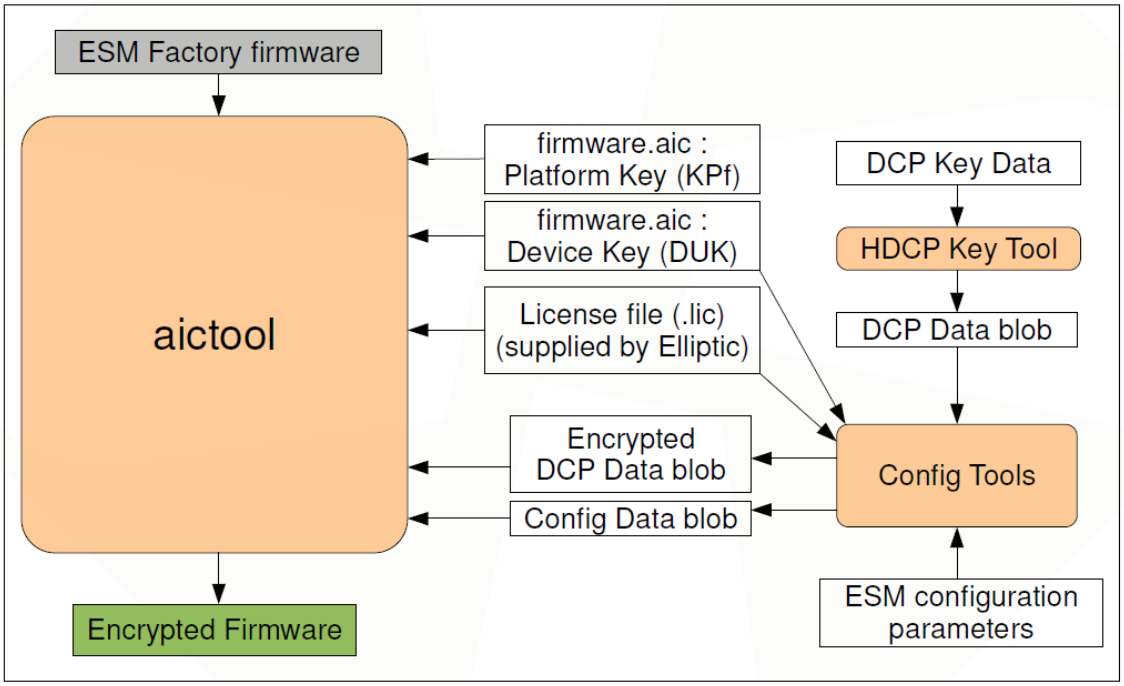

Fig. 33-4 ESM Image tool flow

The DCP Tx key data is common for all transmitter ports whereas the DCP Rx key data is unique for each receiver port.
To facilitate manufacturing it is highly desirable to build and deploy a common software image for all units. If your ESM only contains transmitter ports then it is possible to do this, however if you also have receiver ports you are required by DCP to have a unique receiver key for each receiver in your design.

33.4 Application Notes

33.4.1 Host Application Software

The ESM package contains a series of tools and a run-time library as bellow:

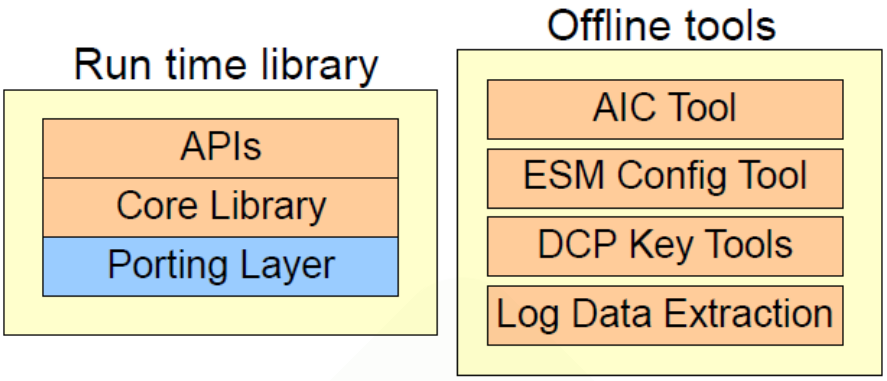

Fig. 33-5 ESM software

33.4.2 Run Time Library

This library is provided as source code and is used by the host application processor to control the ESM.
Setting the configurable options of the ESM is not provided through APIs for security reasons. It is instead embedded into the ESM's Image as part of the process of building a deployable image.
The APIs provide a minimal interface to the ESM, which include the following:

- Load/Initialize firmware image
- Start authentication to secure a link
- Terminate an authenticated link
- Collect logging data
- Get/Set pairing information
- Update SRM data
- Status updates

Sample code is provided and demonstrates how to use the various APIs. In addition, a software API reference guide is included and provides details on the API calls and their parameters.

33.4.3 Offline Tools

There are three separate offline tools that are required to build a deployable image for the ESM as shown in Figure ESM Image tool flow and one tool for logging information. All of these tools are developed to run on a 32 bit Linux system.

33.4.4 Configuration Tool

The troot_base_config_interface tool is used to convert the various configuration files into a data blob to be used by the aictool which creates the encrypted ESM firmware. There are a number of different configuration files which the tools reads, with each configuration file containing a mix of factory configured parameters, and user-adjustable parameters.
This tool also requires the firmware.aic file in order to generate the data blob.

User Parameters for Configuration Files

The following table indicates which parameters in the configuration files are user-adjustable and other non-described parameters should not be changed. A basic description of the parameter is included below, see the configuration file's comments for a more complete description.

Table 33-6 Configuration files

File Name	Parameter	Description
troot_base_config.cfg	[LOGGING_MODE]	Logging on/off
	[LOGGING_LEVEL]	Sets the verbosity of the output log messages.
	[RESEED_TIMEOUT]	Specifies the time the ESM will wait for the TRNG to supply a new nonce before reporting an error

File Name	Parameter	Description
	[RESEED_AUTO_INTERVAL]	By default the ESM will periodically query the TRNG for a new nonce at the period specified.
	[CPU_FREQ]	Sets the frequency of the esm_clk input. Mandatory to change.
troot_hdcpmgr_tx.cfg	[SRM_VERSION]	Denotes whether the SRM is to be checked or not and the minimum version number permitted.
troot_hdcptx.cfg	[I2C_FREQ]	(HDMI) Sets the default I2C frequency. Can be changed via an API.
	[I2C_USE_SHORT_READ]	(HDMI) Sets whether the interface uses short reads for status requests. Can be changed via an API.
	[CEE_BSOD]	(HDMI) Sets the 24 bit fixed pattern value output by the ESM. See the description following this table for more details.
	[AUTO_START]	Sets the default startup state of the Autostart feature
	[HDCP_TIMEOUTS]	Sets whether the ESM enforces the HDCP timeout periods. Should be enabled only for testing and/or debugging.
	[CEE_FRAME_CNT_DEBUG]	(HDMI) The ESM emits periodic log messages once authenticated, based on the number of VSYNC pulses counted by this parameter.
	[PAIRING_ENABLED]	Sets whether pairing will be enabled or not
	[MAX_PAIRING_DEVICES]	Sets the maximum number of paired devices supported per port. Note the external R/W memory requirements increase based on this setting, and the number of Tx ports in your design.
	[MEM_PAIRING_SIZE]	Sets the amount of R/W memory the pairing data will occupy.
	[CAPABLE_BYPASS_TIME]	(HDMI) Sets the maximum amount of time the ESM will enable low value content after a capability

File Name	Parameter	Description
		check before switching back to a fixed pattern output. See HLC_HDCPTX_SetCapability in the API guide.
	[LVC_TIMEOUT]	(HDMI) Sets the maximum amount of time the ESM will enable low value content without a capability check. See HLC_HDCPTX_EnableLowValueContent in the API guide.
	[LVC_EXPIRED_CNT]	(HDMI) Sets the maximum number of LVC timeouts permitted.

The [CEE_BSOD] is a 32 bit decimal value which parameter represents fixed data output on the TMDS data bus if the ESM encounters an authentication issue or detects attempts have been made to tamper with it. The value is only relevant for ports configured for HDMI. This 32 bit value is output as follows:

Table 33-7 ESM BSOD Output Mapping

BSOD Bit Positions	HDMI Controller TMDS Data Channel
7..0	O_tmds_ch0 [7..0]
15..8	O_tmds_ch1 [7..0]
23..16	O_tmds_ch2 [7..0]
32..24	Not used

33.4.5 HDCP Key Tools

This tool (hdcpkeys) is used to create a DCP key data file, which is required to build the encrypted DCP data blob needed for creating the encrypted ESM firmware. The tool reads a configuration file that contains the Rx or Tx key information from DCP in clear text and outputs a structured data file for the configuration interface tool to encrypt with the appropriate secret keys.

The tools can also accept the DCP published key files themselves.

33.4.6 AIC Tool

The aictool tool is used to create the encrypted ESM firmware. To build the encrypted firmware, you must first create the data files for the DCP keys and the configuration. These files, along with an input configuration file for this tool are used to build an image that can be used by the ESM. In addition to specifying the Platform and Device Unique Keys in the configuration file, there are additional keys that also must be specified as noted below.

Content Randomization

There are two separate values in the firmware.aic file, IK and IVc (128 bits and 96 bits respectively), which you must randomly generate to create a new encrypted ESM firmware image. Failure to do this puts secret data in the ESM firmware at risk of being compromised.

33.4.7 Log Data Extraction

The logging information from the ESM is output in a proprietary format. This tool is used to produce readable output of captured logging data content.

The Host Library contains a core library component which includes all the functions necessary to use the ESM. The library is built using portable C code and uses various abstraction functions to allow for migration to different platforms. Before using the ESM in

your system you must properly implement the abstraction components specific to your platform.
There are two distinct abstraction components used by the Host Library, the System Abstraction Layer and the Host Library Driver (HLD) component. The System Abstraction Layer (or Common Component) defines system level functions used by the Host Library, such as malloc, memcpy, etc.
These functions are linked into the Host Library when it is built.
The Host Library Driver (HLD) component establishes a communication between the library and the physical ESM hardware, including managing the memory required for the ESM Image and the read/write area. This is a run-time plug-in module that is defined in your application and specified as a parameter to the ESM initialization function.
The figure below illustrates the abstraction components used by the Host Library package. This figure demonstrates one example where there are three separate ESMs in the system, requiring (typically) three separate HLD instantiations. Consult the ESM Host Library API guide for more details on the HLD implementation.

33.4.8 Host Library

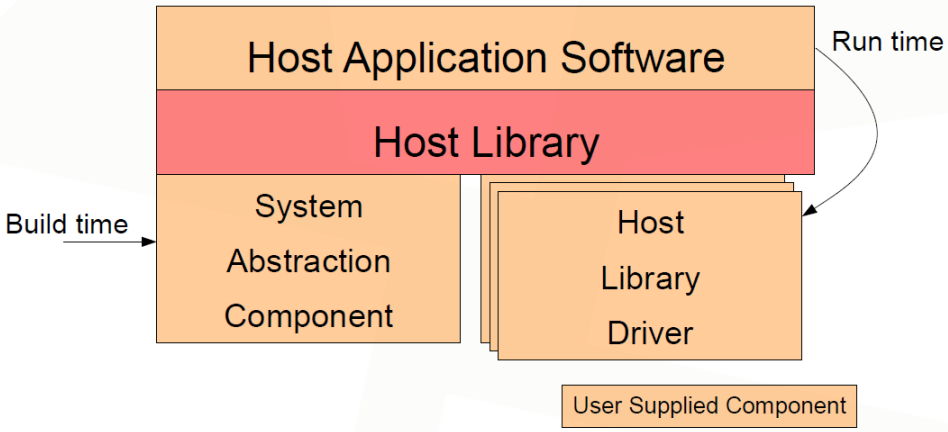

Fig. 33-6 Host Library Layers

The Host Library provides a number of sample applications using the ESM with the library. The
applications demonstrate using the library in a User Space Linux application:

- Repeater/Converter (Linux) [Planned in later releases – not currently available]
- Transmitter (Linux)

All the sample applications demonstrate API usage, loading the ESM firmware, and running a specific ESM application.

The sample applications provided as a Linux User Space application communicate to the ESM hardware through a Linux Kernel driver which is implemented as a Host Library Driver (HLD) plug-in.

Transmitter

There is a sample transmitter applications provided in the samples folder:
hdcp_tx.c is a Linux based example and utilizes file IO and threads.
