Warranty Disclaimer

Rockchip Electronics Co., Ltd makes no warranty, representation or guarantee (expressed, implied, statutory, or otherwise) by or with respect to anything in this document, and shall not be liable for any implied warranties of non-infringement, merchantability or fitness for a particular purpose or for any indirect, special or consequential damages.

Information furnished is believed to be accurate and reliable. However, Rockchip Electronics Co.,Ltd assumes no responsibility for the consequences of use of such information or for any infringement of patents or other rights of third parties that may result from its use.

Rockchip Electronics Co., Ltd's products are not designed, intended, or authorized for using as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Rockchip Electronics Co., Ltd's product could create a situation where personal injury or death may occur, should buyer purchase or use Rockchip Electronics Co., Ltd's products for any such unintended or unauthorized application, buyers shall indemnify and hold Rockchip Electronics Co., Ltd and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, expenses, and reasonable attorney fees arising out of, either directly or indirectly, any claim of personal injury or death that may be associated with such unintended or unauthorized use, even if such claim alleges that Rockchip Electronics Co., Ltd was negligent regarding the design or manufacture of the part.

Copyright and Patent Right

Information in this document is provided solely to enable system and software implementers to use Rockchip Electronics Co.,Ltd 's products. There are no expressed and patent or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Rockchip Electronics Co., Ltd does not convey any license under its copyright and patent rights nor the rights of others.
All copyright and patent rights referenced in this document belong to their respective owners and shall be subject to corresponding copyright and patent licensing requirements.

Trademarks

Rockchip and Rockchip™ logo and the name of Rockchip Electronics Co., Ltd's products are trademarks of Rockchip Electronics Co., Ltd. and are exclusively owned by Rockchip Electronics Co., Ltd. References to other companies and their products use trademarks owned by the respective companies and are for reference purpose only.

Confidentiality

The information contained herein (including any attachments) is confidential. The recipient hereby acknowledges the confidentiality of this document, and except for the specific purpose, this document shall not be disclosed to any third party.

Reverse engineering or disassembly is prohibited.

ROCKCHIP ELECTRONICS CO.,LTD. RESERVES THE RIGHT TO MAKE CHANGES IN ITS PRODUCTS OR PRODUCT SPECIFICATIONS WITH THE INTENT TO IMPROVE FUNCTION OR DESIGN AT ANY TIME AND WITHOUT NOTICE AND IS NOT REQUIRED TO UNDATE THIS DOCUMENTATION TO REFLECT SUCH CHANGES.

Chapter 1 DMC (Dynamic Memory Interface)

1.1 Overview

The DMC includes DDR enhanced memory controller(UMCTL2) and DDRPHY which are a complete memory interface solution for DDR memory subsystems.

The UMCTL2 SoC application bus interface supports AXI interface, with flexible address mapper logic allow application-specific mapping of row, column, bank, bank group and rank bits to achieve industry leading high-efficiency, low-latency and high-performance from memory interface.

The DDR PHY provides control features to ease the customer implementation of digitally controlled features of the PHY such as initialization, DQS gate training, write leveling training and programmable configuration controls.

The DMC supports the following features:

- Support DDR3/DDR3L/DDR4/LPDDR3/LPDDR4
- Support up to 4 ranks and up to 8GB capacity
- Support 32-bit, 16-bit DDR data bus width
- Support up to 16-type address mapping
- Support up to 32-bank (including bank group)
- Support DDR burst8 for DDR3/DDR3L/DDR4/LPDDR3 and burst16 for LPDDR4
- Support different CL/WL latency
- Support DDR3/DDR3L/DDR4/LPDDR3/LPDDR4 SW frequency change
- Support DDR3/DDR3L/DDR4/LPDDR3/LPDDR4 HW frequency change
- Support auto gated clock through DDRC and AXI low power interface
- Support auto put DDR PHYentry or exit self-refresh by DFI lower power interface
- Support auto or SW issue entry or exit clock stop/power-down/self-refresh/deep power-down/max power saving mode
- Support SW or PMU auto control DDR PHY entry or exit retention/self-refresh
- Support open, close, intelligent precharge paging policy
- Support advance refresh control
- Support APB interface for UMCTL2 and PHY software-accessible registers
- Support automatic RX DQS gate training and automatic write leveling training
- Support DDR monitor for debug:
  - AMBA 32-bit APB slave interface
  - Support to monitor DDR read or write address
  - Support to observe whether DDR access address within a specified range
  - Support to do the statistics about DDR read number, write number and active number
    - Hardware mode
    - Software mode
  - Support monitor interrupt

1.2 Block Diagram

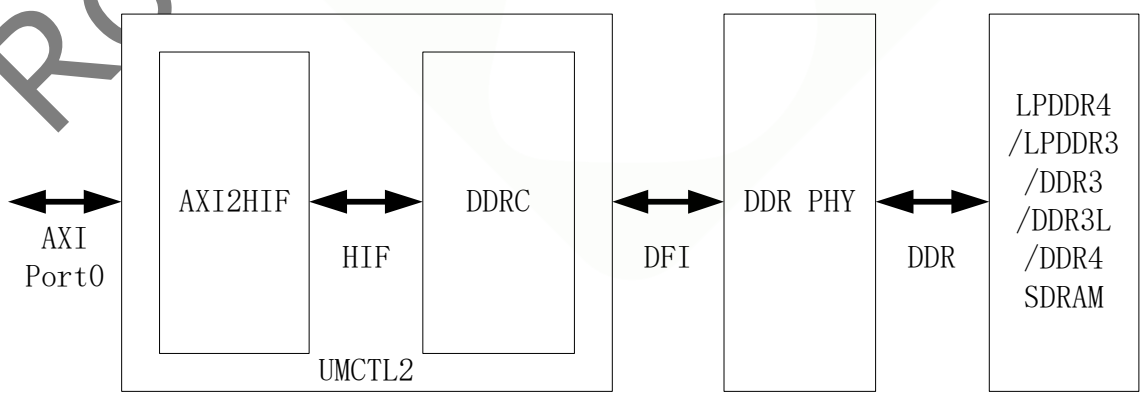

Fig.1-1 DMC Block Diagram

1.3 Function Description

1.3.1 UMCTL2

UMCTL2 supports only one AXI Port0, it receives AXI transactions from memory schedule of interconnect. These transactions are queued internally and scheduled for access in order to the SDRAM while satisfying SDRAM protocol timing requirements. It in turn issues commands on the DFI interface to the DDR PHY block which launches and captures data to and from the SDRAM. UMCTL2 contains the following main components:

- AXI2HIF block: This block provides the AXI interface to system level and HIF interface to DDRC block. It provides bus protocol handing, data buffering, data bus size conversion and memory burst alignment. Read is stored in a SRAM, read re-order buffer and return in order to the AXI Port.
- DDRC block: This block issues the read/write commands in order, carries out the DRAM page management, issues DRAM maintenance commands, and implement the DFI interface. Write data is stored in an SRAM until its associated command is issued to the PHY. Read data is handled by the response engine in the DDRC and is returned in order on the HIF.

1.3.2 DDR PHY

DDR PHY supports DDR3/DDR3L/DDR4/LPDDR3/LPDDR4 SDRAM and provides turnkey physical interface solutions for ICs requiring access to JEDEC compatible SDRAM devices.It is optimized for low power and high speed (up to 1866Mbps for DDR3/DDR3L/LPDDR3 and up to2133Mbps for DDR4/LPDDR4) applications with robust timing and small silicon area in14nm process. It supports all JEDEC DDR3/DDR3L/DDR4/LPDDR3/LPDDR4 SDRAM components in themarket. The PHY components contain DDR specialized functional and utility SSTL I/Osup to 2133MHz in SMIC 14nm, critical timing synchronization module (TSM) and a low power/jitterDLLs with programmable fine-grain control for any SDRAM interface.

1.3.3 DDR Monitor

The DDR Monitor Module has three functions, the first function is used when debug, it will monitor the DDR read or write address. The second function is also used when debug, it will observe whether DDR access address within a specified range. The third function is used to do the statistics about DDR bandwidth and utilization.

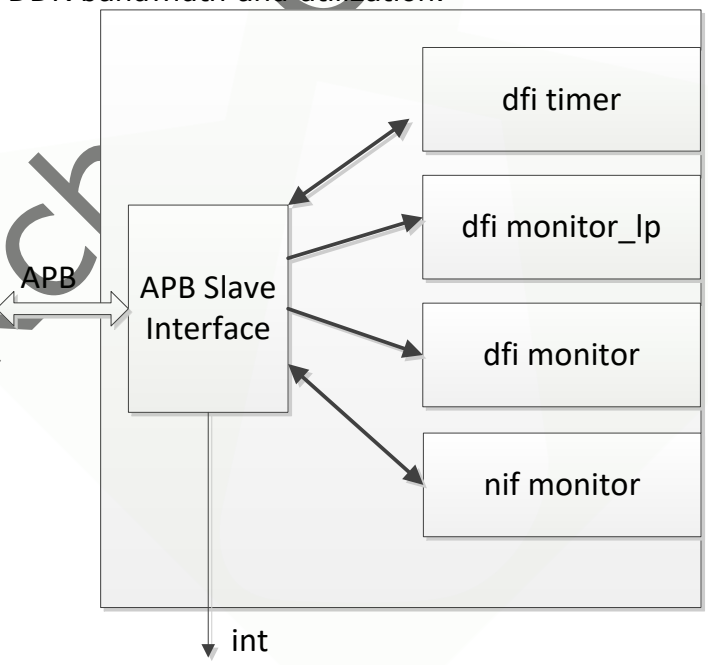

Fig.1-2 DDR Monitor Block Diagram

The host processor gets access to DDR Monitor Register Block through the APB slave interface with 32-bit bus width, and asserts the active-high level interrupt.
DDR Monitor does the monitor and statistics by dfi monitor module, nif monitor module and dfi monitor_lp module.

1.3.4 HWFFC BLOCK

To support hardware fast frequency protocol, a hardware block which is name HWFFC is

implemented in RK3368. The HWFFC is fully compatible with DDRC low-power interface which is send HWFFC request through.

During the HWFFC, a timing procedure is request as follows:
1. The system requests frequency change by de-asserting csysreq_ddrc. csysmode_ddrc = 1, csysfrequency_ddrc and csysdiscamdrain_ddrc must remain at constant values while csysreq_ddrc
= 0. csysreq_ddrc must be held de-asserted until csysack_ddrc is de-asserted.
2. The DDRC issues SRE to put SDRAMs into self-refresh (without power down), and then sends several MRW commands to update timing parameters for opposite side of current FSP, and lastly it switches FSP-OP to the opposite side.
3. The DDRC de-asserts dfi_cke to put SDRAMs into SR-Powerdown.
4. The DDRC requests frequency change to the PHY by asserting dfi_init_start dfi_frequency is set to the frequency value indicated by csysfrequency_ddrc (and holds it during dfi_init_start = 1).
5. The PHY responds to the frequency change request by de-asserting dfi_init_complete.
6. The DDRC de-asserts cactive_ddrc and then de-asserts csysack_ddrc (Frequency change request is accepted).
7. The system changes clock frequency.
8. The system asserts csysreq_ddrc (stable clock is required here).
9. The DDRC de-asserts dfi_init_start.
10. The PHY acknowledges dfi_init_start by asserting dfi_init_complete.
11. The DDRC asserts cactive_ddrc.
12. The DDRC asserts dfi_cke to exit SR-Powerdown, and sends an MRW command to program MR13.VRCG = 0 if required.
13. The DDRC asserts csysack_ddrc. cactive_ddrc starts to behave again as described in other
sections.
14. The DDRC issues SRX to exit self-refresh.
And all csys*_ddrc signals is controlled by HWFFC during frequency change and clock frequency can be controlled by HWFFC block or under software control.

1.4 Register Description

Slave address can be divided into different length for different usage, which is shown as follows.

1.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
DDRC_MSTR	0x0000	W	0x03040001	Master Register 0
DDRC_STAT	0x0004	W	0x00000000	Operating Mode Status Register
DDRC_MRCTRL0	0x0010	W	0x00000000	Mode Register Read/Write Control Register 0
DDRC_MRCTRL1	0x0014	W	0x00000000	Mode Register Read/Write Control Register 1
DDRC_MRSTAT	0x0018	W	0x00000000	Mode Retgister Read/Write Status Register
DDRC_MRCTRL2	0x001c	W	0x00000000	Mode Register Read/Write Control Register 2
DDRC_DERATEEN	0x0020	W	0x00000000	Temperature Derate Enable Register

Name	Offset	Size	Reset Value	Description
DDRC_DERATEINT	0x0024	W	0x00800000	Temperature Derate Interval Registesr
DDRC_PWRCTL	0x0030	W	0x00000000	Lower Power Control Register
DDRC_PWRTMG	0x0034	W	0x00402010	Lower Power Timing Register
DDRC_HWLUMCTL2	0x0038	W	0x00000003	Hardware Lower Power Control Register
DDRC_HWFFCCTL	0x003c	W	0x00000010	Hardware Fast Frequency Change Control Register
DDRC_HWFFCSTAT	0x0040	W	0x00000000	Hardware Fast Frequency Change Status Register
DDRC_RFSHCTL0	0x0050	W	0x00210000	Refresh Control Register
DDRC_RFSHCTL1	0x0054	W	0x00000000	Refresh Control Register 1
DDRC_RFSHCTL3	0x0060	W	0x00000000	Refresh Control Register 3
DDRC_RFSHTMG	0x0064	W	0x0062008c	Refresh Timing Register
DDRC_CRCPARCTL0	0x00c0	W	0x00000000	CRC Parity Control Register 0
DDRC_CRCPARCTL1	0x00c4	W	0x00001000	CRC Parity Control Register 1

1.4.2 Detail Register Description

DDRC_MSTR

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	device_config Configuration of device used 2'b00: x4 device 2'b01: x8 device 2'b10: x16 device 2'b11: x32 device Programming Mode: Static
29	RW	0x0	frequency_mode Choose wich register are used. 1'b0: Original registers 1'b1: FREQ1 registers Programming Mode: Quasi-dynamic Group 2
28:26	RO	0x0	reserved
25:24	RW	0x3	active_ranks 2'b01: One Rank 2'b11: Two Ranks Others: Reserved Programming Mode: Static
23	RO	0x0	reserved

Bit	Attr	Reset Value	Description
22	RW	0x0	frequency_ratio selects the frequency ratio 1'b0: 1:2 mode 1'b1: 1:1 mode Programming Mode: Static
21:20	RW	0x0	active_logical_ranks Number of logical ranks for DDR4 3DS 2'b00: Monolithic (no stack) 2'b01: 2H stack 2'b10: 4H stack 2'b11: 8H stack Programming Mode: Static
19:16	RW	0x4	burst_rdwr SDRAM burst length used: 4'b0001: Burst length of 2 4'b0010: Burst length of 4 4'b0100: Burst length of 8 4'b1000: Burst length of 16 Programming Mode: Static
15	RW	0x0	dll_off_mode 1'b1: Dll-off mode for lower frequency operation 1'b0: Dll-on mode for normal frequency operation Programming Mode: Quasi-dynamic Group 2
14	RO	0x0	reserved
13:12	RW	0x0	data_bus_width 2'b00: Full DQ bus width to SDRAM 2'b01: Half DQ bus width to SDRAM Others: Reserved Programming Mode: Static
11	RW	0x0	geardown_mode 1'b1: Enable geardow mode 1'b0: Normal mode Programming Mode: Quasi-dynamic Group 2
10	RW	0x0	en_2t_timing_mode 1'b1: Use 2T timing 1'b0: Use 1T timing Programming Mode: Static
9	RW	0x0	burstchop 1'b1: Enable burst-chop 1'b0: Disable burst-chop Programming Mode: Static
8	RW	0x0	burst_mode 1'b0: Sequential burst mode 1'b1: Interleaved burst mode Programming Mode: Static
7:6	RO	0x0	reserved
5	RW	0x0	lpddr4 1'b1: LPDDR4 1'b0: Non-LPDDR4 Programming Mode: Static
4	RW	0x0	ddr4 1'b1: DDR4 1'b0: Non-DDR4 Programming Mode: Static

Bit	Attr	Reset Value	Description
3	RW	0x0	lpddr3 1'b1: LPDDR3 1'b0: Non-LPDDR3 Programming Mode: Static
2	RW	0x0	lpddr2 1'b1: LPDDR2 1'b0: Non-LPDDR2 Programming Mode: Static
1	RW	0x0	mobile 1'b1: Mobile/LPDDR 1'b0: Non-Mobile Programming Mode: Static
0	RW	0x1	ddr3 1'b1: DDR3 1'b0: Non-DDR3 Programming Mode: Static

DDRC_STAT

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RO	0x0	selfref_cam_not_empty Self refresh with CAMs not empty. Set to 1 when Self Refresh is entered but CAMs are not drained. Cleared after exiting Self Refresh. Programming Mode: Dynamic
11:10	RO	0x0	reserved
9:8	RO	0x0	selfref_state Self refresh state. This indicates self refresh or self refresh power down state for LPDDR4. This register is used for frequency change and MRR/MRW access during self refresh. 2'b00: SDRAM is not in Self Refresh. 2'b01: Self refresh 1 2'b10: Self refresh power down 2'b11: Self refresh 2 Programming Mode: Dynamic
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5:4	RO	0x0	selfref_type Flags if Self Refresh (except LPDDR4) or SR-Powerdown (LPDDR4) is entered and if it was under Automatic Self Refresh control only or not. 2'b00: SDRAM is not in Self Refresh (except LPDDR4) or SR-Powerdown (LPDDR4). If retry is enabled by CRCPARCTRL1.crc_parity_retry_enable, this also indicates SRE command is still in parity error window or retry is in-progress. 2'b11: SDRAM is in Self Refresh (except LPDDR4) or SRPowerdown (LPDDR4), which was caused by Automatic Self Refresh only. If retry is enabled, this guarantees SRE command is executed correctly without parity error. 2'b10: SDRAM is in Self Refresh (except LPDDR4) or SRPowerdown (LPDDR4), which was not caused solely under Automatic Self Refresh control. It could have been caused by Hardware Low Power Interface and/or Software (PWRCTL.selfref_sw). If retry is enabled, this guarantees SRE command is executed correctly without parity error. 2'b01: SDRAM is in Self Refresh, which was caused by PHY Master Request. Programming Mode: Dynamic
3	RO	0x0	reserved
2:0	RO	0x0	operating_mode Operating mode. This is 3-bits wide in configurations with mDDR/LPDDR2/LPDDR3/LPDDR4/DDR4 support and 2-bits in all other configurations. non-mDDR/LPDDR2/LPDDR3/LPDDR4 and non-DDR4 designs: 2'b00: Init 2'b01: Normal 2'b10: Power-down 2'b11: Self refresh mDDR/LPDDR2/LPDDR3 or DDR4 designs: 3'b000: Init 3'b001: Normal 3'b010: Power-down 3'b011: Self refresh 3'b1xx: Deep power-down/Maximum Power Saving Mode LPDDR4 designs: 3'b000: Init 3'b001: Normal 3'b010: Power-down 3'b011: Self refresh/Self refresh power-down Programming Mode: Dynamic

DDRC_MRCTRL0

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	mr_wr Setting this register bit to 1 triggers a mode register read or write operation. When the MR operation is complete, the uMCTL2 automatically clears this bit. The other register fields of this register must be written in a separate APB transaction, before setting this mr_wr bit. It is recommended NOT to set this signal if in Init, Deep power-down or MPSM operating modes. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
30	RW	0x0	pba_mode Indicates whether PBA access is executed. When setting this bit to 1 along with setting pda_en to 1, uMCTL2 initiates PBA access instead of PDA access. 1'b0: Per DRAM Addressability mode 1'b1: Per Buffer Addressability mode The completion of PBA access is confirmed by MRSTAT.pda_done in the same way as PDA. Programming Mode: Dynamic
29:16	RO	0x0000	reserved
15:12	RW	0x0	mr_addr Address of the mode register that is to be written to. 4'b0000: MR0 4'b0001: MR1 4'b0010: MR2 4'b0011: MR3 4'b0100: MR4 4'b0101: MR5 4'b0110: MR6 4'b0111: MR7 Don't Care for LPDDR2/LPDDR3/LPDDR4 (see MRCTRL1.mr_data for mode register addressing in LPDDR2/LPDDR3/LPDDR4). In case of DDR4, the bit[3:2] corresponds to the bank group bits. Programming Mode: Dynamic
11:6	RO	0x00	reserved
5:4	RW	0x0	mr_rank Controls which rank is accessed by MRCTRL0.mr_wr. Normally, it is desired to access all ranks, so all bits should be set to 1. 2'b01: select rank 0 only 2'b10: select rank 1 only 2'b11: select rank 0 and 1 Programming Mode: Dynamic
3	RW	0x0	sw_init_int Indicates whether Software intervention is allowed via MRCTRL0/MRCTRL1 before automatic SDRAM initialization routine or not. For DDR4, this bit can be used to initialize the DDR4 RCD (MR7) before automatic SDRAM initialization. For LPDDR4, this bit can be used to program additional mode registers before automatic SDRAM initialization if necessary. Note that this must be cleared to 0 after completing Software operation. Otherwise, SDRAM initialization routine will not re-start. 1'b0: Software intervention is not allowed. 1'b1: Software intervention is allowed. Programming Mode: Dynamic
2	RW	0x0	pda_en Indicates whether the mode register operation is MRS in PDA mode or not 1'b0: MRS 1'b1: MRS in Per DRAM Addressability mode Note that when pba_mode=1, PBA access is initiated instead of PDA access. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
1	RW	0x0	mpr_en Indicates whether the mode register operation is MRS or WR/RD for MPR (only supported for DDR4) 1'b0: MRS 1'b1: WR/RD for MPR Programming Mode: Dynamic
0	RW	0x0	mr_type Indicates whether the mode register operation is read or write. Only used for LPDDR2/LPDDR3/LPDDR4/DDR4. 1'b0: Write 1'b1: Read Programming Mode: Dynamic

DDRC_MRCTRL1

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:0	RW	0x00000	mr_data Mode register write data for all non-LPDDR2/non-LPDDR3/non-LPDDR4 modes. For LPDDR2/LPDDR3/LPDDR4, MRCTRL1[15:0] are interpreted as [15:8] MR Address [7:0] MR data for writes, don't care for reads. This is 18-bits wide in configurations with DDR4 support and 16-bits in all other configurations. Programming Mode: Dynamic

DDRC_MRSTAT

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RO	0x0	pda_done The SoC core may initiate a MR write operation in PDA/PBA mode only if this signal is low. This signal goes high when three consecutive MRS commands related to the PDA/PBA mode are issued to the SDRAM. This signal goes low when MRCTRL0.pda_en becomes 0. Therefore, it is recommended to write MRCTRL0.pda_en to 0 after this signal goes high in order to prepare to perform PDA operation next time. 1'b0: Indicates that mode register write operation related to PDA/PBA is in progress or has not started yet. 1'b1: Indicates that mode register write operation related to PDA/PBA has competed. Programming Mode: Dynamic
7:1	RO	0x00	reserved

Bit	Attr	Reset Value	Description
0	RO	0x0	mr_wr_busy The SoC core may initiate a MR write operation only if this signal is low. This signal goes high in the clock after the uMCTL2 accepts the MRW/MRR request. It goes low when the MRW/MRR command is issued to the SDRAM. It is recommended not to perform MRW/MRR commands when MRSTAT.mr_wr_busy is high. 1'b0: Indicates that the SoC core can initiate a mode register write operation 1'b1: Indicates that mode register write operation is in progress Programming Mode: Dynamic

DDRC_MRCTRL2

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	mr_device_sel Indicates the device(s) to be selected during the MRS that happens in PDA mode. Each bit is associated with one device. For example, bit[0] corresponds to Device 0, bit[1] to Device 1 etc. A '1' should be programmed to indicate that the MRS command should be applied to that device. A '0' indicates that the MRS commands should be skipped for that device. Programming Mode: Dynamic

DDRC_DERATEEN

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:8	RW	0x0	rc_derate_value Derate value of tRC for LPDDR4 3'b000: Derating uses +1. 3'b001: Derating uses +2. 3'b010: Derating uses +3. 3'b011: Derating uses +4. Present only in designs configured to support LPDDR4. The required number of cycles for derating can be determined by dividing 3.75ns by the core_ddrc_core_clk period, and rounding up the next integer. Programming Mode: Quasi-dynamic Group 2 and Group 4
7:4	RW	0x0	derate_byte Derate byte Present only in designs configured to support LPDDR2/LPDDR3/LPDDR4. Indicates which byte of the MRR data is used for derating. Programming Mode: Static
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	derate_value Derate value 1'b0: Derating uses +1. 1'b1: Derating uses +2. Present only in designs configured to support LPDDR2/LPDDR3/LPDDR4 Set to 0 for all LPDDR2 speed grades as derating value of +1.875 ns is less than a core_ddrc_core_clk period. For LPDDR3/4, if the period of core_ddrc_core_clk is less than 1.875ns, this register field should be set to 1; otherwise it should be set to 0. Programming Mode: Quasi-dynamic Group 2 and Group 4
0	RW	0x0	derate_enable Enables derating 1'b0: Timing parameter derating is disabled 1'b1: Timing parameter derating is enabled using MR4 read value. Present only in designs configured to support LPDDR2/LPDDR3/LPDDR4 This field must be set to 0 for non-LPDDR2/LPDDR3/LPDDR4 mode. Programming Mode: Dynamic

DDRC_DERATEINT

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RW	0x00800000	mr4_read_interval Interval between two MR4 reads, used to derate the timing parameters. Present only in designs configured to support LPDDR2/LPDDR3/LPDDR4. This register must not be set to zero. Unit: DFI clock cycle. Programming Mode: Static

DDRC_PWRCTL

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	lpddr4_sr_allowed Indicates whether transition from SR-PD to SR and back to SR-PD is allowed. This register field cannot be modified while PWRCTL.selfref_sw==1. 1'b0: SR-PD -> SR -> SR-PD not allowed 1'b1: SR-PD -> SR -> SR-PD allowed Programming Mode: Dynamic
7	RW	0x0	dis_cam_drain_selfref Indicates whether skipping CAM draining is allowed when entering Self-Refresh. This register field cannot be modified while PWRCTL.selfref_sw==1. 1'b0: CAMs must be empty before entering SR. 1'b1: CAMs are not emptied before entering SR. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
6	RW	0x0	stay_in_selfref Self refresh state is an intermediate state to enter to Selfrefresh power down state or exit Self refresh power down state for LPDDR4. This register controls transition from the Self refresh state. 1'b1: Prohibit transition from Self refresh state 1'b0: Allow transition from Self refresh state Programming Mode: Dynamic
5	RW	0x0	selfref_sw A value of 1 to this register causes system to move to Self Refresh state immediately, as long as it is not in INIT or DPD/MPSM operating_mode. This is referred to as Software Entry/Exit to Self Refresh. 1'b1: Software Entry to Self Refresh 1'b0: Software Exit from Self Refresh Programming Mode: Dynamic
4	RW	0x0	mpsm_en When this is 1, the uMCTL2 puts the SDRAM into maximum power saving mode when the transaction store is empty. This register must be reset to '0' to bring uMCTL2 out of maximum power saving mode. Present only in designs configured to support DDR4. For non-DDR4, this register should not be set to 1. Programming Mode: Dynamic
3	RW	0x0	en_dfi_dram_clk_disable Enable the assertion of dfi_dram_clk_disable whenever a clock is not required by the SDRAM. If set to 0, dfi_dram_clk_disable is never asserted. Assertion of dfi_dram_clk_disable is as follows: In DDR2/DDR3, can only be asserted in Self Refresh. In DDR4, can be asserted in the Self Refresh and Maximum Power Saving Mode In mDDR/LPDDR2/LPDDR3, can be asserted in the Self Refresh, Power Down, Deep Power Down and Normal operation (Clock Stop) In LPDDR4, can be asserted in the Self Refresh Power Down, Power Down and Normal operation (Clock Stop) Programming Mode: Dynamic
2	RW	0x0	deeppowerdown_en When this is 1, uMCTL2 puts the SDRAM into deep powerdown mode when the transaction store is empty. This register must be reset to '0' to bring uMCTL2 out of deep power-down mode. Controller performs automatic SDRAM initialization on deep power-down exit. Present only in designs configured to support mDDR or LPDDR2 or LPDDR3. For non-mDDR/non-LPDDR2/nonLPDDR3, this register should not be set to 1. Programming Mode: Dynamic
1	RW	0x0	powerdown_en If true then the uMCTL2 goes into power-down after a programmable number of cycles "maximum idle clocks before power down" PWRTMG.powerdown_to_x32). This register bit may be re-programmed during the course of normal operation. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
0	RW	0x0	selfref_en If true then the uMCTL2 puts the SDRAM into Self Refresh after a programmable number of cycles "maximum idle clocks before Self Refresh (PWRTMG.selfref_to_x32)". This register bit may be re-programmed during the course of normal operation. Programming Mode: Dynamic

DDRC_PWRTMG

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x40	selfref_to_x32 After this many clocks of the DDRC command channel being idle the uMCTL2 automatically puts the SDRAM into Self Refresh. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.selfref_en. Unit: Multiples of 32 DFI clocks. Programming Mode: Static
15:8	RW	0x20	t_dpd_x4096 Minimum deep power-down time. For mDDR, value from the JEDEC specification is 0 as mDDR exits from deep power-down mode immediately after PWRCTL.deeppowerdown_en is de-asserted. For LPDDR2/LPDDR3, value from the JEDEC specification is 500us. Unit: Multiples of 4096 DFI clocks. Programming Mode: Static
7:5	RO	0x0	reserved
4:0	RW	0x10	powerdown_to_x32 After this many clocks of the DDRC command channel being idle the uMCTL2 automatically puts the SDRAM into powerdown. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.powerdown_en. Unit: Multiples of 32 DFI clocks Programming Mode: Static

DDRC_HWLUMCTL2

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	hw_lp_idle_x32 Hardware idle period. The cactive_ddrc output is driven low if the DDRC command channel is idle for hw_lp_idle * 32 cycles if not in INIT or DPD/MPSM operating_mode. The DDRC command channel is considered idle when there are no HIF commands outstanding. The hardware idle function is disabled when hw_lp_idle_x32=0. Unit: Multiples of 32 DFI clocks. Programming Mode: Static
15:2	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x1	hw_lp_exit_idle_en When this bit is programmed to 1 the cactive_in_ddrc pin of the DDRC can be used to exit from the automatic clock stop, automatic power down or automatic self-refresh modes. Note, it will not cause exit of Self-Refresh that was caused by Hardware Low Power Interface and/or Software (PWRCTL.selfref_sw). Programming Mode: Static
0	RW	0x1	hw_lp_en Enable for Hardware Low Power Interface. Programming Mode: Quasi-dynamic Group 3

DDRC_HWFFCCTL

Address: Operational Base + offset (0x003c)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	target_vrcg Set target value of VRCG (MR13 OP[3]). This field value is used when HWFFC request has been issued. Programming Mode: Static
5	RW	0x0	init_vrcg Set initial value of VRCG (MR13 OP[3]). This field value is used when HWFFCCTL.hwffc_en has been changed to 2'b11. Programming Mode: Static
4	RW	0x1	init_fsp Set initial value of FSP-OP (MR13 OP[7]). This field value is used when HWFFCCTL.hwffc_en has been changed to 2'b11. Programming Mode: Static
3:2	RO	0x0	reserved
1:0	RW	0x0	hwffc_en Enable HWFFC through Hardware Low Power Interface. The other fields of this register are used only when changing this field to 11. 2'b00: Disable HWFFC 2'b10: Intermediate, set only when disabling HWFFC 2'b11: Enable HWFFC 2'b01: Not allowed Programming Mode: Dynamic

DDRC_HWFFCSTAT

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RO	0x0	current_vrcg Indicates current value of VRCG (MR13 OP[3]). Programming Mode: Dynamic
8	RO	0x0	current_fsp Indicates current value of FSP-OP (MR13 OP[7]). Programming Mode: Dynamic
7:5	RO	0x0	reserved
4	RO	0x0	current_frequency Indicates the current frequency. 1'b0: Frequency 0/Normal 1'b1: Frequency 1/FREQ1 Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
3:2	RO	0x0	reserved
1	RO	0x0	hwffc_operating_mode Operating mode of HWFFC. 1'b0: Normal 1'b1: Self Refresh or SR-Powerdown Programming Mode: Dynamic
0	RO	0x0	hwffc_in_progress Indicates HWFFC is in progress. Programming Mode: Dynamic

DDRC_RFSHCTL0

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:20	RW	0x2	refresh_margin Threshold value in number of DFI clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_rfc_nom_x32. Note that, in LPDDR2/LPDDR3/LPDDR4, internally used t_rfc_nom_x32 may be equal to RFSHTMG.t_rfc_nom_x32>>2 if derating is enabled (DERATEEN.derate_enable=1). Otherwise, internally used t_rfc_nom_x32 will be equal to RFSHTMG.t_rfc_nom_x32. Unit: Multiples of 32 DFI clocks. Programming Mode: Dynamic - Refresh Related
19:17	RO	0x0	reserved
16:12	RW	0x10	refresh_to_x32 If the refresh timer (tRFCnom, also known as tREFI) has expired at least once, but it has not expired (RFSHCTL0.refresh_burst+1) times yet, then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful, but before it is absolutely required. When the SDRAM bus is idle for a period of time determined by this RFSHCTL0.refresh_to_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the uMCTL2. Unit: Multiples of 32 DFI clocks. Programming Mode: Dynamic - Refresh Related
11:9	RO	0x0	reserved

Bit	Attr	Reset Value	Description
8:4	RW	0x00	refresh_burst The programmed value + 1 is the number of refresh timeouts that is allowed to accumulate before traffic is blocked and the refreshes are forced to execute. Closing pages to perform a refresh is a one-time penalty that must be paid for each group of refreshes. Therefore, performing refreshes in a burst reduces the per-refresh penalty of these page closings. Higher numbers for RFSHCTL.refresh_burst slightly increases utilization; lower numbers decreases the worstcase latency associated with refreshes. 5'h0: Single refresh 5'h1: Burst-of-2 refresh 5'h7: Burst-of-8 refresh For DDR2/3, the refresh is always per-rank and not perbank. The rank refresh can be accumulated over 8*tREFI cycles using the burst refresh feature. In DDR4 mode, according to Fine Granularity feature, 8 refreshes can be postponed in 1X mode, 16 refreshes in 2X mode and 32 refreshes in 4X mode. If using PHY-initiated updates, care must be taken in the setting of RFSHCTL0.refresh_burst, to ensure that tRFCmax is not violated due to a PHY-initiated update occurring shortly before a refresh burst was due. In this situation, the refresh burst will be delayed until the PHYinitiated update is complete. Programming Mode: Dynamic - Refresh Related
3	RO	0x0	reserved
2	RW	0x0	per_bank_refresh 1'b1: Per bank refresh 1'b0: All bank refresh Per bank refresh allows traffic to flow to other banks. Per bank refresh is not supported by all LPDDR2 devices but should be supported by all LPDDR3/LPDDR4 devices. Programming Mode: Static

DDRC_RFSHCTL1

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	refresh_timer1_start_value_x32 Refresh timer start for rank 1 (only present in multi-rank configurations). This is useful in staggering the refreshes to multiple ranks to help traffic to proceed. This is explained in Refresh Controls section of architecture chapter. Unit: Multiples of 32 DFI clock cycles. Programming Mode: Dynamic - Refresh Related
15:12	RO	0x0	reserved
11:0	RW	0x000	refresh_timer0_start_value_x32 Refresh timer start for rank 0 (only present in multi-rank configurations). This is useful in staggering the refreshes to multiple ranks to help traffic to proceed. This is explained in Refresh Controls section of architecture chapter. Unit: Multiples of 32 DFI clock cycles. Programming Mode: Dynamic - Refresh Related

DDRC_RFSHCTL3

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x0	refresh_mode Fine Granularity Refresh Mode 3'b000: Fixed 1x (Normal mode) 3'b001: Fixed 2x 3'b010: Fixed 4x 3'b101: Enable on the fly 2x (not supported) 3'b110: Enable on the fly 4x (not supported) Everything else - reserved Note: Only Fixed 1x mode is supported if RFSHCTL3.dis_auto_refresh = 1. Note: The on-the-fly modes are not supported in this version of the uMCTL2. Note: This must be set up while the Controller is in reset or while the Controller is in self-refresh mode. Changing this during normal operation is not allowed. Making this a dynamic register will be supported in future version of the uMCTL2. Note: This register field has effect only if a DDR4 SDRAM device is in use (MSTR.ddr4 = 1). Programming Mode: Quasi-dynamic Group 2
3:2	RO	0x0	reserved
1	RW	0x0	refresh_update_level Toggle this signal (either from 0 to 1 or from 1 to 0) to indicate that the refresh register(s) have been updated. refresh_update_level must not be toggled when the DDRC is in reset (core_ddrc_rstn = 0). The refresh register(s) are automatically updated when exiting reset. Programming Mode: Dynamic
0	RW	0x0	dis_auto_refresh When '1', disable auto-refresh generated by the uMCTL2. When auto-refresh is disabled, the SoC core must generate refreshes using the registers DBGCMD.rankn_refresh. When dis_auto_refresh transitions from 0 to 1, any pending refreshes are immediately scheduled by the uMCTL2. If DDR4 CRC/parity retry is enabled (CRCPARCTL1.crc_parity_retry_enable = 1), disable autorefresh is not supported, and this bit must be set to '0'. (DDR4 only) If FGR mode is enabled (RFSHCTL3.refresh_mode > 0), disable auto-refresh is not supported, and this bit must be set to '0'. This register field is changeable on the fly. Programming Mode: Dynamic - Refresh Related

DDRC_RFSHTMG

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_rfc_nom_x1_sel Specifies whether the t_rfc_nom_x1_x32 register value is x1 or x32.
30:28	RO	0x0	reserved

Bit	Attr	Reset Value	Description
27:16	RW	0x062	t_rfc_nom_x1_x32 tREFI: Average time interval between refreshes per rank (Specification: 7.8us for DDR2, DDR3 and DDR4. See JEDEC specification for mDDR, LPDDR2, LPDDR3 and LPDDR4). For LPDDR2/LPDDR3/LPDDR4: if using all-bank refreshes (RFSHCTL0.per_bank_refresh= 0), this register should be set to tREFIab if using per-bank refreshes (RFSHCTL0.per_bank_refresh = 1), this register should be set to tREFIpb When the controller is operating in 1:2 frequency ratio mode, program this to (tREFI/2), no rounding up. In DDR4 mode, tREFI value is different depending on the refresh mode. The user should program the appropriate value from the spec based on the value programmed in the refresh mode register. Note that if RFSHTMG.t_rfc_nom_x1_sel==1, RFSHTMG.t_rfc_nom_x1_x32 must be greater than RFSHTMG.t_rfc_min; if RFSHTMG.t_rfc_nom_x1_sel==0, RFSHTMG.t_rfc_nom_x1_x32*32 must be greater than RFSHTMG.t_rfc_min; RFSHTMG.t_rfc_nom_x32 must be greater than 0x1. Non-DDR4 or DDR4 Fixed 1x mode:RFSHTMG.t_rfc_nom_x1_x32 must be less than or equal to 0xFFE. DDR4 Fixed 2x mode: RFSHTMG.t_rfc_nom_x1_x32 must be less than or equal to 0x7FF. DDR4 Fixed 4x mode: RFSHTMG.t_rfc_nom_x1_x32 must be less than or equal to 0x3FF. Unit: Clocks or multiples of 32 clocks, depending on RFSHTMG.t_rfc_nom_x1_sel. Programming Mode: Dynamic - Refresh Related
15	RW	0x0	lpddr3_trefbw_en Used only when LPDDR3 memory type is connected. Should only be changed when uMCTL2 is in reset. Specifies whether to use the tREFBW parameter (required by some LPDDR3 devices which comply with earlier versions of the LPDDR3 JEDEC specification) or not. 1'b0: tREFBW parameter not used 1'b1: tREFBW parameter used Programming Mode: Static
14:10	RO	0x00	reserved
9:0	RW	0x08c	t_rfc_min tRFC (min): Minimum time from refresh to refresh or activate. t_rfc_min should be set to RoundUp(RoundUp(tRFCmin/tCK)/2). In LPDDR2/LPDDR3/LPDDR4 mode: if using all-bank refreshes, the tRFCmin value in the above equations is equal to tRFCab if using per-bank refreshes, the tRFCmin value in the above equations is equal to tRFCpb In DDR4 mode, the tRFCmin value in the above equations is different depending on the refresh mode (fixed 1X,2X,4X) and the device density. The user should program the appropriate value from the spec based on the 'refresh_mode' and the device density that is used. Unit: DFI Clocks. Programming Mode: Dynamic - Refresh Related

DDRC_CRCPARCTL0

Address: Operational Base + offset (0x00c0)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	WO	0x0	dfi_alert_err_cnt_clr DFI alert error count clear. Clear bit for DFI alert error counter. Asserting this bit will clear the DFI alert error counter, CRCPARSTAT.dfi_alert_err_cnt. When the clear operation is complete, the uMCTL2 automatically clears this bit. Programming Mode: Dynamic
1	WO	0x0	dfi_alert_err_int_clr Interrupt clear bit for DFI alert error. If this bit is set, the alert error interrupt on CRCPARSTAT.dfi_alert_err_int will be cleared. When the clear operation is complete, the uMCTL2 automatically clears this bit. Programming Mode: Dynamic
0	RW	0x0	dfi_alert_err_int_en Interrupt enable bit for DFI alert error. If this bit is set, any parity/CRC error detected on the dfi_alert_n input will result in an interrupt being set on CRCPARSTAT.dfi_alert_err_int. Programming Mode: Dynamic

DDRC_CRCPARCTL1

Address: Operational Base + offset (0x00c4)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	retry_add_rd_lat Retry additional read latency value. Delay value used is retry_add_rd_lat+1. Only used if CRCPARCTL1.retry_add_rd_lat_en is enabled. Selects the number of pipeline stages to dfi_rddata_valid/dfi_rddata/dfi_rddata_dbi before rest of internal uMCTL2 logic observes it. Required to compensate for fact delay in PHY/PCB for generating dfi_alert_n for retry may be more than the delay in PHY/PCB on read data path. Recommended settings (in terms of core_ddrc_core_clk): (Maximum Alert delay through PHY/PCB from erroneous read command including tPAR_UNKNOWN) - (Minimum Read data delay through PHY/PCB from erroneous read command) + (PHY's max granularity of dfi_rddata beats that may be corrupted before erroneous Read) Note: This calculation depends on various items such as RL, tPAR_ALERT_ON/tPAR_UNKNOWN/RCD/PHY/PCB behavior. Unit: DFI clock cycles. Programming Mode: Static
15	RW	0x0	retry_add_rd_lat_en Retry additional read latency enable. Number of pipeline stages selected is defined as CRCPARCTL1.retry_add_lat+1. Only set if CRCPARCTL1.crc_parity_retry_enable = 1 Programming Mode: Static
14:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12	RW	0x1	caparity_disable_before_sr If DDR4-SDRAM's CA parity is enabled by INIT6.mr5[2:0]!=0 and this register is set to 1, CA parity is automatically disabled before Self-Refresh entry and enabled after SelfRefresh exit by issuing MR5. 1'b1: CA parity is disabled before Self-Refresh entry 1'b0: CA parity is not disabled before Self-Refresh entry If Geardown is used by MSTR.geardown_mode=1, this register must be set to 1. If this register set to 0, DRAMTMG5.t_ckesr and DRAMTMG5.t_cksre must be increased by PL(Parity latency) Programming Mode: Static
11:8	RO	0x0	reserved
7	RW	0x0	crc_inc_dm CRC Calculation setting register 1'b1: CRC includes DM signal 1'b0: CRC not includes DM signal Present only in designs configured to support DDR4. Programming Mode: Static
6:5	RO	0x0	reserved
4	RW	0x0	crc_enable CRC enable Register 1'b1: Enable generation of CRC 1'b0: Disable generation of CRC The setting of this register should match the CRC mode register setting in the DRAM. Programming Mode: Static
3:1	RO	0x0	reserved
0	RW	0x0	parity_enable C/A Parity enable register 1'b1: Enable generation of C/A parity and detection of C/A parity error 1'b0: Disable generation of C/A parity and disable detection of C/A parity error If RCD's parity error detection or SDRAM's parity detection is enabled, this register should be 1. Programming Mode: Static

DDRC_CRCPARSTAT

Address: Operational Base + offset (0x00cc)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RO	0x0	dfi_alert_err_fatl_int Fatal parity error interrupt. One or more these situation below happens, this interrupt bit is set:MPSMX caused parity error. (RCD's parity error detection only)Parity error happens again during software intervention time MRS was in retry_fifo_max_hold_timer_x4 window from alert_n=0 or STAT.operating_mode is Init. It remains set until cleared by CRCPARCTL0.dfi_alert_err_fatl_clr. If this interrupt is asserted, system reset is strongly recommended. Programming Mode: Static

Bit	Attr	Reset Value	Description
16	RO	0x0	dfi_alert_err_int DFI alert error interrupt. If a parity/CRC error is detected on dfi_alert_n, and the interrupt is enabled by CRCPARCTL0.dfi_alert_err_int_en, this interrupt bit will be set. It will remain set until cleared by CRCPARCTL0.dfi_alert_err_int_clr Programming Mode: Static
15:0	RO	0x0000	dfi_alert_err_cnt DFI alert error count. If a parity/CRC error is detected on dfi_alert_n, this counter be incremented. This is independent of the setting of CRCPARCTL0.dfi_alert_err_int_en. It will saturate at 0xFFFF, and can be cleared by asserting CRCPARCTL0.dfi_alert_err_cnt_clr. Programming Mode: Static

DDRC_INIT0

Address: Operational Base + offset (0x00d0)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	skip_dram_init If lower bit is enabled the SDRAM initialization routine is skipped. The upper bit decides what state the controller starts up in when reset is removed 2'b00: SDRAM Intialization routine is run after power-up 2'b01: SDRAM Intialization routine is skipped after powerup. Controller starts up in Normal Mode 2'b11: SDRAM Intialization routine is skipped after powerup. Controller starts up in Self-refresh Mode 2'b10: SDRAM Intialization routine is run after power-up. Programming Mode: Quasi-dynamic Group 2

DDRC_DIMMCTL

Address: Operational Base + offset (0x00f0)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	mrs_bg1_en Enable for BG1 bit of MRS command. BG1 bit of the mode register address is specified as RFU (Reserved for Future Use) and must be programmed to 0 during MRS. In case where DRAMs which do not have BG1 are attached and both the CA parity and the Output Inversion are enabled, this must be set to 0, so that the calculation of CA parity will not include BG1 bit. Note: This has no effect on the address of any other memory accesses, or of software-driven mode register accesses. If address mirroring is enabled, this is applied to BG1 of even ranks and BG0 of odd ranks. 1'b1: Enabled 1'b0: Disabled Programming Mode: Static
3	RW	0x0	mrs_a17_en Enable for A17 bit of MRS command. A17 bit of the mode register address is specified as RFU (Reserved for Future Use) and must be programmed to 0 during MRS. In case where DRAMs which do not have A17 are attached and the Output Inversion are enabled, this must be set to 0, so that the calculation of CA parity will not include A17 bit. Note: This has no effect on the address of any other memory accesses, or of software-driven mode register accesses. 1'b1: Enabled 1'b0: Disabled Programming Mode: Static

DDRC_RANKCTL

Address: Operational Base + offset (0x00f4)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RW	0x6	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value should consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, should be increased by 1. If write preamble is set to 2tCK(DDR4 only), should be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), should be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, the requirement is ODTLoff - ODTLon - BL/2 + 1 When the controller is operating in 1:2 mode, program this to the larger value divided by two and round it up to the next integer. Programming Mode: Quasi-dynamic Group 2

Bit	Attr	Reset Value	Description
7:4	RW	0x6	diff_rank_rd_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive reads to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value should consider both PHY requirement and ODT requirement. PHY requirement: tphy_rdcsgap (see PHY databook for value of tphy_rdcsgap) If read preamble is set to 2tCK(DDR4 only), should be increased by 1. If read postamble is set to 1.5tCK(LPDDR4 only), should be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during reads. When the controller is operating in 1:2 mode, program this to the larger value divided by two and round it up to the next integer. Programming Mode: Static
3:0	RW	0xf	max_rank_rd Only present for multi-rank configurations. Background: Reads to the same rank can be performed back-to-back. Reads to different ranks require additional gap dictated by the register RANKCTL.diff_rank_rd_gap. This is to avoid possible data bus contention as well as to give PHY enough time to switch the delay when changing ranks. The uMCTL2 arbitrates for bus access on a cycle-by-cycle basis; therefore after a read is scheduled, there are few clock cycles (determined by the value on RANKCTL.diff_rank_rd_gap register) in which only reads from the same rank are eligible to be scheduled. This prevents reads from other ranks from having fair access to the data bus. This parameter represents the maximum number of reads that can be scheduled consecutively to the same rank. After this number is reached, a delay equal to RANKCTL.diff_rank_rd_gap is inserted by the scheduler to allow all ranks a fair opportunity to be scheduled. Higher numbers increase bandwidth utilization, lower numbers increase fairness. This feature can be DISABLED by setting this register to 0. When set to 0, the Controller will stay on the same rank as long as commands are available for it. Minimum programmable value is 0 (feature disabled) and maximum programmable value is 0xF. Programming Mode: Static

DDRC_DRAMTMG0

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved

Bit	Attr	Reset Value	Description
30:24	RW	0x0f	wr2pre Minimum time between write and precharge to same bank. Unit: DFI Clocks Specifications: WL + BL/2 + tWR = approximately 8 cycles + 15 ns = 14 clocks @400MHz and less for lower frequencies where: WL = write latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM. BST (burst terminate) is not supported at present. tWR = Write recovery time. This comes directly from the SDRAM specification. Add one extra cycle for LPDDR2/LPDDR3/LPDDR4 for this parameter. When the controller is operating in 1:2 frequency ratio mode, 1T mode, divide the above value by 2. No rounding up. When the controller is operating in 1:2 frequency ratio mode, 2T mode or LPDDR4 mode, divide the above value by 2 and round it up to the next integer value. Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	zq_reset_busy SoC core may initiate a ZQ Reset operation only if this signal is low. This signal goes high in the clock after the uMCTL2 accepts the ZQ Reset request. It goes low when the ZQ Reset command is issued to the SDRAM and the associated NOP period is over. It is recommended not to perform ZQ Reset commands when this signal is high. 1'b0: Indicates that the SoC core can initiate a ZQ Reset operation. 1'b1: Indicates that ZQ Reset operation is in progress. Programming Mode: Dynamic

DDRC_DFITMG0

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RW	0x07	dfi_t_ctrl_delay Specifies the number of DFI clock cycles after an assertion or de-assertion of the DFI control signals that the control signals at the PHY-DRAM interface reflect the assertion or de-assertion. If the DFI clock and the memory clock are not phase-aligned, this timing parameter should be rounded up to the next integer value. Programming Mode: Quasi-dynamic Group 4
23	RW	0x0	dfi_rddata_use_dfi_phy_clk Defines whether dfi_rddata_en/dfi_rddata/dfi_rddata_valid is generated using HDR (DFI clock) or SDR (DFI PHY clock) values. Selects whether value in DFITMG0.dfi_t_rddata_en is in terms of HDR (DFI clock) or SDR (DFI PHY clock) cycles. 1'b0: In terms of HDR (DFI clock) cycles, Only support HDR DFI clock. 1'b1: In terms of SDR (DFI PHY clock) cycles Programming Mode: Static
22:16	RW	0x02	dfi_t_rddata_en Time from the assertion of a read command on the DFI interface to the assertion of the dfi_rddata_en signal. Refer to PHY specification for correct value. This corresponds to the DFI parameter trddata_en. Unit: DFI clock cycles Programming Mode: Quasi-dynamic Group 1 and Group 4
15	RW	0x0	dfi_wrdata_use_dfi_phy_clk Defines whether dfi_wrdata_en/dfi_wrdata/dfi_wrdata_mask is generated using HDR (DFI clock) or SDR (DFI PHY clock) values Selects whether value in DFITMG0.dfi_tphy_wrlat is in terms of HDR (DFI clock) or SDR (DFI PHY clock) cycles Selects whether value in DFITMG0.dfi_tphy_wrdata is in terms of HDR (DFI clock) or SDR (DFI PHY clock) cycles 1'b0: In terms of HDR (DFI clock) cycles, Only support HDR DFI clock. 1'b1: In terms of SDR (DFI PHY clock) cycles Programming Mode: Static
14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13:8	RW	0x00	dfi_tphy_wrdata Specifies the number of clock cycles between when dfi_wrdata_en is asserted to when the associated write data is driven on the dfi_wrdata signal. This corresponds to the DFI timing parameter tphy_wrdata. Refer to PHY specification for correct value. Note, max supported value is 8. Unit: DFI clock cycles. Programming Mode: Quasi-dynamic Group 4
7:6	RO	0x0	reserved
5:0	RW	0x02	dfi_tphy_wrlat Write latency Number of clocks from the write command to write data enable (dfi_wrdata_en). This corresponds to the DFI timing parameter tphy_wrlat. Refer to PHY specification for correct value. For LPDDR4, dfi_tphy_wrlat>60 is not supported. Unit: DFI clock cycles Programming Mode: Quasi-dynamic Group 1 and Group 4

DDRC_DFITMG1

Address: Operational Base + offset (0x0194)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	dfi_t_cmd_lat Specifies the number of DFI PHY clock cycles between when the dfi_cs signal is asserted and when the associated command is driven. This field is used for CAL mode, should be set to '0' or the value which matches the CAL mode register setting in the DRAM. If the PHY can add the latency for CAL mode, this should be set to '0'. Valid Range: 0, 3, 4, 5, 6, and 8 Programming Mode: Quasi-dynamic Group 2 and Group 4
27:26	RO	0x0	reserved
25:24	RW	0x0	dfi_t_parin_lat Specifies the number of DFI PHY clock cycles between when the dfi_cs signal is asserted and when the associated dfi_parity_in signal is driven. Programming Mode: Quasi-dynamic Group 4
23:21	RO	0x0	reserved
20:16	RW	0x00	dfi_t_wrdata_delay Specifies the number of DFI clock cycles between when the dfi_wrdata_en signal is asserted and when the corresponding write data transfer is completed on the DRAM bus. This corresponds to the DFI timing parameter twrdata_delay. Refer to PHY specification for correct value. Value to be programmed is in terms of DFI clocks, not PHY clocks. In FREQ_RATIO=2, divide PHY's value by 2 and round up to next integer. Programming Mode: Quasi-dynamic Group 4
15:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12:8	RW	0x04	dfi_t_dram_clk_disable Specifies the number of DFI clock cycles from the assertion of the dfi_dram_clk_disable signal on the DFI until the clock to the DRAM memory devices, at the PHY-DRAM boundary, maintains a low value. If the DFI clock and the memory clock are not phase aligned, this timing parameter should be rounded up to the next integer value. Programming Mode: Quasi-dynamic Group 4
7:5	RO	0x0	reserved
4:0	RW	0x04	dfi_t_dram_clk_enable Specifies the number of DFI clock cycles from the deassertion of the dfi_dram_clk_disable signal on the DFI until the first valid rising edge of the clock to the DRAM memory devices, at the PHY-DRAM boundary. If the DFI clock and the memory clock are not phase aligned, this timing parameter should be rounded up to the next integer value. Programming Mode: Quasi-dynamic Group 4

DDRC_DFILPCFG0

Address: Operational Base + offset (0x0198)

Bit	Attr	Reset Value	Description

0	RW	0x0	dfi_lp_en_mpsm Enables DFI Low Power interface handshaking during Maximum Power Saving Mode Entry/Exit. 1'b0: Disabled 1'b1: Enabled This is only present for designs supporting DDR4 devices. Programming Mode: Static

DDRC_DFIUPD0

Address: Operational Base + offset (0x01a0)

Bit	Attr	Reset Value	Description
31	RW	0x0	dis_auto_ctrlupd When '1', disable the automatic dfi_ctrlupd_req generation by the uMCTL2. The core must issue the dfi_ctrlupd_req signal using register DBGCMD.ctrlupd. When '0', uMCTL2 issues dfi_ctrlupd_req periodically. Programming Mode: Quasi-dynamic Group 3
30	RW	0x0	dis_auto_ctrlupd_srx When '1', disable the automatic dfi_ctrlupd_req generation by the uMCTL2 at self-refresh exit. When '0', uMCTL2 issues a dfi_ctrlupd_req before or after exiting self-refresh, depending on DFIUPD0.ctrlupd_pre_srx. Programming Mode: Static
29	RW	0x0	ctrlupd_pre_srx Selects dfi_ctrlupd_req requirements at SRX. 1'b0: Send ctrlupd after SRX 1'b1: Send ctrlupd before SRX If DFIUPD0.dis_auto_ctrlupd_srx=1, this register has no impact, because no dfi_ctrlupd_req will be issued when SRX. Programming Mode: Static
28:26	RO	0x0	reserved
25:16	RW	0x040	dfi_t_ctrlup_max Specifies the maximum number of DFI clock cycles that the dfi_ctrlupd_req signal can assert. Lowest value to assign to this variable is 0x40. Programming Mode: Static
15:10	RO	0x00	reserved
9:0	RW	0x003	dfi_t_ctrlup_min Specifies the minimum number of DFI clock cycles that the dfi_ctrlupd_req signal must be asserted. The uMCTL2 expects the PHY to respond within this time. If the PHY does not respond, the uMCTL2 will de-assert dfi_ctrlupd_req after dfi_t_ctrlup_min + 2 cycles. Lowest value to assign to this variable is 0x3. Programming Mode: Static

DDRC_DFIUPD1

Address: Operational Base + offset (0x01a4)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x00	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between uMCTL2 initiated DFI update requests (which is executed whenever the uMCTL2 is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the uMCTL2 is idle. Minimum allowed value for this field is 1. Unit: 1024 DFI clock cycles Programming Mode: Static
15:8	RO	0x00	reserved
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between uMCTL2 initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for DFIUPD1.dfi_t_ctrlupd_interval_max_x1024 must be greater than DFIUPD1.dfi_t_ctrlupd_interval_min_x1024. Unit: 1024 DFI clock cycles Programming Mode: Static

DDRC_DFIUPD2

Address: Operational Base + offset (0x01a8)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	dfi_phyupd_en Enables the support for acknowledging PHY-initiated updates: 1'b0: Disabled 1'b1: Enabled Programming Mode: Static

DDRC_DFIMISC

Address: Operational Base + offset (0x01b0)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:8	RW	0x00	dfi_frequency Indicates the operating frequency of the system. The number of supported frequencies and the mapping of signal values to clock frequencies are defined by the PHY. Programming Mode: Quasi-dynamic Group 1
7:6	RO	0x0	reserved
5	RW	0x0	dfi_init_start PHY init start request signal.When asserted it triggers the PHY init start request. Programming Mode: Quasi-dynamic Group 3
4	RW	0x0	ctl_idle_en Enables support of ctl_idle signal, which is non-DFI related pin specific to certain Synopsys PHYs. See signal description of ctl_idle signal for further details of ctl_idle functionality. Programming Mode: Static

Bit	Attr	Reset Value	Description
3	RW	0x0	share_dfi_dram_clk_disable Indicate dfi_dram_clk_disable is shared for two channels or not. 1'b1: Share mode 1'b0: Not share In Shared mode, Controller does not request PHY stop clock while any rank of any channel has not disable clock. Note: when dfi_dram_clk_disable is shared by two channels, an additional DFF is inserted, that will cause dram clock enable is delay one cycle. Suggest set dfi_t_dram_clk_enable value to Tdram_clk_enable+1. Tdram_clk_enable value is from PHY, which indicate how many cycles from dfi_dram_clk_disable de-assert to dram clock output. Programming Mode: Static
2	RW	0x0	dfi_data_cs_polarity Defines polarity of dfi_wrdata_cs and dfi_rddata_cs signals. 1'b0: Signals are active low. 1'b1: Signals are active high. Programming Mode: Static
1	RW	0x0	phy_dbi_mode DBI implemented in DDRC or PHY. 1'b0: DDRC implements DBI functionality. 1'b1: PHY implements DBI functionality. Present only in designs configured to support DDR4 and LPDDR4. Programming Mode: Static
0	RW	0x1	dfi_init_complete_en PHY initialization complete enable signal. When asserted the dfi_init_complete signal can be used to trigger SDRAM initialisation. Programming Mode: Quasi-dynamic Group 3

DDRC_SCHED

Address: Operational Base + offset (0x0250)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:24	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. Programming Mode: Static
23:12	RO	0x000	reserved

Bit	Attr	Reset Value	Description
11:8	RW	0x8	lpr_num_entries Number of entries in the low priority transaction store is this value + 1. (MEMC_NO_OF_ENTRY - (SCHED.lpr_num_entries + 1)) is the number of entries available for the high priority transaction store. Setting this to maximum value allocates all entries to low priority transaction store. Setting this to 0 allocates 1 entry to low priority transaction store and the rest to high priority transaction store. Programming Mode: Static
7:3	RO	0x00	reserved
2	RW	0x1	pageclose If true, bank is kept open only while there are page hit transactions available in the CAM to that bank. The last read or write command in the CAM with a bank and page hit will be executed with auto-precharge if SCHED1.pageclose_timer=0. Even if this register set to 1 and SCHED1.pageclose_timer is set to 0, explicit precharge (and not auto-precharge) may be issued in some cases where there is a mode switch between Write and Read or between LPR and HPR. The Read and Write commands that are executed as part of the ECC scrub requests are also executed without auto-precharge. If false, the bank remains open until there is a need to close it (to open a different page, or for page timeout or refresh timeout) - also known as open page policy. The pageclose feature provids a midway between Open and Close page policies. Programming Mode: Quasi-dynamic Group 3

DDRC_SCHED1

Address: Operational Base + offset (0x0254)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	pageclose_timer This field works in conjunction with SCHED.pageclose. It only has meaning if SCHED.pageclose==1. If SCHED.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See SCHED.pageclose for details of when this may happen. If SCHED.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Programming Mode: Static

DDRC_PERFLPR1

Address: Operational Base + offset (0x0264)

Bit	Attr	Reset Value	Description
31:24	RW	0x0f	lpr_xact_run_length Number of transactions that are serviced once the LPR queue goes critical is the smaller of: (a) This number (b) Number of transactions available. Unit: Transaction. Programming Mode: Quasi-dynamic Group 3
23:16	RO	0x00	reserved
15:0	RW	0x007f	lpr_max_starve Number of DFI clocks that the LPR queue can be starved before it goes critical. The minimum valid functional value for this register is 0x1. Programming it to 0x0 will disable the starvation functionality; during normal operation, this function should not be disabled as it will cause excessive latencies. Programming Mode: Quasi-dynamic Group 3

DDRC_PERFWR1

Address: Operational Base + offset (0x026c)

Bit	Attr	Reset Value	Description
31:24	RW	0x0f	w_xact_run_length Number of transactions that are serviced once the WR queue goes critical is the smaller of: (a) This number (b) Number of transactions available. Unit: Transaction. Programming Mode: Quasi-dynamic Group 3
23:16	RO	0x00	reserved
15:0	RW	0x007f	w_max_starve Number of DFI clocks that the WR queue can be starved before it goes critical. The minimum valid functional value for this register is 0x1. Programming it to 0x0 will disable the starvation functionality; during normal operation, this function should not be disabled as it will cause excessive latencies. Programming Mode: Quasi-dynamic Group 3

DDRC_DBG0

Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	dis_collision_page_opt When this is set to '0', auto-precharge is disabled for the flushed command in a collision case. Collision cases are write followed by read to same address, read followed by write to same address, or write followed by write to same address with DBG0.dis_wc bit = 1 (where same address comparisons exclude the two address bits representing critical word). Programming Mode: Static

DDRC_DBG1

Address: Operational Base + offset (0x0304)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	dis_hif When 1, uMCTL2 asserts the HIF command signal hif_cmd_stall. uMCTL2 will ignore the hif_cmd_valid and all other associated request signals. This bit is intended to be switched on-the-fly. Programming Mode: Dynamic
0	RW	0x0	dis_dq When 1, uMCTL2 will not de-queue any transactions from the CAM. Bypass is also disabled. All transactions are queued in the CAM. No reads or writes are issued to SDRAM as long as this is asserted. This bit may be used to prevent reads or writes being issued by the uMCTL2, which makes it safe to modify certain register fields associated with reads and writes (see User Guide for details). After setting this bit, it is strongly recommended to poll DBGCAM.wr_data_pipeline_empty and DBGCAM.rd_data_pipeline_empty, before making changes to any registers which affect reads and writes. This will ensure that the relevant logic in the DDRC is idle. This bit is intended to be switched on-the-fly. Programming Mode: Dynamic

DDRC_DBGCAM

Address: Operational Base + offset (0x0308)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RO	0x0	wr_data_pipeline_empty When 1, indicates that the write data pipeline on the DFI interface is empty. This register is intended to be polled at least twice after setting DBG1.dis_dq, to ensure that all remaining commands/data have completed. Programming Mode: Dynamic
28	RO	0x0	rd_data_pipeline_empty When 1indicates that the read data pipeline on the DFI interface is empty. This register is intended to be polled at least twice after setting DBG1.dis_dq, to ensure that all remaining commands/data have completed. Programming Mode: Dynamic
27	RO	0x0	reserved
26	RO	0x0	dbg_wr_q_empty When 1, all the Write command queues and Write data buffers inside DDRC are empty. This register is to be used for debug purpose. An example use-case scenario: When Controller enters SelfRefresh using the Low-Power entry sequence, Controller is expected to have executed all the commands in its queues and the write and read data drained. Hence this register should be 1 at that time. Programming Mode: Dynamic
25	RO	0x0	dbg_rd_q_empty When 1, all the Read command queues and Read data buffers inside DDRC are empty. This register is to be used for debug purpose. An example use-case scenario: When Controller enters SelfRefresh using the Low-Power entry sequence, Controller is expected to have executed all the commands in its queues and the write and read data drained. Hence this register should be 1 at that time. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
24	RO	0x0	dbg_stall Stall Programming Mode: Dynamic
23:20	RO	0x0	reserved
19:16	RO	0x0	dbg_w_q_depth Write queue depth The last entry of WR queue is reserved for ECC SCRUB operation. This entry is not included in the calculation of the queue depth. Programming Mode: Dynamic
15:12	RO	0x0	reserved
11:8	RO	0x0	dbg_lpr_q_depth Low priority read queue depth. The last entry of Lpr queue is reserved for ECC SCRUB operation. This entry is not included in the calculation of the queue depth. Programming Mode: Dynamic

DDRC_DBGCMD

Address: Operational Base + offset (0x030c)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	ctrlupd Setting this register bit to 1 indicates to the uMCTL2 to issue a dfi_ctrlupd_req to the PHY. When this request is stored in the uMCTL2, the bit is automatically cleared. This operation must only be performed when DFIUPD0.dis_auto_ctrlupd=1. Programming Mode: Dynamic
4	RW	0x0	zq_calib_short Setting this register bit to 1 indicates to the uMCTL2 to issue a ZQCS (ZQ calibration short)/MPC(ZQ calibration) command to the SDRAM. When this request is stored in the uMCTL2, the bit is automatically cleared. This operation can be performed only when ZQCTL0.dis_auto_zq=1. It is recommended NOT to set this register bit if in Init operating mode. This register bit is ignored when in SelfRefresh(except LPDDR4) and SR-Powerdown(LPDDR4) and Deep power-down operating modes and Maximum Power Saving Mode. Programming Mode: Dynamic
3:2	RO	0x0	reserved
1	RW	0x0	rank1_refresh Setting this register bit to 1 indicates to the uMCTL2 to issue a refresh to rank 1. Writing to this bit causes DBGSTAT.rank1_refresh_busy to be set. When DBGSTAT.rank1_refresh_busy is cleared, the command has been stored in uMCTL2. This operation can be performed only when RFSHCTL3.dis_auto_refresh=1. It is recommended NOT to set this register bit if in Init or Deep power-down operating modes or Maximum Power Saving Mode. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
0	RW	0x0	rank0_refresh Setting this register bit to 1 indicates to the uMCTL2 to issue a refresh to rank 0. Writing to this bit causes DBGSTAT.rank0_refresh_busy to be set. When DBGSTAT.rank0_refresh_busy is cleared, the command has been stored in uMCTL2. This operation can be performed only when RFSHCTL3.dis_auto_refresh=1. It is recommended NOT to set this register bit if in Init or Deep power-down operating modes or Maximum Power Saving Mode. Programming Mode: Dynamic

DDRC_DBGSTAT

Address: Operational Base + offset (0x0310)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RO	0x0	ctrlupd_busy SoC core may initiate a ctrlupd operation only if this signal is low. This signal goes high in the clock after the uMCTL2 accepts the ctrlupd request. It goes low when the ctrlupd operation is initiated in the uMCTL2. It is recommended not to perform ctrlupd operations when this signal is high. 1'b0: Indicates that the SoC core can initiate a ctrlupd operation. 1'b1: Indicates that ctrlupd operation has not been initiated yet in the uMCTL2. Programming Mode: Dynamic
4	RO	0x0	zq_calib_short_busy SoC core may initiate a ZQCS (ZQ calibration short) operation only if this signal is low. This signal goes high in the clock after the uMCTL2 accepts the ZQCS request. It goes low when the ZQCS operation is initiated in the uMCTL2. It is recommended not to perform ZQCS operations when this signal is high. 1'b0: Indicates that the SoC core can initiate a ZQCS operation. 1'b1: Indicates that ZQCS operation has not been initiated yet in the uMCTL2. Programming Mode: Dynamic
3:2	RO	0x0	reserved
1	RO	0x0	rank1_refresh_busy SoC core may initiate a rank1_refresh operation (refresh operation to rank 1) only if this signal is low. This signal goes high in the clock after DBGCMD.rank1_refresh is set to one. It goes low when the rank1_refresh operation is stored in the uMCTL2. It is recommended not to perform rank1_refresh operations when this signal is high. 1'b0: Indicates that the SoC core can initiate a rank1_refresh operation. 1'b1: Indicates that rank1_refresh operation has not been stored yet in the uMCTL2. Programming Mode: Dynamic

Bit	Attr	Reset Value	Description
0	RO	0x0	rank0_refresh_busy SoC core may initiate a rank0_refresh operation (refresh operation to rank 0) only if this signal is low. This signal goes high in the clock after DBGCMD.rank0_refresh is set to one. It goes low when the rank0_refresh operation is stored in the uMCTL2. It is recommended not to perform rank0_refresh operations when this signal is high. 1'b0: Indicates that the SoC core can initiate a rank0_refresh operation. 1'b1: Indicates that rank0_refresh operation has not been stored yet in the uMCTL2. Programming Mode: Dynamic

DDRC_SWCTL

Address: Operational Base + offset (0x0320)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	sw_done Enable quasi-dynamic register programming outside reset. Program register to 0 to enable quasi-dynamic programming. Set back register to 1 once programming is done. Programming Mode: Dynamic

DDRC_SWSTAT

Address: Operational Base + offset (0x0324)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x1	sw_done_ack Register programming done. This register is the echo of SWCTL.sw_done. Wait for sw_done value 1 to propagate to sw_done_ack at the end of the programming sequence to ensure that the correct registers values are propagated to the destination clock domains. Programming Mode: Static

DDRC_POISONCFG

Address: Operational Base + offset (0x036c)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	rd_poison_intr_clr Interrupt clear for read transaction poisoning. Allow 2/3 clock cycles for correct value to propagate to core logic and clear the interrupts. Programming Mode: Dynamic
23:21	RO	0x0	reserved
20	RW	0x1	rd_poison_intr_en If set to 1, enables interrupts for read transaction poisoning. Programming Mode: Dynamic
19:17	RO	0x0	reserved
16	RW	0x1	rd_poison_slverr_en If set to 1, enables SLVERR response for read transaction poisoning. Programming Mode: Dynamic
15:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	WO	0x0	wr_poison_intr_clr Interrupt clear for write transaction poisoning. Allow 2/3 clock cycles for correct value to propagate to core logic and clear the interrupts. Programming Mode: Dynamic
7:5	RO	0x0	reserved
4	RW	0x1	wr_poison_intr_en If set to 1, enables interrupts for write transaction poisoning. Programming Mode: Dynamic
3:1	RO	0x0	reserved
0	RW	0x1	wr_poison_slverr_en If set to 1, enables SLVERR response for write transaction poisoning. Programming Mode: Dynamic

DDRC_POISONSTAT

Address: Operational Base + offset (0x0370)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	rd_poison_intr_0 Read transaction poisoning error interrupt for port 0. This register is a APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port's read address channel. Bit 0 corresponds to Port 0, and so on. Interrupt is cleared by register rd_poison_intr_clr, then value propagated to APB clock. Programming Mode: Dynamic
15:1	RO	0x0000	reserved
0	RO	0x0	wr_poison_intr_0 Write transaction poisoning error interrupt for port 0. This register is a APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port's write address channel. Bit 0 corresponds to Port 0, and so on. Interrupt is cleared by register wr_poison_intr_clr, then value propagated to APB clock. Programming Mode: Dynamic

DDRC_PSTAT

Address: Operational Base + offset (0x03fc)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	wr_port_busy_0 Indicates if there are outstanding writes for AXI port 0. Programming Mode: Dynamic
15:1	RO	0x0000	reserved
0	RO	0x0	rd_port_busy_0 Indicates if there are outstanding reads for AXI port 0. Programming Mode: Dynamic

DDRC_PCCFG

Address: Operational Base + offset (0x0400)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	bl_exp_mode Burst length expansion mode. By default (i.e. bl_exp_mode==0) XPI expands every AXI burst into multiple HIF commands, using the memory burst length as a unit. If set to 1, then XPI will use half of the memory burst length as a unit. This applies to both reads and writes. When MSTR.data_bus_width==00, setting bl_exp_mode to 1 has no effect. This can be used in cases where Partial Writes is enabled (UMCTL2_PARTIAL_WR=1), in order to avoid or minimize t_ccd_l penalty in DDR4 and t_ccd_mw penalty in LPDDR4. Hence, bl_exp_mode=1 is only recommended if DDR4 or LPDDR4. Note that if DBICTL.dm_en=0, functionality is not supported in the following cases: UMCTL2_PARTIAL_WR=0 UMCTL2_PARTIAL_WR=1, MSTR.data_bus_width=01, MEMC_BURST_LENGTH=8 and MSTR.burst_rdwr=1000 (LPDDR4 only) UMCTL2_PARTIAL_WR=1, MSTR.data_bus_width=01, MEMC_BURST_LENGTH=4 and MSTR.burst_rdwr=0100 (DDR4 only), with either MSTR.burstchop=0 or CRCPARCTL1.crc_enable=1 Programming Mode: Static
7:5	RO	0x0	reserved
4	RW	0x0	pagematch_limit Page match four limit. If set to 1, limits the number of consecutive same page DDRC transactions that can be granted by the Port Arbiter to four when Page Match feature is enabled. If set to 0, there is no limit imposed on number of consecutive same page DDRC transactions. Programming Mode: Static
3:1	RO	0x0	reserved
0	RW	0x0	go2critical_en If set to 1 (enabled), sets co_gs_go2critical_wr and co_gs_go2critical_lpr / co_gs_go2critical_hpr signals going to DDRC based on urgent input (awurgent, arurgent) coming from AXI master. If set to 0 (disabled), co_gs_go2critical_wr and co_gs_go2critical_lpr / co_gs_go2critical_hpr signals at DDRC are driven to 1b'0. Programming Mode: Static

DDRC_PCFGR_0

Address: Operational Base + offset (0x0404)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	RW	0x0	rd_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related PCCFG.pagematch_limit register. Programming Mode: Static

Bit	Attr	Reset Value	Description
13	RW	0x0	rd_port_urgent_en If set to 1, enables the AXI urgent sideband signal (arurgent). When enabled and arurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_lpr/co_gs_go2critical_hpr signal to DDRC is asserted if enabled in PCCFG.go2critical_en register. Note that arurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Programming Mode: Static
12	RW	0x0	rd_port_aging_en If set to 1, enables aging function for the read channel of the port. Programming Mode: Static
11:10	RO	0x0	reserved
9:0	RW	0x000	rd_port_priority Determines the initial load value of read aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the read aging counter sets the priority of the read channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level (timeout condition -Priority0). For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. In this case, external dynamic priority input, arqos (for reads only) can still be used to set the DDRC read priority (2 priority levels: low priority read - LPR, high priority read - HPR) on a command by command basis. Note: The two LSBs of this register field are tied internally to 2'b00. Programming Mode: Static

DDRC_PCFGW_0

Address: Operational Base + offset (0x0408)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	RW	0x1	wr_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related PCCFG.pagematch_limit register. Programming Mode: Static
13	RW	0x0	wr_port_urgent_en If set to 1, enables the AXI urgent sideband signal (awurgent). When enabled and awurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_wr signal to DDRC is asserted if enabled in PCCFG.go2critical_en register. Note that awurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Programming Mode: Static

Bit	Attr	Reset Value	Description
12	RW	0x0	wr_port_aging_en If set to 1, enables aging function for the write channel of the port. Programming Mode: Static
11:10	RO	0x0	reserved
9:0	RW	0x000	wr_port_priority Determines the initial load value of write aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the write aging counter sets the initial priority of the write channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level. For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. When enable the read training bpass mode, after send out the read command and the read back data will be received by the phy and store in the following registers. When this bit is high, it means the read back data is valid. [0]: The read back data valid signal of byte0. [1]: The read back data valid signal of byte1. [2]: The read back data valid signal of byte2. [3]: The read back data valid signal of byte3. [4]: The read back data valid signal of byte4

Bit	Attr	Reset Value	Description
19:15	RO	0x00	reg_train_done_for_rd_to_reg The done signal of read train for byte0 to byte4. Active high. [0]: The done signal of the read train for byte0. [1]: The done signal of the read train for byte1. [2]: The done signal of the read train for byte2. [3]: The done signal of the read train for byte3. [4]: The done signal of the read train for byte4
14:10	RO	0x00	reg_train_error_for_rd_byte The error signal of read train for byte0 to byte4. Active high. [0]: The error signal of the read train for byte0. [1]: The error signal of the read train for byte1. [2]: The error signal of the read train for byte2. [3]: The error signal of the read train for byte3. [4]: The error signal of the read train for byte4.
9:5	RO	0x00	reg_wr_train_done_byte The done flag of the write training for byte0 to byte4. High means done. [0]: The done flag of the write training for byte0. [1]: The done flag of the write training for byte1. [2]: The done flag of the write training for byte2. [3]: The done flag of the write training for byte3. [4]: The done flag of the write training for byte4
4:0	RO	0x00	reg_wr_train_error_byte The error flag of the write training for byte0 to byte4. High means error. [0]: The error flag of the write training for byte0. [1]: The error flag of the write training for byte1. [2]: The error flag of the write training for byte2. [3]: The error flag of the write training for byte3. [4]: The error flag of the write training for byte4

1.4.3 Registers Summary For DDR Monitor

Name	Offset	Size	Reset Value	Description
DDRMON_IP_VERSION	0x0000	W	0x00000023	DDR Monitor IP Version
DDRMON_CTRL	0x0004	W	0x00000008	DDR Monitor Control Register
DDRMON_INT_STATUS	0x0008	W	0x00000000	Interrupt Status
DDRMON_INT_MASK	0x000C	W	0x00000000	Interrupt mask control
DDRMON_TIMER_COUNT	0x0010	W	0x00000000	The DFI Timer Threshold
DDRMON_FLOOR_NUMBER	0x0014	W	0x00000000	The Low Threshold in the Comparison of DDR Access
DDRMON_TOP_NUMBER	0x0018	W	0x00000000	The High Threshold in the Comparison of DDR Access
DDRMON_DFI_ACT_NUM	0x001C	W	0x00000000	DFI Active Command Number
DDRMON_DFI_WR_NUM	0x0020	W	0x00000000	DFI Write Command Number
DDRMON_DFI_RD_NUM	0x0024	W	0x00000000	DFI Read Command Number
DDRMON_COUNT_NUM	0x0028	W	0x00000000	Timer Count Number
DDRMON_DFI_ACCESS_NUM	0x002C	W	0x00000000	DFI Read And Write Command Number
DDRMON_TOP_LP_NUMBER	0x0030	W	0x00000000	The High Threshold In The Comparison Of DDR Cke Low
DDRMON_FLOOR_LP_NUMBER	0x0034	W	0x00000000	The Low Threshold In The Comparison Of DDR Cke Low
DDRMON_DFI_SREX_NUM	0x0038	W	0x00000000	Number Of Cke Low For DFI Self-refresh

Name	Offset	Size	Reset Value	Description
DDRMON_DFI_PDEX_NUM	0x003C	W	0x00000000	Number Of Cke Low For DFI Power Down
DDRMON_DFI_CLKSTOP_NUM	0x0040	W	0x00000000	Number Of Cke Low For DFI Clkstop
DDRMON_DFI_LP_NUM	0x0044	W	0x00000000	Total Number Of Cke Low
DDRMON_DFI_PHY_LP_NUM	0x0048	W	0x00000000	DDR Phy Low Power
DDRMON_IF_CTRL	0x0200	W	0x00000000	DDR Interface Control Register
DDRMON_MSTID	0x0204	W	0x00000000	Master And AXI ID Of DDR Command
DDRMON_IDMSK	0x0208	W	0x00000000	Master And AXI ID MASK Of DDR Command
DDRMON_WR_START_ADDR	0x020C	W	0x00000000	Write Start Address
DDRMON_WR_END_ADDR	0x0210	W	0x00000000	Write End Address
DDRMON_RD_START_ADDR	0x0214	W	0x00000000	Read Start Address
DDRMON_RD_END_ADDR	0x0218	W	0x00000000	Read End Address
DDRMON_FIFO0_ADDR	0x0240	W	0x00000000	DDR Controller Interface Address FIFO0
DDRMON_FIFO0_ID	0x0244	W	0x00000000	DDR Controller Interface Command ID FIFO0
DDRMON_FIFO1_ADDR	0x0248	W	0x00000000	DDR Controller Interface Address FIFO1
DDRMON_FIFO1_ID	0x024C	W	0x00000000	DDR Controller Interface Command ID FIFO1
DDRMON_FIFO2_ADDR	0x0250	W	0x00000000	DDR Controller Interface Address FIFO2
DDRMON_FIFO2_ID	0x0254	W	0x00000000	DDR Controller Interface Command ID FIFO2
DDRMON_FIFO3_ADDR	0x0258	W	0x00000000	DDR Controller Interface Address FIFO3
DDRMON_FIFO3_ID	0x025C	W	0x00000000	DDR Controller Interface Command ID FIFO3

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

1.4.4 Detail Registers Description

DDRMON_IP_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RO	0x23	ip_version DDR monitor IP version

DDRMON_CTRL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_enable When bit 16=1, bit 0 can be written by softwar. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15:8	RO	0x00	reserved
7:6	RW	0x0	rank_cs_num define the rank number for monitor 2'b01 1 rank 2'b10 2 rank other value: 4 rank
5	RW	0x0	ddr4_en 1'b1: Enable 1'b0: Disable
4	RW	0x0	lpddr4_en 1'b1: Enable 1'b0: Disable
3	RW	0x1	hardware_en 1'b1: Enable 1'b0: Disable
2	RW	0x0	lpddr23_en Enable lpddr2 or lpddr3 1'b1: Enable 1'b0: Disable
1	RW	0x0	software_en 1'b1: Enable 1'b0: Disable
0	RW	0x0	timer_cnt_en 1'b1: Enable 1'b0: Disable

DDRMON_INT_STATUS

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
12	RO	0x0	rd_addr_hit This is the interrupt status read address hit the setting range.
11	RO	0x0	wr_addr_hit This is the interrupt status write address hit the setting range.
10	RO	0x0	over_int_phylp This is the interrupt status of DDR PHY LP number over than high threshold. Only valid for lpddr2/lpddr3/lpddr4.
9	RO	0x0	below_int_phylp This is the interrupt status of DDR PHY LP number less than low threshold. Only valid for lpddr2/lpddr3/lpddr4.
8	RO	0x0	over_int_clkstop This is the interrupt status of DDR clk stop number over than high threshold. Only valid for lpddr2/lpddr3/lpddr4.
7	RO	0x0	below_int_clkstop This is the interrupt status of DDR clk stop number less than low threshold. Only valid for lpddr2/lpddr3/lpddr4.

Bit	Attr	Reset Value	Description
6	RO	0x0	over_int_pdex This is the interrupt status of DDR power down number over than high threshold.
5	RO	0x0	below_int_pdex This is the interrupt status of DDR power down number less than low threshold.
4	RW	0x0	compare_statistics This is the interrupt status to statistics the number of activate, write or read command and so on.
3	RW	0x0	over_int_srex This is the interrupt status of DDR self refresh number over than high threshold.
2	RW	0x0	below_int_srex This is the interrupt status of DDR self refresh number less than low threshold.
1	RO	0x0	over_int This is the interrupt status of DDR read and write burst number more than high threshold.
0	RO	0x0	below_int This is the interrupt status of DDR read and write burst number less than low threshold.

DDRMON_INT_MASK

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	write_enable When bit 16=1, bit 0 can be written by softwar. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15:11	RO	0x00	reserved
10	RW	0x0	rd_addr_hit_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
9	RW	0x0	wr_addr_hit_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
8	RW	0x0	over_int_clkstop_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
7	RW	0x0	below_int_clkstop_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
6	RO	0x0	over_int_pdex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
5	RO	0x0	below_int_pdex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

Bit	Attr	Reset Value	Description
4	RW	0x0	compare_statistics_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
3	RW	0x0	over_int_srex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
2	RW	0x0	below_int_srex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
1	RO	0x0	over_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
0	RO	0x0	below_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

DDRMON_TIMER_COUNT

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	timer_count The timer counter threshold, the statistics of DDR access only be done when timer counter is less then this threshold in hardware mode, in OSC clock cycle.

DDRMON_FLOOR_NUMBER

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	floor_number The low threshold in the comparison of DDR access.

DDRMON_TOP_NUMBER

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	top_number The high threshold in the comparison of DDR access.

DDRMON_DFI_ACT_NUM

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_act_num DFI active command number in the statistics range.

DDRMON_DFI_WR_NUM

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_wr_num DFI write command number in the statistics range.

DDRMON_DFI_RD_NUM

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_rd_num DFI read command number in the statistics range.

DDRMON_COUNT_NUM

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_count_num The DFI counter number in the statistics range, in DDR clock cycle.

DDRMON_DFI_ACCESS_NUM

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_access_num DFI read and write command number in the statistics range.

DDRMON_TOP_LP_NUMBER

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	top_lp_number The high threshold in the comparison of DDR self-refresh, power down or clkstop.

DDRMON_FLOOR_LP_NUMBER

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	floor_lp_number The low threshold in the comparison of DDR self-refresh, power down or clkstop.

DDRMON_DFI_SREX_NUM

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_srex_num DFI self-refresh number during cke low.

DDRMON_DFI_PDEX_NUM

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_pdex_num DFI power down number during cke low.

DDRMON_DFI_CLKSTOP_NUM

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_clkstop_num DFI clkstop number during cke low. Only valid for lpddr2/3/4.

DDRMON_DFI_LP_NUM

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_lp_num The sum of DFI self-refresh, power down and clkstop number during cke low.

DDRMON_DFI_PHY_LP_NUM

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dfi_phy_lp_num Phy low power count number during the time both dfi_lp_req and dfi_lp_ack assert.

DDRMON_IF_CTRL

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15:3	RO	0x0000	reserved
2	RW	0x0	if_mon_en 1'b1: Enable 1'b0: Disable
1	RO	0x0	reserved
0	RW	0x0	direction 1'b1: Read 1'b0: Write

DDRMON_MSTID

Address: Operational Base + offset (0x0204)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	ddr_mstid High 7 bits: Master ID Low 10 bits: AXI command ID

DDRMON_IDMSK

Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	ddr_idmsk When bit set to high, this bit of MSTID will be masked, and does not take part in the ID comparison.

DDRMON_WR_START_ADDR

Address: Operational Base + offset (0x020C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_start_addr Write start address for address comparison.

DDRMON_WR_END_ADDR

Address: Operational Base + offset (0x0210)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_end_addr Write end address for address comparison.

DDRMON_RD_START_ADDR

Address: Operational Base + offset (0x0214)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	rd_start_addr Read start address for address comparison.

DDRMON_RD_END_ADDR

Address: Operational Base + offset (0x0218)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	rd_end_addr Read end address for address comparison.

DDRMON_FIFO0_ADDR

Address: Operational Base + offset (0x0240)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ddr_fifo0_addr DDR controller interface address FIFO0.

DDRMON_FIFO0_ID

Address: Operational Base + offset (0x0244)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RO	0x00000	ddr_fifo0_id DDR controller interface command ID FIFO0.

DDRMON_FIFO1_ADDR

Address: Operational Base + offset (0x0248)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ddr_fifo1_addr DDR controller interface address FIFO1.

DDRMON_FIFO1_ID

Address: Operational Base + offset (0x024C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RO	0x00000	ddr_fifo1_id DDR controller interface command ID FIFO1.

DDRMON_FIFO2_ADDR

Address: Operational Base + offset (0x0250)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ddr_fifo2_addr DDR controller interface address FIFO2.

DDRMON_FIFO2_ID

Address: Operational Base + offset (0x0254)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RO	0x00000	ddr_fifo2_id DDR controller interface command ID FIFO2.

DDRMON_FIFO3_ADDR

Address: Operational Base + offset (0x0258)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ddr_fifo3_addr DDR controller interface address FIFO3.

DDRMON_FIFO3_ID

Address: Operational Base + offset (0x025C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RO	0x00000	ddr_fifo3_id DDR controller interface command ID FIFO3.

1.4.5 Registers Summary For HWFFC

Name	Offset	Size	Reset Value	Description
HWFFC_HWFFC_EN	0x0000	W	0x00000000	HWFFC enable register
HWFFC_HWFFC_MODE	0x0004	W	0x00000000	HWFFC mode
HWFFC_HWFFC_CTRL	0x0008	W	0x00000000	HWFFC control
HWFFC_HWFFC_INT_STATUS	0x000C	W	0x00000000	Int status
HWFFC_HWFFC_CNT	0x0010	W	0x00000000	Count
HWFFC_HWFFC_INT_EN	0x0014	W	0x00000000	Int Enable

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

1.4.6 Detail Registers Description

HWFFC_HWFFC_EN

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	hwffc_en 1'b0 diable hwffc function 1'b1 enable hwffc function, this bit should be configured at the last of a sequence of a software operations.

HWFFC_HWFFC_MODE

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	hwffc_mode To choose hwffc mode, which are 2'b00 automode 2'b01 semi-auto mode 2'b11 sw mode The differences of 3 modes are: Auto mode send hwffc request to ddrc and switch clock automatically. Semi-auto mode send hwffc request to ddrc automatically but clock switch is handle by software. In SW mode, software controls sending request to ddrc and clock switch.

HWFFC_HWFFC_CTRL

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RW	0x0	hwffc_clk_switch_sw when bit10 of HWFFC_CTRL=1, hardware clk_switch value = hwffc_clk_switch_sw

Bit	Attr	Reset Value	Description
10	RW	0x0	clk_switch_sw_en 1'b1 hardware clk_switch value equals to hwffc_clk_switch_sw(bit 11 of HWFFC_CTRL) 1'b0 disable this function
9	RW	0x0	clk_switch_semi_en 1'b1 hardware clock switch is enabled for semi-auto mode 1'b0 hardware clock switch is not enabled for semi-auto mode
8	RW	0x0	clk_switch_auto_en 1'b1: hardware clock switch is enabled for auto mode 1'b0: hardware clock switch is not enabled for auto mode
7	RW	0x0	ignore_phy_ready 1'b0: after clock switch, wait a phy ready signal and continue 1'b1: Do not wait phy ready signal when hwffc
6	RW	0x0	hwffc_clk_switch_load Only used in auto mode or semi-auto mode The initial value of cru switch signal
5	RW	0x0	hwffc_clk_switch_init Only used in auto mode or semi-auto mode 1'b1: load the initial value of cru switch signal, which is a mux select pin of a clock switch. 1'b0: Disable loading
4	RW	0x0	csysreq_ddrc_sw Only used in SW mode When in SW mode, configure this bit to send csysreq_ddrc request to the controller. 1'b0: send request 1'b1: not send request
3	RW	0x0	csysdiscamdrain_ddrc Disable CAM draining for DDRC Hardware Fast Frequency Change. When asserted, Self-Refresh can be entered without draining CAM. This signal is effective only when Hardware Fast Frequency Change is requested (that is, csysreq_ddrc=0 and csysmode_ddrc=1).
2:1	RW	0x0	csysrequency_ddrc Target frequency for DDRC Hardware Fast Frequency Change. This signal is effective only when Hardware Fast Frequency Change is requested (that is, csysreq_ddrc=0 and csysmode_ddrc=1).
0	RW	0x0	csysmode_ddrc The csysmode_ddrc value DDRC Hardware Fast Frequency Change mode. 1'b0: Hardware Low-Power is requested 1'b1: Hardware Fast Frequency Change is requested

HWFFC_HWFFC_INT_STATUS

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RO	0x0	csysack_ddrc DDRC Hardware Low-Power Request Acknowledge. Acknowledgement from the peripheral (DDRC) of a system low-power request.
2	RO	0x0	csysack_ddrc DDRC Hardware Low-Power Clock Active. Indicates that the peripheral (DDRC) requires its clock signal

Bit	Attr	Reset Value	Description
1	RC/W1C	0x0	hwffc_done_int 1'b1: a hwffc done interrupt is detected 1'b0: no hwffc done interrupt is detected
0	RC/W1C	0x0	hwffc_clk_switch_int 1'b1: a clock switch interrupt is detected 1'b0: no clock switch interrupt is detected

HWFFC_HWFFC_CNT

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hwffc_cnt only used for auto mode How many ddrc clock cycle wait during clk switch, in case of pll lock issue.

HWFFC_HWFFC_INT_EN

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	hwffc_done_int_en 1'b1: enable hwffc done interrupt 1'b0: diable hwffc done interrupt
0	RW	0x0	hwffc_clk_switch_int_en 1'b1: enable hwffc clock switch interrupt 1'b0: diable hwffc clock switch interrupt

1.5 Interface Description

DDR IOs from DDR PHY are listed as following Table.

Table 1-1DDR IO description

Pin Name	Description
CK	Positive differential clock
CKB	Negative differential clock
CKE	Active-high clock enable signal for two chip select.
CSBi (i=0,1)	Active-low chip select signal. There are two chip select.
ACTN	Activation command input.
BA[1:0] BG[1:0]	Bank address signal. For DDR3, BA0 should connect to the BA0. BA1 should connect to BA1. BG0 should connect to BA2. For DDR4, please connect directly. Unused for LPDDRn.
A[17:0]	Address signal.
DQ[31:0]	Bidirectional data line
DQS[3:0]	Positive differential bidirectional data strobes
DQSB[3:0]	Negative differential bidirectional data strobes.
DM[3:0]	Active-low data mask signal.
ODTi (i=0,1)	On-Die Termination output signal for two chip select.
RESETN	Reset signal.

The DDR PHY supports more than one SDRAM type and the command pad of DDR PHY is named in the format of DDR4. The PHY supports different command map for different SDRAM type and also supports to use the register to control the map between the commands, and then the user can be very conveniently to design the Combo Memory System based on the different command map function. The default command map relationship shows in the following table. When the user uses the mem_select[2:0](reg01[2:0])to choose the memory type, thecommand will change to the default command map. The user should accord to the following table to connectthe

command pad to the SDRAM pad.

Table 1-2 DDR IO Mapping Table

CMD PAD OF PHY (DDR4)	DDR3	LPDDR3	LPDDR3 4RANK	LPDDR4	LPDDR4 4rank
A0	A9	-	-	CK_B	CK_2
A1	A2	-	-	-	-
A2	A4	A6	A6	CA1_A	CA1_A
A3	A3	-	CSB2	CKE1_A	CKE2
A4	BA1	A3	A3	CA3_B	CA3_B
A5	A11	A2	A2	CA5_B	CA5_B

RESETN	RESETN	-	-	RESETN	RESETN

At the PHY top-level, the mapping relationships between the DQ pads and dfi_wrdata/dfi_rddata shows in the following table. When connecting a DDR3/DDR4/LPDDR3 memory to the interface, there is a default mapping between the DDR3/DDR4/LPDDR3 signals to the PHY top-level pins.

Table 1-3 Default DDR DQ IO Mapping Table for DDR3/DDR4/LPDDR3/LPDDR4

PHY TOP-LEVEL PINS	SDRAM	dfi_wrdata/dfi_rddata
A_DQ[7:0]	DQ[7:0]	dfi_wrdata[7:0]/dfi_rddata[7:0]
A_DQ[15:8]	DQ[15:8]	dfi_wrdata[15:8]/dfi_rddata[15:8]
B_DQ[7:0]	DQ[15:8]	dfi_wrdata[23:16]/dfi_rddata[23:16]
B_DQ[15:8]	DQ[31:24]	dfi_wrdata[31:24]/dfi_rddata[31:24]

RK3568 support a remap feature from DFI DQ byte to SDRAM DQ byte. By default, DRAM DQ0 maps to DFI DQ0, DRAM DQ1 maps to DFI DQ1, and so on. If software wants to map DRAM DQ0 with DFI DQ1, and DRAM DQ1 map to DFI DQ2, DRAM DQ2 maps to DFI DQ3 and DRAM DQ3 map to DFI DQ0, it should configure DDR_GRF_CON3 before DRAM access.

Table 1-4 Example DDR DQ IO <-> DFI Remapping

PHY TOP-LEVEL PINS	GRF	dfi_wrdata/dfi_rddata

A_DQ[7:0]	grf_ddr_con3[9:8]=1	dfi_wrdata[15:8]/dfi_rddata[15:8]
A_DQ[15:8]	grf_ddr_con3[11:10]=2	dfi_wrdata[23:16]/dfi_rddata[23:16]
B_DQ[23:16]	grf_ddr_con3[13:12]=3	dfi_wrdata[31:24]/dfi_rddata[31:24]
B_DQ[31:24]	grf_ddr_con3[15:14]=0	dfi_wrdata[7:0]/dfi_rddata[7:0]

1.6 Application Notes

1.6.1 Initialization

1. UMCTL2 & DDR PHY Initialization

1. Assert the resets (presetn, core_ddrc_rstn and aresetn_0 of UMCTL2)
2. Configure PLL of DDR PHY and wait PLL lock.
3. De-assert presetn if clocks are active and stable.
4. Initial UMCTL2 register and PHY Register
5. Start PHY initialization with DFIMISC[5] register of UMCTL2
6. De-assert the remaining resets (core_ddrc_rstn and aresetn_0 of UMCTL2)
7. Wait UMCTL2 initialization done (STAT.operation_mode==normal)
8. Start PHY dqs calibrationwith PHYREG2 register and wait calibration finish with PHY REG91 register.
9. (Optional) After dqs calibration, start write leveling training with PHYREG2 register and wait write leveling training finish with PHY REG92 register.
10. Start to write and read

2. DDR3/DDR3L Initialization Sequence

The initialization steps for DDR3/DDR3L SDRAMs are as follows:

1. Power-up.
2. Maintain dfi_reset_n low for duration specified by INIT1.dram_rstn_x1024. Specification requires atleast 200 us with stable power.
3. Issue NOP/deselect for duration specified by INIT0.pre_cke_x1024. Specification requires at least 500us.
4. Assert CKE and issue NOP/deselect for INIT0.post_cke_x1024 (specification requires at least tXPR).
5. Issue MRS (mode register set) command to load MR2 with INIT4.emr2 value followed byNOP/deselect for duration of DRAMTMG3.t_mrd.
6. Issue MRS command to load MR3 with INIT4.emr3 followed by NOP/deselect for duration ofDRAMTMG3.t_mrd.
7. Issue MRS command to load MR1 with INIT4.emr followed by NOP/deselect for duration ofDRAMTMG3.t_mrd.
8. Issue MRS command to load MR0 with INIT3.mr followed by NOP/deselect for duration ofDRAMTMG3.t_mod.
9. Issue ZQCL command to start ZQ calibration and wait for INIT5.dev_zqinit_x32.
10. Wait for INIT5.dev_zqinit_x32 counting to finish. Ensure wait from step 8 is larger than tDLLK.
11. The UMCTL2 controller is now ready for normal operation.

3. DDR4 Initialization Sequence

The initialization steps for DDR4 SDRAMs are as follows:

1. Power-up.
2. Maintain dfi_reset_n low for duration specified by INIT1.dram_rstn_x1024. Specification requires atleast 200 us with stable power.
3. Issue NOP/deselect for duration specified by INIT0.pre_cke_x1024. Specification requires at least 500 us.
4. Assert CKE and issue NOP/deselect for INIT0.post_cke_x1024 (specification requires at least tXPR).
5. Issue MRS (mode register set) command to load MR3 with INIT4.emr3 value followed by NOP/deselect for duration of DRAMTMG3.t_mrd.
6. Issue MRS (mode register set) command to load MR6 with INIT7.mr6 value followed byNOP/deselect for duration of DRAMTMG3.t_mrd.
7. Issue MRS (mode register set) command to load MR5 with INIT6.mr5 value followed by NOP/deselect for duration of DRAMTMG3.t_mrd.
8. Issue MRS (mode register set) command to load MR4 with INIT7.mr4 value followed by

NOP/deselect for duration of DRAMTMG3.t_mrd.
9. Issue MRS command to load MR2 with INIT4.emr2 followed by NOP/deselect for duration of DRAMTMG3.t_mrd.
10. Issue MRS command to load MR1 with INIT4.emr followed by NOP/deselect for duration of DRAMTMG3.t_mrd.
11. Issue MRS command to load MR0 with INIT3.mr followed by NOP/deselect for duration of DRAMTMG3.t_mod.
12. Issue ZQCL command to start ZQ calibration and wait for INIT5.dev_zqinit_x32.
13. Wait for INIT5.dev_zqinit_x32 counting to finish. Ensure wait from step 8 is larger than tDLLK.
14. The UMCTL2 controller is now ready for normal operation.

4. LPDDR3 Initialization Sequence

The initialization steps for LPDDR3 SDRAMs are as follows:
1. Power-up.
2. CKE is held low for a duration specified by INIT0.pre_cke_x1024. The clock is checked to be stable forduration specified by INIT2.min_stable_clock_x1 (minimum of 5 clock cycles) prior to the first low tohigh transition of CKE.
3. Assert CKE for INIT0.post_cke_x1024 (specification requires at least 200 us).
4. A MRW (Reset) command is issued to MRW63 register. Values of MA<7:0> = 3FH and OP<7:0> =00H is used for this command. The MRW reset command brings the device to the device autoinitialization (resetting) state in the power-on initialization sequence.
5. Issue NOP/deselect for duration specified by INIT2.idle_after_reset_x32 (specification requires 1 usminimum) and INIT5.max_auto_init_x1024 (specification requires maximum time of 10 us).
6. An MRW ZQ initialization calibration command is issued to the memory to register MR10 to initiatethe ZQ calibration. Values of MA<7:0> = 0AH and OP<7:0>= FFH is used for this command.
7. Issue NOP/deselect for duration specified by INIT5.dev_zqinit_x32 (specification requires aminimum time of 1us).
8. Program MR2 register by setting MR2 register to INIT3.emr followed by a NOP/deselect for aduration specified by DRAMTMG3.t_mrw (typical value of 5 clock cycles).
9. Program MR1 register by setting MR1 register to INIT3.mr followed by a NOP/deselect for aduration specified by DRAMTMG3.t_mrw (typical value of 5 clock cycles).
10. Program MR3 register by setting MR3 register to INIT4.emr2 followed by a NOP/deselect for aduration specified by DRAMTMG3.t_mrw (typical value of 5 clock cycles).
11. Schedule multiple all bank refresh.
12. The UMCTL2 controller is now ready for normal operation.

5. LPDDR4 Initialization Sequence

The initialization steps for LPDDR4 SDRAMs are as follows:
1. Power-up.
2. Maintain dfi_reset_n and dfi_reset_n_ref low for duration specified by INIT1.dram_rstn_x1024.Specification requires at least 200 us with stable power.
3. Issue NOP/deselect for duration specified by INIT0.pre_cke_x1024. Specification requires at least 2ms.
4. Assert CKE and issue NOP/deselect for INIT0.post_cke_x1024. Specification requires at least 2 us.
5. Issue MRS (mode register set) command to load MR13 with INIT4.emr3 value followed by NOP/deselect for duration of DRAMTMG3.t_mrw.
6. Issue MRS (mode register set) command to load MR1 with INIT3.mr value followed by NOP/deselect for duration of DRAMTMG3.t_mrw.
7. Issue MRS (mode register set) command to load MR2 with INIT3.emr value followed by NOP/deselect for duration of DRAMTMG3.t_mrw.
8. Issue MRS (mode register set) command to load MR3 with INIT4.emr2 value followed by NOP/deselect for duration of DRAMTMG3.t_mrd.
9. Issue ZQCal Start command and wait for ZQCTL0.t_zq_long_nop.
10. Issue ZQCal Latch command and wait for ZQCTL0.t_zq_short_nop.
11. Schedule multiple refresh.

12. The UMCTL2 controller is now ready for normal operation.

1.6.2 High Speed IO Drive Strength

The register related to the CMD IO drive strength shows in the following table.

Table 1-5 The related register of the DATA IO drive strength

ADDR	RW	NAME	BITS	DEF	DESCRIPTIONS
0xf4	RW	reg_cmd_abutnrcomp_reg	[28:24]	5'b01110	The pull-down resistance of CMD except CK. The resistance relation with the configuration show in Table 4-7 and Table 4 8.

1.6.3 Command Perbit De-Skew Control

The DDR PHY supports to use the per-bit de-skew to adjust the delay of the command PAD to change the phase of the command which will be sent to the SDRAM.
For DDR4, the user can use the register to change the per-bit de-skew of the command directly.
Because the PHY supports the default command pad mapping, the user needs to change the corresponding register after the command pad mapping.
For example, if the user chooses DDR4 SDRAM mode, it can change the phase A0 directlythrough the reg_a0_invdelaysel register.The following table gives the detail description about the relationship between the control register and SDRAM PAD.

Table 1-9 The CMD Per Bit De-skew Control Map for SDRAM

NAME	ADDR	BIT	DEFAULT	SDRAM PAD			
				DDR4	DDR3	LPDDR3	LPDDR4
reg_a0_invdelaysel	0x104	[31,24]	8'h80	A0	A9	-	CK_B

For LPDDR4, the SDRAM supports the command bus train function, so the command per-bit de-skew can be controlled by the register directly or it can be control by the command bus trainmodule. The command per-bit de-skew control path shows in the following figure.

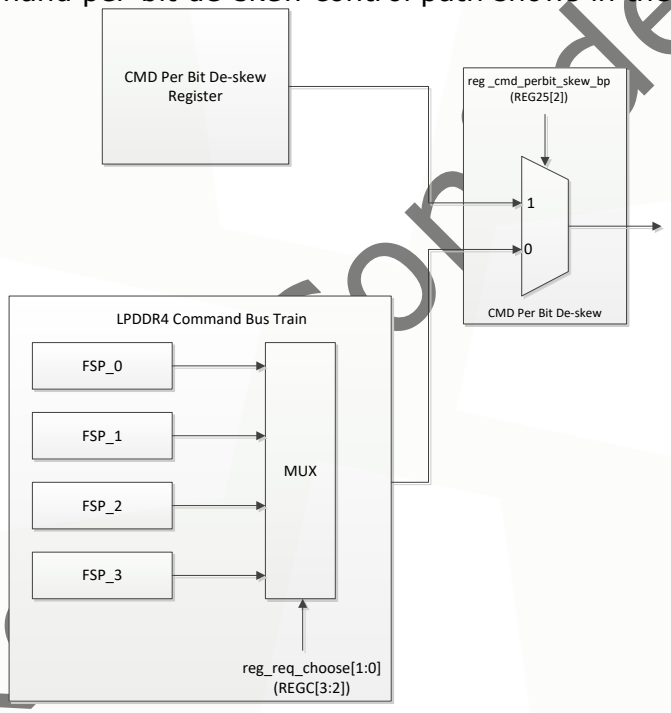

Fig.1-3 CMD Per Bit De-skew Ctrl Path of LPDDR4

After power up, apb reset and phy reset, reg_cmd_perbit_skew_bp(REG25[2]) is 1'b0. The PHY will choose the command bus train reset value to control the command per-bit de-skew. When set reg_cmd_perbit_skew_bp(REG25[2])to 1'b1, then the user can use the register to control the command per-bit de-skew directly.

The FSP_0/FSP_1/FSP_2/FSP_3 blocks in the command bus train module are used to control thecommand per-bit de-skew for different frequency groups. When enable the auto command bustrain function, the FSP_n will control the command per-bit de-skew according to the

reg_freq_choose[1:0](REGC[3:2]) automatically. After complete the auto command bus train, the train value will be locked in the FSP_n module, then the user canusethereg_freq_choose[1:0](REGC[3:2])to switch frequency quickly. The user also canuse the register to update the FSP_n lock value after the command bus train. The steps show below:

1. Configure the per-bit de-skew value of the command through the corresponding register. For example, if you want to change the per-bit de-skew of the CA1_A, configure the desired value tothe reg_a13_invdelaysel.

2. Use the register reg_freq_choose[1:0](REGC[3:2]) to choose the frequency point.
For example, if you want to change the per-bit de-skew of the command at frequency point 2,
configure the 0x02 to reg_freq_choose[1:0](REGC[3:2]).
3. Set the reg_ca_perbit_skew_update(REG22[6]) to 1'b1 to update the lock value andrecover to 1'b0.
4. After these steps, the per-bit de-sew of command belong to frequency point 2 will change and be locked again.
The above configure path is enabled when reg_cmd_perbit_skew_bp(REG25[2]) set to 1'b0.
When reg_cmd_perbit_skew_bp(REG25[2])set to 1'b1, the user can use the register to controlthe per-bit de-skew directly. The register directly control path is useful when enable the commandbus train bypass mode.

1.6.4 Data Perbit De-Skew Control

The address offset of different data channels shows in following table.

Table 1-10 The address offset of each channel

CHANNEL	ADDRESS_OFFSET
Byte0(CS0)	0x320
Byte0(CS1)	0x340
Byte0(CS2)	0x400
Byte0(CS3)	0x420

There are three paths to control the TX data Perbit de-skew show in thefollowing table.

Table 1-11 TX data Perbit de-skew path

PATH	DESCRIPTION	CONFIGURE
Register	Using the register to update the TX data Perbit de-skew directly.	reg_dq_wr_train_en(REGA0[1]) set to 0. reg_wl_bypass(REG04[7]) set to 1. Generate the posedge of reg_wl_freq_update(REG44[28])
Write Leveling	Using the write levelingresult.	reg_wl_bypass(REG04[7]) set to 0.
Write Training	Using the write trainingresult.	reg_dq_wr_train_en(REGa0[1]) set to 1. reg_wl_bypass(REG04[7]) set to 1.

There are two paths to control the RX data Perbit de-skew show in thefollowing table.

Table 1-12 RX data Perbit de-skew path

PATH	DESCRIPTION	CONFIGURE
Register	Using the register to update the RX data Perbit de-skew directly.	reg_dq_rd_train_en(REG94[0]) set to 0 and reg_rd_train_predef_en(REG94[14]) set to 0. Generate the posedge of reg_rd_train_freq_update(REG94[2])
Read Training	Using the read trainingresult.	reg_dq_rd_train_en(REG94[0]) set to 1 or reg_rd_train_predef_en(REG94[14]) set to 1.

1.6.5 DDR PHY Command Bus Training

The LPDDR4-SDRAM command bus must be trained before enabling termination forhigh-frequency operation. The DDR PHY supports the auto command bus trainfunction to center the internal VREF(ca) in the CA data eye and adjustment of the CS and CAsignals to meet setup/hold requirements.

When enable the auto command bus train function, the PHY will complete the train of the VREF(ca), CS and CA automatically. The auto command bus train flow shows in the following steps.

1. Configure reg_phy_sdram_nitial(reg0x26[7]) to 1'b1 to fix the input of the command path
2. PHY initialization
3. Configure reg_clk_div_cnt(reg0x4e[3:0]) to choose the divider for the low speed
4. Configure reg_tmrw(reg0x11[7:4]/reg_tcacd(reg0x11[3:0])/reg_tvrefca)reg0x12[7:0]/reg_tcaent(reg0x13[7:0])/reg_tckelck(reg0x14[7:4])/reg_tdstrain(reg0x14[3:0])/reg_tadr(reg0x15[7:4])/reg_txcbt(reg0x15[3:0])/reg_tfc(reg0x16[7:0]) to configure the timing parameter for auto cat train
5. Configure reg_cat_rank_num(reg0x21[7:6]) = 2'b11 to chosse the ca train rank reg_lpddr4_ca_odt(reg0x20[5:4]=2'b01 to terminate the rank0 (or reg_lpddr4_ca_odt(reg0x20[5:4] = 2'b10 to terminate the rank1)
6. Configure reg_cat_cs_train_valude(reg0x21[5:0]) reg_cat_ca_train_value(reg0x22[5:0])

to choose the cs and ca training pattern
7. Configure reg_cha_cat_cs_check_value(reg0x76[5:0])
regchb_cat_cs_check_value(reg0x77[5:0]) reg_cha_cat_ca_check_value(reg0x78[5:0])
reg_chb_cat_ca_check_value(reg0x79[5:0]) to choose the cs and ca training pattern
8. Configure reg_cat_enable(reg0x10[0]) to 1'b1 to enable the auto command bus train
9. Configure reg_cat_start(reg0x10[1]) to 1'b1 to start the auto command bus train
10. Wait auto command bus train done by read reg0x93[1:0], when it equals to 2'b11(for two ranks), it means complete the auto command bus train.
11. Configure reg_cat_start(reg0x10[1]) to 1'b0 to exit the auto command bus train
12. Configure reg_cat_enable(reg0x10[0]) to 1'b0 to disable the auto command bus train
13. Read register reg0x3a0-reg0x3df to get the ca train result
The command bus train not only adjusts the phase of the CA bus but also adjusts the phase of the CS. The user can use the reg_cat_skep_cs_train(REG0x38[2]) to control the enable or disable ofthe cstrain. When this signal sets to 1, the PHY will skip the cstrain; when this signal sets to0, the PHY will enable the cstrain.
The PHY support two modes cstrain controlled by the reg_cs_pwc_disable(REG0x38[7]):
Normal cstrain (reg_cs_pwc_disable = 1): When choose the normal cstrain mode, the pulse width of the CS will keep the same width of the CK period.
Modulation cstrain (reg_cs_pwc_disable =0): It is the default mode. When choose this mode,
the pulse width of the CS will the 75% of the CK period when the CS is in the train mode (after
the frequency changes from the FSP[X] to FSP[Y]). The state shows in the following figure.

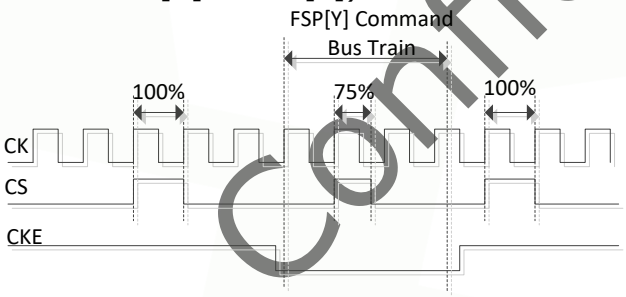

Fig.1-4 Modulation cstrain mode

If the user enables the Modulation cstrain mode, the CS Train is based on the 75% pulse widthof the normal CS. So the cstrain result has fixed 25% offset and need to compensate 12.5% offset using the special register after the command bus train. After that, the CS will go to the bestpoint of the cstrain.
The user uses the following registers to complete the compensation of the cs train result.

Table 1-13 Compensation of the ca and cs train result

ADDR	SIGNAL	DESCRIPTION
0x40[29:24]	reg_cha_cat_cs_check_value	The check value of channel A when do the cs train
0x40[21:16]	reg_chb_cat_cs_check_value	The check value of channel A when do the cs train
0x40[13:8]	reg_cha_cat_ca_check_value	The check value of channel A when do the ca train
0x40[5:0]	reg_chb_cat_ca_check_value	The check value of channel A when do the ca train

This register should be set after the command bus train and before change the frequency to the train frequency point.

1.6.6 DDR PHY RX DQS Calibration

DDR PHY auto dqs calibration function has been implemented in the PHY. The entire training processes only need to configure the register to start andwait for finish.
The entire training process is as follows:
1. PHY's register is reset, the setup is complete.
2. Send the initial command to dram and complete dram initialization.
3. Set the PHY's register beginning calibration.

ADDR	BIT	DEFAULT	DESCRIPTION
0x4	5:2	0xe	The rank select signal of the rx-dqs calibration fuction. Low is valid. 4'b0000: The rx-dqs calibration result will auto switch between the RANK0, RANK1,RANK2,RANK3 according to the DFI interface command after the rx-dqs calibration training. 4'b0111: Choose the RANK3. The chip which connects to CS3 will be chooses to enable the auto rx-dqs calibration training. 4'b1011: Choose the RANK2. The chip which connects to CS2 will be chooses to enable the auto rx-dqs calibration training. 4'b1101: Choose the RANK1. The chip which connects to CS1 will be chooses to enable the auto rx-dqs calibration training. 4'b1110: Choose the RANK0. The chip which connects to CS0 will be chooses to enable the auto rx-dqs calibration training. 4'b11: Reserved. Note: Can't set to 2'b00 when enable the rx-dqs calibration training funciton. If the PHY needs to support two ranks, this register should set to 2'b00 after the rx-dqs calibration training.
	1	0x0	set calibration bypass mode(1:bypass mode; 0:nomal)
	0	0x0	The auto rx-dqs calibration training enable signal. High is valid. 0: Keep current state or exit the auto rx-dqs calibration training. 1: Enable the auto rx-dqs calibration training function.
0x20c	6		The rx dqs calib complete signal. Active high. Only change to 1'b1 when all open channel have compelte the rx dqs calibration
	5		The error flag of the rx dqs calib. Active high.
	4:0		The rx dqs calib complete signal of each channel. Active high. [0]: The rx dqs calib complete of byte0. [1]: The rx dqs calib complete of byte1. [2]: The rx dqs calib complete of byte2. [3]: The rx dqs calib compelte of byte3. [4]: The rx dqs calib compelte of byte4

4. Wait for the calibration finish by PHYREG0x20c.
5. Normal read and writes operation can begin.

1.6.7 DDR PHY Write Leveling Training

DDR PHY auto write leveling training function has been implemented in the PHY. The entire training processes only need to configure the register to start and wait for finish。
The entire training process is as follows:
1. PHY’s register is reset, the setup is complete.
2. Send the initial command to dram and complete dram initialization.
3. Set the PHY REG0x4 to configure the dram mode register which used to enable dram write leveling training function.
4. Set the PHY's register to begintraining.

ADDR	BIT	DEFAULT	DESCRIPTION
0x4	31:16	0x0	[23:16]Write leveling load mode [7:0]. The PHY needs to configure the load mode to enable the write leveling function. In case of that write leveling operation changs the load mode value in the SDRAM which is written by the MC, so we need to use this register to keep the same

ADDR	BIT	DEFAULT	DESCRIPTION
			setting with the MC for the mode register which is related to the write leveling. This is the low 8bits of the mode register which is related to the write leveling. For DDR3/DDR4, this register should keep the same value with the MR1[7:0]. For LPDDR3/LPDDR4, this register should keep the same value with the MR2[7:0]. Please reference to the section 4.5.2 to get more information. [31:24]"Write leveling load mode [15:8]. Relate to the register 10’ h002 [2]. The PHY needs to configure the load mode to enable the write leveling function. In case of that write leveling operation changs the load mode value in the SDRAM which is written by the MC, so we need to use this register to keep the same setting with the MC for the mode register which is related to the write leveling. This is the low 8bits of the mode register which is related to the write leveling. For DDR3/DDR4, this register [13:8] should keep the same value with the MR1[13:8] and this register[15:14] should set 2'b01. For LPDDR3/LPDDR4, this register should set to 8'h0.
	11:8	0xe	The rank select signal of the write-leveling fuction. Low is valid. 4'b0000: The write-leveling result will auto switch between the RANK0 ,RANK1,RANK2,RANK3 according to the DFI interface command after the write-leveling training. 4'b0111: Choose the RANK3. The chip which connects to CS3 will be chooses to enable the write-leveling training. 4'b1011: Choose the RANK2. The chip which connects to CS2 will be chooses to enable the write-leveling training. 4'b1101: Choose the RANK1. The chip which connects to CS1 will be chooses to enable the write-leveling training. 4'b1110: Choose the RANK0. The chip which connects to CS0 will be chooses to enable the write-leveling training. 4'b1111: Reserved. Note: Can't set to 4'b0000 when enable the write-levleing training funciton. If the PHY needs to support two ranks, this register should set to 2'b00 after the write-leveling training.
	7	0x0	The tx perbit-skew bypass function enable signal. High is valid. 0: Use the write-leveling training result to control the tx perbit-skew delay. The A_DQ0~A_DQ7/A_DM0 will use the A_DQS0 training result. The A_DQ8~A_DQ15/A_DM1 will use the A_DQS1 training result. The B_DQ0~A_DQ7/A_DM0 will use the B_DQS0 training result. The B_DQ8~A_DQ15/A_DM0 will use the B_DQS1 training result. 1: Use the register to control the tx perbit-skew delay. Each data pad has an independet controller register.

ADDR	BIT	DEFAULT	DESCRIPTION
	6	0x0	The write-leveling training enable signal. High is valid. 0: Keep current state or exit the write-leveling training state. 1: Eanble the write-leveling training function
0x44	28	0x0	The data tx delay line control value update signal. Active high. In the default mode, the tx delay line is controlled by the write-levevling/write training result according to the frequency point. If the user wants to change the value to adjust the delay line, the user can use the bypass registers (invdelay_t) that show in the Table "Data Perbit De-skew Control Registers For TX And RX" to set the value and set this signal “1”. Then the bypass register value will be updated to the control register of the tx perbit skew base on the current frequency point.
0x02c	12:8		The write leveling complete signal of each channel. Active high. [0]: The write leveling complete of byte0. [1]: The write leveling complete of byte1. [2]: The write leveling complete of byte2. [3]: The write leveling compelte of byte3. [4]: The write leveling compelte of byte4

5. Wait for the calibration finish by polling PHY REG92. The write leveling results can be read from the following registers.

Table 1-14 The write leveling result for all bytes

ADDR	BIT	DEFAULT	DESCRIPTION
0x370	[23:16]	0x0	The write-leveling result of byte0 for RANK0. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte0 for RANK1. The user can get the write-leveling result after the write-leveling training complete
0x44c	[23:16]	0x0	The write-leveling result of byte0 for RANK2. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte0 for RANK3. The user can get the write-leveling result after the write-leveling training complete
0x4f0	[23:16]	0x0	The write-leveling result of byte1 for RANK0. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte1 for RANK1. The user can get the write-leveling result after the write-leveling training complete
0x5cc	[23:16]	0x0	The write-leveling result of byte1 for RANK2. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte1 for RANK3. The user can get the write-leveling result after the write-leveling training complete
0x670	[23:16]	0x0	The write-leveling result of byte2 for RANK0. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte2 for RANK1. The user can get the write-leveling result after the write-leveling training complete
0x74c	[23:16]	0x0	The write-leveling result of byte2 for RANK2. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte2 for RANK3. The user can get the write-leveling result after the write-leveling training complete
0x7f0	[23:16]	0x0	The write-leveling result of byte3 for RANK0. The user can get the write-leveling result after the write-leveling training complete

	[7:0]	0x0	The write-leveling result of byte3 for RANK1. The user can get the write-leveling result after the write-leveling training complete
0x8cc	[23:16]	0x0	The write-leveling result of byte3 for RANK2. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte3 for RANK3. The user can get the write-leveling result after the write-leveling training complete
0x970	[23:16]	0x0	The write-leveling result of byte4 for RANK0. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte4 for RANK1. The user can get the write-leveling result after the write-leveling training complete
0xa4c	[23:16]	0x0	The write-leveling result of byte4 for RANK2. The user can get the write-leveling result after the write-leveling training complete
	[7:0]	0x0	The write-leveling result of byte4 for RANK3. The user can get the write-leveling result after the write-leveling training complete

6. Normal read and writes operation can begin.

1.6.8 DDR PHY Read Train

The DDR PHY supports the read training. It includes three modes:

- Auto MPR/MPC Mode(Only support for DDR3/DDR4/LPDDR3/LPDDR4)
- Predefined mode (Only support DDR3/DDR4/LPDDR3/LPDDR4)
- Bypass Mode(Only support LPDDR3 and LPDDR4)

Auto MPR/MPC Mode: When the PHY chooses the DDR3/DDR4, it will use the MPR command to complete the read training of the Auto-Mode. When the PHY chooses theLPDDR3/LPDDR4, it will use the RD DQ Calibration command to complete the read training of the Auto-Mode and BP-Mode.

Predefine mode: you should write data to SDRAM and make sure the data has been written to the SDRAM at the specified location. For example, you can write data when SDRAM working at low frequency. Then the PHY read the data which you write to SDRAM.

When we enable the read training, the PHY will adjust the per-bit de-skew to change the delay ofthe RX DQS and RX DQ to find the optimal position. The adjust range of the per-bit de-skew isfrom 6'h0 to 6'h3f.

In rx vref training, we change the value of phy's vref. When set a new vref value to PHY, we should wait 800ns to update it. And the adjust range of the vref is from 8'h00 to 8'hff. You can
change the PHY's vref value yourself by configuring the associated register.

For predefined mode, the phy can support rx vref training. If you enable the vref training function, the predefinedread training have 3 steps, step1 adjust per-bitde-skew (step1_delay),step2 adjust vref(step2_vref), step3 adjust per-bit de-skew(step3_delay) again. When you disable vreftraining function, the predefinedread training only have step1.When step1 done, all steps done.

During the training, if you set reg_phy_refresh_en to 1'b1, the PHY support to do auto refresh
by itself. If you use this function, the controller should send a refresh (both rank in

themeantime) after training enable, otherwise the PHY will keep waiting.
When the user enables the normal read training function, it will complete the read training automatically. The normal read training using the following steps.
1. Open PHY auto refresh function in training(if you need) by configuring reg_phy_refresh_en=0x1.
2. Choose the read training rank using the reg_rdtrain_cs_sel=2'b10(rank0).
3. Configure the MR15/MR20/MR32/MR40 through reg_lpddr4_mr15_value/reg_lpddr4_mr20_value/reg_lpddr4_mr32_value/reg_lpddr4_mr40_value to choose the read training pattern(Only for lpddr4).
4. choose the dqs phase before read training by setting cha_reg_l_rd_train_dqs_default/cha_reg_r_rd_train_dqs_default/chb_reg_l_rd_train_dqs_default/chb_reg_r_rd_train_dqs_default=0xe.
5. Enable the read training by setting reg_dq_rd_train_en=0x1.
6. Send a auto refresh(rank0 and rank1 in the meantime) if you open PHY auto refresh function.
7. Wait the train done by polling the reg_train_true_done=0x1.
8. Check the read train state by read cha(b)_train_done_for_rd_to_reg[1:0].High means error.
9. Exit the Read train by setting reg_dq_rd_train_en=0x0.

1.6.9 DDR PHY Write Train

The DDR PHY supports the write training. It only supports the auto mode.When the PHY chooses the DDR3/DDR4/LPDDR3, it will use the normal write and readcommand to complete the write training. When the PHY chooses the LPDDR4, it will use theDQS-DQ training mode command to complete the write training.
When we enable the write training, the PHY will adjust the per-bit de-skew to change the delay ofthe TX DQ to find the optimal position(The dqs will keep to the phase find by the write-levelingwhen enable the write leveling function). The adjust range of the per-bit de-skew is from 6'h0 to6'h3f.
The PHY can support tx vref training(only for LPDDR4). If you enable the vref training function,the wr training have 3 steps, step1 adjust per-bit de-skew(step1_delay), step2 adjust vref(step2_vref), step3 adjust per-bit de-skew(step3_delay) again. When you close vref trainingfunction, the wr training only have step1, when step1 done ,all step done.
When the user enables the normal write training function, it will complete the write trainingautomatically. The normal write training using steps shows below.
1. Configure the initial address(write data to this address) reg_train_col_address/reg_train_ba_address/reg_train_row_address.
2. If you set reg_wrtrain_check_data_value_random_gen=0x0, configure the check data value as the data you want to write to SDRAM(10*BL8).
3. If you need the PHY do refresh in training, you should configure the reg_phy_trefi, reg_phy_trfc, reg_max_refi_cnt. Then enable the reg_phy_refresh_en=0x1.
4. Choose the write training rank using the reg_wrtrain_cs_sel=0x2(rank0).
5. If you need the PHY do tx vref training, you should configure reg_train_vref_step_max, reg_train_vref_step_min, reg_wrtrain_lpddr4_vref_range, reg_wrtrain_vref_wait_vref_cnt_50ns.
6. If you enable the DBI function, and want to do wr training with DBI function open, you should set reg_ddr4_dbi=0x1 first(Only for DDR4).
7. Choose the dqs phase before write training by setting reg_wr_train_dqs_default_bypass=0x1. Otherwise PHY will choose the write leveling training result.
8. Choose the write training auto mode by setting reg_dq_wr_train_auto=0x1.
9. Enable the tx vref training by setting(if need) reg_train_vref_en=0x1. Enable the write training by setting reg_dq_wr_train_en=0x1.
10. Send a auto refresh if you open PHY auto refresh function.
11. Wait the wr train done by polling the train_all_step_done=0x1.
12. Check the wr train state by read train_step1_error, train_step2_error, train_step3_error. High means error.
13. Exit the write training by setting reg_dq_wr_train_en=0x0.

1.6.10 DDR Monitor

1. DDR read or write address monitor

DDR monitor module can store 4 consecutive read or write addresses in real time. We can read these addresses by APB bus for debug when system enters abnormal state.

The steps of configuration to monitor DDR read or write address:

- Configure DDRMON_DDR_IF_CTRL.direction to select storing read or write address.
- Set DDRMON_DDR_IF_CTRL.if_mon_en to '1' to enable DDR monitor.
- When system is abnormal, we can read the register to get the current four addresses.

2. DDR access address monitor within a specified range

Sometimes we want to confirm whether DDR read or write within a specified address range, then we can configure the address range and enable this function.

The steps of configuration to monitor DDR access address within a specified range:

Configure thewrite address range registers DDRMON_WR_START_ADDR, DDRMON_WR_END_ADDR, and read address registers DDRMON _RD_START_ADDR, DDRMON _RD_END_ADDR.

- Enable interrupt by configure the register DDRMON_INT_MASK[6:5] to 0.
- Set DDRMON_DDR_IF_CTRL.if_mon_en to '1' to enable DDR address monitor.
- If the read or write addresses hit the range, then interrupt will assert, and we can read the interrupt status register DDRMON_INT_STATUS.

3. DDR access command statistics

This module can do the statistics about DDR access command, like write, read and active by monitoring DFI interface. There are two mode to do statistics, hardware mode and software mode. Two thresholds can be set, if read and write command number is more than high threshold, or less than low threshold, the interrupt will be asserted.

4. DDR low power statistics

It does the statistics the low power period such as DDR self-refresh, power down, clkstop and PHY low power. After compare statistics interrupt asserts, the low power period represent in correspond count register will be updated and can be accessed through APB bus interface.

Hardware mode

In hardware mode, a dfi timer is used to specify a statistics period, the command statistics is done in the statistics period. The dfi timer is running in 24MHz. After dfi timer counts to the threshold, and update the statistics value, the dfi timer will restart automatically, and count again.

The steps of hardware mode of DDR access command statistics:

- Configure register DDRMON_CTRL.hardware_en as '1' to enable hardware mode.
- Configure register DDRMON_TIMER_COUNT to set the dfi timer count threshold, the statistics is done in the period of timer being less than the value of DDRMON_TIMER_COUNT.
- Configure register DDRMON_CTRL.lpddr23_en and DDRMON_CTRL.lpddr4_en to set the DDR mode:

DDRMON_CTRL.lpddr23_en	DDRMON_CTRL.lpddr4_en	DDRMON_CTRL.ddr4_en	DDR mode
1	0	0	LPDDR3
0	0	0	DDR3
0	1	0	LPDDR4
0	0	1	DDR4

- Configure register DDRMON_FLOOR_NUMBER to specify the low threshold of interrupt, and configure register DDRMON_TOP_NUMBER to specify the high threshold of interrupt.
- Configure register DDRMON_CTRL.timer_cnt_en as '1' to start hardware mode.
- Wait for the interrupt to do following process. We also can read the read, write and active command number separately.

Software mode

In software mode, the statistics is controlled by software.

The steps of hardware mode of DDR access command statistics:

- Configure register DDRMON_CTRL.lpddr23_en, DDRMON_CTRL.lpddr4_en and

DDRMON_CTRL.ddr4_en to set the DDR mode like hardware mode.

- Configure register DDRMON_CTRL.software_en as '1' to enable software mode statistics.
- Configure register DDRMON_CTRL.software_en as '0' to stop the statistics, and generate the statistics result. We can read the read, write and active command number separately.

1.6.11 HWFFC

To enable Hardware Fast Frequency change function, software must configure DDR_GRF_CON3[6:3] to 0x3, which means DDRC low power interface is controlled by HWFFC block.

And following software procedure is example for how to used HWFFC function auto mode.

1. Enable DDR clock switch function by configure CRU_MISC_CON0[13] to 1'b1.
2. Clear dfi_init_start by configuring DDRC_DFIMISC[5] to 1'b0.
3. Enable DDRC HWFFC function by configure DDRC.DDRC_HWFFCCTL to 0x3
4. Configure timing related register for Frequency 1 to 3
5. Configure DDRC.DDRC_MSTR[29] for frequency mode
6. Configure DDRC.DDRC_MSTR[3:2] for target frequency
7. Configure HWFFC.HWFFC_MODE to 0x0 to choose auto mode
8. Configure HWFFC.HWFFC_CTRL = 0x1(fast freq change) | 0x1<<1 (FSP1) | 0x1<<5 (load initial value) | 0x1<<7(ignore phy ready) | 0x1<<8 (auto clock switch en)
9. Configure HWFFC.HWFFC_CTRL[5] to 0x0 to disable loading initial clk switch value.
10. Configure HWFFC.HWFFC_CNT for PLL lock time
11. Configure HWFFC.HWFFC_EN[0] to 1'b1 to enable HWFFC
12. Wait for DDRC_HWFFCSTAT[1:0] to 0x0
13. Configure DDRC.DDRC_HWFFCCTL[3:2] to 0x0 to disable HWFFC function for DDRC
14. Configure HWFFC.HWFFC_EN[0] to 0x0 to disable HWFFC function for HWFFC block.
15. Write-leveling and RXdqs training.
16. DDR access

Chapter 2 DDR Converter of Frequency (DCF)

2.1 Overview

DDR Converter of Frequency (DCF) is used to implement DDR frequency conversion without the participation of CPU. DCF is connected to SOC through an AXI Master and an APB Slave, with a DMAC and instruction buffer inside. Beforehand, software puts into SRAM formulary pieces of instructions which consist of all the register-related configurations in the process of frequency conversion. When started-up, DCF automatically reads instructions to the inside buffer by means of DMA, and implement register configuration after analysis. A done signal will be provided for CPU after all the instructions are analyzed.

DCF supports the following features:

- AMBA 32-bit AXI compliant
- Support DMA operation from SRAM to buffer
  - Support burst8 only
  - LLP not supported
- Support 2 internal instruction registers : r0 & r1
- Support following software instructions:
  - IDL (delay)
  - LDR (read register)
  - STR (write register)
  - ISB (write with flush)
  - Bitwise AND
  - Bitwise OR
  - Bitwise INV
  - LSR (left shift)
  - RSR (right shift)
  - ADD
  - SUB
  - POLLEQ (poll a register until the value match)
  - POLLNEQ (poll a register until the value mismatch)
  - CMPEQ (compare if equal)
  - CMPNEQ (compare if unequal)
  - BL (jump upwards or downwards, 8bytes align)
- Support following program functions through combination of basic instructions
  - If-else
  - while
  - loop
  - for

2.2 Block Diagram

DCF comprises with:

- An AXI Master Interface
- An APB Slave Interface
- A DMA controller
- An Instruction Buffer
- Instruction analyzer

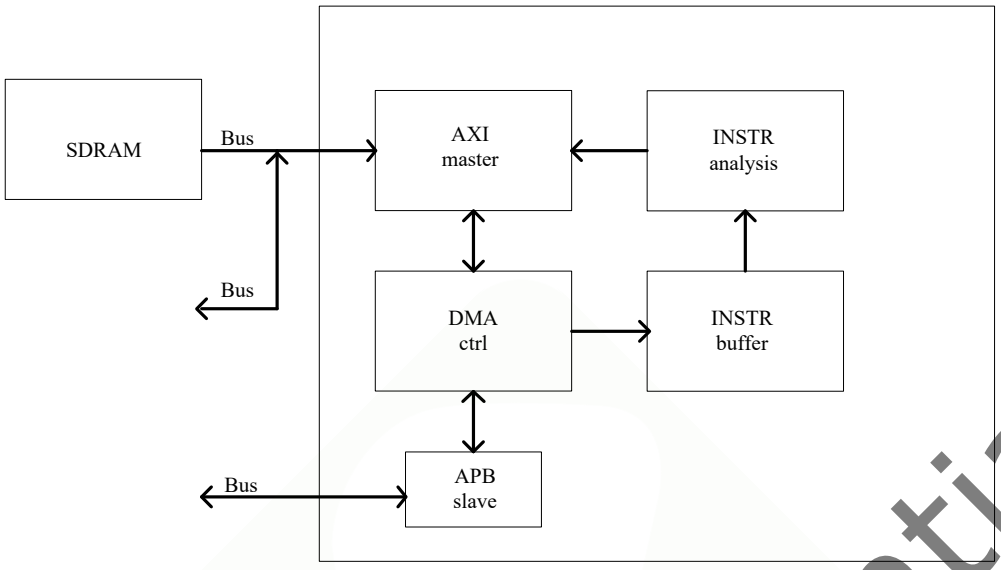

Fig.2-1 DCF Block Diagram

2.3 Register Description

2.3.1 Registers Summary

Name	Offset	Size	Reset Value	Description
DCF_CTRL	0x0000	W	0x00000000	DCF Control Register
DCF_STATUS	0x0004	W	0x00000001	DCF Internal Status Register
DCF_ADDR	0x0008	W	0x00000000	DCF Instruction Start Address Register
DCF_ISR	0x000c	W	0x00000000	DCF Interrupt Status Register
DCF_TIMEOUT_CYC	0x0014	W	0xffffffff	DCF Instruction Timeout Cycle Register
DCF_CURR_R0	0x0020	W	0x00000000	Current Internal R0 Value Register
DCF_CURR_R1	0x0024	W	0x00000000	Current Internal R1 Value Register
DCF_CMD_COUNTER	0x0028	W	0x00000000	Current Command Counter Value Register
DCF_LAST_ADDR1	0x0030	W	0x00000000	Last 1 Instruction Address Register
DCF_LAST_ADDR2	0x0034	W	0x00000000	Last 2 Instruction Address Register
DCF_LAST_ADDR3	0x0038	W	0x00000000	Last 3 Instruction Address Register
DCF_LAST_ADDR4	0x003c	W	0x00000000	Last 4 Instruction Address Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

2.3.2 Detail Registers Description

DCF_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x0	vop_hw_en 1'b1 : Enable 1'b0 : Disable
1	WO	0x0	timeout_en 1'b1: Enable 1'b0: Disable

Bit	Attr	Reset Value	Description
0	WO	0x0	start This bit will be auto cleared when DCF is done. 1'b1: Start DCF 1'b0: Stop DCF

DCF_STATUS

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	WO	0x0	dma_done_st 1'b1: DCF has fetched all the instructions.
6	WO	0x0	instr_done_st 1'b1: DCF has done all the instructions analysis.
5	WO	0x0	dma_error_st 1'b1 : Error response received when DCF is fetching instructions.
4	WO	0x0	instr_error_st 1'b1 : Error response received when DCF is handling instructions.
3	WO	0x0	dcf_timeout_st 1'b1: DCF timeout
2	WO	0x0	dcf_edge_trigger_st 1'b1 : DCF is triggered by dma_finish from vop.
1	WO	0x0	dcf_level_trigger_st 1'b1 : DCF is triggered by one of the following sources: vop_standby / vop_clockgating / vop_powndown
0	RO	0x1	dcf_idle_st 1'b1 : DCF is idle 1'b0 : DCF is busy

DCF_ADDR

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	addr DCF instruction fetch start address

DCF_ISR

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	WO	0x0	dcf_error 1'b1: Error response or timeout during DDR change frequency.
0	WO	0x0	dcf_done 1'b1: DDR change frequency completed. 1'b0: DDR change frequency not completed.

DCF_TIMEOUT_CYC

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	timeout Calculated by axi clock

DCF_CURR_R0

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	curr_r0 R0 value is sampled when dcf_done or dcf_error occurs.

DCF_CURR_R1

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	curr_r1 R1 value is sampled when dcf_done or dcf_error occurs.

DCF_CMD_COUNTER

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	cmd_counter cmd_counter value is sampled when dcf_done or dcf_error occurs. it records the number of pieces of instructions among DCF.

DCF_LAST_ADDR1

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	last_addr1 Value is sampled when dcf_done or dcf_error occurs. it records the last 1 instruction address.

DCF_LAST_ADDR2

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	last_addr2 Value is sampled when dcf_done or dcf_error occurs. it records the last 2 instruction address.

DCF_LAST_ADDR3

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	last_addr3 Value is sampled when dcf_done or dcf_error occurs. it records the last 3 instruction address.

DCF_LAST_ADDR4

Address: Operational Base + offset (0x003c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	last_addr4 Value is sampled when dcf_done or dcf_error occurs. it records the last 4 instruction address.

2.4 Application Notes

2.4.1 DCF Work Flow

1、 Software needs to open up a separate space in SRAM and loads a series of instructions in advance. The instruction should consists of:
   a、 Configure msch and cpu idle.
   b、 Configure Memory Controller to move DDR into Low-power State.
   c、 Reset DDRPHY if needed.
   d、 Configure Clock frequency, wait for PLL lock.
   e、 Configure all the Timing-relative registers.

f、 De-assert DDRPHY reset if needed.
g、 Initialize DDRPHY, do calibration.
h、 Configure Memory Controller to move DDR into Access State.

2、 Software configure DCF, notifying the start_addr, and then start DCF.
3、 DCF will transfer instruction data through DMA from SRAM to an internal buffer.
4、 In the meanwhile, An instruction analysis module will read these instructions from buffer, and transform them to corresponding bus-relative operations, including Write&Read registers, delay some clock cycles, arithmetic operation and so on.
5、 By Axi master, DCF will configure uPCTL、DDRPHY、CRU module to implement the procedure of DDR frequency conversion.
6、 DCF will recognize the last command, and generate a dcf_done interrupt for CPU.

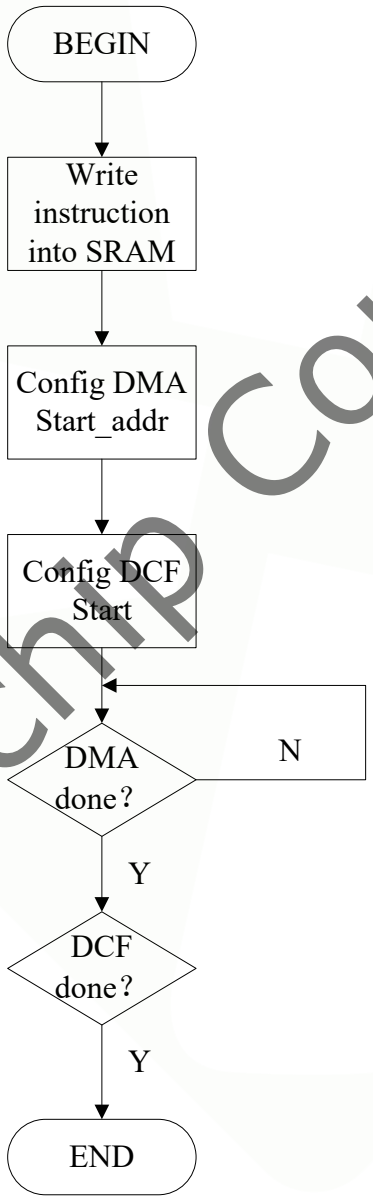

Fig.2-2 DCF work flow

2.4.2 Instruction Format

One piece of instruction, which is 64bit, should consist of the information of:

1、 Address
2、 Data

3、 Command

63:59	58:34	33:32	31:0
cmd[4:0]	addr[26:2]	(r1,r0)	data

The overall principle of instruction information is:

1、 Address[31:27] is reserved for 5bit command, which represents the corresponding operation.
2、 Address[1:0] is used to indicate operation of r0 or r1.
3、 Address[26:2] is the real bus address. If 0, it means no bus operation ; if not 0, it means a combination of 2 instructions with a bus operation ahead and an arithmetic c operation followed in order to improve efficiency.

For example, let us analyze the instruction: 0f620002_00000003

1、 Command is 1,which represents an bitwise AND operation.
2、 Address is 0xff620000, represents a bus-read operation.
3、 R1 is indicated, represents that the middle result is stored into internal register r1.
4、 Data is 0x00000003, represents that the operation value is 0x3.
So, this instruction will do following operations:
- LDR #0xff620000, r1 ; //read register 0xff620000, and store value into r1
- AND r1, 0x00000003 ; //r1 is bitwise AND with 0x3, and re-store the result

The following table lists all the supported command

INSTR	cmd[4:0	addr[26:2]	R1	R0	Data[31:0]

2.4.3 Hardware Trigger Flow

When DCF_CTRL.vop_hw_en is enabled, DCF can be triggered by any of the followed three sources: dma_finish 、vop_standby、vop_clkgate_en.

DCF is edge sensitive for dma_finish signal, and level sensitive for vop_standby and vop_clkgate_en signal.

When DCF is working, a dcf_idle is driven to low to indicate vop not to exit vop_standby status. And when DCF is not working, dcf_idle is driven to high for SOC and VOP to inquire.

Chapter 3 SPINLOCK

3.1 Overview

The hardware spinlock used for spinlock status storage. All the CPU can access spinlock to get the lock status.

3.2 Block Diagram

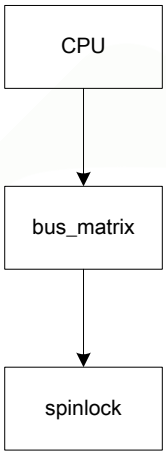

Fig.3-1 Spinlock in System

3.3 Register Description

3.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

3.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
SPINLOCK_status_n (range of n is 0~63)	0x0+4*n	W	0x00000000	spinlock status controller register_n

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

3.3.3 Detail Register Description

SPINLOCK_status_n

Address: Operational Base + offset (0x0000+4*n)

Bit	Attr	Reset Value	Description
31:4	RO	0x000000	reserved reserved
3:0	RW	0x0	spinlock_status when 4bits is 0, 4bits can be written with new value. when 4bits is not 0, 4bits cannot be written. when write data is 0x0000, 4bits clean to 0.

Chapter 4 Crypto

4.1 Overview

Crypto is a hardware accelerator for encrypting or decrypting. It supports the most commonly used algorithm: DES/3DES, AES, SHA1, SHA256, MD5 and PKA.

The Crypto supports following features:

- Support Link List Item (LLI) DMA transfer
- Support SHA-1, SHA-256/224, SHA-512/384, MD5, SM3 with hardware padding
- Support HMAC of SHA-1, SHA-256, SHA-512, MD5, SM3 with hardware padding
- Support AES-128, AES-192, AES-256 encrypt & decrypt cipher
- Support DES & TDES cipher
- Support AES ECB/CBC/OFB/CFB/CTR/CTS/XTS/CCM/GCM/CBC-MAC/CMAC mode
- Support SM4 ECB/CBC/OFB/CFB/CTR/CTS/XTS/CCM/GCM/CBC-MAC/CMAC mode
- Support DES/TDES ECB/CBC/OFB/CFB mode
- Support up to 4096 bits PKA mathematical operations for RSA/ECC/SM2
- Support up to 8-channels configuration

4.2 Block Diagram

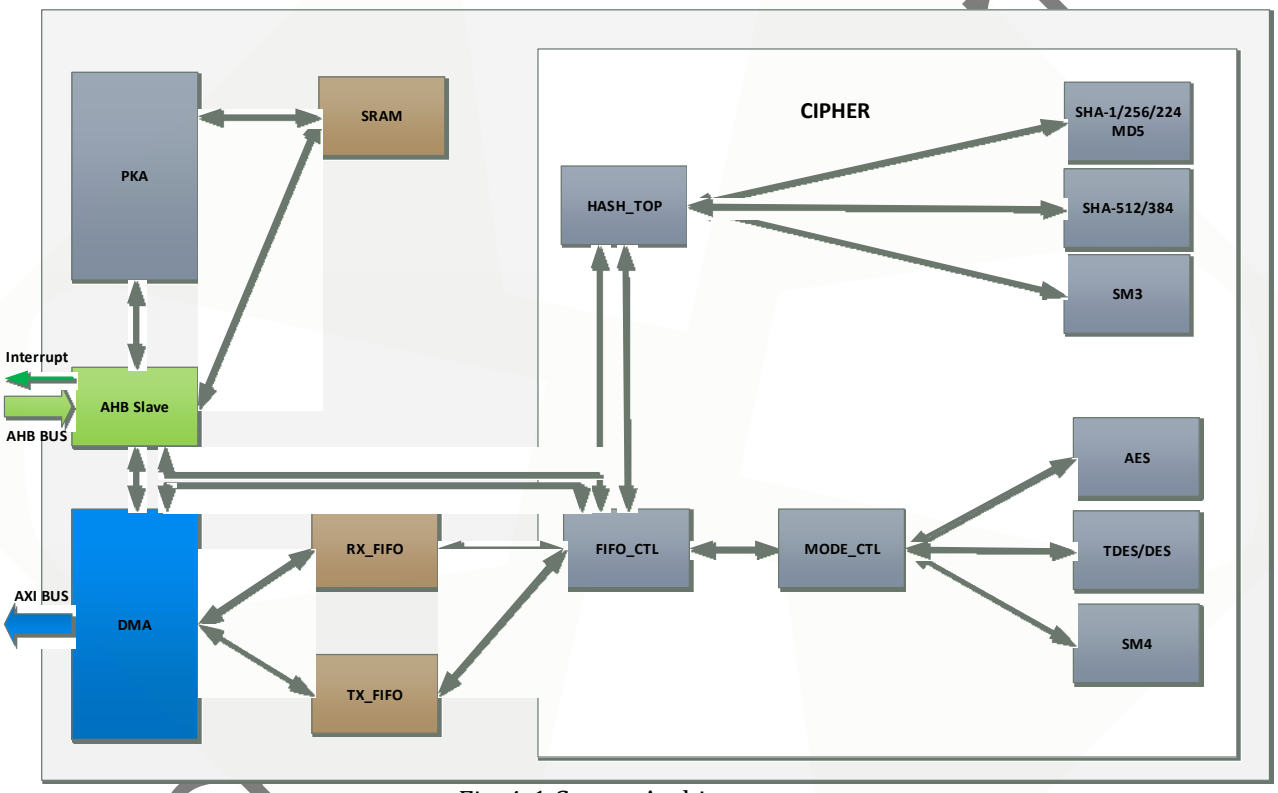

Fig. 4-1 Crypto Architecture

Crypto contains several modules : AHB_Slave, DMA, CIPHER, PKA.

AHB_Slave

AHB_Slave is used to configure registers. This module is in HCLK domain.

DMA

DMA is used to transfer data from external memory to RX_FIFO, or from TX_FIFO to external memory. DMA uses 64-bits AXI3 protocol with max burst length to 16. LLI transfer is also supported for performance and convenience consideration. This module is in ACLK domain.

CIPHER

CIPHER contains AES, SM4, DES/TDES and HASH engines. And it also supports various mode operations. The source data is either from RX_FIFO , or from other engine output. The result data is sending either to TX_FIFO, or Registers in module AHB_Slave. This module is in CLK_CORE domain.

PKA

PKA is used to accelerate mathematical operations for big numbers. It supports - Modular

arithmetic (addition, subtraction, multiplication and division), Regular arithmetic (addition, subtraction, multiplication and division), Modular inversion, Modular exponentiation, Logical operations (AND, OR, XOR, SHIFT). PKA has a SRAM which is used to store source , result and intermediate data for PKA operations. The software driver could use PKA operations to implement complicate calculation, such as RSA, ECC etc. It could support up to 4096 bits RSA modular exponentiation calculation. This module is in CLK_PKA domain.

4.3 Register description

4.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

4.3.2 Registers Summary

Name	Offset	Size	Reset Value	Description
CRYPTO_CLK_CTL	0x0000	W	0x00000001	Clock Control Register

CRYPTO_DEBUG_EXT_ADDR	0x08c4	W	0x00000000	Debug Extra Address Register

Name	Offset	Size	Reset Value	Description
CRYPTO_PKA_DEBUG_HALT	0x08c8	W	0x00000000	PKA Debug Halt State Register
CRYPTO_PKA_MON_READ	0x08d0	W	0x0000feef	PKA Monitor Read Register
CRYPTO_PKA_INT_ENA	0x08d4	W	0x00000000	PKA Interrupt Enable Register
CRYPTO_PKA_INT_ST	0x08d8	W	0x00000000	PKA Interrupt Status Register
CRYPTO_SRAM_ADDR	0x1000	W	0x00000000	SRAM Base Address

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

4.3.3 Detail Register Description

CRYPTO_CLK_CTL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	reserved
16	WO	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:1	RO	0x0	reserved
0	RW	0x1	auto_clkgate_en 1: enable. CRYPTO will gate unused Block Cipher and HASH module automatically to save power. 0: disable. Symmetric Cipher and HASH Module clock will be always available.

CRYPTO_RST_CTL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:19	RO	0x0	reserved
18:16	RW	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:3	RO	0x0	reserved
2	RW	0x0	sw_pka_reset Software set this bit to start a reset to PKA module. After the reset is done, CRYPTO will clear this bit.
1	RW	0x0	reserved
0	R/WSC	0x0	sw_cc_reset Software set this bit to start a reset to Symmetric Cipher and HASH module. After the reset is done, CRYPTO will clear this bit.

CRYPTO_DMA_INT_EN

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:9	RO	0x0	reserved
7	RW	0x0	lockstep_flag_int_en 1: enable ; 0: disable;
6	RW	0x0	zero_len_int_en 1: enable ; 0: disable;
5	RW	0x0	list_err_int_en 1: enable ; 0: disable;
4	RW	0x0	src_err_int_en 1: enable ; 0: disable.
3	RW	0x0	dst_err_int_en 1: enable ; 0: disable;
2	RW	0x0	src_item_done_int_en 1: enable ; 0: disable.
1	RW	0x0	dst_item_done_int_en 1: enable ; 0: disable.
0	RW	0x0	list_done_int_en 1: enable ; 0: disable.

CRYPTO_DMA_INT_ST

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:8	RO	0x0	reserved
7	W1C	0x0	sync_lockstep_flag Indicate that crypto was attacked. After the bit is read, the application should write 1 to clear this bit for next time use.
6	W1C	0x0	zero_len Indicate that DMA has met an 0 byte source transfer length in list descriptors. After the bit is read, the application should write 1 to clear this bit for next time use.
5	W1C	0x0	list_err Indicate that DMA has met an error response when transfer list descriptors. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use.

Bit	Attr	Reset Value	Description
4	W1C	0x0	src_err Indicate that DMA has met an error response when transfer source data. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use.
3	W1C	0x0	dst_err Indicate that DMA has met an error response when transfer destination data. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use.
2	W1C	0x0	src_item_done Indicate that DMA has completed a read transfers which the current list descriptor pointed to . After the bit is read, the application should write 1 to clear this bit for next time use.
1	W1C	0x0	dst_item_done Indicate that DMA has completed a write transfers which the current list descriptor pointed to . After the bit is read, the application should write 1 to clear this bit for next time use.
0	W1C	0x0	list_done Indicate that DMA has completed all the transfers which the list descriptors pointed to . After the bit is read, the application should write 1 to clear this bit for next time use.

CRYPTO_DMA_CTL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:18	RO	0x0	reserved
17:16	WO	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:2	RO	0x0	reserved
1	R/WSC	0x0	dma_restart If DMA data for next stage is not ready, application could pause DMA by descriptor commands. DMA will stop prefetching next descriptor . The application could restart DMA by asserting this bit when DMA data for next state is ready. Crypto will continue with previous transfer, and clear the bit automatically.
0	R/WSC	0x0	dma_start DMA asserts the bit to start DMA transfer, then Crypto will clear the bit automatically .

CRYPTO_DMA_LLI_ADDR

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	dma_lli_addr When DMA_CTL.start asserted, Crypto will read the address to get the 1'st descriptor. It should be 8-bytes align. We suggest dma_lli_addr 64-byte align for best performance consideration.
2:0	RO	0x0	reserved

CRYPTO_DMA_ST

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RW	0x0	dma_busy 1: dma busy ; 0: dma idle ;

CRYPTO_DMA_STATE

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:6	RO	0x0	reserved
5:4	RO	0x0	dma_lli_state For debug use only. 00: IDLE STATE; 01: FETCH STATE ; 10: WORK STATE ;
3:2	RO	0x0	dma_src_state For debug use only. 00: IDLE STATE; 01: LOAD STATE ; 10: WORK STATE ;
1:0	RO	0x0	dma_dst_state For debug use only. 00: IDLE STATE; 01: LOAD STATE ; 10: WORK STATE ;

CRYPTO_DMA_LLI_RADDR

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dma_lli_raddr For debug use only. It indicates the current dma lli read address.

CRYPTO_DMA_SRC_RADDR

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dma_src_raddr For debug use only. It indicates the current dma source read address.

CRYPTO_DMA_DST_WADDR

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dma_dst_waddr For debug use only. It indicates the current dma destination write address.

CRYPTO_DMA_ITEM_ID

Address: Operational Base + offset (0x002c)

Bit	Attr	Reset Value	Description
31:8	RO	0x0	reserved
7:0	RO	0x00	dma_item_id For debug use only. It indicates the current descriptor ID.

CRYPTO_FIFO_CTL

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:18	RO	0x0	reserved
17:16	WO	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:2	RO	0x0	reserved
1	RW	0x1	dout_byteswap 1: little endian ; 0: big endian .
0	RW	0x1	din_byteswap 1: little endian ; 0: big endian .

CRYPTO_BC_CTL

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:26	RO	0x0	reserved

Bit	Attr	Reset Value	Description
25:16	WO	0x000	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:10	RO	0x0	reserved
9:8	RW	0x0	bc_cipher_sel 00: AES ; 01: SM4; 10: DES ; 11: TDES .
7:4	RW	0x0	mode FOR AES, 0x0: ECB ; 0x1: CBC ; 0x2: CTS ; 0x3: CTR ; 0x4: CFB ; 0x5: OFB ; 0x6: XTS ; 0x7: CCM; 0x8: GCM; 0x9: CMAC ; 0xA: CBC-MAC. Others: Reserved. For TDES/DES , 0x0: ECB ; 0x1: CBC ; 0x4: CFB ; 0x5: OFB ; Others: Reserved.
3:2	RW	0x0	key_size For AES , 00: 128 bit ; 01: 192 bit ; 10: 256 bit ; 11: reserved. For TDES/DES, it is reserved.
1	RW	0x0	decrypt 1: decrypt ; 0: encrypt .
0	RW	0x0	bc_enable 1: enable ; 0: disable .

CRYPTO_HASH_CTL

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:24	RO	0x0	reserved
23:16	WO	0x00	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:8	RO	0x0	reserved
7:4	RW	0x0	hash_cipher_sel 0x0: SHA-1 ; 0x1: MD-5 ; 0x2: SHA-256 ; 0x3: SHA-224 ; 0x4: SM3 ; 0x8: SHA-512 ; 0x9: SHA-384 ; 0xA: SHA-512/224 ; 0xB: SHA-512/256 ; Others: Reserved.
3	RW	0x0	hmac_enable Crypto supports HMAC-SHA1, HMAC-SHA256, HMAC_SHA512, HMAC-MD5, HMAC-SM3. 1: enable ; 0: disable. Note: If hmac_enable set '1', hash_cipher_sel must set 0x6 when chose HMAC-SM3 mode; hash_cipher_sel set the corresponding value when chose other mode.
2	RW	0x1	hw_pad_enable 1: enable ; 0: disable .
1	RW	0x0	hash_src_sel 0: from RX-FIFO ; 1: from TX-FIFO .
0	RW	0x0	hash_enable 1: enable ; 0: disable.

CRYPTO_CIPHER_ST

Address: Operational Base + offset (0x004c)

Bit	Attr	Reset Value	Description
31:2	RO	0x0	reserved
1	RO	0x0	hash_busy 1: busy ; 0: idle ;
0	RO	0x0	block_cipher_busy 1: busy ; 0: idle ;

CRYPTO_CIPHER_STATE

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14:10	RW	0x01	hash_state For debug use only. 00001: IDLE State ; 00010: IPAD State ; 00100: TEXT State; 01000: OPAD State; 10000: OPAD EXT State .
9:8	RW	0x0	gcm_state For debug use only. 00: IDLE State; 01: PRE State; 10: NA State; 11: PC State.
7:6	RW	0x0	ccm_state For debug use only. 00: IDLE State; 01: PRE State; 10: NA State; 11: PC State.
5:4	RW	0x0	parallel_state For debug use only. 00: IDLE State; 01: PRE State; 10: BULK State. 11: Reserved
3:2	RW	0x0	mac_state For debug use only. 00: IDLE State; 01: PRE State; 10: BULK State. 11: Reserved

Bit	Attr	Reset Value	Description
1:0	RO	0x0	serial_state For debug use only. 00: IDLE State; 01: PRE State; 10: BULK State. 11: Reserved

CRYPTO_CHn_IV_0

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_0 Channel n range from 0 to 7. CHn_IV_0 address = 0x0100 + 0x10 * n . For CTR Mode, IV stands for counter. For XTS Mode, IV stands for tweak.

CRYPTO_CHn_IV_1

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_1 Channel n range from 0 to 7. CHn_IV_1 address = 0x0104 + 0x10 * n . For CTR Mode, IV stands for counter. For XTS Mode, IV stands for tweak.

CRYPTO_CHn_IV_2

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_2 Channel n range from 0 to 7. CHn_IV_2 address = 0x0108 + 0x10 * n . For CTR Mode, IV stands for counter. For XTS Mode, IV stands for tweak.

CRYPTO_CHn_IV_3

Address: Operational Base + offset (0x010c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_3 Channel n range from 0 to 7. CHn_IV_3 address = 0x010c + 0x10 * n . For CTR Mode, IV stands for counter. For XTS Mode, IV stands for tweak.

CRYPTO_CHn_KEY_0

Address: Operational Base + offset (0x0180)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_0 Channel n range from 0 to 7. CHn_KEY_0 address = 0x0180 + 0x10 * n .

CRYPTO_CHn_KEY_1

Address: Operational Base + offset (0x0184)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_1 Channel n range from 0 to 7. CHn_KEY_1 address = 0x0184 + 0x10 * n .

CRYPTO_CHn_KEY_2

Address: Operational Base + offset (0x0188)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_2 Channel n range from 0 to 7. CHn_KEY_2 address = 0x0188 + 0x10 * n .

CRYPTO_CHn_KEY_3

Address: Operational Base + offset (0x018c)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_3 Channel n range from 0 to 7. CHn_KEY_3 address = 0x018c + 0x10 * n .

CRYPTO_CHn_PKEY_0

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_pkey_0 Channel n range from 0 to 7. CHn_PKEY_0 address = 0x0200 + 0x10 * n .

CRYPTO_CHn_PKEY_1

Address: Operational Base + offset (0x0204)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_pkey_1 Channel n range from 0 to 7. CHn_PKEY_1 address = 0x0204 + 0x10 * n .

CRYPTO_CHn_PKEY_2

Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_pkey_2 Channel n range from 0 to 7. CHn_PKEY_2 address = 0x208 + 0x10 * n .

CRYPTO_CHn_PKEY_3

Address: Operational Base + offset (0x020c)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_3 Channel n range from 0 to 7. CHn_PKEY_3 address = 0x020c + 0x10 * n .

CRYPTO_CHn_PC_LEN_0

Address: Operational Base + offset (0x0280)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_pc_len_0 Channel n range from 0 to 7. CHn_PC_LEN_0 address = 0x0280 + 0x8 * n . Length in byte unit.

CRYPTO_CHn_PC_LEN_1

Address: Operational Base + offset (0x0284)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:0	RW	0x00000000	chn_pc_len_1 Channel n range from 0 to 7. CHn_PC_LEN_1 address = 0x0284 + 0x8 * n . Length in byte unit.

CRYPTO_CHn_ADA_LEN_0

Address: Operational Base + offset (0x02c0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_ada_len_0 Channel n range from 0 to 7. CHn_ADA_LEN_0 address = 0x02c0 + 0x8 * n . Length in byte unit.

CRYPTO_CHn_ADA_LEN_1

Address: Operational Base + offset (0x02c4)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:0	RW	0x00000000	chn_ada_len_1 Channel n range from 0 to 7. CHn_ADA_LEN_1 address = 0x02c4 + 0x8 * n . Length in byte unit.

CRYPTO_CHn_IV_LEN_0

Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:5	RO	0x0	reserved
4:0	RW	0x00	chn_iv_len Channel n range from 0 to 7. CHn_IV_LEN_0 address = 0x0300 + 0x4 * n . Length in byte unit. Up to 16 byte IV for GCM

CRYPTO_CHn_TAG_0

Address: Operational Base + offset (0x0320)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_0 Channel n range from 0 to 7. CHn_TAG_0 address = 0x0320 + 0x10 * n . When the corresponding TAG_VALID is high, TAG value is valid.

CRYPTO_CHn_TAG_1

Address: Operational Base + offset (0x0324)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_1 Channel n range from 0 to 7. CHn_TAG_1 address = 0x0324 + 0x10 * n . When the corresponding TAG_VALID is high, TAG value is valid.

CRYPTO_CHn_TAG_2

Address: Operational Base + offset (0x0328)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_2 Channel n range from 0 to 7. CHn_TAG_2 address = 0x0328 + 0x10 * n . When the corresponding TAG_VALID is high, TAG value is valid.

CRYPTO_CHn_TAG_3

Address: Operational Base + offset (0x032c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_3 Channel n range from 0 to 7. CHn_TAG_3 address = 0x032c + 0x10 * n . When the corresponding TAG_VALID is high, TAG value is valid.

CRYPTO_HASH_DOUT_0

Address: Operational Base + offset (0x03a0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_0 0'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_1

Address: Operational Base + offset (0x03a4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_1 1'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_2

Address: Operational Base + offset (0x03a8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_2 2'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_3

Address: Operational Base + offset (0x03ac)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_3 3'th output word for all hash function, in big endian.This is MD5 last output word. HASH_DOUT_4 ~ HASH_DOUT_15 is invalid data for MD5.

CRYPTO_HASH_DOUT_4

Address: Operational Base + offset (0x03b0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_4 4'th output word for all hash function, in big endian.This is SHA-1 last output word. HASH_DOUT_5 ~ HASH_DOUT_15 is invalid data for SHA-1.

CRYPTO_HASH_DOUT_5

Address: Operational Base + offset (0x03b4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_5 5'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_6

Address: Operational Base + offset (0x03b8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_6 6'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_7

Address: Operational Base + offset (0x03bc)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_7 7'th output word for all hash function, in big endian.This is SHA-256/224 last output word. HASH_DOUT_8 ~ HASH_DOUT_15 is invalid data for SHA-256/224.

CRYPTO_HASH_DOUT_8

Address: Operational Base + offset (0x03c0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_8 8'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_9

Address: Operational Base + offset (0x03c4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_9 9'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_10

Address: Operational Base + offset (0x03c8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_10 10'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_11

Address: Operational Base + offset (0x03cc)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_11 11'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_12

Address: Operational Base + offset (0x03d0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_12 12'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_13

Address: Operational Base + offset (0x03d4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_13 13'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_14

Address: Operational Base + offset (0x03d8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_14 14'th output word for all hash function, in big endian.

CRYPTO_HASH_DOUT_15

Address: Operational Base + offset (0x03dc)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_15 15'th output word for all hash function, in big endian.This is SHA-512, SHA-384, SHA-512/224, SHA-512/256 last output word.

CRYPTO_TAG_VALID

Address: Operational Base + offset (0x03e0)

Bit	Attr	Reset Value	Description
31:8	RO	0x0	reserved
7	W1C	0x0	ch7_tag_valid When channel 7 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 7 tag is valid ; 0: channel 7 tag is invalid ;
6	W1C	0x0	ch6_tag_valid When channel 6 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 6 tag is valid ; 0: channel 6 tag is invalid ;
5	W1C	0x0	ch5_tag_valid When channel 5 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 5 tag is valid ; 0: channel 5 tag is invalid ;

Bit	Attr	Reset Value	Description
4	W1C	0x0	ch4_tag_valid When channel 4 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 4 tag is valid ; 0: channel 4 tag is invalid ;
3	W1C	0x0	ch3_tag_valid When channel 3 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 3 tag is valid ; 0: channel 3 tag is invalid ;
2	W1C	0x0	ch2_tag_valid When channel 2 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 2 tag is valid ; 0: channel 2 tag is invalid ;
1	W1C	0x0	ch1_tag_valid When channel 1 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 1 tag is valid ; 0: channel 1 tag is invalid ;
0	W1C	0x0	ch0_tag_valid When channel 0 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: channel 0 tag is valid ; 0: channel 0 tag is invalid ;

CRYPTO_HASH_VALID

Address: Operational Base + offset (0x03e4)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	W1C	0x0	hash_valid When HASH calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1: HASH_DOUT is valid ; 0: HASH_DOUT is invalid ;

CRYPTO_VERSION

Address: Operational Base + offset (0x03f0)

Bit	Attr	Reset Value	Description
31:0	RO	0x01010010	version_num Version number: V1.0.0.1.

CRYPTO_RAM_CTL

Address: Operational Base + offset (0x0480)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	reserved
16	WO	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:1	RO	0x0	reserved
0	RW	0x0	ram_pka_rdy Indicate whether ram is controlled by PKA engine. 0: ram is controlled by CPU. 1: ram is controlled by CRYPTO PKA engine.

CRYPTO_RAM_ST

Address: Operational Base + offset (0x0484)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RO	0x1	clk_ram_rdy Indicate whether clk_ram is stable, and ready for use. 0: not stable ; 1: stable.

CRYPTO_DEBUG_CTL

Address: Operational Base + offset (0x04a0)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	reserved
16	WO	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:1	RO	0x0	reserved
0	RW	0x0	pka_debug_mode 1: PKA is in debug mode ; 0: PKA is in normal mode.

CRYPTO_DEBUG_ST

Address: Operational Base + offset (0x04a4)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RO	0x1	pka_debug_clk_en For debug use only.

CRYPTO_DEBUG_MONITOR

Address: Operational Base + offset (0x04a8)

Bit	Attr	Reset Value	Description
31:0	RW	0x0000feef	pka_monitor_bus For debug use only.

CRYPTO_PKA_MEM_MAP0

Address: Operational Base + offset (0x0800)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map0 memory map 0 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP1

Address: Operational Base + offset (0x0804)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map1 memory map 1 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP2

Address: Operational Base + offset (0x0808)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map2 memory map 2 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP3

Address: Operational Base + offset (0x080c)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map3 memory map 3 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP4

Address: Operational Base + offset (0x0810)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map4 memory map 4 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP5

Address: Operational Base + offset (0x0814)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map5 memory map 5 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP6

Address: Operational Base + offset (0x0818)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map6 memory map 6 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP7

Address: Operational Base + offset (0x081c)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map7 memory map 7 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP8

Address: Operational Base + offset (0x0820)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map8 memory map 8 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP9

Address: Operational Base + offset (0x0824)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map9 memory map 9 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP10

Address: Operational Base + offset (0x0828)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved
11:2	RW	0x000	memory_map10 memory map 10 [11:2], bit[1:0] is stuck to 0.
1:0	RO	0x0	reserved

CRYPTO_PKA_MEM_MAP11

Address: Operational Base + offset (0x082c)

Bit	Attr	Reset Value	Description
31:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5:0	WO	0x00	tag Tag.

CRYPTO_N_NP_TO_T1_ADDR

Address: Operational Base + offset (0x0884)

Bit	Attr	Reset Value	Description
31:20	RO	0x0	reserved
19:15	RW	0x1f	reg_t1 Virtual address of temporary register number 1. Virtual address 0 point to PKA_MEM_MAP0. Virtual address 1 point to PKA_MEM_MAP1. ... Virtual address 15 point to PKA_MEM_MAP15.
14:10	RW	0x1e	reg_t0 Virtual address of temporary register number 0. Virtual address 0 point to PKA_MEM_MAP0. Virtual address 1 point to PKA_MEM_MAP1. ... Virtual address 15 point to PKA_MEM_MAP15.
9:5	RW	0x01	reg_np Virtual address of register np. Virtual address 0 point to PKA_MEM_MAP0. Virtual address 1 point to PKA_MEM_MAP1. ... Virtual address 15 point to PKA_MEM_MAP15.
4:0	RW	0x00	reg_n Virtual address of register n. Virtual address 0 point to PKA_MEM_MAP0. Virtual address 1 point to PKA_MEM_MAP1. ... Virtual address 15 point to PKA_MEM_MAP15.

CRYPTO_PKA_STATUS

Address: Operational Base + offset (0x0888)

Bit	Attr	Reset Value	Description
31:20	RO	0x0	reserved
19:14	RO	0x00	tag Tag of the Last Operation.
13:9	RO	0x00	opcode the last OPCODE.
8	RO	0x0	pka_cpu_busy PKA is busy memory control is by PKA.
7	RO	0x0	modinv_of_zero modular inverse of zero flag.

Bit	Attr	Reset Value	Description
6	RO	0x0	alu_sign_out sign of the last operation(MSB).
5	RO	0x0	alu_carry Carry of the last ALU operation.
4	RO	0x0	div_by_zero Division by 0.
3	RO	0x0	alu_mod_ovflw Modular overflow flag.
2	RO	0x0	alu_out_zero ALU out is 0.
1	RO	0x0	pka_busy PKA is busy.
0	RO	0x1	pipe_is_busy PKA ready signal 0 : pipe full 1 : PKA ready for new command.

CRYPTO_PKA_SW_RESET

Address: Operational Base + offset (0x088c)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	WO	0x0	pka_sw_reset PKA software reset the reset mechanism will take about four PKA clocks until the reset line is de-asserted.

CRYPTO_PKA_L0

Address: Operational Base + offset (0x0890)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l0 PKA length 0, in bit unit.

CRYPTO_PKA_L1

Address: Operational Base + offset (0x0894)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l1 PKA length 1, in bit unit.

CRYPTO_PKA_L2

Address: Operational Base + offset (0x0898)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l2 PKA length 2, in bit unit.

CRYPTO_PKA_L3

Address: Operational Base + offset (0x089c)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l3 PKA length 3, in bit unit.

CRYPTO_PKA_L4

Address: Operational Base + offset (0x08a0)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l4 PKA length 4, in bit unit.

CRYPTO_PKA_L5

Address: Operational Base + offset (0x08a4)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l5 PKA length 5, in bit unit.

CRYPTO_PKA_L6

Address: Operational Base + offset (0x08a8)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l6 PKA length 6, in bit unit.

CRYPTO_PKA_L7

Address: Operational Base + offset (0x08ac)

Bit	Attr	Reset Value	Description
31:13	RO	0x0	reserved
12:0	RW	0x0000	pka_l7 PKA length 7, in bit unit.

CRYPTO_PKA_PIPE_RDY

Address: Operational Base + offset (0x08b0)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RO	0x1	pka_pipe_rdy PKA pipe is ready for new opcode

CRYPTO_PKA_DONE

Address: Operational Base + offset (0x08b4)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RO	0x1	pka_done PKA operation is completed and pipe is empty.

CRYPTO_PKA_MON_SELECT

Address: Operational Base + offset (0x08b8)

Bit	Attr	Reset Value	Description
31:4	RO	0x0	reserved
3:0	RW	0x0	pka_mon_select PKA monitor select which PKA fsm monitor is being output.

CRYPTO_PKA_DEBUG_REG_EN

Address: Operational Base + offset (0x08bc)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RW	0x0	pka_debug_reg_en Enable all the debug mechanism when set.

CRYPTO_DEBUG_CNT_ADDR

Address: Operational Base + offset (0x08c0)

Bit	Attr	Reset Value	Description
31:20	RO	0x0	reserved
19:0	R/WSC	0x00000	debug_cnt_addr The clock counter initial values. clock is disabled when counter expires. Triggered when pka_debug_en is set.

CRYPTO_DEBUG_EXT_ADDR

Address: Operational Base + offset (0x08c4)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	WO	0x0	debug_ext_addr Disable the debug Mechanism

CRYPTO_PKA_DEBUG_HALT

Address: Operational Base + offset (0x08c8)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RO	0x0	pka_debug_halt In debug mode: PKA is in halt state.

CRYPTO_PKA_MON_READ

Address: Operational Base + offset (0x08d0)

Bit	Attr	Reset Value	Description
31:0	RO	0x0000feef	pka_mon_read This is the PKA monitor bus register output.

CRYPTO_PKA_INT_ENA

Address: Operational Base + offset (0x08d4)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	RW	0x0	pka_int_ena 1: enable pka interrupt. 0: disable pka interrupt

CRYPTO_PKA_INT_ST

Address: Operational Base + offset (0x08d8)

Bit	Attr	Reset Value	Description
31:1	RO	0x0	reserved
0	W1C	0x0	pka_int_st Indicate that PKA operation completes . After the bit is read, the application should write 1 to clear this bit for next time use.

CRYPTO_SRAM_ADDR

Address: Operational Base + offset (0x1000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sram_addr Sram address starts from 0x1000 to 0x1fff. When RAM_CTL.ram_pka_rdy == 0, application could access sram. Otherwise, application can't .

4.4 Application Note

4.4.1 Clock & Reset

There are 4 clock domains in Crypto. The clock and reset signals are described in the following table .

Table 4-1 Crypto Clock & Reset Description

Signal	Attr	Description
hclk	clock	AHB clock
aclk	clock	AXI master clock
clk_core	clock	Cipher work clock
clk_pka	clock	PKA work clock

Signal	Attr	Description
hresetn	reset	Asynchronously assert, synchronously de-assert to hclk, low active
aresetn	reset	Asynchronously assert, synchronously de-assert to aclk, low active
resetn_core	reset	Asynchronously assert, synchronously de-assert to clk_core, low active
resetn_pka	reset	Asynchronously assert, synchronously de-assert to clk_pka, low active

Each function need different clocks. The applications could gate the un-used clock to save power. Please see the following table for detail information.

Table 4-2 Crypto Clock & Reset Description

Operation	HCLK	ACLK	CLK_CORE	CLK_PKA
AES	ON	ON	ON	OFF
DES/TDES	ON	ON	ON	OFF
SM4	ON	ON	ON	OFF
HASH/HMAC	ON	ON	ON	OFF
PKA	ON	OFF	OFF	ON

Even when CLK_CORE is on, Crypto is doing some cipher job. And Crypto could still be able to automatically gate most parts of un-used blocks to save more power, if CRYPTO_CLK_CTL.auto_clkgate_en is set to '1' . The default value for this bit is also '1' .
Application could do a soft reset to a certain clock domain. Please refer to "Chapter CRU" for more details.

4.4.2 Performance

Cipher performance is shown in the following table.

Table 4-3 Crypto Performance Description

Algorithm	block size (Byte)	clk_core frequency (Mhz)	cycle	serial max throughput (MBps)	parallel max throughput (MBps)
DES	8	200	18	88	352
TDES	8	200	55	29	116
AES-128	16	200	12	266	1066
AES-192	16	200	14	228	914
AES-256	16	200	16	200	800
SM4	16	200	34	94	376
SM3	64	200	66	194	NA
SHA-1	64	200	81	158	NA
MD5	64	200	65	196	NA
SHA-256/224	64	200	65	196	NA
SHA-512/384/ 512_224/ 512_256	128	200	81	316	NA

There are 2 column throughput rates in the table, 1 is serial mode, the other is parallel mode. In parallel mode, there are 4 engines working at the same time . So the speed is 4 times than serial mode. Parallel mode includes ECB/CTR/XTS both encryption and decryption mode, CFB/CBC/CTS only decryption mode. Other modes are serial. HASH doesn't have parallel mode.
For PKA, the cycles for each calculation are not certain. It depends on the parameters. Take RSA-2048 for example, it takes about 28M cycles to finish a calculation. PKA can run 300 Mhz. It means it can run over 10 times per second.

4.4.3 DMA

DMA supports Link List Item (LLI) DMA transaction.

- Each item contains 8 bytes, and start address should be 8 bytes align ;
- We suggest that DATA start address is 8 bytes align ;

- Total DATA length is byte align.
- Support segmenting HASH/HMAC DATA into multi sections. We suggest that each section DATA length is a multiple of 64 bytes, except this section is the last section.

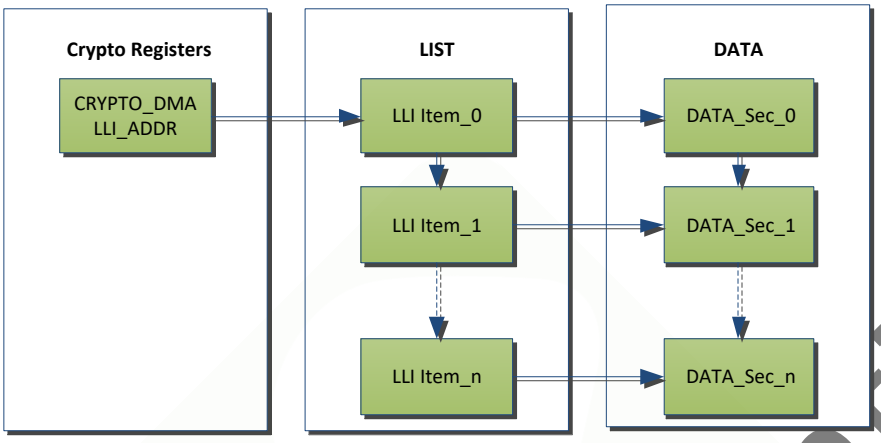

Fig.4-2 LLI DMA Usage

As shown in the Figure above, Register CRYPTO_DMA_LLI_ADDR points to 1'st LLI item in external memory. Each LLI item contains DATA address, length, control information and next LLI item pointer, except the last LLI item. The last item doesn't have the next LLI Item pointer. After the last LLI item is finished , DMA will go to idle state.
LLI item definition is shown in the following table.

Table 4-4 LLI Item Description

offset	Def	Description
0x00	SRC_ADDRESS[31:0]	Source data start address
0x04	SRC_LENGTH[31:0]	Source data length，in byte unit
0x08	DST_ADDRESS[31:0]	Destination data start address
0x0c	DST_LENGTH[31:0]	Destination data length，in byte unit
0x10	USER_DEFINE[31:0]	Used in cipher block
0x14	Reserved	Reserved
0x18	DMA_CTRL[31:0]	Used in DMA block
0x1c	NEXT_ADDRESS[31:0]	Next LLI item address. When DMA_CTRL.LAST = "1"，NEXT_ADDRESS is invalid.

DMA_CTRL: the definition is shown in the following table.

Table 4-5 LLI Item dma_ctl Description

Bit	Def	Definition
[31:24]	ITEM_ID[7:0]	Used to identify LLI items.
[23:16]	Reserved	Reserved
[15:11]	Reserved	Reserved
10	Source_item_done enable	When source data fetch is completed, CRYPTO_DMA_INT_ST.source_item_done will assert if this bit is set.
9	Dst_item_done enable	When destination data fetch is completed, CRYPTO_DMA_INT_ST.dst_item_done will assert if this bit is set.
8	List_done enable	When all LLI items transfer is completed, CRYPTO_DMA_INT_ST.list_done will assert if this bit is set.

Bit	Def	Definition
[7:2]	Reserved	Reserved
1	PAUSE	Indicate DMA will hold on after executes current item. DMA won't go on unless CRYPTO_DMA_CTL.restart is configured
0	LAST	Indicate current item is the last one. After executes current item, DMA will return to IDLE state.

Table 4-6 LLI Item user_define Description

Bit	Signal	Description
31:7	Reserved	Reserved
6:4	Chnl_num	channel number, from 0 to 7 .
3	String_attr	indicate current item's attribution. 1: ADA ; 0: PC(plaintext or ciphertext)
2	String_last	indicate current item is the string last item
1	String_start	indicate current item is the string first item
0	Cipher_start	indicate current item is the cipher first item

4.4.4 Multi-Channel Map

There are 8-channel configurations for AES or DES/TDES operation. For different key-size, the map is different. Please find the register map in the following table.

Table 4-7 LLI Item user_define Description

Cipher sel	otpkey sel	privacy sel	chnl num	key	iv(tag/...)
AES-128/ DES	0	0	0	CH0_KEY0-3/ CH0_KEY0-1	CH0_IV0-3/ CH0_IV0-1

AES-128	0	NA	4-7	not supported	not supported	not supported
AES-128	1	NA	NA	not supported	not supported	not supported
AES-256	0	0	0	CH0_KEY0-3, CH1_KEY0-3	CH4_KEY0-CH5_KEY3	CH0_IV0-3
AES-256	0	0	1	CH2_KEY0-3, CH3_KEY0-3	CH6_KEY0-CH7_KEY3	CH1_IV0-3
AES-256	0	1	0	CH0_PKEY0-3, CH1_PKEY0-3	CH4_PKEY0-CH5_PKEY3	CH0_IV0-3
AES-256	0	1	1	CH2_PKEY0-3, CH3_PKEY0-3	CH6_PKEY0-CH7_PKEY3	CH1_IV0-3
AES-256	0	NA	2-7	not supported	not supported	not supported
AES-256	1	NA	NA	not supported	not supported	not supported

Note: The difference between CHn_KEY and CHn_PKEY is that: CHn_KEY could be read/write, CHn_PKEY could be write , but can't be read . The read value for CHn_PKEY is all '0'.

4.4.5 HASH Data Path

HASH and AES could run in parallel way. There are 2 paths lead to AES-HASH function. One is AES-HASH-RX mode, the other is AES-HASH-TX mode.

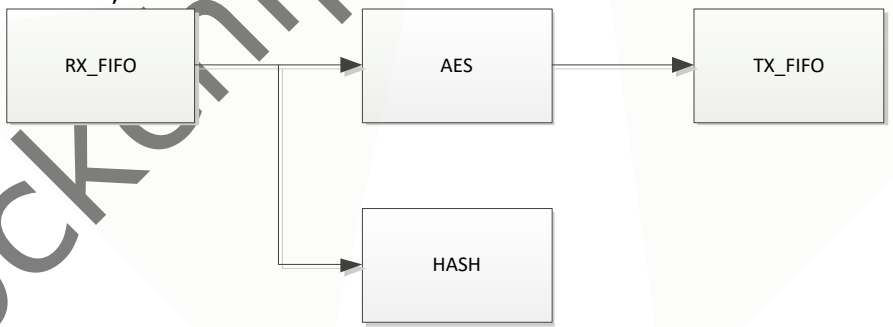

Fig.4-3 AES-HASH-RX mode

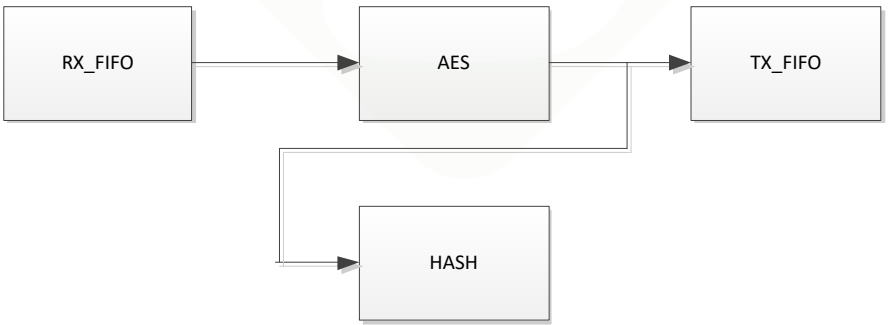

Fig.4-4 AES-HASH-TX mode

As shown in the figures above, we could facilitate operations in some cases. For example, secure boot, we need both AES and HASH operations for the same blocks of data. The data HASH gets from RX_FIFO or TX_FIFO is byteswaped if the byteswap function is configured.

4.4.6 Program Steps

The application could succeed various crypto operations if they program properly.

- Program the LLI address to DMA_LLI_ADDR;
- Program KEY , IV, or other parameter if needed ;
- Program BC_CTL or HASH_CTL for control information;
- Prepare LLI Item;
- Enable interrupt, or do nothing.

All these operations could be in any order.

- Program DMA_CTL.start to start the operation;

This step should be the last configuration step. After this register is configured, other registers should not be changed.

- Wait interrupt asserted, or just poll the DMA_INT_ST bits .
- Program DMA_INT_ST to clear interrupt status, and get the result.

The application could also use LLI.pause when the next LLI item is not ready. After the new item is prepared, the application could program DMA_CTL.restart to continue previous operation.

Chapter 5 True Random Number Generator(TRNG)

5.1 Overview

TRNG is a true random number generator to generate random number:

- A 32 bits AHB slave
- The generated random number length can be configured as 64bits 128bits, 192bits and 256 bits
- OSC is available in four lengths
- The sampling period for random number per bit is available

5.2 Block Diagram

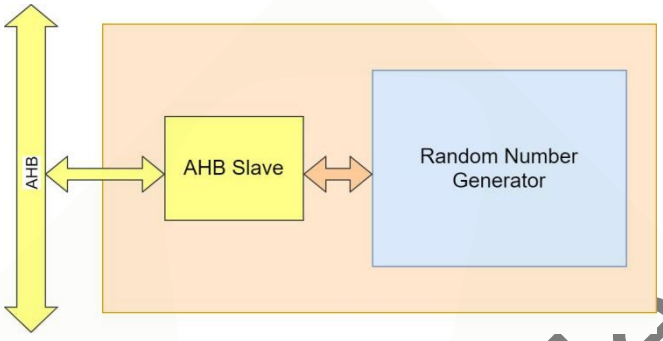

Fig. 5-1 TRNG Block Diagram

TRNG is comprised of:

- AHB Slave

The AHB slave implements the AHB slave operation. Its data bus width is 32 bits.

- Random Number Generator

The Random Number Generator generate true random number according to register configuration.

5.3 Function Description

5.3.1 Operation

- **True random number generate**

User first configures the RNG_SAMPLE_CNT and RNG_CTL register, excluding the rng_start field of the RNG_CTL register. The rng_start field of the RNG_CTL register is then finally configured to start the random number generation. Wait until the rng_start field of the RST_CTL register reads out a value of 0, which indicates that the random number is generated.

- **Reset operation**

User write 0x00020002 to RST_CTL register. Then, wait until the RST_CTL register reads out a value of 0. After these operations, TRNG clear RNG_DOUT and the internal state.

5.4 Register Description

This section describes the control/status registers of the design. Software should read and write these registers using 32-bits accesses.

5.4.1 Registers Summaryc

Name	Offset	Size	Reset Value	Description
TRNG_RST_CTL	0x0004	W	0x00000000	Reset Control Register
TRNG_RNG_CTL	0x0400	W	0x0000000C	RNG Control Register
TRNG_RNG_SAMPLE_CNT	0x0404	W	0x00000000	RNG Sample Counter Register
TRNG_RNG_DOUT_0	0x0410	W	0x00000000	RNG Data Output Register 0
TRNG_RNG_DOUT_1	0x0414	W	0x00000000	RNG Data Output Register 1
TRNG_RNG_DOUT_2	0x0418	W	0x00000000	RNG Data Output Register 2
TRNG_RNG_DOUT_3	0x041C	W	0x00000000	RNG Data Output Register 3
TRNG_RNG_DOUT_4	0x0420	W	0x00000000	RNG Data Output Register 4
TRNG_RNG_DOUT_5	0x0424	W	0x00000000	RNG Data Output Register 5
TRNG_RNG_DOUT_6	0x0428	W	0x00000000	RNG Data Output Register 6
TRNG_RNG_DOUT_7	0x042C	W	0x00000000	RNG Data Output Register 7

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-*

Double WORD (64 bits) access

5.4.2 Detail Register Description

TRNG_RST_CTL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x0	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
16:2	RO	0x0000	reserved
1	R/WSC	0x0	sw_rng_reset Software set this bit to start a reset to TRNG module. After the reset is done, CRYPTO will clear this bit.
0	RO	0x0	reserved

TRNG_RNG_CTL

Address: Operational Base + offset (0x0400)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	WO	0x00	write_enable When bit n=1, the corresponding bit n-16 can be written by software; When bit n=0, the corresponding bit n-16 can't be written by software.
15:6	RO	0x000	reserved
5:4	RW	0x0	rng_len 2'b00: 64 bit 2'b01: 128 bit 2'b10: 192 bit 2'b11: 256 bit
3:2	RW	0x3	ring_sel There are 4 osc rings choice to decide the rng output data. 2'b00: Slowest osc ring 2'b01: faster than osc ring 0 2'b10: faster than osc ring 1 2'b11: fastest osc ring
1	RW	0x0	rng_enable 1'b1: Enable 1'b0: Disable
0	R/WSC	0x0	rng_start The application triggers this bit to start collect rng output data. After rng is started, CRYPTO will clear the bit automatically. 1'b1: Start 1'b0: Do nothing

TRNG_RNG_SAMPLE_CNT

Address: Operational Base + offset (0x0404)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	rng_sample_cnt RNG collects osc ring output bit every rng_sample_cnt time. The value of rng_sample_cnt affects RNG output data rate, the value more bigger, the rate more slower.

TRNG_RNG_DOUT_0

Address: Operational Base + offset (0x0410)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rng_dout_0 The 32'th osc ring bit is captured in RNG_DOUT_0.bit31.

TRNG_RNG_DOUT_1

Address: Operational Base + offset (0x0414)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rng_dout_1 The 64'th osc ring bit is captured in RNG_DOUT_1.bit31. If RNG_CTL.rng_len = 0x00, the last valid bit of RNG is stored in RNG_DOUT_1.bit31, and RNG_DOUT_2 ~ RNG_DOUT_7 are invalid.

TRNG_RNG_DOUT_2

Address: Operational Base + offset (0x0418)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rng_dout_2 The 96'th osc ring bit is captured in RNG_DOUT_2.bit31.

TRNG_RNG_DOUT_3

Address: Operational Base + offset (0x041C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rng_dout_3 The 128'th osc ring bit is captured in RNG_DOUT_3.bit31. If RNG_CTL rng_len = 0x01, the last valid bit of RNG is stored in RNG_DOUT_3.bit31, and RNG_DOUT_4 ~ RNG_DOUT_7 are invalid.

TRNG_RNG_DOUT_4

Address: Operational Base + offset (0x0420)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rng_dout_4 The 160'th osc ring bit is captured in RNG_DOUT_4.bit31.

TRNG_RNG_DOUT_5

Address: Operational Base + offset (0x0424)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rng_dout_5 The 192'th osc ring bit is captured in RNG_DOUT_5.bit31. If RNG_CTL.rng_len = 0x02, the last valid bit of RNG is stored in RNG_DOUT_5.bit31, and RNG_DOUT_6~ RNG_DOUT_7 are invalid.

TRNG_RNG_DOUT_6

Address: Operational Base + offset (0x0428)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	rng_dout_6 The 224'th osc ring bit is captured in RNG_DOUT_6.bit31.

TRNG_RNG_DOUT_7

Address: Operational Base + offset (0x042C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	rng_dout_7 The 256'th osc ring bit is captured in RNG_DOUT_7.bit31. If RNG_CTL.rng_len = 0x03, the last valid bit of RNG is stored in RNG_DOUT_7.bit31.

5.5 Application Notes

- When random numbers do not meet randomness requirements, user can resolve the problem by adjusting the RNG_SAMPLE_CNT register and ring_sel field of RNG_CTL register.

Chapter 6 Mobile Storage Host Controller

6.1 Overview

The Mobile Storage Host Controller is designed to support Secure Digital memory (SD-max version 3.01) with 1 bits or 4 bits data width, Multimedia Card(MMC-max version 4.51) with 1 bits or 4 bits or 8 bits data width.

The Host Controller is instantiated for SDMMC0, SDMMC1, SDMMC2. The interface difference between these instances is shown in "Interface Description".

The Host Controller supports following features:

- Bus Interface Features:
  - Support AMBA AHB interface for master and slave
  - Supports internal DMA interface(IDMAC)
    - Supports 16/32-bit data transfers
    - Single engine used for Transmit and Receive, which are mutually exclusive
    - Dual-buffer and chained descriptor linked list
    - Each descriptor can transfer up to 4KB of data in chained mode and 8KB of data in dual-buffer mode
    - Programmable burst size for optimal host bus utilization
  - Support combined single FIFO for both transmit and receive operations
  - Support FIFO size of 256x32
  - Support FIFO over-run and under-run prevention by stopping card clock
- Card Interface Features:
  - Support Secure Digital memory protocol commands
  - Support Secure Digital I/O protocol commands
  - Support Multimedia Card protocol commands
  - Support Command Completion Signal and interrupts to host
  - Support CRC generation and error detection
  - Support programmable baud rate
  - Support power management and power switch
  - Support card detection
  - Support write protection
  - Support hardware reset
  - Support SDIO interrupts in 1-bit and 4-bit modes
  - Support 4-bit mode in SDIO3.0
  - Support SDIO suspend and resume operation
  - Support SDIO read wait
  - Support block size of 1 to 65,535 bytes
  - Support 1-bit, 4-bit modes
  - Supports 4-bit DDR
  - Support boot in 1-bit and 4-bit SDR modes
- Clock Interface Features:
  - Support 0/90/180/270-degree phase shift operation for sample clock (cclk_in_sample) and drive clock(cclk_in_drv) relative to function clock(cclk_in) respectively
  - Support phase tuning using delay line for sample clock(cclk_in_sample) and drive clock(cclk_in_drv) relative to function clock (cclk_in) respectively. The max number of delay element number is 256

6.2 Block Diagram

The Host Controller consists of the following main functional blocks.

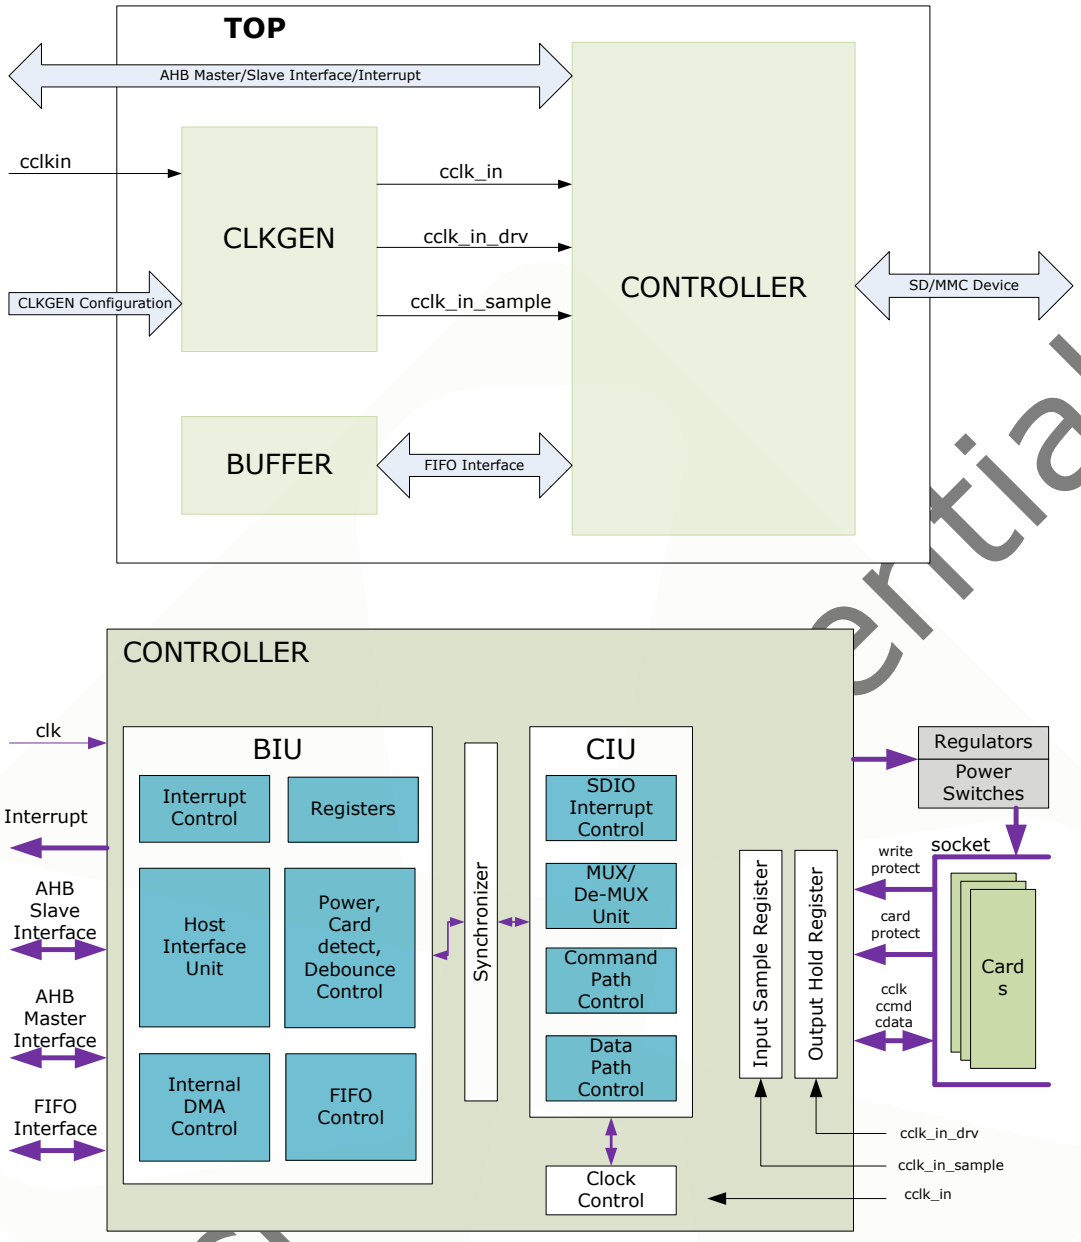

Fig. 6-1 Mobile Storage Host Control Block Diagram

- Clock Generate Unit (CLKGEN): Generates card interface clock cclk_in/ cclk_sample/cclk_drv based on cclkin and configuration information.
  - cclkin: original clock
  - cclk_in: functional clock
  - cclk_sample: sample clock
  - cclk_drv: driver clock
- Asynchronous dual-port memory (BUFFER): Use a two-clock synchronous read and synchronous write dual-port RAM. One of the ports is connected to the host clock, and the other port is connected to the card clock.
- Bus Interface Unit (BIU): Provides AMBA AHB interfaces for register and data read/write.
- Card Interface Unit (CIU): Takes care of the SD/MMC protocols and provides clock management.

6.3 Function Description

6.3.1 Bus Interface Unit

The Bus Interface Unit provides the following functions:

- Host interface
- Interrupt control
- Register access
- External FIFO access

- Power control and card detection

6.3.1.1 Host Interface Unit

The Host Interface Unit is an AHB slave interface, which provides the interface between the SD/MMC card and the host bus.

6.3.1.2 Register Unit

The register unit is part of the bus interface unit; it provides read and write access to the registers.

All registers reside in the Bus Interface Unit clock domain. When a command is sent to a card by setting the start_bit, which is bit[31] of the SDMMC_CMD register, all relevant registers needed for the CIU operation are transferred to the CIU block. During this time, the registers that are transferred from the BIU to the CIU should not be written. The software should wait for the hardware to clear the start bit before writing to these registers again. The register unit has a hardware locking feature to prevent illegal writes to registers. The lock is necessary in order to avoid metastability violations, both because the host and card clock domains are different and to prevent illegal software operations.

Once a command start is issued by setting the start_bit of the SDMMC_CMD register, the following registers cannot be reprogrammed until the command is accepted by the card interface unit:

- SDMMC_CMD – Command
- SDMMC_CMDARG – Command Argument
- SDMMC_BYTCNT – Byte Count
- SDMMC_BLKSIZ – Block Size
- SDMMC_CLKDIV – Clock Divider
- SDMMC_CLKENA – Clock Enable
- SDMMC_CLKSRC – Clock Source
- SDMMC_TMOUT – Timeout
- SDMMC_CTYPE – Card Type

The hardware resets the start_bit once the CIU accepts the command. If a host write to any of these registers is attempted during this locked time, then the write is ignored and the hardware lock error bit is set in the raw interrupt status register. Additionally, if the interrupt is enabled and not masked for a hardware lock error, then an interrupt is sent to the host.

When the Card Interface Unit is in an idle state, it typically takes the following number of clocks for the command handshake, where clk is the BIU clock and cclk_in is the CIU clock:

3 (clk) + 3 (cclk_in)

Once a command is accepted, you can send another command to the CIU-which has a one-deep command queue-under the following conditions:

- If the previous command was not a data transfer command, the new command is sent to the SD/MMC card once the previous command completes.
- If the previous command is a data transfer command and if wait_prvdata_complete (bit[13]) of the SDMMC_CMD register is set for the new command, the new command is sent to the SD/MMC card only when the data transfer completes.
- If the wait_prvdata_complete is 0, then the new command is sent to the SD/MMC card as soon as the previous command is sent. Typically, you should use this only to stop or abort a previous data transfer or query the card status in the middle of a data transfer.

6.3.1.3 Interrupt Controller Unit

The interrupt controller unit generates an interrupt that depends on the controller raw interrupt status, the interrupt-mask register, and the global interrupt-enable register bit. Once an interrupt condition is detected, it sets the corresponding interrupt bit in the raw interrupt status register SDMMC_RINTSTS. The raw interrupt status bit stays on until the software clears the bit by writing a 1 to the interrupt bit; a 0 leaves the bit untouched.

The interrupt port is an active-high, level-sensitive interrupt. The interrupt port is active only when any bit in the raw interrupt status register is active, the corresponding interrupt mask bit is 1, and the global interrupt enable bit is 1. The interrupt port is registered in order to avoid any combinational glitches.

The int_enable is reset to 0 on power-on, and the interrupt mask bits are set to 32'h0, which masks all the interrupts.

Notes:

Before enabling the interrupt, it is always recommended that you write 32'hffff_ffff to the raw interrupt status register in order to clear any pending unserviced interrupts. When clearing interrupts during normal operation, ensure that you clear only the interrupt bits that you serviced.
The SDIO Interrupts, Receive FIFO Data Request (RXDR), and Transmit FIFO Data Request (TXDR) are set by level-sensitive interrupt sources. Therefore, the interrupt source should be first cleared before you can clear the interrupt bit of the Raw Interrupt register. For example, on seeing the Receive FIFO Data Request (RXDR) interrupt, the FIFO should be emptied so that the "FIFO count greater than the RX-Watermark" condition, which triggers the interrupt, becomes inactive. The rest of the interrupts are triggered by a single clock-pulse-width source.

Table 6-1 Bits in Interrupt Status Register

Bits	Interrupt	Description
24	sdio_interrupt	Interrupt from SDIO card. In MMC-Ver3.3-only mode, these bits are always 0.
16	Card no-busy	If card exit busy status, the interrupt happened.
15	End Bit Error (read) / Write no CRC (EBE)	Error in end-bit during read operation, or no data CRC received during write operation. For MMC CMD19, there may be no CRC status returned by the card. Hence, EBE is set for CMD19. The application should not treat this as an error.
14	Auto Command Done (ACD)	Stop/abort commands automatically sent by card unit and not initiated by host; similar to Command Done (CD) interrupt. Recommendation: Software typically need not enable this for non CE-ATA accesses; Data Transfer Over (DTO) interrupt that comes after this interrupt determines whether data transfer has correctly competed.
13	Start Bit Error (SBE)	Error in data start bit when data is read from a card. In 4-bit mode, if DAT[0] line indicates start bit-that is, 0-and any of the other data bits do not have start bit, then this error is set. Busy Complete Interrupt when data is written to the card. This interrupt is generated after completion of busy driven by the card after the last data block is written into the card.
12	Hardware Locked write Error (HLE)	During hardware-lock period, write attempted to one of locked registers. When software sets the start_cmd bit in the SDMMC_CMD register, the Host Controller tries to load the command. If the command buffer is already filled with a command, this error is raised. The software then has to reload the command.
11	FIFO Underrun/ Overrun Error (FRUN)	Host tried to push data when FIFO was full, or host tried to read data when FIFO was empty. Typically this should not happen, except due to error in software. Card unit never pushes data into FIFO when FIFO is full, and pop data when FIFO is empty. If IDMAC is enabled, FIFO under-run/over-run can occur due to a programming error on MSIZE and watermark values in SDMMC_FIFOTH register.
10	Data Starvation by Host Timeout (HTO)	To avoid data loss, card clock out is stopped if FIFO is empty when writing to card, or FIFO is full when reading from card. Whenever card clock is stopped to avoid data loss, data-starvation timeout counter is started with data-timeout value. This interrupt is set if host does not fill data into FIFO during write to card, or does not read from FIFO during read from card before timeout period.

Bits	Interrupt	Description
		Even after timeout, card clock stays in stopped state, with CIU state machines waiting. It is responsibility of host to push or pop data into FIFO upon interrupt, which automatically restarts cclk_out and card state machines. Even if host wants to send stop/abort command, it still needs to ensure it has to push or pop FIFO so that clock starts in order for stop/abort command to send on command signal along with data that is sent or received on data line.
9	Data Read Timeout (DRTO)	In Normal functioning mode: Data read timeout (DRTO) Data timeout occurred. Data Transfer Over (DTO) also set if data timeout occurs. In Boot Mode: Boot Data Start (BDS) When set, indicates that Host Controller has started to receive boot data from the card. A write to this register with a value of 1 clears this interrupt.
8	Response Timeout (RTO)	In normal functioning mode: Response timeout (RTO) Response timeout occurred. Command Done (CD) also set if response timeout occurs. If command involves data transfer and when response times out, no data transfer is attempted by Host Controller. In Boot Mode: Boot Ack Received (BAR) When expect_boot_ack is set, on reception of a boot acknowledge pattern—0-1-0—this interrupt is asserted. A write to this register with a value of 1 clears this interrupt.
7	Data CRC Error (DCRC)	Received Data CRC does not match with locally-generated CRC in CIU. Can also occur if the Write CRC status is incorrectly sampled by the Host.
6	Response CRC Error (RCRC)	Response CRC does not match with locally-generated CRC in CIU.
5	Receive FIFO Data Request (RXDR)	Interrupt set during read operation from card when FIFO level is greater than Receive-Threshold level. Recommendation: In DMA modes, this interrupt should not be enabled. In non-DMA mode: pop RX_WMark + 1 data from FIFO.

4	Transmit FIFO Data Request (TXDR)	Interrupt set during write operation to card when FIFO level reaches less than or equal to Transmit-Threshold level.
		Recommendation:
		In DMA modes, this interrupt should not be enabled.
		In non-DMA mode:
		if (pending_bytes > (FIFO_DEPTH - TX_WMark))
		push (FIFO_DEPTH - TX_WMark) data into FIFO
		else
		push pending_bytes data into FIFO

3	Data Transfer Over (DTO)	Indicates Data transfer completed. Though on detection of errors-Start Bit Error, Data CRC error, and so on, DTO may or may not be set; the application must issue CMD12, which ensures that DTO is set. Recommendation:

Bits	Interrupt	Description
		In non-DMA mode, when data is read from card, on seeing interrupt, host should read any pending data from FIFO. In DMA mode, DMA controllers guarantee FIFO is flushed before interrupt. DTO bit is set at the end of the last data block, even if the device asserts MMC busy after the last data block.
2	Command Done(CD)	Command sent to card and got response from card, even if Response Error or CRC error occurs.
1	Response Error (RE)	Error in received response set if one of following occurs: ● Transmission bit != 0 ● Command index mismatch ● End-bit != 1
0	Card-Detect (CDT)	When one or more cards inserted or removed, this interrupt occurs. Software should read card-detect register to determine current card status. Recommendation: After power-on and before enabling interrupts, software should read card detect register and store it in memory. When interrupt occurs, it should read card detect register and compare it with value stored in memory to determine which card(s) were removed/inserted. Before exiting ISR, software should update memory with new card-detect value.

6.3.1.4 FIFO Controller Unit

The FIFO controller interfaces the external FIFO to the host interface and the card controller unit. When FIFO overrun and under-run conditions occur, the card clock stops in order to avoid data loss.

The FIFO uses a two-clock synchronous read and synchronous write dual-port RAM. One of the ports is connected to the host clock(clk), and the second port is connected to the card clock(cclk_in).

Notes: The FIFO controller does not support simultaneous read/write access from the same port. For debugging purposes, the software may try to write into the FIFO and read back the data; results are indeterminate, since the design does not support read/write access from the same port.

6.3.1.5 Card Detection Unit

The register unit has registers that control the power. Power to each card can be selectively turned on or off.

The card detection unit looks for any changes in the card-detect signals for card insertion or card removal. It filters out the debounce associated with mechanical insertion or removal, and generates one interrupt to the host. You can program the debounce filter value.

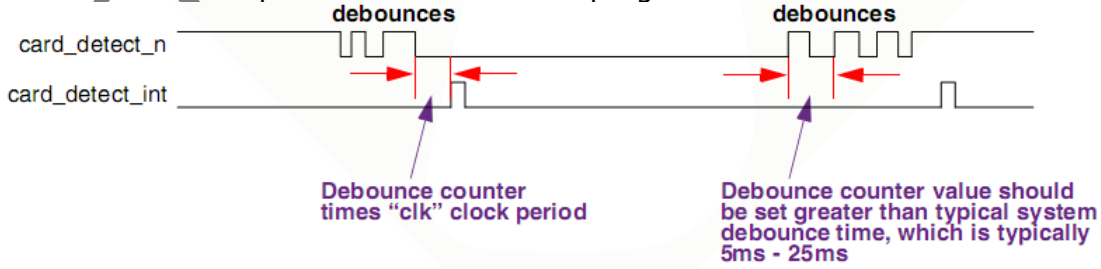

Fig. 6-2 SD/MMC Card-Detect Signal

6.3.2 Card Interface Unit

The Card Interface Unit (CIU) interfaces with the Bus Interface Unit (BIU) and the external devices. The host writes command parameters to the BIU control registers, and these parameters are then passed to the CIU. Depending on control register values, the CIU generates SD/MMC command and data traffic on a selected card bus according to SD/MMC protocol. The Host Controller accordingly controls the command and data path.

The following software restrictions should be met for proper CIU operation:

- Only one data transfer command can be issued at a time.
- During an open-ended card write operation, if the card clock is stopped because the FIFO is empty, the software must first fill the data into the FIFO and start the card clock. It can then issue only a stop/abort command to the card.
- When issuing card reset commands (CMD0, CMD15 or CMD52_reset) while a card data transfer is in progress, the software must set the stop_abort_cmd bit in the SDMMC_CMD register so that the Host Controller can stop the data transfer after issuing the card reset command.
- When the data end bit error is set in the SDMMC_RINTSTS register, the Host Controller does not guarantee SDIO interrupts. The software should ignore the SDIO interrupts and issue the stop/abort command to the card, so that the card stops sending the read data.
- If the card clock is stopped because the FIFO is full during a card read, the software should read at least two FIFO locations to start the card clock.

The CIU block consists of the following primary functional blocks:

- Command path
- Data path
- SDIO interrupt control
- Clock control
- Error detection

6.3.2.1 Command Path

The command path performs the following functions:

- Loads clock parameters
- Loads card command parameters
- Sends commands to card bus (ccmd_out line)
- Receives responses from card bus (ccmd_in line)
- Sends responses to BIU
- Drives the P-bit on command line

A new command is issued to the Host Controller by programming the BIU registers and setting the start_cmd bit in the SDMMC_CMD register. The BIU asserts start_cmd, which indicates that a new command is issued to the SD/MMC device. The command path loads this new command (command, command argument, timeout) and sends acknowledge to the BIU by asserting cmd_taken.

Once the new command is loaded, the command path state machine sends a command to the device bus-including the internally generated CRC7-and receives a response, if any. The state machine then sends the received response and signals to the BIU that the command is done, and then waits for eight clocks before loading a new command.

Load Command Parameters

One of the following commands or responses is loaded in the command path:

- New command from BIU – When start_cmd is asserted, then the start_cmd bit is set in the SDMMC_CMD register.
- Internally generated auto-stop command – When the data path ends, the stop command request is loaded.
- IRQ response with RCA 0x000 – When the command path is waiting for an IRQ response from the MMC card and a "send irq response" request is signaled by the BIU, then the send_irq_response bit is set in the SDMMC_CTRL register.

Loading a new command from the BIU in the command path depends on the following SDMMC_CMD register bit settings:

- update_clock_registers_only – If this bit is set in the SDMMC_CMD register, the command path updates only the clock enable, clock divider, and clock source registers. If this bit is not set, the command path loads the command, command argument, and timeout registers; it then starts processing the new command.
- wait_prvdata_complete – If this bit is set, the command path loads the new command under one of the following conditions:
  - Immediately, if the data path is free (that is, there is no data transfer in progress), or if an open-ended data transfer is in progress (byte_count = 0).
  - After completion of the current data transfer, if a predefined data transfer is in progress.

Send Command and Receive Response

Once a new command is loaded in the command path, update_clock_registers_only bit is unset – the command path state machine sends out a command on the device bus; the command path state machine is illustrated in following figure.

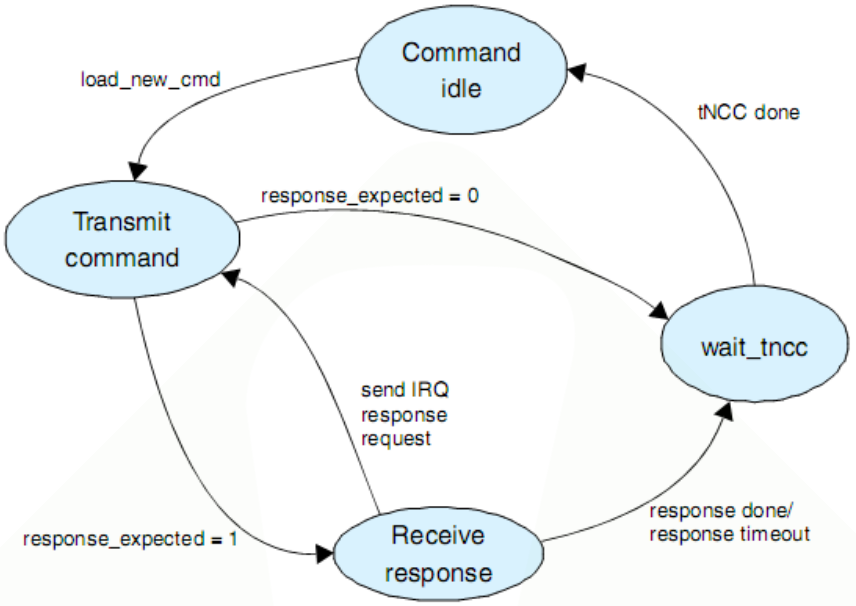

Fig. 6-3 Host Controller Command Path State Machine

The command path state machine performs the following functions, according to SDMMC_CMD register bit values:

- send_initialization – Initialization sequence of 80 clocks is sent before sending the command.
- response_expected – Response is expected for the command. After the command is sent out, the command path state machine receives a 48-bit or 136-bit response and sends it to the BIU. If the start bit of the card response is not received within the number of clocks programmed in the timeout register, then the response timeout and command done bit is set in the Raw Interrupt Status register as a signal to the BIU. If the response-expected bit is not set, the command path sends out a command and signals a response done to the BIU; that is, the command done bit is set in the Raw Interrupt Status register.
- response_length – If this bit is set, a 136-bit response is received; if it is not set, a 48-bit response is received.
- check_response_crc – If this bit is set, the command path compares CRC7 received in the response with the internally-generated CRC7. If the two do not match, the response CRC error is signaled to the BIU; that is, the response CRC error bit is set in the Raw Interrupt Status register SDMMC_RINTSTS.

Send Response to BIU

If the response_expected bit is set in the SDMMC_CMD register, the received response is sent to the BIU. The Response0 register is updated for a short response, and the Response3, Response2, Response1, and Response0 registers are updated on a long response, after which the Command Done bit is set. If the response is for an auto_stop command sent by the CIU, the response is saved in the Response1 register, after which the Auto Command Done bit is set.

Additionally, the command path checks for the following:

- Transmission bit = 0
- Command index matches command index of the sent command
- End bit = 1 in received card response

The command index is not checked for a 136-bit response or if the check_response_crc bit is unset. For a 136-bit response and reserved CRC 48-bit responses, the command index is reserved-that is, 111111.

Polling Command Completion Signal

The device generates the Command Completion Signal in order to notify the host controller

of the normal command completion or command termination.

Command Completion Signal Detection and Interrupt to Host Processor

If the ccs_expected bit is set in the SDMMC_CMD register, the Command Completion Signal (CCS) from the device is indicated by setting the Data Transfer Over (DTO) bit in the SDMMC_RINTSTS register. The Host Controller generates a Data Transfer Over (DTO) interrupt if this interrupt is not masked.

Command Completion Signal Timeout

If the command expects a CCS from the device—if the ccs_expected bit is set in the SDMMC_CMD register—the command state machine waits for the CCS and remains in a wait_CCSS state. If the device fails to send out the CCS, the host software should implement a timeout mechanism to free the command and data path. The host controller does not implement a hardware timer; it is the responsibility of the host software to maintain a software timer.

In the event of a CCS timeout, the host should issue a CCSD by setting the send_ccsd bit in the CTRL register. The host controller command state machine sends the CCSD to the device and exits to an idle state. After sending the CCSD, the host should also send a CMD12 to the device in order to abort the outstanding command.

Send Command Completion Signal Disable

If the send_ccsd bit is set in the SDMMC_CTRL register, the host sends a Command Completion Signal Disable (CCSD) pattern on the CMD line. The host can send the CCSD while waiting for the CCS or after a CCS timeout happens.

After sending the CCSD pattern, the host sets the Command Done (CD) bit in SDMMC_RINTSTS and also generates an interrupt to the host if the Command Done interrupt is not masked.

6.3.2.2 Data Path

The data path block pops the data FIFO and transmits data on cdata_out during a write data transfer, or it receives data on cdata_in and pushes it into the FIFO during a read data transfer. The data path loads new data parameters—that is, data expected, read/write data transfer, stream/block transfer, block size, byte count, card type, timeout registers—whenever a data transfer command is not in progress.

If the data_expected bit is set in the SDMMC_CMD register, the new command is a data transfer command and the data path starts one of the following:

- Transmit data if the read/write bit = 1
- Data receive if read/write bit = 0

Data Transmit

The data transmit state machine, illustrated in following figure, starts data transmission two clocks after a response for the data write command is received; this occurs even if the command path detects a response error or response CRC error. If a response is not received from the card because of a response timeout, data is not transmitted. Depending upon the value of the transfer_mode bit in the SDMMC_CMD register, the data transmit state machine puts data on the card data bus in a stream or in block(s).

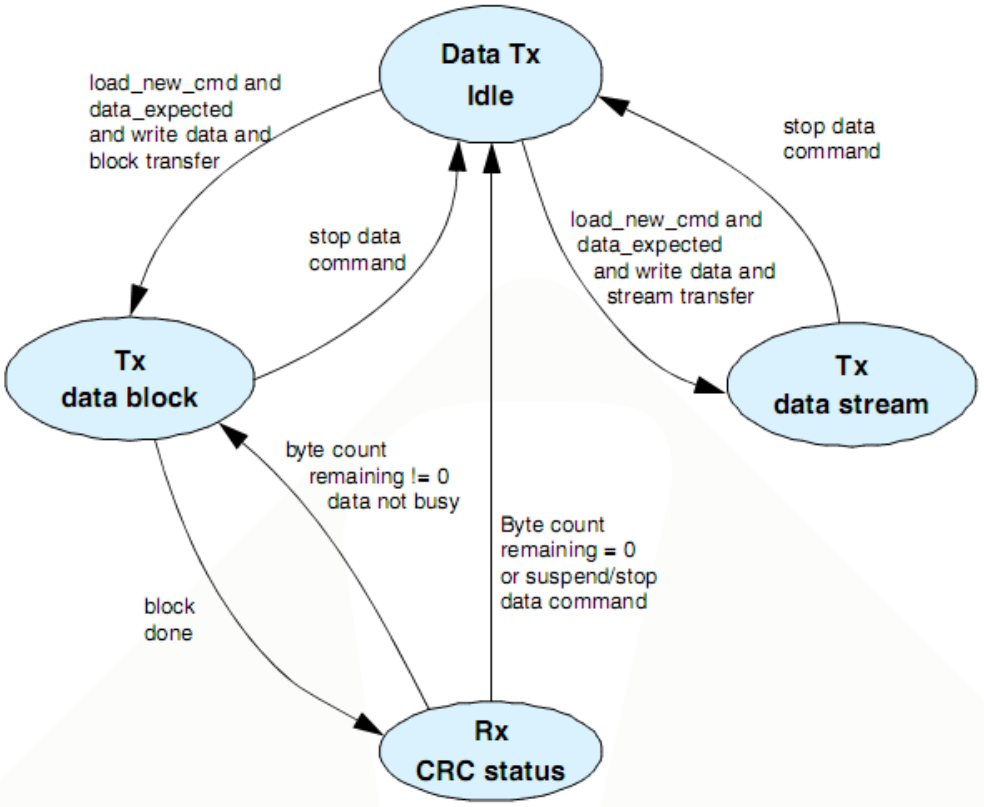

Fig. 6-4 Host Controller Data Transmit State Machine

Stream Data Transmit

If the transfer_mode bit in the SDMMC_CMD register is set to 1, it is a stream-write data transfer. The data path pops the FIFO from the BIU and transmits in a stream to the card data bus. If the FIFO becomes empty, the card clock is stopped and restarted once data is available in the FIFO.

If the byte_count register is programmed to 0, it is an open-ended stream-write data transfer. During this data transfer, the data path continuously transmits data in a stream until the host software issues a stop command. A stream data transfer is terminated when the end bit of the stop command and end bit of the data match over two clocks.

If the byte_count register is programmed with a non-zero value and the send_auto_stop bit is set in the SDMMC_CMD register, the stop command is internally generated and loaded in the command path when the end bit of the stop command occurs after the last byte of the stream write transfer matches.

This data transfer can also terminate if the host issues a stop command before all the data bytes are transferred to the card bus.

Single Block Data

If the transfer_mode bit in the SDMMC_CMD register is set to 0 and the byte_count register value is equal to the value of the block_size register, a single-block write-data transfer occurs. The data transmit state machine sends data in a single block, where the number of bytes equals the block size, including the internally-generated CRC16.

If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set for a 1-bit, 4-bit, or 8-bit data transfer, the data is transmitted on 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and transmitted for 1, 4, or 8 data lines, respectively.

After a single data block is transmitted, the data transmit state machine receives the CRC status from the card and signals a data transfer to the BIU; this happens when the data-transfer-over bit is set in the SDMMC_RINTSTS register.

If a negative CRC status is received from the card, the data path signals a data CRC error to the BIU by setting the data CRC error bit in the SDMMC_RINTSTS register.

Additionally, if the start bit of the CRC status is not received by two clocks after the end of the data block, a CRC status start bit error is signaled to the BIU by setting the write-no-CRC bit in the SDMMC_RINTSTS register.

Multiple Block Data

A multiple-block write-data transfer occurs if the transfer_mode bit in the SDMMC_CMD register is set to 0 and the value in the byte_count register is not equal to the value of the block_size register. The data transmit state machine sends data in blocks, where the number of bytes in a block equals the block size, including the internally-generated CRC16.

If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set to 1-bit, 4-bit, or 8-bit data transfer, the data is transmitted on 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and transmitted on 1, 4, or 8 data lines, respectively.

After one data block is transmitted, the data transmit state machine receives the CRC status from the card. If the remaining byte_count becomes 0, the data path signals to the BIU that the data transfer is done; this happens when the data-transfer-over bit is set in the SDMMC_RINTSTS register.

If the remaining data bytes are greater than 0, the data path state machine starts to transmit another data block.

If a negative CRC status is received from the card, the data path signals a data CRC error to the BIU by setting the data CRC error bit in the SDMMC_RINTSTS register, and continues further data transmission until all the bytes are transmitted.

Additionally, if the CRC status start bit is not received by two clocks after the end of a data block, a CRC status start bit error is signaled to the BIU by setting the write-no-CRC bit in the SDMMC_RINTSTS register; further data transfer is terminated.

If the send_auto_stop bit is set in the SDMMC_CMD register, the stop command is internally generated during the transfer of the last data block, where no extra bytes are transferred to the card. The end bit of the stop command may not exactly match the end bit of the CRC status in the last data block.

If the block size is less than 4, 16, or 32 for card data widths of 1 bit, 4 bits, or 8 bits, respectively, the data transmit state machine terminates the data transfer when all the data is transferred, at which time the internally generated stop command is loaded in the command path.

If the byte_count is 0 – the block size must be greater than 0 – it is an open-ended block transfer. The data transmit state machine for this type of data transfer continues the block-write data transfer until the host software issues a stop or abort command.

Data Receive

The data-receive state machine, illustrated in following figure, receives data two clock cycles after the end bit of a data read command, even if the command path detects a response error or response CRC error. If a response is not received from the card because a response timeout occurs, the BIU does not receive a signal that the data transfer is complete; this happens if the command sent by the Host Controller is an illegal operation for the card, which keeps the card from starting a read data transfer.

If data is not received before the data timeout, the data path signals a data timeout to the BIU and an end to the data transfer done. Based on the value of the transfer_mode bit in the SDMMC_CMD register, the data-receive state machine gets data from the card data bus in a stream or block(s).

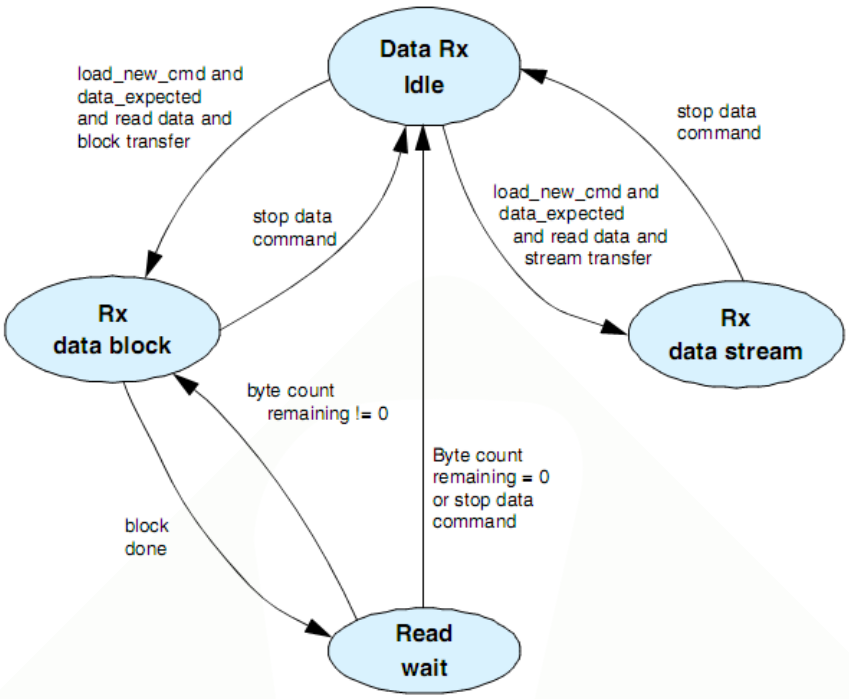

Fig. 6-5 Host Controller Data Receive State Machine

Stream Data Read

A stream-read data transfer occurs if the transfer_mode bit in the SDMMC_CMD register equals 1, at which time the data path receives data from the card and pushes it to the FIFO. If the FIFO becomes full, the card clock stops and restarts once the FIFO is no longer full. An open-ended stream-read data transfer occurs if the byte_count register equals 0. During this type of data transfer, the data path continuously receives data in a stream until the host software issues a stop command. A stream data transfer terminates two clock cycles after the end bit of the stop command.

If the byte_count register contains a non-zero value and the send_auto_stop bit is set in the SDMMC_CMD register, a stop command is internally generated and loaded into the command path, where the end bit of the stop command occurs after the last byte of the stream data transfer is received. This data transfer can terminate if the host issues a stop or abort command before all the data bytes are received from the card.

Single-Block Data Read

A single-block read-data transfer occurs if the transfer_mode bit in the SDMMC_CMD register is set to 0 and the value of the byte_count register is equal to the value of the block_size register. When a start bit is received before the data times out, data bytes equal to the block size and CRC16 are received and checked with the internally-generated CRC16. If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set to a 1-bit, 4-bit, or 8-bit data transfer, data is received from 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and checked for 1, 4, or 8 data lines, respectively. If there is a CRC16 mismatch, the data path signals a data CRC error to the BIU. If the received end bit is not 1, the BIU receives an end-bit error.

Multiple-Block Data Read

If the transfer_mode bit in the SDMMC_CMD register is set to 0 and the value of the byte_count register is not equal to the value of the block_size register, it is a multiple-block read-data transfer. The data-receive state machine receives data in blocks, where the number of bytes in a block is equal to the block size, including the internally-generated CRC16.

If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set to a 1-bit, 4-bit, or 8-bit data transfer, data is received from 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and checked for 1, 4, or 8 data lines, respectively.

After a data block is received, if the remaining byte_count becomes 0, the data path signals a data transfer to the BIU.

If the remaining data bytes are greater than 0, the data path state machine causes another data block to be received. If CRC16 of a received data block does not match the internally-generated CRC16, a data CRC error to the BIU and data reception continue further data transmission until all bytes are transmitted.
Additionally, if the end of a received data block is not 1, data on the data path signals terminate the bit error to the CIU and the data-receive state machine terminates data reception, waits for data timeout, and signals to the BIU that the data transfer is complete.
If the send_auto_stop bit is set in the SDMMC_CMD register, the stop command is internally generated when the last data block is transferred, where no extra bytes are transferred from the card; the end bit of the stop command may not exactly match the end bit of the last data block.
If the requested block size for data transfers to cards is less than 4, 16, or 32 bytes for 1-bit, 4-bit, or 8-bit data transfer modes, respectively, the data-transmit state machine terminates the data transfer when all data is transferred, at which point the internally-generated stop command is loaded in the command path. Data received from the card after that are then ignored by the data path.
If the byte_count is 0—the block size must be greater than 0—it is an open-ended block transfer. For this type of data transfer, the data-receive state machine continues the block-read data transfer until the host software issues a stop or abort command.

Auto-Stop

The Host Controller internally generates a stop command and is loaded in the command path when the send_auto_stop bit is set in the SDMMC_CMD register.
The software should set the send_auto_stop bit according to details listed in following table.

Table 6-2 Auto-Stop Generation

Card type	Transfer type	Byte Count	send_auto_stop bit set	Comments
MMC	Stream read	0	No	Open-ended stream
MMC	Stream read	>0	Yes	Auto-stop after all bytes transfer
MMC	Stream write	0	No	Open-ended stream
MMC	Stream write	>0	Yes	Auto-stop after all bytes transfer
MMC	Single-block read	>0	No	Byte count =0 is illegal
MMC	Single-block write	>0	No	Byte count =0 is illegal
MMC	Multiple-block read	0	No	Open-ended multiple block
MMC	Multiple-block read	>0	Yes①	Pre-defined multiple block
MMC	Multiple-block write	0	No	Open-ended multiple block
MMC	Multiple-block write	>0	Yes①	Pre-defined multiple block
SDMEM	Single-block read	>0	No	Byte count =0 is illegal
SDMEM	Single-block write	>0	No	Byte count =0 illegal
SDMEM	Multiple-block read	0	No	Open-ended multiple block
SDMEM	Multiple-block read	>0	Yes	Auto-stop after all bytes transfer
SDMEM	Multiple-block write	0	No	Open-ended multiple block
SDMEM	Multiple-block write	>0	Yes	Auto-stop after all bytes transfer
SDIO	Single-block read	>0	No	Byte count =0 is illegal
SDIO	Single-block write	>0	No	Byte count =0 illegal
SDIO	Multiple-block read	0	No	Open-ended multiple block
SDIO	Multiple-block read	>0	No	Pre-defined multiple block
SDIO	Multiple-block write	0	No	Open-ended multiple block
SDIO	Multiple-block	>0	No	Pre-defined multiple block

Card type	Transfer type	Byte Count	send_auto_stop bit set	Comments
	write			

*①:The condition under which the transfer mode is set to block transfer and byte_count is equal to block size is treated as a single-block data transfer command for both MMC and SD cards. If byte_count = n*block_size (n = 2, 3, …), the condition is treated as a predefined multiple-block data transfer command. In the case of an MMC card, the host software can perform a predefined data transfer in two ways: 1) Issue the CMD23 command before issuing CMD18/CMD25 commands to the card – in this case, issue MD18/CMD25 commands without setting the send_auto_stop bit. 2) Issue CMD18/CMD25 commands without issuing CMD23 command to the card, with the send_auto_stop bit set. In this case, the multiple-block data transfer is terminated by an internally-generated auto-stop command after the programmed byte count.*

The following list conditions for the auto-stop command.

- Stream read for MMC card with byte count greater than 0 – The Host Controller generates an internal stop command and loads it into the command path so that the end bit of the stop command is sent out when the last byte of data is read from the card and no extra data byte is received. If the byte count is less than 6 (48 bits), a few extra data bytes are received from the card before the end bit of the stop command is sent.
- Stream write for MMC card with byte count greater than 0 - The Host Controller generates an internal stop command and loads it into the command path so that the end bit of the stop command is sent when the last byte of data is transmitted on the card bus and no extra data byte is transmitted. If the byte count is less than 6 (48 bits), the data path transmits the data last in order to meet the above condition.
- Multiple-block read memory for SD card with byte count greater than 0 – If the block size is less than 4 (single-bit data bus), 16 (4-bit data bus), or 32 (8-bit data bus), the auto-stop command is loaded in the command path after all the bytes are read. Otherwise, the top command is loaded in the command path so that the end bit of the stop command is sent after the last data block is received.
- Multiple-block write memory for SD card with byte count greater than 0 – If the block size is less than 3 (single-bit data bus), 12 (4-bit data bus), or 24 (8-bit data bus), the auto-stop command is loaded in the command path after all data blocks are transmitted. Otherwise, the stop command is loaded in the command path so that the end bit of the stop command is sent after the end bit of the CRC status is received.
- Precaution for host software during auto-stop – Whenever an auto-stop command is issued, the host software should not issue a new command to the SD/MMC device until the auto-stop is sent by the Host Controller and the data transfer is complete. If the host issues a new command during a data transfer with the auto-stop in progress, an auto-stop command may be sent after the new command is sent and its response is received; this can delay sending the stop command, which transfers extra data bytes. For a stream write, extra data bytes are erroneous data that can corrupt the card data. If the host wants to terminate the data transfer before the data transfer is complete, it can issue a stop or abort command, in which case the Host Controller does not generate an auto-stop command.

6.3.2.3 Non-Data Transfer Commands that Use Data Path

Some non-data transfer commands (non-read/write commands) also use the data path. Following table lists the commands and register programming requirements for them.

Table 6-3 Non-data Transfer Commands and Requirements

Base Address [12:8]	CMD 27	CMD 30	CMD 42	ACMD 13	ACMD 22	ACMD 51
SDMMC_CMD register programming						
cmd_index	6'h1B	6'h1E	6'h2A	6'h0D	6'h16	6'h33
response_expect	1	1	1	1	1	1
rResponse_length	0	0	0	0	0	0
check_response_crc	1	1	1	1	1	1
data_expected	1	1	1	1	1	1
read/write	1	0	1	0	0	0
transfer_mode	0	0	0	0	0	0
send_auto_stop	0	0	0	0	0	0

Base Address [12:8]	CMD 27	CMD 30	CMD 42	ACMD 13	ACMD 22	ACMD 51
wait_prevdata_complete	0	0	0	0	0	0
stop_abort_cmd	0	0	0	0	0	0
Command Argument register programming						
	stuff bits	32-bit write protect data address	stuff bits	stuff bits	stuff bits	stuff bits
Block Size register programming						
	16	4	Num_bytes①	64	4	8
Byte Count register programming						
	16	4	Num_bytes①	64	4	8

①: Num_bytes = No. of bytes specified as per the lock card data structure (Refer to the SD specification and the MMC specification)

6.3.2.4 SDIO Interrupt Control

Interrupts for SD cards are reported to the BIU by asserting an interrupt signal for two clock cycles. SDIO cards signal an interrupt by asserting cdata_in low during the interrupt period; an interrupt period for the selected card is determined by the interrupt control state machine. An interrupt period is always valid for non-active or non-selected cards, and 1-bit data mode for the selected card. An interrupt period for a wide-bus active or selected card is valid for the following conditions:

- Card is idle
- Non-data transfer command in progress
- Third clock after end bit of data block between two data blocks
- From two clocks after end bit of last data until end bit of next data transfer command

Bear in mind that, in the following situations, the controller does not sample the SDIO interrupt of the selected card when the card data width is 4 bits. Since the SDIO interrupt is level-triggered, it is sampled in a further interrupt period and the host does not lose any SDIO interrupt from the card.

- Read/Write Resume – The CIU treats the resume command as a normal data transfer command. SDIO interrupts during the resume command are handled similarly to other data commands. According to the SDIO specification, for the normal data command the interrupt period ends after the command end bit of the data command; for the resume command, it ends after the response end bit. In the case of the resume command, the Controller stops the interrupt sampling period after the resume command end bit, instead of stopping after the response end bit of the resume command.
- Suspend during read transfer – If the read data transfer is suspended by the host, the host sets the abort_read_data bit in the controller to reset the data state machine. In the CIU, the SDIO interrupts are handled such that the interrupt sampling starts after the abort_read_data bit is set by the host. In this case the controller does not sample SDIO interrupts between the period from response of the suspend command to setting the abort_read_data bit, and starts sampling after setting the abort_read_data bit.

6.3.2.5 Clock Control

The clock control block provides different clock frequencies required for SD/MMC cards. The cclk_in signal is the source clock (cclk_in >= card max operating frequency) for clock divider of the clock control block. This source clock (cclk_in) is used to generate different card clock frequencies (cclk_out). The card clock can have different clock frequencies, since the card can be a low-speed card or a full-speed card. The Host Controller provides one clock signal (cclk_out).

The clock frequency of a card depends on the following clock control registers:

- Clock Divider register – Internal clock dividers are used to generate different clock frequencies required for card. The division factor for each clock divider can be programmed by writing to the Clock Divider register. A value of 0 represents a clock-divider bypass, a value of 1 represents a divide by 2.
- Clock Control register – cclk_out can be enabled or disabled for each card under the

following conditions:

- clk_enable – cclk_out for a card is enabled if the clk_enable bit for a card in the Clock Control register is programmed (set to 1) or disabled (set to 0).
- Low-power mode – Low-power mode of a card can be enabled by setting the low-power mode bit of the Clock Control register to 1. If low-power mode is enabled to save card power, the cclk_out is disabled when the card is idle for at least 8 card clock cycles. It is enabled when a new command is loaded and the command path goes to a non-idle state.

Additionally, cclk_out is disabled when an internal FIFO is full – card read (no more data can be received from card) – or when the FIFO is empty – card write (no data is available for transmission). This helps to avoid FIFO overrun and underrun conditions. It is used by the command and data path to qualify cclk_in for driving outputs and sampling inputs at the programmed clock frequency for the selected card, according to the Clock Divider and Clock Source register values.

Under the following conditions, the card clock is stopped or disabled, along with the active clk_en, for the selected card:

- Clock can be disabled by writing to Clock Enable register (clk_en bit = 1).
- If low-power mode is selected and card is idle, or not selected for 8 clocks.
- FIFO is full and data path cannot accept more data from the card and data transfer is incomplete –to avoid FIFO overrun.
- FIFO is empty and data path cannot transmit more data to the card and data transfer is incomplete – to avoid FIFO underrun.

6.3.2.6 Error Detection

- Response
  - Response timeout – Response expected with response start bit is not received within programmed number of clocks in timeout register.
  - Response CRC error – Response is expected and check response CRC requested; response CRC7 does not match with the internally-generated CRC7.
  - Response error – Response transmission bit is not 0, command index does not match with the command index of the send command, or response end bit is not 1.
- Data transmit
  - No CRC status – During a write data transfer, if the CRC status start bit is not received two clocks after the end bit of the data block is sent out, the data path does the following:
    - Signals no CRC status error to the BIU
    - Terminates further data transfer
    - Signals data transfer done to the BIU
  - Negative CRC – If the CRC status received after the write data block is negative (that is, not 010), a data CRC error is signaled to the BIU and further data transfer is continued.
  - Data starvation due to empty FIFO – If the FIFO becomes empty during a write data transmission, or if the card clock is stopped and the FIFO remains empty for data timeout clocks, then a data-starvation error is signaled to the BIU and the data path continues to wait for data in the FIFO.
- Data receive
  - Data timeout – During a read-data transfer, if the data start bit is not received before the number of clocks that were programmed in the timeout register, the data path does the following:
    - Signals data-timeout error to the BIU
    - Terminates further data transfer
    - Signals data transfer done to BIU
  - Data start bit error – During a 4-bit or 8-bit read-data transfer, if the all-bit data line does not have a start bit, the data path signals a data start bit error to the BIU and waits for a data timeout, after which it signals that the data transfer is done.
  - Data CRC error – During a read-data-block transfer, if the CRC16 received does not match with the internally generated CRC16, the data path signals a data CRC error to the BIU and continues further data transfer.

- Data end-bit error – During a read-data transfer, if the end bit of the received data is not 1, the data path signals an end-bit error to the BIU, terminates further data transfer, and signals to the BIU that the data transfer is done.
- Data starvation due to FIFO full – During a read data transmission and when the FIFO becomes full, the card clock is stopped. If the FIFO remains full for data timeout clocks, a data starvation error is signaled to the BIU (Data Starvation by Host Timeout bit is set in SDMMC_RINTSTS register) and the data path continues to wait for the FIFO to start to empty.

6.3.3 Internal Direct Memory Access Controller (IDMAC)

The Internal Direct Memory Access Controller (IDMAC) has a Control and Status Register (CSR) and a single Transmit/Receive engine, which transfers data from host memory to the device port and vice versa. The controller utilizes a descriptor to efficiently move data from source to destination with minimal Host CPU intervention. You can program the controller to interrupt the Host CPU in situations such as data Transmit and Receive transfer completion from the card, as well as other normal or error conditions.

The IDMAC and the Host driver communicate through a single data structure. CSR addresses 0x80 to 0x98 are reserved for host programming.

The IDMAC transfers the data received from the card to the Data Buffer in the Host memory, and it transfers Transmit data from the Data Buffer in the Host memory to the FIFO. Descriptors that reside in the Host memory act as pointers to these buffers.

A data buffer resides in physical memory space of the Host and consists of complete data or partial data. Buffers contain only data, while buffer status is maintained in the descriptor. Data chaining refers to data that spans multiple data buffers. However, a single descriptor cannot span multiple data.

A single descriptor is used for both reception and transmission. The base address of the list is written into Descriptor List Base Address Register (SDMMC_DBADDR @0x88). A descriptor list is forward linked. The Last Descriptor can point back to the first entry in order to create a ring structure. The descriptor list resides in the physical memory address space of the Host. Each descriptor can point to a maximum of two data buffers.

6.3.3.1 IDMAC CSR Access

When an IDMAC is introduced, an additional CSR space resides in the IDMAC that controls the IDMAC functionality. The host accesses the new CSR space in addition to the existing control register set in the BIU. The IDMAC CSR primarily contains descriptor information. For a write operation to the CSR, the respective CSR logic of the IDMAC and BIU decodes the address before accepting. For a read operation from the CSR, the appropriate CSR read path is enabled.

You can enable or disable the IDMAC operation by programming bit[25] in the SDMMC_CTRL register of the BIU. This allows the data transfer by accessing the slave interface on the AMBA bus if the IDMAC is present but disabled. When IDMAC is enabled, the FIFO cannot be accessed through the slave interface.

6.3.3.2 Descriptors

- Descriptor structures

The IDMAC uses these types of descriptor structures:

- Dual-Buffer Structure – The distance between two descriptors is determined by the Skip Length value programmed in the Descriptor Skip Length (DSL) field of the Bus Mode Register (SDMMC_BMOD @0x80).

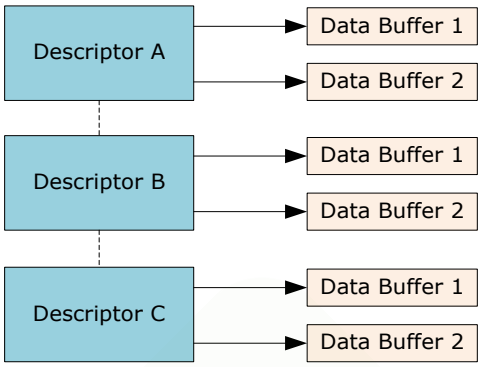

Fig. 6-6 Dual-Buffer Descriptor Structure

- Chain Structure – Each descriptor points to a unique buffer and the next descriptor.

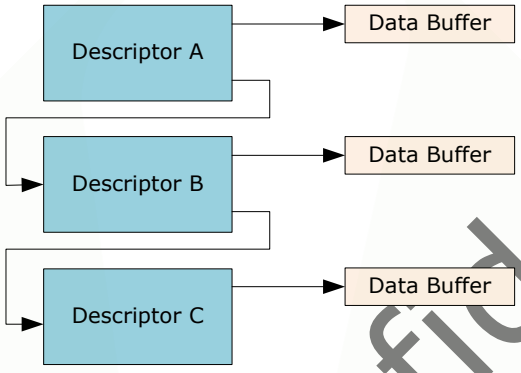

Fig. 6-7 Chain Descriptor Structure

- Descriptor formats

Following figure illustrates the internal formats of a descriptor. The descriptor addresses must be aligned to the bus width used for 32-bit AHB data buses. Each descriptor contains 16 bytes of control and status information. DES0 is a notation used to denote the [31:0] bits, DES1 to denote [63:32] bits, DES2 to denote [95:64] bits, DES3 to denote [127:96] bits.

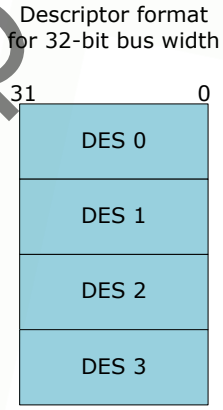

Fig. 6-8 Descriptor Formats for 32-bit AHB Address Bus Width

- The DES0 element in the IDMAC contains control and status information.

Table 6-4 Bits in IDMAC DES0 Element

Bit	Name	Description
31	OWN	When set, this bit indicates that the descriptor is owned by the IDMAC. When this bit is reset, it indicates that the descriptor is owned by the Host. The IDMAC clears this bit when it completes the data transfer.
30	Card Error Summary (CES)	These error bits indicate the status of the transaction to or from the card. These bits are also present in SDMMC_RINTSTS Indicates the logical OR of the following bits:

Bit	Name	Description
		● EBE: End Bit Error ● RTO: Response Time out ● RCRC: Response CRC ● SBE: Start Bit Error ● DRTO: Data Read Timeout ● DCRC: Data CRC for Receive ● RE: Response Error
29:6	Reserved	-
5	End of Ring (ER)	When set, this bit indicates that the descriptor list reached its final descriptor. The IDMAC returns to the base address of the list, creating a Descriptor Ring. This is meaningful for only a dual-buffer descriptor structure.
4	Second Address Chained (CH)	When set, this bit indicates that the second address in the descriptor is the Next Descriptor address rather than the second buffer address. When this bit is set, BS2 (DES1[25:13]) should be all zeros.
3	First Descriptor (FS)	When set, this bit indicates that this descriptor contains the first buffer of the data. If the size of the first buffer is 0, next Descriptor contains the beginning of the data.
2	Last Descriptor (LD)	This bit is associated with the last block of a DMA transfer. When set, the bit indicates that the buffers pointed to by this descriptor are the last buffers of the data. After this descriptor is completed, the remaining byte count is 0. In other words, after the descriptor with the LD bit set is completed, the remaining byte count should be 0.
1	Disable Interrupt on Completion (DIC)	When set, this bit will prevent the setting of the TI/RI bit of the IDMAC Status Register (IDSTS) for the data that ends in the buffer pointed to by this descriptor.
0	Reserved	-

■ The DES1 element contains the buffer size.

Table 6-5 Bits in IDMAC DES1 Element

Bit	Name	Description
31:26	Reserved	-
25:13	Buffer 2 Size (BS2)	These bits indicate the second data buffer byte size. The buffer size must be a multiple of 2, 4, or 8, depending upon the bus widths—16, 32, and 64 respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and proceeds to the next buffer in case of a dual-buffer structure. This field is not valid for chain structure; that is, if DES0[4] is set.
12:0	Buffer 1 Size (BS1)	Indicates the data buffer byte size, which must be a multiple of 2, 4, or 8 bytes, depending upon the bus widths—16, 32, and 64, respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. This field should not be zero. Note: If there is only one buffer to be programmed, you need to use only the Buffer 1, and not Buffer 2.

■ The DES2 element contains the address pointer to the data buffer.

Table 6-6 Bits in IDMAC DES2 Element

Bit	Name	Description
31:26	Reserved	
25:13	Buffer 2 Size (BS2)	These bits indicate the second data buffer byte size. The buffer size must be a multiple of 2, 4, or 8, depending upon the bus

Bit	Name	Description
		widths—16, 32, and 64 respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and proceeds to the next buffer in case of a dual-buffer structure. This field is not valid for chain structure; that is, if DES0[4] is set.
12:0	Buffer 1 Size (BS1)	Indicates the data buffer byte size, which must be a multiple of 2, 4, or 8 bytes, depending upon the bus widths—16, 32, and 64, respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. This field should not be zero. Note: If there is only one buffer to be programmed, you need to use only the Buffer 1, and not Buffer 2.

- The DES3 element contains the address pointer to the next descriptor if the present descriptor is not the last descriptor in a chained descriptor structure or the second buffer address for a dual-buffer structure.

Table 6-7 Bits in IDMAC DES3 Element

Bit	Name	Description
31:0	Buffer Address Pointer 2/ Next Descriptor Address (BAP2)	These bits indicate the physical address of the second buffer when the dual-buffer structure is used. If the Second Address Chained (DES0[4]) bit is set, then this address contains the pointer to the physical memory where the Next Descriptor is present. If this is not the last descriptor, then the Next Descriptor address pointer must be bus-width aligned.

6.3.3.3 Initialization

IDMAC initialization occurs as follows:

1) Write to IDMAC Bus Mode Register—SDMMC_BMOD to set Host bus access parameters.
2) Write to IDMAC Interrupt Enable Register—SDMMC_IDINTEN to mask unnecessary interrupt causes.
3) The software driver creates either the Transmit or the Receive descriptor list. Then it writes to IDMAC Descriptor List Base Address Register (SDMMC_DBADDR), providing the IDMAC with the starting address of the list.
4) The IDMAC engine attempts to acquire descriptors from the descriptor lists.

- Host Bus Burst Access

The IDMAC attempts to execute fixed-length burst transfers on the AHB Master interface if configured using the FB bit of the IDMAC Bus Mode register. The maximum burst length is indicated and limited by the PBL field. The descriptors are always accessed in the maximum possible burst-size for the 16-bytes to be read— 16*8/bus-width.

The IDMAC initiates a data transfer only when sufficient space to accommodate the configured burst is available in the FIFO or the number of bytes to the end of data, when less than the configured burst-length.

The IDMAC indicates the start address and the number of transfers required to the AHB Master Interface. When the AHB Interface is configured for fixed-length bursts, then it transfers data using the best combination of INCR4/8/16 and SINGLE transactions. Otherwise, in no fixed-length bursts, it transfers data using INCR (undefined length) and SINGLE transactions.

- Host Data Buffer Alignment

The Transmit and Receive data buffers in host memory must be aligned, depending on the data width.

- Buffer Size Calculations

The driver knows the amount of data to transmit or receive. For transmitting to the card, the IDMAC transfers the exact number of bytes to the FIFO, indicated by the buffer size field of DES1.

If a descriptor is not marked as last-LS bit of DES0-then the corresponding buffer(s) of the

descriptor are full, and the amount of valid data in a buffer is accurately indicated by its buffer size field. If a descriptor is marked as last, then the buffer cannot be full, as indicated by the buffer size in DES1. The driver is aware of the number of locations that are valid in this case.

- Transmission

IDMAC transmission occurs as follows:

1) The Host sets up the elements (DES0-DES3) for transmission and sets the OWN bit (DES0[31]). The Host also prepares the data buffer.
2) The Host programs the write data command in the SDMMC_CMD register in BIU.
3) The Host will also program the required transmit threshold level (TX_WMark field in SDMMC_FIFOTH register).
4) The IDMAC determines that a write data transfer needs to be done as a consequence of step 2.
5) The IDMAC engine fetches the descriptor and checks the OWN bit. If the OWN bit is not set, it means that the host owns the descriptor. In this case the IDMAC enters suspend state and asserts the Descriptor Unable interrupt in the SDMMC_IDSTS register. In such a case, the host needs to release the IDMAC by writing any value to the poll demand register.
6) It will then wait for Command Done (CD) bit and no errors from BIU which indicates that a transfer can be done.
7) The IDMAC engine will now wait for a DMA interface request from BIU. This request will be generated based on the programmed transmit threshold value. For the last bytes of data which can't be accessed using a burst, SINGLE transfers are performed on AHB Master Interface.
8) The IDMAC fetches the Transmit data from the data buffer in the Host memory and transfers to the FIFO for transmission to card.
9) When data spans across multiple descriptors, the IDMAC will fetch the next descriptor and continue with its operation with the next descriptor. The Last Descriptor bit in the descriptor indicates whether the data spans multiple descriptors or not.
10) When data transmission is complete, status information is updated in SDMMC_IDSTS register by setting Transmit Interrupt, if enabled. Also, the OWN bit is cleared by the IDMAC by performing a write transaction to DES0.

- Reception

IDMAC reception occurs as follows:

1) The Host sets up the element (DES0-DES3) for reception, sets the OWN (DES0[31]).
2) The Host programs the read data command in the SDMMC_CMD register in BIU.
3) The Host will program the required receive threshold level (RX_WMark field in FIFOTH register).
4) The IDMAC determines that a read data transfer needs to be done as a consequence of step 2.
5) The IDMAC engine fetches the descriptor and checks the OWN bit. If the OWN bit is not set, it means that the host owns the descriptor. In this case the DMA enters suspend state and asserts the Descriptor Unable interrupt in the SDMMC_IDSTS register. In such a case, the host needs to release the IDMAC by writing any value to the poll demand register.
6) It will then wait for Command Done (CD) bit and no errors from BIU which indicates that a transfer can be done.
7) The IDMAC engine will now wait for a DMA interface request from BIU. This request will be generated based on the programmed receive threshold value. For the last bytes of data which can't be accessed using a burst, SINGLE transfers are performed on AHB.
8) The IDMAC fetches the data from the FIFO and transfer to Host memory.
9) When data spans across multiple descriptors, the IDMAC will fetch the next descriptor and continue with its operation with the next descriptor. The Last Descriptor bit in the descriptor indicates whether the data spans multiple descriptors or not.
10) When data reception is complete, status information is updated in SDMMC_IDSTS register by setting Receive Interrupt, if enabled. Also, the OWN bit is cleared by the IDMAC by performing a write transaction to DES0.

- Interrupts

Interrupts can be generated as a result of various events. SDMMC_IDSTS register contains all the bits that might cause an interrupt. SDMMC_IDINTEN register contains an Enable bit for each of the events that can cause an interrupt.
There are two groups of summary interrupts-Normal and Abnormal-as outlined in SDMMC_IDSTS register. Interrupts are cleared by writing a 1 to the corresponding bit position. When all the enabled interrupts within a group are cleared, the corresponding summary bit is cleared. When both the summary bits are cleared, the interrupt signal dmac_intr_o is de-asserted.
Interrupts are not queued and if the interrupt event occurs before the driver has responded to it, no additional interrupts are generated. For example, Receive Interrupt—SDMMC_IDSTS[1] indicates that one or more data was transferred to the Host buffer. An interrupt is generated only once for simultaneous, multiple events. The driver must scan SDMMC_IDSTS register for the interrupt cause.

6.3.4 Variable Delay/Clock Generation Unit

Variable delay mechanism for the cclk_in_drv is useful in order to meet a range of hold-time requirements across modes. Variable delay mechanism for the cclk_in_sample is mandatory and is required to achieve the correct sampling point for data.
The Clock Generation Unit (CLKGEN) includes Phase Shift Unit and Delay Line Unit.
The Phase Shift Unit can shift cclk_in_sample/cclk_in_drv by 0/90/180/270-degree relative to cclk_in. The Delay Line Unit can shift cclk_in_sample/cclk_in_drv step by step in the unit of delay element. The delay value range is 25ps~56ps for every delay element; the max delay element number is 256.
The architecture is as follows.

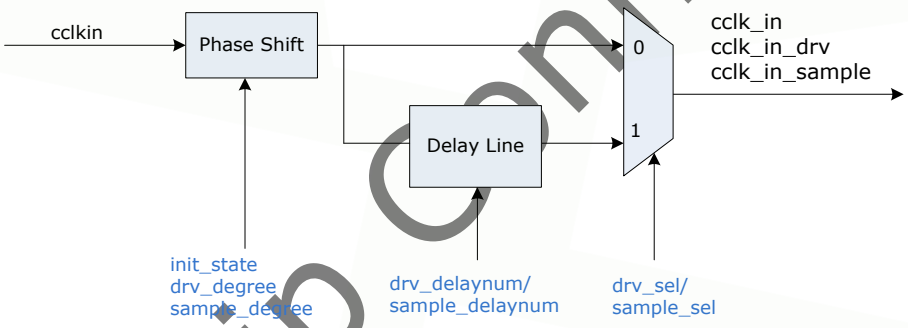

Fig. 6-9 Clock Generation Unit

6.4 Register Description

6.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
SDMMC_CTRL	0x0000	W	0x00000000	Control register
SDMMC_PWREN	0x0004	W	0x00000000	Power enable register
SDMMC_CLKDIV	0x0008	W	0x00000000	Clock divider register
SDMMC_CLKSRC	0x000c	W	0x00000000	SD clock source register
SDMMC_CLKENA	0x0010	W	0x00000000	Clock enable register
SDMMC_TMOUT	0x0014	W	0xFFFFFF40	Timeout register
SDMMC_CTYPE	0x0018	W	0x00000000	Card type register
SDMMC_BLKSIZ	0x001c	W	0x00000200	Block size register
SDMMC_BYTCNT	0x0020	W	0x00000200	Byte count register
SDMMC_INTMASK	0x0024	W	0x00000000	Interrupt mask register
SDMMC_CMDARG	0x0028	W	0x00000000	Command argument register
SDMMC_CMD	0x002c	W	0x20000000	Command register
SDMMC_RESP0	0x0030	W	0x00000000	Response register 0
SDMMC_RESP1	0x0034	W	0x00000000	Response register 1
SDMMC_RESP2	0x0038	W	0x00000000	Response register 2
SDMMC_RESP3	0x003c	W	0x00000000	Response register 3
SDMMC_MINTSTS	0x0040	W	0x00000000	Masked interrupt status register

Name	Offset	Size	Reset Value	Description
SDMMC_RINTSTS	0x0044	W	0x00000000	Raw interrupt status register
SDMMC_STATUS	0x0048	W	0x00000106	Status register
SDMMC_FIFOTH	0x004c	W	0x00FF0000	FIFO threshold register
SDMMC_CDETECT	0x0050	W	0x00000001	Card detect register
SDMMC_WRTPRT	0x0054	W	0x00000000	Write protect register
SDMMC_TCBCNT	0x005c	W	0x00000000	Transferred card byte count register
SDMMC_TBBCNT	0x0060	W	0x00000000	Transferred host to FIFO byte count register
SDMMC_DEBNCE	0x0064	W	0x00FFFFFF	Debounce count register
SDMMC_USRID	0x0068	W	0x00000000	User ID register
SDMMC_VERID	0x006c	W	0x5342270A	Version ID register
SDMMC_HCON	0x0070	W	0x04C434C1	Hardware configuration register
SDMMC_UHSREG	0x0074	W	0x00000000	UHS-1 control register
SDMMC_RSTN	0x0078	W	0x00000001	Hardware reset register
SDMMC_BMOD	0x0080	W	0x00000000	Bus mode register
SDMMC_PLDMND	0x0084	W	0x00000000	Poll demand register
SDMMC_DBADDR	0x0088	W	0x00000000	Descriptor list base address register
SDMMC_IDSTS	0x008c	W	0x00000000	Internal DMAC status register
SDMMC_IDINTEN	0x0090	W	0x00000000	Internal DMAC interrupt enable register
SDMMC_DSCADDR	0x0094	W	0x00000000	Current host descriptor address register
SDMMC_BUFADDR	0x0098	W	0x00000000	Current buffer descriptor address register
SDMMC_CARDTHRCTL	0x0100	W	0x00000000	Card threshold control register
SDMMC_BACKEND_POWER	0x0104	W	0x00000000	Back-end power register
SDMMC_EMMCDDR_REG	0x010c	W	0x00000000	eMMC4.5 DDR start bit detection control register
SDMMC_RDYINT_GEN	0x0120	W	0x00FF0000	Card ready interrupt generation control register
SDMMC_FIFO_BASE	0x0200	W	0x00000000	FIFO base address register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

6.4.2 Detail Register Description

SDMMC_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	use_internal_dmac Present only for the Internal DMAC configuration; else, it is reserved. 1'b0: The host performs data transfers through the slave interface 1'b1: Internal DMAC used for data transfer
24:12	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
11	RW	0x0	ceata_device_interrupt_status 1'b0: Interrupts not enabled in CE-ATA device 1'b1: Interrupts are enabled in CE-ATA device Software should appropriately write to this bit after power-on reset or any other reset to CE-ATA device. After reset, usually CE-ATA device interrupt is disabled. If the host enables CE-ATA device interrupt, then software should set this bit.
10	RW	0x0	send_auto_stop_ccsd 1'b0: Clear bit if Host Controller does not reset the bit 1'b1: Send internally generated STOP after sending CCSD to CE-ATA device NOTE: Always set send_auto_stop_ccsd and send_ccsd bits together send_auto_stop_ccsd should not be set independent of send_ccsd. When set, the Host Controller automatically sends internally-generated STOP command (CMD12) to CE-ATA device. After sending internally-generated STOP command, Auto Command Done (ACD) bit in SDMMC_RINTSTS is set and generates interrupt to host if Auto Command Done interrupt is not masked. After sending the CCSD, the Host Controller automatically clears send_auto_stop_ccsd bit.
9	RW	0x0	send_ccsd 1'b0: Clear bit if Host Controller does not reset the bit 1'b1: Send Command Completion Signal Disable (CCSD) to CE-ATA device When set, the Host Controller sends CCSD to CE-ATA device. Software sets this bit only if current command is expecting CCS (that is, RW_BLK) and interrupts are enabled in CE-ATA device. Once the CCSD pattern is sent to device, the Host Controller automatically clears send_ccsd bit. It also sets Command Done (CD) bit in SDMMC_RINTSTS register and generates interrupt to host if Command Done interrupt is not masked. NOTE: Once send_ccsd bit is set, it takes two card clock cycles to drive the CCSD on the CMD line. Due to this, during the boundary conditions it may happen that CCSD is sent to the CE-ATA device, even if the device signalled CCS.
8	RW	0x0	abort_read_data 1'b0: No change 1'b1: After suspend command is issued during read-transfer, software polls card to find when suspend happened. Once suspend occurs, software sets bit to reset data state-machine, which is waiting for next block of data. Bit automatically clears once data state machine resets to idle. Used in SDIO card suspend sequence.
7	RW	0x0	send_irq_response 1'b0: No change 1'b1: Send auto IRQ response Bit automatically clears once response is sent. To wait for MMC card interrupts, software issues CMD40, and the Host Controller waits for interrupt response from MMC card. In meantime, if software wants the Controller to exit waiting for interrupt state, it can set this bit, at which time the Host Controller command state-machine sends CMD40 response on bus and returns to idle state.

Bit	Attr	Reset Value	Description
6	RW	0x0	read_wait 1'b0: Clear read wait 1'b1: Assert read wait For sending read-wait to SDIO cards.
5	RW	0x0	dma_enable 1'b0: Disable DMA transfer mode 1'b1: Enable DMA transfer mode Even when DMA mode is enabled, host can still push/pop data into or from FIFO; this should not happen during the normal operation. If there is simultaneous FIFO access from host/DMA, the data coherency is lost. Also, there is no arbitration inside the controller to prioritize simultaneous host/DMA access.
4	RW	0x0	int_enable Global interrupt enable/disable bit. 1'b0: Disable interrupts 1'b1: Enable interrupts The int port is 1 only when this bit is 1 and one or more unmasked interrupts are set.
3	RO	0x0	reserved
2	WO	0x0	dma_reset 1'b0: No change 1'b1: Reset internal DMA interface control logic To reset DMA interface, firmware should set bit to 1. This bit is auto-cleared after two AHB clocks.
1	WO	0x0	fifo_reset 1'b0: No change 1'b1: Reset to data FIFO to reset FIFO pointers To reset FIFO, firmware should set bit to 1. This bit is auto-cleared after completion of reset operation.
0	WO	0x0	controller_reset 1'b0: No change 1'b1: Reset Host Controller To reset Host Controller, firmware should set bit to 1. This bit is auto-cleared after two AHB and two cclk_in clock cycles. This resets: a. BIU/CIU interface b. CIU and state machines c. abort_read_data, send_irq_response, and read_wait bits of SDMMC_CTRL register d. start_cmd bit of SDMMC_CMD register Does not affect any registers or DMA interface, or FIFO or controller interrupts.

SDMMC_PWREN

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	power_enable Power on/off switch for the card. Once power is turned on, firmware should wait for regulator/switch ramp-up time before trying to initialize card. 1'b0: Power off 1'b1: Power on Bit values output to card_power_en port.

SDMMC_CLKDIV

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	clk_divider0 Clock divider-0 value. Clock division is 2*n. For example, value of 0 means divide by 2*0 = 0 (no division, bypass), value of 1 means divide by 2*1 = 2, and so on. The recommended value is 0 or 1.

SDMMC_CLKSRC

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	clk_source Clock divider source. 2'b00: Clock divider 0 The cclk_out is always from clock divider 0, and this register is not implemented.

SDMMC_CLKENA

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	cclk_low_power Low-power control for SD card clock and MMC card clock supported. 1'b0: Non-low-power mode 1'b1: Low-power mode Stop clock when card in IDLE (should be normally set to only MMC and SD memory cards; for SDIO cards, if interrupts must be detected, clock should not be stopped).
15:1	RO	0x0000	reserved
0	RW	0x0	cclk_enable Clock-enable control for SD card clock and MMC card clock supported. 1'b0: Clock disabled 1'b1: Clock enabled

SDMMC_TMOUT

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:8	RW	0xffffff	data_timeout Value for card data read timeout; same value also used for data starvation by host timeout. Value is in number of card output clock. Note: The software timer should be used if the timeout value is in the order of 100 ms. In this case, read data timeout interrupt needs to be disabled.
7:0	RW	0x40	response_timeout Response timeout value. Value is in number of card output clock cclk_out.

SDMMC_CTYPE

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	card_width_8 Indicates if card is 8-bit. 1'b0: Non 8-bit mode 1'b1: 8-bit mode
15:1	RO	0x0000	reserved
0	RW	0x0	card_width Indicates if card is 1-bit or 4-bit. 1'b0: 1-bit mode 1'b1: 4-bit mode

SDMMC_BLKSIZ

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0200	block_size Block size

SDMMC_BYTCNT

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000200	byte_count Number of bytes to be transferred; should be integer multiple of block size for block transfers. For undefined number of byte transfers, byte count should be set to 0. When byte count is set to 0, it is responsibility of host to explicitly send stop/abort command to terminate data transfer.

SDMMC_INTMASK

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	sdio_int_mask 1'b0: SDIO interrupt not masked 1'b1: SDIO interrupt masked
23:17	RO	0x00	reserved
16	RW	0x0	data_nobusy_int_mask 1'b0: Data no busy interrupt not masked 1'b1: Data no busy interrupt masked

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	int_mask Bits used to mask unwanted interrupts. Value of 0 masks interrupt; value of 1 enables interrupt. bit 15: End-bit error (read)/Write no CRC (EBE) bit 14: Auto command done (ACD) bit 13: Start-bit error (SBE) bit 12: Hardware locked write error (HLE) bit 11: FIFO underrun/overrun error (FRUN) bit 10: Data starvation-by-host timeout (HTO) /Volt_switch_int bit 9: Data read timeout (DRTO) bit 8: Response timeout (RTO) bit 7: Data CRC error (DCRC) bit 6: Response CRC error (RCRC) bit 5: Receive FIFO data request (RXDR) bit 4: Transmit FIFO data request (TXDR) bit 3: Data transfer over (DTO) bit 2: Command done (CD) bit 1: Response error (RE) bit 0: Card detect (CD)

SDMMC_CMDARG

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cmd_arg Value indicates command argument to be passed to card.

SDMMC_CMD

Address: Operational Base + offset (0x002c)

Bit	Attr	Reset Value	Description
31	RW	0x0	start_cmd Start command. Once command is taken by CIU, bit is cleared. When bit is set, host should not attempt to write to any command registers. If write is attempted, hardware lock error is set in raw interrupt register. Once command is sent and response is received from SD/MMC cards, Command Done bit is set in raw interrupt register.
30	RO	0x0	reserved
29	RW	0x1	use_hold_reg Use hold register. 1'b0: CMD and DATA sent to card bypassing hold register 1'b1: CMD and DATA sent to card through the hold register
28	RW	0x0	volt_switch Voltage switch bit. 1'b0: No voltage switching 1'b1: Voltage switching enabled; must be set for CMD11 only.
27	RW	0x0	boot_mode Boot mode selection. 1'b0: Mandatory boot operation 1'b1: Alternate boot operation
26	RW	0x0	disable_boot Disable boot. When software sets this bit along with start_cmd, CIU terminates the boot operation. Do not set disable_boot and enable_boot together.

Bit	Attr	Reset Value	Description
25	RW	0x0	expect_boot_ack Expect boot acknowledge. When software sets this bit along with enable_boot, CIU expects a boot acknowledge start pattern of 0-1-0 from the selected card.
24	RW	0x0	enable_boot Enable boot. This bit should be set only for mandatory boot mode. When Software sets this bit along with start_cmd, CIU starts the boot sequence for the corresponding card by asserting the CMD line low. Do not set disable_boot and enable_boot together.
23	RW	0x0	ccs_expected 1'b0: Interrupts are not enabled in CE-ATA device or command does not expect CCS from device 1'b1: Interrupts are enabled in CE-ATA device and RW_BLK command expects command completion signal from CE-ATA device If the command expects command completion signal (CCS) from the CE-ATA device, the software should set this control bit. The Host Controller sets data transfer over (DTO) bit in SDMMC_RINTSTS register and generates interrupt to host if data transfer over interrupt is not masked.
22	RW	0x0	read_ceata_device 1'b0: Host is not performing read access towards CE-ATA device 1'b1: Host is performing read access towards CE-ATA device Software should set this bit to indicate that CE-ATA device is being accessed for read transfer. This bit is used to disable read data timeout indication while performing CE-ATA read transfers. Maximum value of I/O transmission delay can be no less than 10 seconds. The Host Controller should not indicate read data timeout while waiting for data from CE-ATA device.
21	RW	0x0	update_clock_regs_only 1'b0: Normal command sequence 1'b1: Do not send commands, just update clock register value into card clock domain. Following register values transferred into card clock domain: SDMMC_CLKDIV, SDMMC_CLRSRC, SDMMC_CLKENA. Changes card clocks (change frequency, truncate off or on, and set low-frequency mode); provided in order to change clock frequency or stop clock without having to send command to cards. During normal command sequence, when update_clock_regs_only = 0, following control registers are transferred from BIU to CIU: SDMMC_CMD, SDMMC_CMDARG, SDMMC_TMOUT, SDMMC_CTYPE, SDMMC_BLKSIZ, SDMMC_BYTCNT. CIU uses new register values for new command sequence to card. When bit is set, there are no Command Done interrupts because no command is sent to SD_MMC_CEATA cards.
20:16	RO	0x00	reserved

Bit	Attr	Reset Value	Description
15	RW	0x0	send_initialization 1'b0: Do not send initialization sequence (80 clocks of 1) before sending this command 1'b1: Send initialization sequence before sending this command After power on, 80 clocks must be sent to card for initialization before sending any commands to card. Bit should be set while sending first command to card so that controller will initialize clocks before sending command to card. This bit should not be set for either of the boot modes (alternate or mandatory).
14	RW	0x0	stop_abort_cmd 1'b0: Neither stop nor abort command to stop current data transfer in progress. If abort is sent to function-number currently selected or not in data-transfer mode, then bit should be set to 0. 1'b1: Stop or abort command intended to stop current data transfer in progress. When open-ended or predefined data transfer is in progress, and host issues stop or abort command to stop data transfer, bit should be set so that command/data state-machines of CIU can return correctly to idle state. This is also applicable for Boot mode transfers. To Abort boot mode, this bit should be set along with SDMMC_CMD[26]=disable_boot.
13	RW	0x0	wait_prvdata_complete 1'b0: Send command at once, even if previous data transfer has not completed 1'b1: Wait for previous data transfer completion before sending command The wait_prvdata_complete=0 option typically used to query status of card during data transfer or to stop current data transfer; card_number should be same as in previous command.
12	RW	0x0	send_auto_stop 1'b0: No stop command sent at end of data transfer 1'b1: Send stop command at end of data transfer When set, the Host Controller sends stop command to card at end of data transfer. a. When send_auto_stop bit should be set, since some data transfers do not need explicit stop commands b. Open-ended transfers that software should explicitly send to stop command Additionally, when "resume" is sent to resume-suspended memory access of SD-Combo card, bit should be set correctly if suspended data transfer needs send_auto_stop. Don't care if no data expected from card.
11	RW	0x0	transfer_mode 1'b0: Block data transfer command 1'b1: Stream data transfer command Don't care if no data expected.
10	RW	0x0	wr 1'b0: Read from card 1'b1: Write to card Don't care if no data expected from card.
9	RW	0x0	data_expected 1'b0: No data transfer expected (read/write) 1'b1: Data transfer expected (read/write)

Bit	Attr	Reset Value	Description
8	RW	0x0	check_response_crc 1'b0: Do not check response CRC 1'b1: Check response CRC Some of command responses do not return valid CRC bits. Software should disable CRC checks for those commands in order to disable CRC checking by controller.
7	RW	0x0	response_length 1'b0: Short response expected from card 1'b1: Long response expected from card
6	RW	0x0	response_expect 1'b0: No response expected from card 1'b1: Response expected from card
5:0	RW	0x00	cmd_index Command index

SDMMC_RESP0

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response0 Bit[31:0] of response

SDMMC_RESP1

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response1 Register represents bit[63:32] of long response. When CIU sends auto-stop command, then response is saved in register. Response for previous command sent by host is still preserved in response 0 register. Additional auto-stop issued only for data transfer commands, and response type is always "short" for them.

SDMMC_RESP2

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response2 Bit[95:64] of long response.

SDMMC_RESP3

Address: Operational Base + offset (0x003c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response3 Bit[127:96] of long response.

SDMMC_MINTSTS

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RO	0x0	sdio_interrupt SDIO interrupt status when sdio_int_mask is set.
23:17	RO	0x00	reserved
16	RW	0x0	data_nobusy_int_status Data no busy interrupt status when data_nobusy_int_mask is set

Bit	Attr	Reset Value	Description
15:0	RO	0x0000	int_status Interrupt enabled only if corresponding bit in interrupt mask register is set. bit 15: End-bit error (read)/Write no CRC (EBE) bit 14: Auto command done (ACD) bit 13: Start-bit error (SBE) bit 12: Hardware locked write error (HLE) bit 11: FIFO underrun/overrun error (FRUN) bit 10: Data starvation-by-host timeout (HTO) /Volt_switch_int bit 9: Data read timeout (DRTO) bit 8: Response timeout (RTO) bit 7: Data CRC error (DCRC) bit 6: Response CRC error (RCRC) bit 5: Receive FIFO data request (RXDR) bit 4: Transmit FIFO data request (TXDR) bit 3: Data transfer over (DTO) bit 2: Command done (CD) bit 1: Response error (RE) bit 0: Card detect (CD)

SDMMC_RINTSTS

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	WO	0x0	sdio_interrupt Raw SDIO interrupt status. Write value of 1 clears this bit, and value of 0 leaves bit intact.
23:17	RO	0x00	reserved
16	WO	0x0	data_nobusy_int_status Raw data no busy interrupt status. Write value of 1 clears this bit, and value of 0 leaves bit intact.
15:0	WO	0x0000	int_status Raw interrupt status. Writes to bits clear status bit. Write value of 1 clears status bit, and value of 0 leaves bit intact. bit 15: End-bit error (read)/Write no CRC (EBE) bit 14: Auto command done (ACD) bit 13: Start-bit error (SBE) bit 12: Hardware locked write error (HLE) bit 11: FIFO underrun/overrun error (FRUN) bit 10: Data starvation-by-host timeout (HTO) /Volt_switch_int bit 9: Data read timeout (DRTO) bit 8: Response timeout (RTO) bit 7: Data CRC error (DCRC) bit 6: Response CRC error (RCRC) bit 5: Receive FIFO data request (RXDR) bit 4: Transmit FIFO data request (TXDR) bit 3: Data transfer over (DTO) bit 2: Command done (CD) bit 1: Response error (RE) bit 0: Card detect (CD)

SDMMC_STATUS

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31	RO	0x0	dma_req DMA request signal state
30	RO	0x0	dma_ack DMA acknowledge signal state
29:17	RO	0x0000	fifo_count Number of filled locations in FIFO
16:11	RO	0x00	response_index Index of previous response, including any auto-stop sent by core.
10	RO	0x0	data_state_mc_busy Data transmit or receive state-machine is busy.
9	RO	0x0	data_busy Inverted version of raw selected card_data[0]. 1'b0: Card data not busy 1'b1: Card data busy
8	RO	0x1	data_3_status Raw selected card_data[3]; checks whether card is present. 1'b0: Card not present 1'b1: Card present
7:4	RO	0x0	command_fsm_states Command FSM states: 4'h0: Idle 4'h1: Send init sequence 4'h2: Tx cmd start bit 4'h3: Tx cmd tx bit 4'h4: Tx cmd index + arg 4'h5: Tx cmd crc7 4'h6: Tx cmd end bit 4'h7: Tx resp start bit 4'h8: Rx resp IRQ response 4'h9: Rx resp tx bit 4'ha: Rx resp cmd idx 4'hb: Rx resp data 4'hc: Rx resp crc7 4'hd: Rx resp end bit 4'he: Cmd path wait NCC 4'hf: Wait; CMD-to-response turnaround The command FSM state is represented using 19 bits. The SDMMC_STATUS register[7:4] has 4 bits to represent the command FSM states. Using these 4 bits, only 16 states can be represented. Thus three states cannot be represented in the SDMMC_STATUS[7:4] register. The three states that are not represented in the SDMMC_STATUS register[7:4] are: Bit 16: Wait for CCS Bit 17: Send CCSD Bit 18: Boot Mode Due to this, while command FSM is in "Wait for CCS state" or "Send CCSD" or "Boot Mode", the SDMMC_STATUS register indicates status as 0 for the bit field [7:4].
3	RO	0x0	fifo_full FIFO is full status
2	RO	0x1	fifo_empty FIFO is empty status

Bit	Attr	Reset Value	Description
1	RO	0x1	fifo_tx_watermark FIFO reached Transmit watermark level; not qualified with data transfer.
0	RO	0x0	fifo_rx_watermark FIFO reached Receive watermark level; not qualified with data transfer.

SDMMC_FIFOTH

Address: Operational Base + offset (0x004c)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:28	RW	0x0	dma_mutiple_transaction_size Burst size of multiple transaction; should be programmed same as DMA controller multiple-transaction-size SRC/DEST_MSIZE. 3'b000: 1 transfers 3'b001: 4 transfers 3'b010: 8 transfers 3'b011: 16 transfers 3'b100: 32 transfers 3'b101: 64 transfers 3'b110: 128 transfers 3'b111: 256 transfers The unit for transfer is 32bits.
27:16	RW	0x0ff	rx_wmark FIFO threshold watermark level when receiving data to card. When FIFO data count reaches greater than this number, DMA/FIFO request is raised. During end of packet, request is generated regardless of threshold programming in order to complete any remaining data. In non-DMA mode, when receiver FIFO threshold (RXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, interrupt is not generated if threshold programming is larger than any remaining data. It is responsibility of host to read remaining bytes on seeing Data Transfer Done interrupt. In DMA mode, at end of packet, even if remaining bytes are less than threshold, DMA request does single transfers to flush out any remaining bytes before Data Transfer Done interrupt is set. 12 bits-1 bit less than FIFO-count of status register, which is 13 bits. Limitation: rx_wmark <= FIFO_DEPTH-2 Recommended: (FIFO_DEPTH/2) - 1; (means greater than (FIFO_DEPTH/2) - 1) NOTE: In DMA mode during CCS time-out, the DMA does not generate the request at the end of packet, even if remaining bytes are less than threshold. In this case, there will be some data left in the FIFO. It is the responsibility of the application to reset the FIFO after the CCS timeout.
15:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11:0	RW	0x000	tx_wmark FIFO threshold watermark level when transmitting data to card. When FIFO data count is less than or equal to this number, DMA/FIFO request is raised. If Interrupt is enabled, then interrupt occurs. During end of packet, request or interrupt is generated, regardless of threshold programming. In non-DMA mode, when transmit FIFO threshold (TXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, on last interrupt, host is responsible for filling FIFO with only required remaining bytes (not before FIFO is full or after CIU completes data transfers, because FIFO may not be empty). In DMA mode, at end of packet, if last transfer is less than burst size, DMA controller does single cycles until required bytes are transferred. 12 bits -1 bit less than FIFO-count of status register, which is 13 bits. Limitation: tx_wmark >= 1; Recommended: FIFO_DEPTH/2; (means less than or equal to FIFO_DEPTH/2)

SDMMC_CDETECT

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
10:8	RO	0x0	pbl Programmable burst length. These bits indicate the maximum number of beats to be performed in one IDMAC transaction. The IDMAC will always attempt to burst as specified in PBL each time it starts a Burst transfer on the host bus. The permissible values are 1, 4, 8, 16, 32, 64, 128 and 256. This value is the mirror of MSIZE of SDMMC_FIFOTH register. In order to change this value, write the required value to SDMMC_FIFOTH register. This is an encode value as follows. 3'b000: 1 transfers 3'b001: 4 transfers 3'b010: 8 transfers 3'b011: 16 transfers 3'b100: 32 transfers 3'b101: 64 transfers 3'b110: 128 transfers 3'b111: 256 transfers Transfer unit is 32 bits. PBL is a read-only value and is applicable only for data access; it does not apply to descriptor accesses.
7	RW	0x0	de IDMAC enable. When set, the IDMAC is enabled.
6:2	RW	0x00	dsl Descriptor skip length. Specifies the number of word to skip between two unchained descriptors. This is applicable only for dual buffer structure.
1	RW	0x0	fb Fixed burst. Controls whether the AHB Master interface performs fixed burst transfers or not. When set, the AHB will use only SINGLE, INCR4, INCR8 or INCR16 during start of normal burst transfers. When reset, the AHB will use SINGLE and INCR burst transfer operations.
0	RW	0x0	swr Software reset. When set, the DMA Controller resets all its internal registers. It is automatically cleared after 1 clock cycle.

SDMMC_PLDMND

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	pd Poll demand. If the OWN bit of a descriptor is not set, the FSM goes to the suspend state. The host needs to write any value into this register for the IDMAC FSM to resume normal descriptor fetch operation.

SDMMC_DBADDR

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sbl Start of descriptor list. Contains the base address of the first descriptor. The LSB bits[1:0] are ignored and taken as all-zero by the IDMAC internally. Hence these LSB bits are read-only.

SDMMC_IDSTS

Address: Operational Base + offset (0x008c)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:13	RO	0x0	fsm DMAC FSM present state. 4'h0: DMA_IDLE 4'h1: DMA_SUSPEND 4'h2: DESC_RD 4'h3: DESC_CHK 4'h4: DMA_RD_REQ_WAI 4'h5: DMA_WR_REQ_WAI 4'h6: DMA_RD 4'h7: DMA_WR 4'h8: DESC_CLOSE Others: Reserved
12:10	RO	0x0	eb Error bits. Indicates the type of error that caused a bus error. Valid only with fatal bus. 3'h1: Host abort received during transmission 3'h2: Host abort received during reception Others: Reserved
9	RW	0x0	ais Abnormal interrupt summary. Logical OR of the following: SDMMC_IDSTS[2] fatal bus interrupt SDMMC_IDSTS[4] du bit interrupt Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes ais to be set is cleared. Writing a 1 clears this bit.
8	RW	0x0	nis Normal interrupt summary. Logical OR of the following: SDMMC_IDSTS[0] transmit interrupt SDMMC_IDSTS[1] receive interrupt Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes nis to be set is cleared. Writing a 1 clears this bit.
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5	RW	0x0	ces Card error summary. Indicates the status of the transaction to/from the card; also present in SDMMC_RINTSTS. Indicates the logical OR of the following bits: EBE: End Bit Error RTO: Response Timeout/Boot Ack Timeout RCRC: Response CRC SBE: Start Bit Error DRTO: Data Read Timeout/BDS timeout DCRC: Data CRC for Receive RE: Response Error Writing a 1 clears this bit. The abort condition of the IDMAC depends on the setting of this CES bit. If the CES bit is enabled, then the IDMAC aborts on a "response error"; however, it will not abort if the CES bit is cleared.
4	RW	0x0	dui Descriptor unavailable interrupt. This bit is set when the descriptor is unavailable due to OWN bit = 0 (DES0[31] =0). Writing a 1 clears this bit.
3	RO	0x0	reserved
2	RW	0x0	fbe Fatal bus error interrupt. Indicates that a bus error occurred (SDMMC_IDSTS[12:10]). When this bit is set, the DMA disables all its bus accesses. Writing a 1 clears this bit.
1	RW	0x0	ri Receive interrupt. Indicates the completion of data reception for a descriptor. Writing a 1 clears this bit.
0	RW	0x0	ti Transmit interrupt. Indicates that data transmission is finished for a descriptor. Writing 1 clears this bit.

SDMMC_IDINTEN

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RW	0x0	ai Abnormal interrupt summary enable. When set, an abnormal interrupt is enabled. This bit enables the following bits: SDMMC_IDINTEN[2] fatal bus error interrupt SDMMC_IDINTEN[4] du interrupt
8	RW	0x0	ni Normal interrupt summary enable. When set, a normal interrupt is enabled. When reset, a normal interrupt is disabled. This bit enables the following bits: SDMMC_IDINTEN[0] transmit interrupt SDMMC_IDINTEN[1] receive interrupt
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5	RW	0x0	ces Card error summary interrupt enable. When set, it enables the card interrupt summary.
4	RW	0x0	du Descriptor unavailable interrupt. When set along with abnormal interrupt summary enable, the du interrupt is enabled.
3	RO	0x0	reserved
2	RW	0x0	fbe Fatal bus error enable. When set with abnormal interrupt summary enable, the fatal bus error interrupt is enabled. When reset, fatal bus error enable interrupt is disabled.
1	RW	0x0	ri Receive interrupt enable. When set with normal interrupt summary enable, receive interrupt is enabled. When reset, receive interrupt is disabled.
0	RW	0x0	ti Transmit interrupt enable. When set with normal interrupt summary enable, transmit interrupt is enabled. When reset, transmit interrupt is disabled.

SDMMC_DSCADDR

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hda Host descriptor address pointer. This register points to the start address of the current descriptor read by the IDMAC. Cleared on reset. Pointer updated by IDMAC during operation.

SDMMC_BUFADDR

Address: Operational Base + offset (0x0098)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hba Host buffer address pointer. This register points to the current data buffer address being accessed by the IDMAC. Cleared on Reset. Pointer updated by IDMAC during operation.

SDMMC_CARDTHRCTL

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	card_rd_thres Card read threshold size
15:2	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	busy_clr_int_en Busy clear interrupt. 1'b0: Busy clear interrupt disabled 1'b1: Busy clear interrupt enabled Note: The application can disable this feature if it does not want to wait for a busy clear interrupt. For example, in a multi-card scenario, the application can switch to the other card without waiting for a busy to be completed. In such cases, the application can use the polling method to determine the status of busy. By default this feature is disabled and backward-compatible to the legacy drivers where polling is used.
0	RW	0x0	card_rd_thres_en Card read threshold enable. 1'b0: Card read threshold disabled 1'b1: Card read threshold enabled. The host initiates read transfer only if zcard_rd_thres amount of space is available in receive FIFO.

SDMMC_BACKEND_POWER

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	back_end_power Back end power. 1'b0: Off; Reset 1'b1: Back-end power supplied to card application

SDMMC_EMMCDDR_REG

Address: Operational Base + offset (0x010c)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	half_start_bit Control for start bit detection mechanism inside Host Controller based on duration of start bit. For eMMC 4.5, start bit can be: 1'b0: Full cycle (half_start_bit=0) 1'b1: Less than one full cycle (half_start_bit=1) Set half_start_bit=1 for eMMC 4.5 and above; set to 0 for SD applications.

SDMMC_RDYINT_GEN

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RO	0x0	rdyint_cnt_finish Counter finish indication. When high, it indicates that the rdyint counter is finished.
23:16	RO	0xff	rdyint_cnt_status Couner status, reflect internal counter value.
15:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	rdyint_gen_working Working indication for rdyint generator. When high, Host Controller start to count and generate one rdyint trigger. After the rdyint trigger is generated, this bit will be set to 0 by Host Controller. So software should set it to 1 before detecting next interrupt.
7:0	RW	0x00	rdyint_gen_maxval Max counter value to detect cdata_in0 high value for generating rdyint, based on internal clock frequency.

SDMMC_FIFO_BASE

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	fifo_base_addr FIFO base address

6.6 Application Notes

6.6.1 Card-Detect and Write-Protect Mechanism

Following figure illustrates how the SD/MMC card detection and write-protect signals are connected. Most of the SD/MMC sockets have card-detect pins. When no card is present, card_detect_n is 1 due to the pull-up. When the card is inserted, the card-detect pin is shorted to ground, which makes card_detect_n go to 0. Similarly in SD cards, when the write-protect switch is toward the left, it shorts the write_protect port to ground.

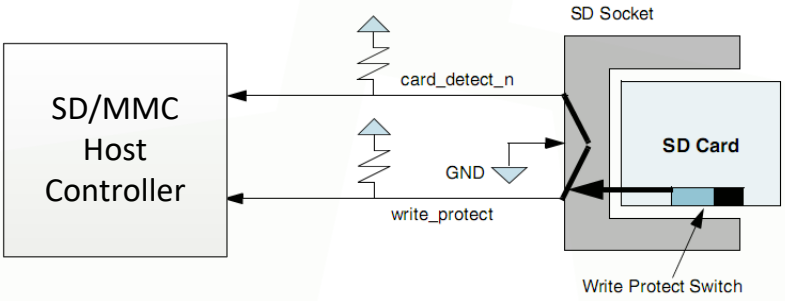

Fig. 6-10 SD/MMC Card-Detect and Write-Protect

6.6.2 SD/MMC Termination Requirement

Following Figure illustrates the SD/MMC termination requirements, which is required to pull up ccmd and cdata lines on the device bus. The recommended specification for pull-up on the ccmd line (Rcmd) is 4.7K - 100K for MMC, and 10K - 100K for an SD. The recommended pull-up on the cdata line (Rdat) is 50K - 100K.

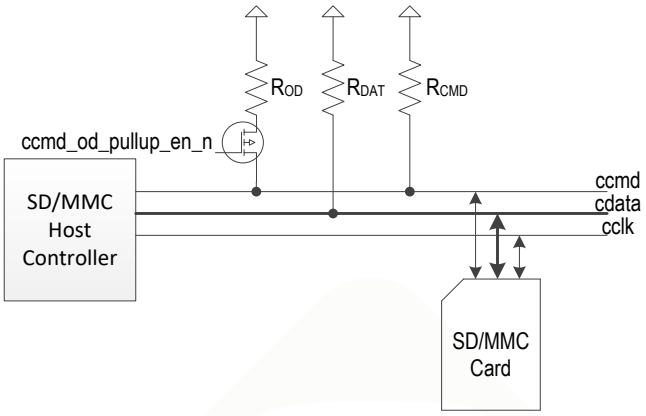

Fig. 6-11 SD/MMC Card Termination

Rcmd and Rod Calculation

The SD/MMC card enumeration happens at a very low frequency – 100-400KHz. Since the MMC bus is a shared bus between multiple cards, during enumeration open-drive mode is used to avoid bus conflict. Cards that drive 0 win over cards that drive "z". The pull-up in the command line pulls the bus to 1 when all cards drive "z". During normal data transfer, the host chooses only one card and the card driver switches to push-pull mode.

For example, if enumeration is done at 400KHz and the total bus capacitance is 200 pf, the pull-up needed during enumeration is:

2.2 RC = rise-time = 1/400KHz

R = 1/(2.2 * C * 100KHz)

= 1/(2.2 x 200 x 10**-12 x 400 x 10**3)

= 1/(17.6 x 10**-5)

= 5.68K

The ROD and RCMD should be adjusted in such a way that the effective pull-up is at the maximum 5.68K during enumeration. If there are only a few cards in the bus, a fixed RCMD resister is sufficient and there is no need for an additional ROD pull-up during enumeration. You should also ensure the effective pull-up will not violate the Iol rating of the drivers.

In SD mode, since each card has a separate bus, the capacitance is less, typically in the order of 20-30pf (host capacitance + card capacitance + trace + socket capacitance). For example, if enumeration is done at 400KHz and the total bus capacitance is 20pf, the pull-up needed during enumeration is:

2.2 RC = rise-time = 1/400KHz

R = 1/(2.2 * C * 100KHz)

= 1/(2.2 x 20 x 10**-12 x 400 x 10**3)

= 1/(1.76 x 10**-5)

= 56.8K

Therefore, a fixed 56.8K permanent Rcmd is sufficient in SD mode to enumerate the cards. The driver of the SD/MMC on the "command" port needs to be only a push-pull driver. During enumeration, the SD/MMC emulates an open-drain driver by driving only a 0 or a"z" by controlling the ccmd_out and ccmd_out_en signals.

6.6.3 Software/Hardware Restriction

Before issuing a new data transfer command, the software should ensure that the card is not busy due to any previous data transfer command. Before changing the card clock frequency, the software must ensure that there are no data or command transfers in progress.

If the card is enumerated in SDR50, or DDR50 mode, then the application must program the use_hold_reg bit[29] in the SDMMC_CMD register to 1'b0 (phase shift of cclk_in_drv = 0) or 1'b1 (phase shift of cclk_in_drv>0). If the card is enumerated in SDR12 or SDR25 mode, the application must program the use_hold_reg bit[29] in the SDMMC_CMD register to 1'b1. This programming should be done for all data transfer commands and non-data commands that are sent to the card. When the use_hold_reg bit is programmed to 1'b0, the Host Controller bypasses the Hold Registers in the transmit path. The value of this bit should not be changed when a Command or Data Transfer is in progress. For more details on using

use_hold_reg and the implementation requirements for meeting the Card input hold time, refer to "Recommended Usage" in following table.

Table 6-12 Recommended Usage of use_hold_reg

No.	Speed Mode	use_hold_reg	cclk_in (MHz)	clk_in_drv (MHz)	clk_divider	Phase shift
1	SDR104	1'b0	200	200	0	0
2	SDR104	1'b1	200	200	0	Tunable> 0
3	SDR50	1'b0	100	100	0	0
4	SDR50	1'b1	100	100	0	Tunable> 0
5	DDR50 (8bit)	1'b0	100	100	1	0
6	DDR50 (8bit)	1'b1	100	100	1	Tunable> 0
7	DDR50 (4bit)	1'b0	50	50	0	0
8	DDR50 (4bit)	1'b1	50	50	0	Tunable> 0
9	SDR25	1'b1	50	50	0	Tunable> 0
10	SDR12	1'b1	50	50	1	Tunable> 0

To avoid glitches in the card clock outputs, the software should use the following steps when changing the card clock frequency:

1) Before disable the clocks, ensure that the card is not busy due to any previous data command. To determine this, check for 0 in bit9 of SDMMC_STATUS register.
2) Update the Clock Enable register to disable all clocks. To ensure completion of any previous command before this update, send a command to the CIU to update the clock registers by setting:

- start_cmd bit
- "update clock registers only" bits
- "wait_previous data complete" bit

Wait for the CIU to take the command by polling for 0 on the start_cmd bit.

3) Set the start_cmd bit to update the Clock Divider and/or Clock Source registers, and send a command to the CIU in order to update the clock registers; wait for the CIU to take the command.
4) Set start_cmd to update the Clock Enable register in order to enable the required clocks and send a command to the CIU to update the clock registers; wait for the CIU to take the command.

In non-DMA mode, while reading from a card, the Data Transfer Over (SDMMC_RINTSTS[3]) interrupt occurs as soon as the data transfer from the card is over. There still could be some data left in the FIFO, and the RX_WMark interrupt may or may not occur, depending on the remaining bytes in the FIFO. Software should read any remaining bytes upon seeing the Data Transfer Over (DTO) interrupt. While using the external DMA interface for reading from a card, the DTO interrupt occurs only after all the data is flushed to memory by the DMA interface unit.

While writing to a card in external DMA mode, if an undefined-length transfer is selected by setting the Byte Count Register to 0, the DMA logic will likely request more data than it will send to the card, since it has no way of knowing at which point the software will stop the transfer. The DMA request stops as soon as the DTO is set by the CIU.

If the software issues a controller_reset command by setting control register bit[0] to 1, all the CIU state machines are reset; the FIFO is not cleared. The DMA sends all remaining bytes to the host. In addition to a card-reset, if a FIFO reset is also issued, then:

- Any pending DMA transfer on the bus completes correctly
- DMA data read is ignored
- Write data is unknown(x)

Additionally, if dma_reset is also issued, any pending DMA transfer is abruptly terminated. When the DMA is used, the DMA controller channel should also be reset and reprogrammed. If any of the previous data commands do not properly terminate, then the software should issue the FIFO reset in order to remove any residual data, if any, in the FIFO. After asserting

the FIFO reset, you should wait until this bit is cleared.
One data-transfer requirement between the FIFO and host is that the number of transfers should be a multiple of the FIFO data width (32bits). For example, you want to write only 15 bytes to an SD/MMC card (SDMMC_BYTCNT), the host should write 16 bytes to the FIFO or program the DMA to do 16-byte transfers. The software can still program the Byte Count register to only 15, at which point only 15 bytes will be transferred to the card. Similarly, when 15 bytes are read from a card, the host should still read all 16 bytes from the FIFO. It is recommended that you not change the FIFO threshold register in the middle of data transfers.

6.6.4 Programming Sequence

6.6.4.1 Initialization

Following figure illustrates the initialization flow.

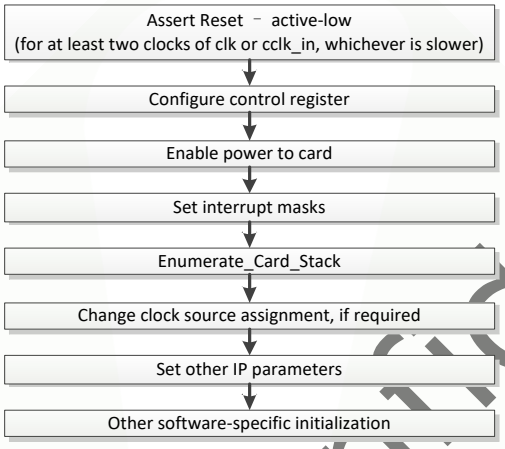

Fig. 6-12 Host Controller Initialization Sequence

Once the power and clocks are stable, reset_n should be asserted(active-low) for at least two cycles of clk or cclk_in, whichever is slower. The reset initializes the registers, ports, FIFO-pointers, DMA interface controls, and state-machines in the design. After power-on reset, the software should do the following:

1) Configure control register – For MMC mode, enable the open-drain pullup by setting enable_OD_pullup(bit24) in the SDMMC_CTRL register.
2) Enable power to cards – Before enabling the power, confirm that the voltage setting to the voltage regulators is correct. Enable power to the connected cards by setting the corresponding bit to 1 in the Power Enable register. Wait for the power ramp-up time.
3) Set masks for interrupts by clearing appropriate bits in the Interrupt Mask register. Set the global int_enable bit of the SDMMC_CTRL register. It is recommended that you write 0xffff_ffff to the Raw Interrupt register in order to clear any pending interrupts before setting the int_enable bit.
4) Enumerate card stack – Each card is enumerated according to card type; for details, refer to "Enumerated Card Stack". For enumeration, you should restrict the clock frequency to 400KHz.
5) Changing clock source assignment – set the card frequency using the clock-divider and clock-source registers; for details, refer to "Clock Programming". MMC cards operate at a maximum of 20MHz (at maximum of 52MHz in high-speed mode). SD mode operates at a maximum of 25MHz (at maximum of 50MHz in high-speed mode).
6) Set other parameters, which normally do not need to be changed with every command, with a typical value such as timeout values in cclk_out according to SD/MMC specifications.

- ResponseTimeOut = 0x64
- DataTimeOut = highest of one of the following:
- (10*((TAAC*Fop)+(100*NSAC))
- Host FIFO read/write latency from FIFO empty/full
- Set the debounce value to 25ms(default:0x0fffff) in host clock cycle units in the SDMMC_DEBNCE register.
- FIFO threshold value in bytes in the SDMMC_FIFOTH register.

6.6.4.2 Enumerated Card Stack

The card stack does the following:

- Enumerates all connected cards
- Sets the RCA for the connected cards
- Reads card-specific information
- Stores card-specific information locally

Enumeration depends on the operating mode of the SD/MMC card; the card type is first identified and the appropriate card enumeration routine is called.

1) Check if the card is connected.
2) Clear the card type register to set the card width as a single bit. For the given card number, clear the corresponding bits in the card_type register. Clear the register bit for a 1-bit, 4-bit bus width. For example, for card number=1, clear bit 0 and bit 16 of the card_type register.
3) Set clock frequency to FOD=400KHz, maximum – Program clock divider0 (bits 0-7 in the SDMMC_CLKDIV register) value to one-half of the cclk_in frequency divided by 400KHz. For example, if cclk_in is 20MHz, then the value is 20, 000/(2*400)=25.
4) Identify the card type; that is, SD, MMC, or SDIO.
   a. Send CMD5 first. If a response is received, then the card is SDIO
   b. If not, send CMD8 with the following Argument
      Bit[31:12] = 20'h0 //reserved bits
      Bit[11:8] = 4'b0001 //VHS value
      Bit[7:0] = 8'b10101010 //Preferred Check Pattern by SD2.0
   c. If Response is received the card supports High Capacity SD2.0 then send ACMD41 with the following Argument
      Bit[31] = 1'b0; //Reserved bits
      Bit[30] = 1'b1; //High Capacity Status
      Bit[29:24] = 6'h0; //Reserved bits
      Bit[23:0] = Supported Voltage Range
   d. If Response is received for ACMD41 then the card is SD. Otherwise the card is MMC.
   e. If response is not received for initial CMD8 then card does not support High Capacity SD2.0, then issue CMD0 followed by ACMD41 with the following Argument
      Bit[31] = 1'b0; //Reserved bits
      Bit[30] = 1'b0; //High Capacity Status
      Bit[29:24] = 6'h0; //Reserved bits
      Bit[23:0] = Supported Voltage Range
5) Enumerate the card according to the card type.
6) Use a clock source with a frequency = Fod (that is, 400KHz) and use the following enumeration command sequence:

- SD card – Send CMD0, CMD8, ACMD41, CMD2, CMD3.
- MMC – Send CMD0, CMD1, CMD2, CMD3.

6.6.4.3 Clock Programming

The Host Controller supports one clock source. The clock to an individual card can be enabled or disabled. Registers that support this are:

- SDMMC_CLKDIV – Programs individual clock source frequency. SDMMC_CLKDIV limited to 0 or 1 is recommended.
- SDMMC_CLKSRC – Assign clock source for each card.
- SDMMC_CLKENA – Enables or disables clock for individual card and enables low-power mode, which automatically stops the clock to a card when the card is idle for more than 8 clocks.

The Host Controller loads each of these registers only when the start_cmd bit and the update_clk_regs_only bit in the SDMMC_CMD register are set. When a command is successfully loaded, the Host Controller clears this bit, unless the Host Controller already has another command in the queue, at which point it gives an HLE(Hardware Locked Error). Software should look for the start_cmd and the update_clk_regs_only bits, and should also set the wait_prvdata_complete bit to ensure that clock parameters do not change during data transfer. Note that even though start_cmd is set for updating clock registers, the Host Controller does not raise a command_done signal upon command completion.

The following shows how to program these registers:
1) Confirm that no card is engaged in any transaction; if there is a transaction, wait until it finishes.
2) Stop all clocks by writing 0 to the SDMMC_CLKENA register. Set the start_cmd, Update_clk_regs_only, and wait_prvdata_complete bits in the SDMMC_CMD register. Wait until start_cmd is cleared or an HLE is set; in case of an HLE, repeat the command.
3) Program the SDMMC_CLKDIV and SDMMC_CLKSRC registers, as required. Set the start_cmd, Update_clk_regs_only, and wait_prvdata_complete bits in the SDMMC_CMD register. Wait until start_cmd is cleared or an HLE is set; in case of an HLE, repeat the command.
4) Re-enable all clocks by programming the SDMMC_CLKENA register. Set the start_cmd, update_clk_regs_only, and wait_prvdata_complete bits in the SDMMC_CMD register. Wait until start_cmd is cleared or an HLE is set; in case of an HLE, repeat the command.

6.6.4.4 No-Data Command With or Without Response Sequence

To send any non-data command, the software needs to program the SDMMC_CMD register @0x2C and the SDMMC_CMDARG register @0x28 with appropriate parameters. Using these two registers, the Host Controller forms the command and sends it to the command bus. The Host Controller reflects the errors in the command response through the error bits of the SDMMC_RINTSTS register.

When a response is received – either erroneous or valid – the Host Controller sets the command_done bit in the SDMMC_RINTSTS register. A short response is copied in Response Register0, while along response is copied to all four response registers @0x30, 0x34, 0x38, and 0x3C. The Response3 register bit 31 represents the MSB, and the Response0 register bit 0 represents the LSB of a long response.

For basic commands or non-data commands, follow these steps:
1) Program the Command register @0x28 with the appropriate command argument parameter.
2) Program the Command register @0x2C with the settings in following table.

Table 6-13 Command Settings for No-Data Command

Parameter	Value	Description
Default		
start_cmd	1	-
use_hold_reg	1/0	Choose value based on speed mode being used;ref to "use_hold_reg" on SDMMC_CMD register
update_clk_regs_only	0	No clock parameters update command
data_expected	0	No data command
card number	0	Actual card number(one controller only connect one card, the num is No. 0)
cmd_index	command-index	-
send_initialization	0	Can be 1, but only for card reset commands, such as CMD0
stop_abort_cmd	0	Can be 1 for commands to stop data transfer, such as CMD12
response_length	0	Can be 1 for R2(long) response
response_expect	1	Can be 0 for commands with no response; for example, CMD0, CMD4, CMD15, and so on
User-selectable		

Parameter	Value	Description
wait_prvdata_complete	1	Before sending command on command line, host should wait for completion of any data command in process, if any (recommended to always set this bit, unless the current command is to query status or stop data transfer when transfer is in progress)
check_response_crc	1	If host should crosscheck CRC of response received

3) Wait for command acceptance by host. The following happens when the command is loaded into the Host Controller:
- Host Controller accepts the command for execution and clears the start_cmd bit in the SDMMC_CMD register, unless one command is in process, at which point the Host Controller can load and keep the second command in the buffer.
- If the Host Controller is unable to load the command – that is, a command is already in progress, a second command is in the buffer, and a third command is attempted – then it generates an HLE (hardware-locked error).

4) Check if there is an HLE.
5) Wait for command execution to complete. After receiving either a response from a card or response timeout, the Host Controller sets the command_done bit in the SDMMC_RINTSTS register. Software can either poll for this bit or respond to a generated interrupt.
6) Check if response_timeout error, response_CRC error, or response error is set. This can be done either by responding to an interrupt raised by these errors or by polling bits 1, 6, and 8 from the SDMMC_RINTSTS register @0x44. If no response error is received, then the response is valid. If required, the software can copy the response from the response registers @0x30-0x3C.

Software should not modify clock parameters while a command is being executed.

6.6.4.5 Data Transfer Commands

Data transfer commands transfer data between the memory card and the Host Controller. To send a data command, the Host Controller needs a command argument, total data size, and block size. Software can receive or send data through the FIFO.

Before a data transfer command, software should confirm that the card is not busy and is in a transfer state, which can be done using the CMD13 and CMD7 commands, respectively.

For the data transfer commands, it is important that the same bus width that is programmed in the card should be set in the card type register @0x18.

The Host Controller generates an interrupt for different conditions during data transfer, which are reflected in the SDMMC_RINTSTS register @0x44 as:

1) Data_Transfer_Over (bit 3) – When data transfer is over or terminated. If there is a response timeout error, then the Host Controller does not attempt any data transfer and the "Data Transfer Over" bit is never set.
2) Transmit_FIFO_Data_request (bit 4) – FIFO threshold for transmitting data was reached; software is expected to write data, if available, in FIFO.
3) Receive_FIFO_Data_request (bit 5) – FIFO threshold for receiving data was reached; software is expected to read data from FIFO.
4) Data starvation by Host timeout (bit 10) – FIFO is empty during transmission or is full during reception. Unless software writes data for empty condition or reads data for full condition, the Host Controller cannot continue with data transfer. The clock to the card has been stopped.
5) Data read timeout error (bit 9) – Card has not sent data within the timeout period.
6) Data CRC error (bit 7) – CRC error occurred during data reception.
7) Start bit error (bit 13) – Start bit was not received during data reception.
8) End bit error (bit 15) – End bit was not received during data reception or for a write operation; a CRC error is indicated by the card.

Conditions 6), 7), and 8) indicate that the received data may have errors. If there was a response timeout, then no data transfer occurred.

6.6.4.6 Single-Block or Multiple-Block Read

Steps involved in a single-block or multiple-block read are:

1) Write the data size in bytes in the SDMMC_BYTCNT register @0x20.
2) Write the block size in bytes in the SDMMC_BLKSIZ register @0x1C. The Host Controller expects data from the card in blocks of size SDMMC_BLKSIZ each.
3) Program the SDMMC_CMDARG register @0x28 with the data address of the beginning of a data read.
4) Program the Command register with the parameters listed in following table. For SD and MMC cards, use CMD17 for a single-block read and CMD18 for a multiple-block read. For SDIO cards, use CMD53 for both single-block and multiple-block transfers.

Table 6-14 Command Setting for Single or Multiple-Block Read

Parameter	Value	Description
Default		
start_cmd	1	-
use_hold_reg	1/0	Choose value based on speed mode being used;ref to "use_hold_reg" on SDMMC_CMD register
update_clk_regs_only	0	No clock parameters update command
card number	0	Actual card number(one controller only connect one card, the num is No.0)
send_initialization	0	Can be 1, but only for card reset commands, such as CMD0
stop_abort_cmd	0	Can be 1 for commands to stop data transfer, such as CMD12
send_auto_stop	0/1	-
transfer_mode	0	Block transfer
read_write	0	Read from card
data_expected	1	Data command
response_length	0	Can be 1 for R2(long) response
response_expect	1	Can be 0 for commands with no response; for example, CMD0, CMD4, CMD15, and so on
User-selectable		
cmd_index	command-index	-
wait_prvdata_complete	1	0: Sends command immediately 1: Sends command after previous data transfer ends
check_response_crc	1	0: Host Controller should not check response CRC 1: Host Controller should check response CRC

After writing to the SDMMC_CMD register, the Host Controller starts executing the command; when the command is sent to the bus, the command_done interrupt is generated.

- Software should look for data error interrupts; that is, bits 7, 9, 13, and 15 of the SDMMC_RINTSTS register. If required, software can terminate the data transfer by

sending a STOP command.
- Software should look for Receive_FIFO_Data_request and/or data starvation by host timeout conditions. In both cases, the software should read data from the FIFO and make space in the FIFO for receiving more data.
- When a Data_Transfer_Over interrupt is received, the software should read the remaining data from the FIFO.

6.6.4.7 Single-Block or Multiple-Block Write

Steps involved in a single-block or multiple-block write are:

1) Write the data size in bytes in the SDMMC_BYTCNT register @0x20.
2) Write the block size in bytes in the SDMMC_BLKSIZ register @0x1C; the Host Controller sends data in blocks of size SDMMC_BLKSIZ each.
3) Program SDMMC_CMDARG register @0x28 with the data address to which data should be written.
4) Write data in the FIFO; it is usually best to start filling data the full depth of the FIFO.
5) Program the Command register with the parameters listed in following table.

Table 6-15 Command Settings for Single or Multiple-Block Write

Parameter	Value	Description
Default		
start_cmd	1	-
use_hold_reg	1/0	Choose value based on speed mode being used;ref to "use_hold_reg" on SDMMC_CMD register
update_clk_regs_only	0	No clock parameters update command
card number	0	Actual card number(one controller only connect one card, the num is No. 0)
send_initialization	0	Can be 1, but only for card reset commands, such as CMD0
stop_abort_cmd	0	Can be 1 for commands to stop data transfer, such as CMD12
send_auto_stop	0/1	-
transfer_mode	0	Block transfer
read_write	1	Write to card
data_expected	1	Data command
response_length	0	Can be 1 for R2(long) response
response_expect	1	Can be 0 for commands with no response; for example, CMD0, CMD4, CMD15, and so on
User-selectable		
cmd_index	command-index	-
wait_prvdata_complete	1	0: Sends command immediately 1: Sends command after previous data transfer ends
check_response_crc	1	0: Host Controller should not check response CRC 1: Host Controller should check response CRC

After writing to the SDMMC_CMD register, Host Controller starts executing a command; when the command is sent to the bus, a command_done interrupt is generated.

- Software should look for data error interrupts; that is, for bits 7, 9, and 15 of the SDMMC_RINTSTS register. If required, software can terminate the data transfer by sending the STOP command.
- Software should look for Transmit_FIFO_Data_Request and/or timeout conditions from data starvation by the host. In both cases, the software should write data into the FIFO.
- When a Data_Transfer_Over interrupt is received, the data command is over. For an open-ended block transfer, if the byte count is 0, the software must send the STOP command. If the byte count is not 0, then upon completion of a transfer of a given number of bytes, the Host Controller should send the STOP command, if necessary. Completion of the AUTO-STOP command is reflected by the Auto_command_done interrupt – bit 14 of the SDMMC_RINTSTS register. A response to AUTO_STOP is stored in SDMMC_RESP1 @0x34.

6.6.4.8 Stream Read

A stream read is like the block read mentioned in "Single-Block or Multiple-Block Read", except for the following bits in the Command register:

transfer_mode = 1; //Stream transfer
cmd_index = CMD20;

A stream transfer is allowed for only a single-bit bus width.

6.6.4.9 Stream Write

A stream write is exactly like the block write mentioned in "Single-Block or Multiple-Block Write", except for the following bits in the Command register:

transfer_mode = 1;//Stream transfer
cmd_index = CMD11;

In a stream transfer, if the byte count is 0, then the software must send the STOP command. If the byte count is not 0, then when a given number of bytes completes a transfer, the Host Controller sends the STOP command. Completion of this AUTO_STOP command is reflected by the Auto_command_done interrupt. A response to an AUTO_STOP is stored in the SDMMC_RESP1 register@0x34.
A stream transfer is allowed for only a single-bit bus width.

6.6.4.10 Sending Stop or Abort in Middle of Transfer

The STOP command can terminate a data transfer between a memory card and the Controller, while the ABORT command can terminate an I/O data transfer for only the SDIO_IOONLY and SDIO_COMBO cards.

- Send STOP command – Can be sent on the command line while a data transfer is in progress; this command can be sent at any time during a data transfer.

You can also use an additional setting for this command in order to set the Command register bits (5-0) to CMD12 and set bit 14 (stop_abort_cmd) to 1. If stop_abort_cmd is not set to 1, the Controller does not know that the user stopped a data transfer. Reset bit 13 of the Command register (wait_prvdata_complete) to 0 in order to make the Controller send the command at once, even though there is a data transfer in progress.

- Send ABORT command – Can be used with only an SDIO_IOONLY or SDIO_COMBO card. To abort the function that is transferring data, program the function number in ASx bits (CCCR register of card, address 0x06, bits (0-2) using CMD52.

6.6.4.11 Read_Wait Sequence

Read_wait is used with only the SDIO card and can temporarily stall the data transfer—either from function or memory—and allow the host to send commands to any function within the SDIO device. The host can stall this transfer for as long as required. The Host Controller provides the facility to signal this stall transfer to the card. The steps for doing this are:

1) Check if the card supports the read_wait facility; read SRW (bit 2) of the CCCR register @0x08. If this bit is 1, then all functions in the card support the read_wait facility. Use CMD52 to read this bit.
2) If the card supports the read_wait signal, then assert it by setting the read_wait (bit 6) in the SDMMC_CTRL register @0x00.
3) Clear the read_wait bit in the SDMMC_CTRL register.

6.6.4.12 Controller/DMA/FIFO Reset Usage

- Controller reset – Resets the controller by setting the controller_reset bit (bit 0) in the

SDMMC_CTRL register; this resets the CIU and state machines, and also resets the BIU-to-CIU interface. Since this reset bit is self-clearing, after issuing the reset, wait until this bit is cleared.

- FIFO reset - Resets the FIFO by setting the fifo_reset bit (bit 1) in the SDMMC_CTRL register; this resets the FIFO pointers and counters of the FIFO. Since this reset bit is self-clearing, after issuing the reset, wait until this bit is cleared.

In external DMA transfer mode, even when the FIFO pointers are reset, if there is a DMA transfer in progress, it could push or pop data to or from the FIFO; the DMA itself completes correctly. In order to clear the FIFO, the software should issue an additional FIFO reset and clear any FIFO under-run or overrun errors in the SDMMC_RAWINTS register caused by the DMA transfers after the FIFO was reset.

6.6.4.13 Card Read Threshold

When an application needs to perform a Single or Multiple Block Read command, the application must program the SDMMC_CARDTHRCTL register with the appropriate Card Read Threshold size (CardRdThreshold) and set the Card Read Threshold Enable (CardRdThrEnable) bit to 1'b1. This additional programming ensures that the Host controller sends a Read Command only if there is space equal to the Card Read Threshold available in the Rx FIFO. This in turn ensures that the card clock is not stopped in the middle a block of data being transmitted from the card. The Card Read Threshold can be set to the block size of the transfer, which guarantees that there is a minimum of one block size of space in the RxFIFO before the controller enables the card clock. The Card Read Threshold is required when the Round Trip Delay is greater than 0.5cclk_in period.

6.6.4.14 Error Handling

The Host Controller implements error checking; errors are reflected in the SDMMC_RAWINTS register@0x44 and can be communicated to the software through an interrupt, or the software can poll for these bits. Upon power-on, interrupts are disabled (int_enable in the SDMMC_CTRL register is 0), and all the interrupts are masked (bits 0-31 of the SDMMC_INTMASK register; default is 0).

Error handling:

- Response and data timeout errors – For response timeout, software can retry the command. For data timeout, the Host Controller has not received the data start bit – either for the first block or the intermediate block – within the timeout period, so software can either retry the whole data transfer again or retry from a specified block onwards. By reading the contents of the SDMMC_TCBCNT later, the software can decide how many bytes remain to be copied.
- Response errors – Set when an error is received during response reception. In this case, the response that copied in the response registers is invalid. Software can retry the command.
- Data errors – Set when error in data reception are observed; for example, data CRC, start bit not found, end bit not found, and so on. These errors could be set for any block-first block, intermediate block, or last block. On receipt of an error, the software can issue a STOP or ABORT command and retry the command for either whole data or partial data.
- Hardware locked error – Set when the Host Controller cannot load a command issued by software. When software sets the start_cmd bit in the SDMMC_CMD register, the Host Controller tries to load the command. If the command buffer is already filled with a command, this error is raised. The software then has to reload the command.
- FIFO under-run/overrun error – If the FIFO is full and software tries to write data in the FIFO, then an overrun error is set. Conversely, if the FIFO is empty and the software tries to read data from the FIFO, an under-run error is set. Before reading or writing data in the FIFO, the software should read the fifo_empty or fifo_full bits in the Status register.
- Data starvation by host timeout – Raised when the Host Controller is waiting for software intervention to transfer the data to or from the FIFO, but the software does not transfer within the stipulated timeout period. Under this condition and when a read transfer is in process, the software should read data from the FIFO and create space for further data reception. When a transmit operation is in process, the software should fill

data in the FIFO in order to start transferring data to the card.

- CRC Error on Command – If a CRC error is detected for a command, the CE-ATA device does not send a response, and a response timeout is expected from the Host Controller. The ATA layer is notified that an MMC transport layer error occurred.

Notes: During a multiple-block data transfer, if a negative CRC status is received from the device, the data path signals a data CRC error to the BIU by setting the data CRC error bit in the SDMMC_RINTSTS register. It then continues further data transmission until all the bytes are transmitted.

6.6.5 Voltage Switching

The Host Controller supports SD 3.0 Ultra High Speed (UHS-1) and is capable of voltage switching in SD-mode, which can be applied to SD High-Capacity (SDHC) and SD Extended Capacity (SDXC) cards. UHS-1 supports only 4-bit mode.

However, whether the IO voltage of 1.8v supported or not is depended on the SoC design.

SD 3.0 UHS-1 supports the following transfer speed modes for UHS-50 and/or UHS-104 cards:

- DS – default-speed up to 25MHz, 3.3V signaling
- HS – high-speed up to 50MHz, 3.3V signaling
- SDR12 – SDR up to SDR 25MHz, 1.8V signaling
- SDR25 – SDR up to 50MHz, 1.8V signaling
- SDR50 – SDR up to 100MHz, 1.8V signaling
- DDR50 – DDR up to 50MHz, 1.8V signaling

Voltage selection can be done in only SD mode. The first CMD0 selects the bus mode-either SD mode or SPI mode. The card must be in SD mode in order for 1.8V signaling mode to apply, during which time the card cannot be switched to SPI mode or 3.3V signaling without a power cycle.

If the System BIOS in an embedded system already knows that it is connected to an SD 3.0 card, then the driver programs the Controller to initiate ACMD41. The software knows from the response of ACMD41 whether or not the card supports voltage switching to 1.8V.

- If bit 32 of ACMD41 response is 1'b1: card supports voltage switching and next command-CMD11-invokes voltage switching sequence. After CMD11 is started, the software must program the IO voltage selection register based on the soc architecture.
- If bit 32 of ACMD41 response is 1'b0: card does not support voltage switching and CMD11 should not be started.

If the card and host controller accept voltage switching, then they support UHS-1 modes of data transfer. After the voltage switch to 1.8V, SDR12 is the default speed.

Since the UHS-1 can be used in only 4-bit mode, the software must start ACMD6 and change the card data width to 4-bit mode; ACMD6 is driven in any of the UHS-1 speeds. If the host wants to select the DDR mode of data transfer, then the software must program the SDMMC_DDR_REG register in the CSR space with the appropriate card number.

To choose from any of the SDR or DDR modes, appropriate values should be programmed in the SDMMC_CLKDIV register.

6.6.5.1 Voltage Switch Operation

The Voltage Switch operation must be performed in SD mode only.

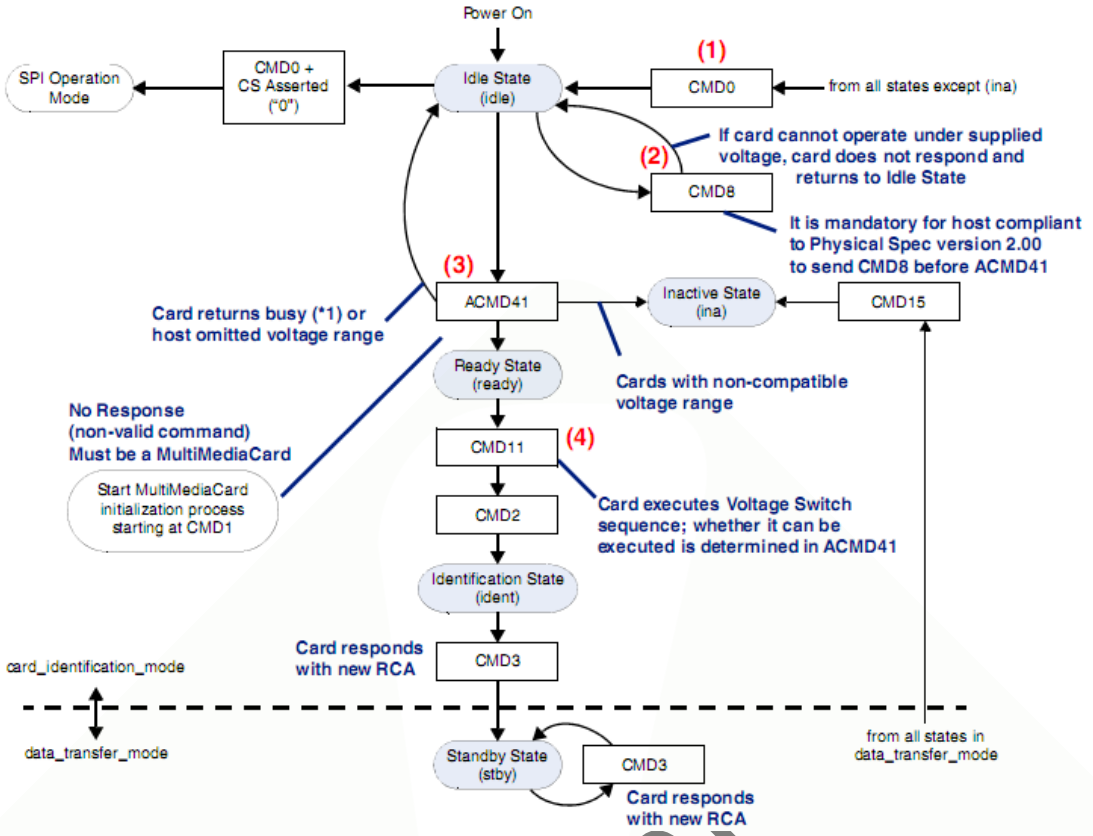

Fig. 6-13 Voltage Switching Command Flow Diagram

The following outlines the steps for the voltage switch programming sequence

1) Software Driver starts CMD0, which selects the bus mode as SD.
2) After the bus is in SD card mode, CMD8 is started in order to verify if the card is compatible with the SD Memory Card Specification, Version 2. 00. CMD8 determines if the card is capable of working within the host supply voltage specified in the VHS (19:16) field of the CMD; the card supports the current host voltage if a response to CMD8 is received.
3) ACMD 41 is started. The response to this command informs the software if the card supports voltage switching; bits 38, 36, and 32 are checked by the card argument of ACMD41; refer to following figure.

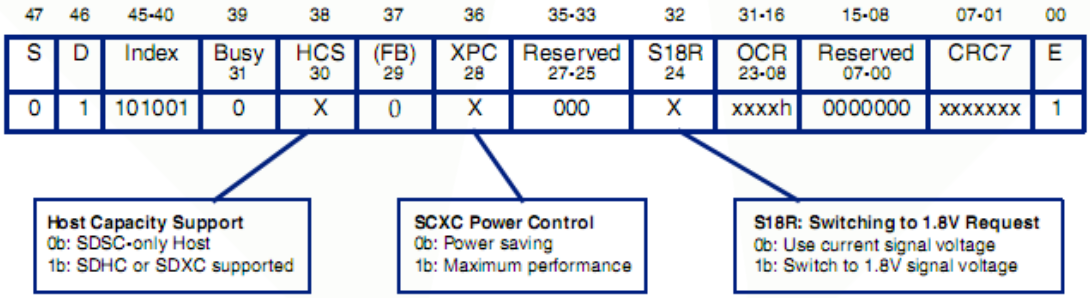

Fig. 6-14 ACMD41 Argument

- Bit 30 informs the card if host supports SDHC/SDXC or not; this bit should be set to 1'b1.
- Bit 28 can be either 1 or 0.
- Bit 24 should be set to 1'b1, indicating that the host is capable of voltage switching; refer to following figure.

47	46	45-40	39	38	37	36-33	32	31-16	15-08	07-01	00
S	D	Index	Busy 31	CCS 30	Rsvd 29	Reserved 28-25	S18R 24	OCR 23-08	Reserved 07-00	CRC7	E
0	0	111111	X	X	0	0000	X	xxxxh	0000000	1111111	1

Busy Status
0b: On Initialization
1b: Initialization complete

Card Capacity Status
0b: SDSC
1b: SCHC or SCXC

S18R: Switching to 1.8V Accepted
0b: Continues current voltage signalling
1b: Ready for switching signal voltage

Fig. 6-15 ACMD41 Response(R3)

- Bit 30 – If set to 1'b1, card supports SDHC/SDXC; if set to 1'b0, card supports only SDSC
- Bit 24 – If set to 1'b1, card supports voltage switching and is ready for the switch
- Bit 31 – If set to 1'b1, initialization is over; if set to 1'b0, means initialization in process

4) If the card supports voltage switching, then the software must perform the steps discussed for either the "Voltage Switch Normal Scenario" or the "Voltage Switch Error Scenario".

6.6.5.2Voltage Switch Normal Scenario

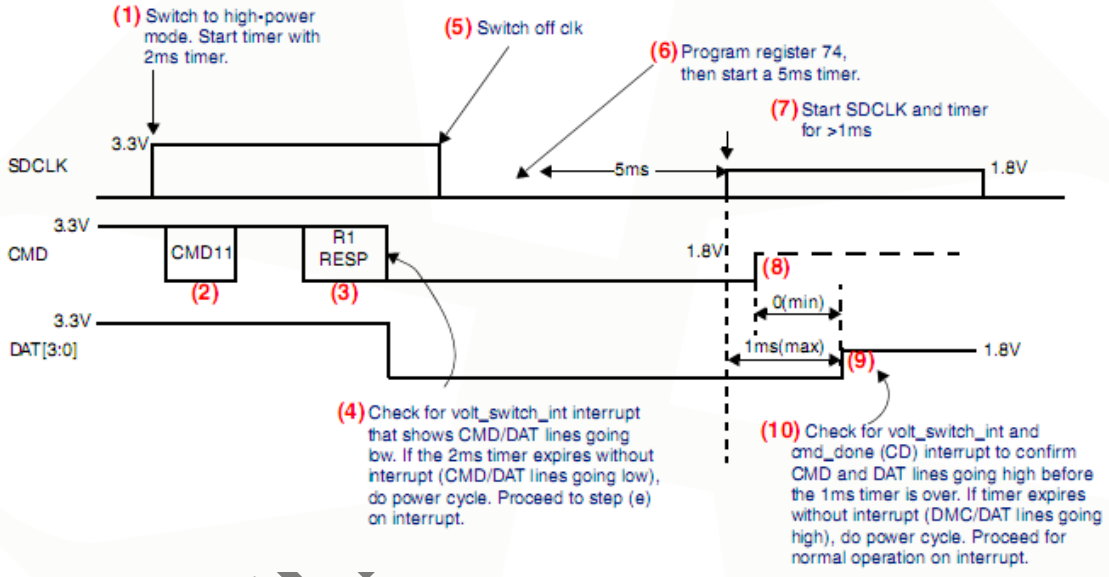

Fig. 6-16 Voltage Switch Normal Scenario

1) The host programs SDMMC_CLKENA—cclk_low_power register—with zero (0) for the corresponding card, which makes the host controller move to high-power mode. The application should start a timer with a recommended value of 2ms; this value of 2 ms is determined as below: Total cycles required for CMD11 = 48 cycles
Total cycles required for RESP R1 = 48 cycles
Maximum clock delay between MCD11 end to start of RESP1 = 60 cycles
Total = 48+48 + 60 = 160
Minimum frequency during enumeration is 100 KHz; that is, 10us
Total time = 160 * 10us = 1600us = 1. 6ms ~ 2ms
2) The host issues CMD11 to start the voltage switch sequence. Set bit 28 to 1'b1 in CMD when setting CMD11; for more information on setting bits, refer to "Boot Operation".
3) The card returns R1 response; the host controller does not generate cmd_done interrupt on receiving R1 response.
4) The card drives CMD and DAT [3:0] to low immediately after the response. The host controller generates interrupt (VOLT_SWITCH_INT) once the CMD or DAT [3:0] line goes low. The application should wait for this interrupt. If the 2ms timer expires without an interrupt (CMD/DAT lines going low), do a power cycle.

Note: Before doing a power cycle, switch off the card clock by programming SDMMC_CLKENA register

Proceed to step (5) on getting an interrupt (VOLT_SWITCH_INT).

Note: This interrupt must be cleared once this interrupt is received. Additionally, this interrupt should not be

masked during the voltage switch sequence.

If the timer expires without interrupt (CMD/DAT lines going low), perform a power cycle. Proceed to step (5) on interrupt.

1) Program the SDMMC_CLKENA register, with 0 for the corresponding card; the host stops supplying SDCLK.
2) Program Voltage register to the required values for the corresponding card. The application should start a timer > 5ms.
3) After the 5ms timer expires, the host voltage regulator is stable. Program SDMMC_CLKENA register, with 1 for the corresponding card; the host starts providing SDCLK at 1. 8V; this can be at zero time after Voltage register has been programmed. When the SDMMC_CLKENA register is programmed, the application should start another timer > 1ms.
4) By detecting SDCLK, the card drives CMD to high at 1. 8V for at least one clock and then stops driving (tri-state); CMD is triggered by the rising edge of SDCLK (SDR timing).
5) If switching to 1. 8V signaling is completed successfully, the card drives DAT [3:0] to high at 1. 8V for at least one clock and then stops driving (tri-state); DAT [3:0] is triggered by the rising edge of SDCLK (SDR timing). DAT[3:0] must be high within 1ms from the start of SDCLK.
6) The host controller generates a voltage switch interrupt (VOLT_SWITCH_INT) and a command done (CD) interrupt once the CMD and DAT[3:0] lines go high. The application should wait for this interrupt to confirm CMD and DAT lines going high before the 1ms timer is done.

If the timer expires without the voltage switch interrupt (VOLT_SWITCH_INT), a power cycle should be performed. Program the SDMMC_CLKENA register to stop the clock for the corresponding card number. Wait for the cmd_done (CD) interrupt. Proceed for normal operation on interrupt. After the sequence is completed, the host and the card start communication in SDR12 timing.

6.6.5.3 Voltage Switch Error Scenario

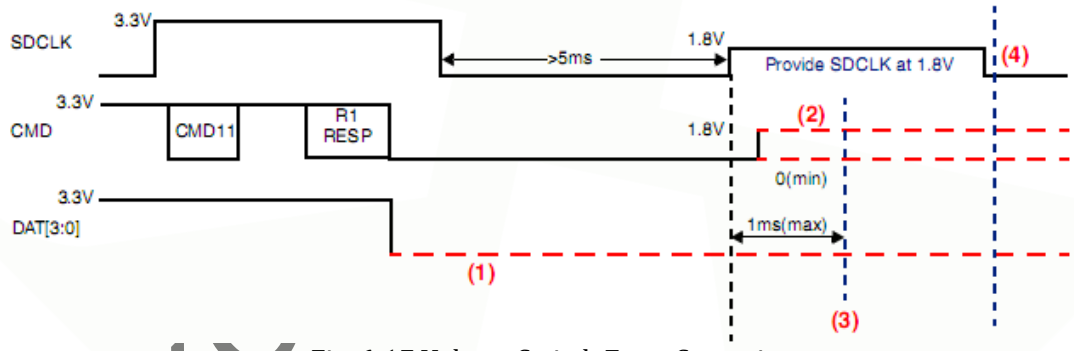

Fig. 6-17 Voltage Switch Error Scenario

1) If the interrupt (VOLT_SWITCH_INT) does not come, then the 2 ms timer should time out and a power cycle should be initiated.

Note: Before performing a power cycle, switch off the card clock by programming SDMMC_CLKENA register; no cmd_done (CD) interrupt is generated.

Additionally, if the card detects a voltage error at any point in between steps (5) and (7) in the card keeps driving DAT[3:0] to low until card power off.

2) CMD can be low or tri-state.
3) The host controller generates a voltage switch interrupt once the CMD and DAT[3:0] lines go high. The application should check for an interrupt to confirm CMD and DAT lines going high before the 1 ms timer is done.

If the 1 ms timer expires without interrupt (VOLT_SWITCH_INT) and cmd_done (CD), a power cycle should be performed. Program the SDMMC_CLKENA register to stop SDCLK of the corresponding card. Wait for the cmd_done interrupt. Proceed for normal operation on interrupt.

4) If DAT[3:0] is low, the host drives SDCLK to low and then stops supplying the card power.

Note: The card checks voltages of its own regulator output and host signals to ensure they are less than 2. 5V. Errors are indicated by (1) and (2).

- If voltage switching is accepted by the card, the default speed is SDR12.
- Command Done is given:
  - If voltage switching is properly done, CMD and DAT line goes high.
  - If switching is not complete, the 1ms timer expires, and the card clock is switched off.

Note: No other CMD should be driven before the voltage switching operation is completed and Command Done is received.

- The application should use CMD6 to check and select the particular function; the function appropriate-speed should be selected.

After the function switches, the application should program the correct value in the CLKDIV register, depending on the function chosen. Additionally, if Function 0x4 of the Access mode is chosen—that is, DDR50, then the application should also program 1'b1 in DDR_REG for the card number that has been selected for DDR50 mode.

6.6.6 DDR Operation

6.6.6.14-bit DDR Programming Sequence

DDR programming should be done only after the voltage switch operation has completed. The following outlines the steps for the DDR programming sequence:

1) Once the voltage switch operation is complete, the user must program voltage selection register to the required values for the corresponding card.

- To start a card to work in DDR mode, the application must program a bit of the newly defined SDMMC_UHSREG[16] register with a value of 1'b1.
- The bit that the user programs depends on which card is to be accessed in DDR mode.

2) To move back to SDR mode, a power cycle should be run on the card—putting the card in SDR12 mode—and only then should SDMMC_UHSREG[16]be set back to 1'b0 for the appropriate card.

6.6.6.28-bit DDR Programming Sequence

The following outlines the steps for the 8-bit DDR programming sequence:

1) The cclk_in signal should be twice the speed of the required cclk_out. Thus, if the cclk_out signal is required to be 50 MHz, the cclk_in signal should be 100 MHz.
2) The SDMMC_CLKDIV register should always be programmed with a value higher than zero (0); that is, a clock divider should always be used for 8-bit DDR mode.
3) The application must program the SDMMC_UHSREG[16] register (ddr_reg bits) by assigning it with a value of 1 for the bit corresponding to the card number; this causes the selected card to start working in DDR mode.
4) Depending on the card number, the SDMMC_CTYPE [16] bits should be set in order to make the host work in the 8-bit mode.

6.6.6.3eMMC4.5 DDR START Bit

The eMMC4.5 changes the START bit definition in the following manner:

1) Receiver samples the START bit on the rising edge.
2) On the next rising edge after sampling the START bit, the receiver must sample the data.
3) Removes requirement of the START bit and END bit to be high for one full cycle.

Notes: The Host Controller does not support a START bit duration higher than one clock cycle. START bit durations of one or less than one clock cycle are supported and can be defined at the time of startup by programming the EMMC_DDR_REG register.

6.6.6.4Reset Command/Moving From DDR50 to SDR12

To reset the mode of operation from DDR50 to SDR12, the following sequence of operations has to be done by the application:

1) Issue CMD0.
2) When CMD0 is received, the card changes from DDR50 to SDR12.
3) Program the SDMMC_CLKDIV register with an appropriate value.
4) Set ddr_reg to 0.

Note: The Voltage register should not be programmed to 0 while switching from DDR50 to SDR12, since the card is still operating in 1.8V mode after receiving CMD0.

6.6.7 H/W Reset Operation

When the RST_n signal goes low, the card enters a pre-idle state from any state other than the inactive state.

The following outlines the steps for the H/W reset programming sequence:

1) Program CMD12 to end any transfer in process.
2) Wait for DTO, even if no response is sent back by the card.
3) Set the following resets:
- DMA reset–SDMMC_CTRL [2] bit
- FIFO reset–SDMMC_CTRL [1] bit

Note: The above steps are required only if a transfer is in process.

4) Program the SDMMC_RSTN register with a value of 0; this can be done at any time when the card is connected to the controller. This programming asserts the RST_n signal and resets the card.
5) Wait for minimum of 1 µs or cclk_in period, whichever is greater
6) After a minimum of 1 µs, the application should program a value of 0 into the SDMMC_RSTN register. This de-asserts the RST_n signal and takes the card out of reset.
7) The application can program a new CMD only after a minimum of 200 µs after the de-assertion of the RST_n signal, as per the MMC 4.41 standard.

Note: For backward compatibility, the RST_n signal is temporarily disabled in the card by default. The host may need to set the signal as either permanently enabled or permanently disabled before it uses the card.

6.6.8 FBE Scenarios

An FBE occurs due to an AHB error response on the AHB bus. This is a system error, so the software driver should not perform any further programming to the Host. The only recovery mechanism from such scenarios is to do one of the following:

- Issue a hard reset by asserting the reset_n signal
- Do a program controller reset by writing to the SDMMC_CTRL[0] bit

6.6.8.1 FIFO Overflow and Underflow

During normal data transfer conditions, FIFO overflow and underflow will not occur. However if there is a programming error, then FIFO overflow/underflow can result. For example, consider the following scenarios.

- For transmit: PBL=4, Tx watermark = 1. For the above programming values, if the FIFO has only one location empty, it issues a dma_req to IDMAC FSM. Due to PBL value=4, the IDMAC FSM performs 4 pushes into the FIFO. This will result in a FIFO overflow interrupt.
- For receive: PBL=4, Rx watermark = 1. For the above programming values, if the FIFO has only one location filled, it issues a dma_req to IDMAC FSM. Due to PBL value=4, the IDMAC FSM performs 4 pops to the FIFO. This will result in a FIFO underflow interrupt.

The driver should ensure that the number of bytes to be transferred as indicated in the descriptor should be a multiple of 4bytes with respect to H_DATA_WIDTH=32. For example, if the SDMMC_BYTCNT=13, the number of bytes indicated in the descriptor should be 16 for H_DATA_WIDTH=32.

6.6.8.2 Programming of PBL and Watermark Levels

The DMAC performs data transfers depending on the programmed PBL and threshold values.

Table 6-16 PBL and Watermark Levels

PBL (Number of transfers)	Tx/Rx Watermark Value
1	greater than or equal to 1
4	greater than or equal to 4
8	greater than or equal to 8
16	greater than or equal to 16
32	greater than or equal to 32
64	greater than or equal to 64
128	greater than or equal to 128
256	greater than or equal to 256

6.6.9 Variable Delay Usage

The delay time of every element is in the range of 32ps~70ps, varying with different voltage and temperature.

The control signals for variable delay element usage are shown as follows.

6.6.9.1 SDMMC0 Variable Delay Usage

Table 6-17 Configuration for SDMMC0 Variable Delay Usage

Signal Name	Source	Default	Description
init_state	CRU_SDMMC_CON0[0]	0	Soft initial state for phase shift.

Signal Name	Source	Default	Description
drv_degree[1:0]	CRU_SDMMC_CON0[2:1]	2	Phase shift for cclk_in_drv. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree
drv_delaynum[7:0]	CRU_SDMMC_CON0[10:3]	0	Element number in delay line for cclk_in_drv
drv_sel	CRU_SDMMC_CON0[11]	0	cclk_in_drv source selection: 1'b0: use clock after phase_shift 1;b1: use clock after phase_shift and delay line
sample_degree[1:0]	CRU_SDMMC_CON1[2:1]	0	Phase shift for cclk_in_sample. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree
sample_delaynum[7:0]	CRU_SDMMC_CON1[10:3]	0	Element number in delay line for cclk_in_sample
sample_sel	CRU_SDMMC_CON1[11]	0	cclk_in_sample source selection: 1'b0: use clock after phase_shift 1'b1: use clock after phase_shift and delay line

6.6.9.2SDMMC1 Variable Delay Usage

Table 6-18 Configuration for SDMMC1 Variable Delay Usage

Signal Name	Source	Default	Description
init_state	CRU_SDMMC1_CON0[0]	0	Soft initial state for phase shift.
drv_degree[1:0]	CRU_SDMMC1_CON0[2:1]	2	Phase shift for cclk_in_drv. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree
drv_delaynum[7:0]	CRU_SDMMC1_CON0[10:3]	0	Element number in delay line for cclk_in_drv
drv_sel	CRU_SDMMC1_CON0[11]	0	cclk_in_drv source selection: 1'b0: use clock after phase_shift 1;b1: use clock after phase_shift and delay line
sample_degree[1:0]	CRU_SDMMC1_CON1[2:1]	0	Phase shift for cclk_in_sample. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree
sample_delaynum[7:0]	CRU_SDMMC1_CON1[10:3]	0	Element number in delay line for cclk_in_sample
sample_sel	CRU_SDMMC1_CON1[11]	0	cclk_in_sample source selection: 1'b0: use clock after phase_shift 1'b1: use clock after phase_shift and delay line

6.6.9.3SDMMC2 Variable Delay Usage

Table 6-19 Configuration for SDMMC2 Variable Delay Usage

Signal Name	Source	Default	Description
init_state	CRU_SDMMC2_CON0[0]	0	Soft initial state for phase shift.
drv_degree[1:0]	CRU_SDMMC2_CON0[2:1]	2	Phase shift for cclk_in_drv. 2'h0: 0-degree 2'h1: 90-degree

Signal Name	Source	Default	Description
			2'h2: 180-degree 2'h3: 270-degree
drv_delaynum[7:0]	CRU_SDMMC2_CON0[10:3]	0	Element number in delay line for cclk_in_drv
drv_sel	CRU_SDMMC2_CON0[11]	0	cclk_in_drv source selection: 1'b0: use clock after phase_shift 1;b1: use clock after phase_shift and delay line
sample_degree[1:0]	CRU_SDMMC2_CON1[2:1]	0	Phase shift for cclk_in_sample. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree
sample_delaynum[7:0]	CRU_SDMMC2_CON1[10:3]	0	Element number in delay line for cclk_in_sample
sample_sel	CRU_SDMMC2_CON1[11]	0	cclk_in_sample source selection: 1'b0: use clock after phase_shift 1'b1: use clock after phase_shift and delay line

The following outlines the steps for clock generation sequence:

1) Assert init_state to soft reset the CLKGEN.
2) Configure drv_degree/sample_degree.
3) If fine adjustment required, delay line can be used by configuring drv_delaynum/sample_delaynum and drv_sel/sample_sel.
4) Dis-assert init_state to start CLKGEN.

6.6.10 Variable Delay Tuning

Tuning is defined by SD and MMC cards to determine the correct sampling point required for the host, especially for the speed modes SDR104 and HS200 where the output delays from the cards can be up to 2 UI. Tuning is required for other speed modes-such as DDR50-even though the output delay from the card is less than one cycle.

Command for tuning is different for different cards.

- SD Memory Card:
  - CMD19 – SD card for SDR50 and SDR104 speed modes. Tuning data is defined by card specifications.
  - CMD6 – SD card for speed modes not supporting CMD19. Tuning data is the 64byte SD status.
- Multimedia Card:
  - CMD21 – MMC card for HS200 speed mode. Tuning data is defined by card specifications.
  - CMD8 – MMC card for speed modes not supporting CMD21. Tuning data is 512 byte ExtCSD data.

The following is the procedure for variable delay tuning:

1) Set a phase shift of 0-degree on cclk_in_sample.
2) Send the Tuning command to the card; the card in turn sends an R1 response on the CMD line and tuning data on the DAT line.
3) If the host sees any of the errors—start bit error, data crc error, end bit error, data read time-out, response CRC error, response error—then the sampling point is incorrect.
4) Send CMD12 to bring the host controller state machines to idle.
   - The card may treat CMD12 as an invalid command because the card has successfully sent the tuning data, and it cannot send a response.
   - The host controller may generate a response time-out interrupt that must be cleared by software.
5) Repeat steps 2) to 4) by increasing the phase shift value or delay element number on cclk_in_sample until the correct sampling point is received such that the host does not see any of the errors.
6) Mark this phase shift value as the starting point of the sampling window.

7) Repeat steps 2 to 4 by increasing the phase shift value or delay element number on cclk_in_sample until the host sees the errors starting to come again or the phase shift value reaches 360-degree.
8) Mark the last successful phase shift value as the ending point of the sampling window.

A window is established where the tuning block is matched. For example, for a scenario where the tuning block is received correctly for a phase shift window of 90-degree and 180-degree, then an appropriate sampling point is established as 135-degree. Once a sampling point is established, no errors should be visible in the tuning block.

6.6.11 Card Detection Method

There are many methods for SDMMC0/SDMMC1/SDMMC2 device detection.

- Method1: Using SDMMC_CDETECT register, which is value on card_detect_n input port. 0 represents presence of card. This method is available only for SDMMC0/SDMMC1/SDMMC2.
- Method2: Using card detection unit in Host Controller, outputting host interrupt. The card detection unit looks for any changes in the card-detect signals for card insertion or card removal. It filters out the debounces associated with mechanical insertion or removal, and generates one interrupt to the host. You can program the debounce filter value in SDMMC_DEBNCE [23:0]. Following figure illustrates the timing for card-detect signals. This method is available only for SDMMC0/SDMMC1/SDMMC2.

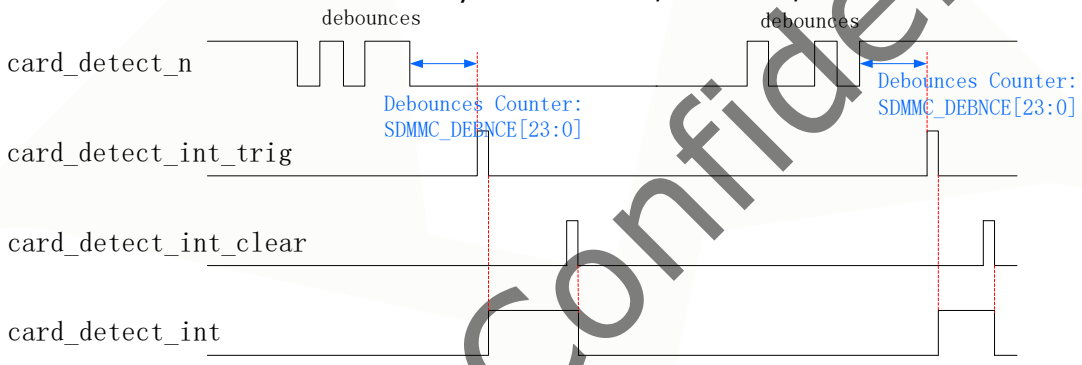

Fig. 6-18 Card Detection Method 2

- Method3: Using card detection unit in GRF, outputting detect_dual_edge_int connecting to IRQ[184] for SDMMC0/IRQ[185] for SDMMC1/IRQ[186] for SDMMC2. Similar to Method2, except that the debounce time is configurable by PMUGRF_SDMMC_DET; and the insertion/removal detection interrupt can be enabled or cleared respectively.

The detailed register information is:

Table 6-20 Register for SDMMC0 Card Detection Method 3

Signal Name	Source	Default	Description
sd_detectn_rise_edge_irq_en	PMUGRF_SD_DETECT_CON[0]	0	sdmmc detect_n signal rise edge interrupt enable. 1: enable 0: disable
sd_detect_fall_edge_detect_en	PMUGRF_SD_DETECT_CON[1]	0	sd_detect_falling_edge enable 0: disable 1: enable
sd_detect_rising_edge_dectect_status	PMUGRF_SD_DETECT_STATUS[0]	0	sd_detect_rising_edge status 0: disable 1: enable
sd_detect_fall_edge_detect_status	PMUGRF_SD_DETECT_STATUS[1]	0	sd_detect_falling_edge status 0: disable 1: enable
sd_detect_rising_edge_dectect_clr	PMUGRF_SD_DETECT_CLR[0]	0	sd_detect_rising_edge clear 0: disable 1: enable
sd_detect_fall_edge_detect_clr	PMUGRF_SD_DETECT_CLR[1]	0	sd_detect_falling_edge clear 0: disable 1: enable

Table 6-21 Register for SDMMC1 Card Detection Method 3

Signal Name	Source	Default	Description
sd_detectn_rise_edge_irq_en	PMUGRF_SD_DETECT_CON[2]	0	sdmmc detect_n signal rise edge interrupt enable. 1: enable 0: disable
sd_detect_fall_edge_detect_en	PMUGRF_SD_DETECT_CON[3]	0	sd_detect_falling_edge enable 0: disable 1: enable
sd_detect_rising_edge_dectect_status	PMUGRF_SD_DETECT_STATUS[2]	0	sd_detect_rising_edge status 0: disable 1: enable
sd_detect_fall_edge_detect_status	PMUGRF_SD_DETECT_STATUS[3]	0	sd_detect_falling_edge status 0: disable 1: enable
sd_detect_rising_edge_dectect_clr	PMUGRF_SD_DETECT_CLR[2]	0	sd_detect_rising_edge clear 0: disable 1: enable
sd_detect_fall_edge_detect_clr	PMUGRF_SD_DETECT_CLR[3]	0	sd_detect_falling_edge clear 0: disable 1: enable

Table 6-22 Register for SDMMC2 Card Detection Method 3

Signal Name	Source	Default	Description
sd_detectn_rise_edge_irq_en	PMUGRF_SD_DETECT_CON[4]	0	sdmmc detect_n signal rise edge interrupt enable. 1: enable 0: disable
sd_detect_fall_edge_detect_en	PMUGRF_SD_DETECT_CON[5]	0	sd_detect_falling_edge enable 0: disable 1: enable
sd_detect_rising_edge_dectect_status	PMUGRF_SD_DETECT_STATUS[4]	0	sd_detect_rising_edge status 0: disable 1: enable
sd_detect_fall_edge_detect_status	PMUGRF_SD_DETECT_STATUS[5]	0	sd_detect_falling_edge status 0: disable 1: enable
sd_detect_rising_edge_dectect_clr	PMUGRF_SD_DETECT_CLR[4]	0	sd_detect_rising_edge clear 0: disable 1: enable
sd_detect_fall_edge_detect_clr	PMUGRF_SD_DETECT_CLR[5]	0	sd_detect_falling_edge clear 0: disable 1: enable

- Method4: Using filtered card_detect_n with the debounce time PMUGRF_SDMMC_DET for interrupt source, connecting to IRQ [187] directly. This method is available only for SDMMC0.

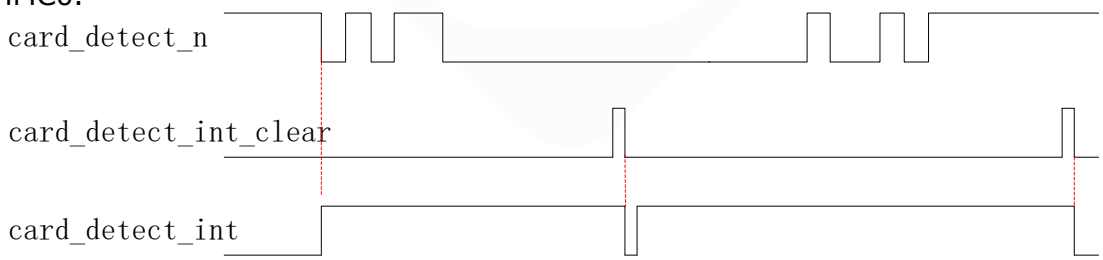

Fig. 6-19 Card Detection Method 4

6.6.12 SDMMC IOMUX With JTAG

The IO for sdmmc0_cdata2/sdmmc0_cdata3 is shared with jtag_tck/jtag_tms. The condition of usage for SDMMC or JTAG usage is as follows.

- If SGRF_SOC_CON2[4] is equal to 1 and SD/MMC card is not detected within detection time(in the unit of XIN24M clock), the GPIOs are used for JTAG.
- Otherwise, the GPIOs' usage is defined by IOMUX configuration.

Chapter 7 eMMC Host Controller

7.1 Overview

The eMMC Host Controller is highly configurable and programmable, and provides high performance eMMC Host Controller with AXI as the bus interface for data transfer (master interface) and AHB as its slave interface.

It supports following features:

- Supports SD-HCI Host version 4 mode or less
  - Supports same SD-HCI register set for eMMC transfers
  - Supports Command Queuing Engine (CQE) and compliant with eMMC CQ HCI
  - Supports the following data transfer types: CPU, SDMA, AMDM2, ADMA3
- Supports eMMC protocols including eMMC 5.1
  - Supports Auto-tuning
  - Supports 4-bit/8-bit interface
  - Supports legacy, High Speed SDR, High Speed DDR, HS200, and HS400 speed modes
  - Supports boot operation and alternative boot operation
- AHB Slave Interface: Supports 32-bit data width and address width
- AXI Master Interface: Supports 32-bit address width and 64-bit data width
- Clock adjustment: support phase auto adjustment for transmit clock, sample clock and data strobe.

7.2 Block Diagram

The Host Controller consists of the following main functional blocks.

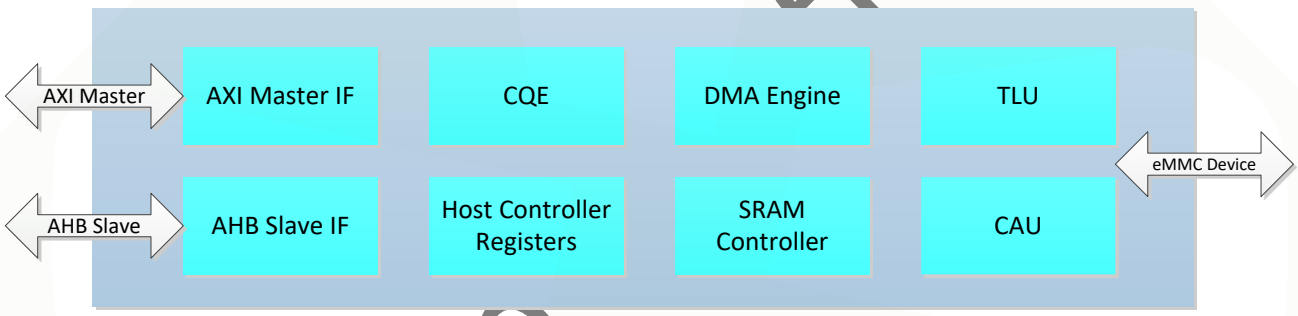

Fig. 7-1 EMMC Host Control Block Diagram

7.3 Function Description

7.3.1 The AXI Master Bus Interface Unit

This Master Bus Interface Unit implements the logic to transfer data on the AMBA Extensible Interface Bus (AXI) bus. The AXI interface transfers data to and from the system memory through the AXI master bus interface, respectively.

7.3.2 The AHB Slave Bus Interface Unit

The AHB slave bus interface module implements the logic to primarily access the host registers by using an external AMBA high-performance (AHB) bus.

7.3.3 Host Controller Registers

The host controller register unit comprises of the standard SD host controller registers as specified in the SD Specifications Part A2 SD Host Controller Standard Specification Version 4.20a. It also includes Command Queuing registers compliance to JEDEC eMMC 5.1 HCI specification.

7.3.4 DMA Engine

The DMA Engine unit handles data transfer between the host and system memory.

- Support SDMA/ADMA2/ADMA3 modes
- Fetch the descriptor and data
- The same DMA engine is used to interleave data transfer and descriptor fetch. This enables new task descriptor fetches (for CMD44 and CMD45) while DMA is moving data during task execution (for CMD46 and CMD47).
- The AXI transaction ID 0 is used for moving data and AXI transaction ID 1 is used to fetch task descriptors.

- Pre-fetch data for back-to-back eMMC write commands
- Write back the received data packets to the system memory

7.3.5 SRAM Controller

The SRAM controller interfaces the packet buffer of the host and the transaction controller units. The SRAM is a single clock single-port RAM synchronous to the core base clock. The width is 64-bit, the depth is 288-location.

7.3.6 Command Queuing Engine

This module implements command queuing and includes the following:

- Task scheduler with the ability to prioritize execution of tasks
- Control logic for descriptor fetch
- Control and sequence task submission and execution
- Status polling
- Timers and counter dedicated for CQE operation
- Interrupt coalescing logic

7.3.7 Transfer Level Unit

The TLU manages the command/response and data flow for communication with memory cards.

7.3.8 Clock Adjustment Unit

The clock adjustment unit (CAU) will detect the clock period and get the delay precision, adjust the clock phase base on the dedicate delay element. Also, you can program the register to set the delay precision. The flowing clocks supports adjustment: transmit clock, sample clock and data strobe.

7.4 Register Description

7.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
EMMC_SDMASA	0x0000	W	0x00000000	SDMA System Address Register
EMMC_BLOCKSIZE	0x0004	HW	0x00000000	Block Size Register
EMMC_BLOCKCOUNT	0x0006	HW	0x00000000	16-bit Block Count Register
EMMC_ARGUMENT	0x0008	W	0x00000000	Argument Register
EMMC_XFER_MODE	0x000C	HW	0x00000000	Transfer Mode Register
EMMC_CMD	0x000E	HW	0x00000000	Command Register
EMMC_RESP01	0x0010	W	0x00000000	Response Register 0/1
EMMC_RESP23	0x0014	W	0x00000000	Response Register 2/3
EMMC_RESP45	0x0018	W	0x00000000	Response Register 4/5
EMMC_RESP67	0x001C	W	0x00000000	Response Register 6/7
EMMC_BUF_DATA	0x0020	W	0x00000000	Buffer Data Port Register
EMMC_PSTATE	0x0024	W	0x19FF0000	Present State Register
EMMC_HOST_CTRL1	0x0028	B	0x00000000	Host Control 1 Register
EMMC_PWR_CTRL	0x0029	B	0x00000000	Power Control Register
EMMC_BGAP_CTRL	0x002A	B	0x00000000	Block Gap Control Register
EMMC_CLK_CTRL	0x002C	HW	0x00000000	Clock Control Register
EMMC_TOUT_CTRL	0x002E	B	0x00000000	Timeout Control Register
EMMC_SW_RST	0x002F	B	0x00000000	Software Reset Register
EMMC_NORMAL_INT_STAT	0x0030	HW	0x00000000	Normal Interrupt Status Register
EMMC_ERROR_INT_STAT	0x0032	HW	0x00000000	Error Interrupt Status Register

7.4.2 Detail Register Description

EMMC_SDMASA

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	BLOCKCNT_SDMASA 32-bit Block Count (SDMA System Address). 1. SDMA System Address (Host Version 4 Enable = 0): This register contains the system memory address for an SDMA transfer in the 32-bit addressing mode. When the Host Controller stops an SDMA transfer, this register points to the system address of the next contiguous data position. It can be accessed only if no transaction is executing. Reading this register during data transfers may return an invalid value. 2. 32-bit Block Count (Host Version 4 Enable = 1): From the Host Controller Version 4.10 specification, this register is redefined as 32-bit Block Count. The Host Controller decrements the block count of this register for every block transfer and the data transfer stops when the count reaches zero. This register must be accessed when no transaction is executing. Reading this register during data transfers may return invalid value. Values: 32'hFFFFFFFF: 1 Block ..... 32'h00000002: 2 Blocks 32'h00000001: 1 Block 32'h00000000: Stop Count Note: a. For Host Version 4 Enable = 0, the Host driver does not program the system address in this register while operating in ADMA mode. The system address must be programmed in the ADMA System Address register. b. For Host Version 4 Enable = 0, the Host driver programs a non-zero 32-bit block count value in this register when Auto CMD23 is enabled for non-DMA and ADMA modes. Auto CMD23 cannot be used with SDMA. c. This register must be programmed with a non-zero value for data transfer if the 32-bit Block count register is used instead of the 16-bit Block count register.

EMMC_BLOCKSIZE

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
15	RO	0x0	reserved
14:12	RW	0x0	SDMA_BUF_BDARY SDMA Buffer Boundary. These bits specify the size of contiguous buffer in system memory. The SDMA transfer waits at every boundary specified by these fields and the Host Controller generates the DMA interrupt to request the Host Driver to update the SDMA System Address register. Values: 3'h0: 4K bytes SDMA Buffer Boundary 3'h1: 8K bytes SDMA Buffer Boundary 3'h2: 16K bytes SDMA Buffer Boundary 3'h3: 32K bytes SDMA Buffer Boundary 3'h4: 64K bytes SDMA Buffer Boundary 3'h5: 128K bytes SDMA Buffer Boundary 3'h6: 256K bytes SDMA Buffer Boundary 3'h7: 512K bytes SDMA Buffer Boundary

Bit	Attr	Reset Value	Description
11:0	RW	0x000	XFER_BLOCK_SIZE Transfer Block Size. These bits specify the block size of data transfers. In case of memory, it is set to 512 bytes. It can be accessed only if no transaction is executing. Read operations during transfers may return an invalid value, and write operations are ignored. Values: 12'h1: 1 byte 12'h2: 2 bytes 12'h3: 3 bytes ..... 12'h1FF: 511 byte 12'h200: 512 bytes ..... 12'h800: 2048 bytes Note: This register must be programmed with a non-zero value for data transfer.

EMMC_BLOCKCOUNT

Address: Operational Base + offset (0x0006)

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	BLOCK_CNT 16-bit Block Count. If the Host Version 4 Enable bit is set 0 or the 16-bit Block Count register is set to non-zero, the 16-bit Block Count register is selected. If the Host Version 4 Enable bit is set 1 and the 16-bit Block Count register is set to zero, the 32-bit Block Count register is selected. Values: 16'h0: Stop Count 16'h1: 1 Block 16'h2: 2 Blocks ..... 16'hFFFF: 65535 Blocks Note: For Host Version 4 Enable = 0, this register must be set to 0 before programming the 32-bit block count register when Auto CMD23 is enabled for non-DMA and ADMA modes.

EMMC_ARGUMENT

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ARGUMENT Command Argument. These bits specify the SD/eMMC command argument that is specified in bits 39-8 of the Command format.

EMMC_XFER_MODE

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
15:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	RESP_INT_DISABLE Response Interrupt Disable. The Host Controller supports response check function to avoid overhead of response error check by the Host driver. Response types of only R1 and R5 can be checked by the Controller. If Host Driver checks the response error, set this bit to 0 and wait for Command Complete Interrupt and then check the response register. If the Host Controller checks the response error, set this bit to 1 and set the Response Error Check Enable bit to 1. The Command Complete Interrupt is disabled by this bit regardless of the Command Complete Signal Enable. Note: During tuning (when the Execute Tuning bit in the Host Control2 register is set), the Command Complete Interrupt is not generated irrespective of the Response Interrupt Disable setting. Values: 1'b0: Response Interrupt is enabled 1'b1: Response Interrupt is disabled
7	RW	0x0	RESP_ERR_CHK_ENABLE Response Error Check Enable. The Host Controller supports response check function to avoid overhead of response error check by Host driver. Response types of only R1 and R5 can be checked by the Controller. If the Host Controller checks the response error, set this bit to 1 and set Response Interrupt Disable to 1. If an error is detected, the Response Error interrupt is generated in the Error Interrupt Status register. Note: a. Response error check must not be enabled for any response type other than R1 and R5. b. Response check must not be enabled for the tuning command. Values: 1'b0: Response Error Check is disabled 1'b1: Response Error Check is enabled
6	RW	0x0	RESP_TYPE Response Type R1/R5. This bit selects either R1 or R5 as a response type when the Response Error Check is selected. Values: 1'b0: R1 1'b1: R5
5	RW	0x0	MULTI_BLK_SEL Multi/Single Block Select. This bit is set when issuing multiple-block transfer commands using the DAT line. If this bit is set to 0, it is not necessary to set the Block Count register. Values: 1'b0: Single Block 1'b1: Multiple Block

Bit	Attr	Reset Value	Description
4	RW	0x0	DATA_XFER_DIR Data Transfer Direction Select. This bit defines the direction of DAT line data transfers. This bit is set to 1 by the Host Driver to transfer data from the SD/eMMC card to the Host Controller and it is set to 0 for all other commands. Values: 1'b0: Write (Host to Card) 1'b1: Read (Card to Host)
3:2	RW	0x0	AUTO_CMD_ENABLE Auto Command Enable. This field determines use of Auto Command functions. Values: 2'h0: Auto Command Disabled 2'h1: Auto CMD12 Enable 2'h2: Auto CMD23 Enable 2'h3: Auto CMD Auto Select
1	RW	0x0	BLOCK_COUNT_ENABLE Block Count Enable. This bit is used to enable the Block Count register, which is relevant for multiple block transfers. If this bit is set to 0, the Block Count register is disabled, which is useful in executing an infinite transfer. The Host Driver must set this bit to 0 when ADMA is used. Values: 1'b0: Disable 1'b1: Enable
0	RW	0x0	DMA_ENABLE DMA Enable. This bit enables the DMA functionality. If this bit is set to 1, a DMA operation begins when the Host Driver writes to the Command register. You can select one of the DMA modes by using DMA Select in the Host Control 1 register. Values: 1'b0: No data transfer or Non-DMA data transfer 1'b1: DMA Data transfer

EMMC_CMD

Address: Operational Base + offset (0x000E)

Bit	Attr	Reset Value	Description
15:14	RO	0x0	reserved
13:8	RW	0x00	CMD_INDEX Command Index. These bits are set to the command number that is specified in bits 45-40 of the Command Format.

Bit	Attr	Reset Value	Description
7:6	RW	0x0	CMD_TYPE Command Type. These bits indicate the command type. Note: While issuing Abort CMD using CMD12/CMD52 or reset CMD using CMD0/CMD52, CMD_TYPE field shall be set to 0x3. Values: 2'h0: Normal 2'h1: Suspend 2'h2: Resume 2'h3: Abort
5	RW	0x0	DATA_PRESENT_SEL Data Present Select. This bit is set to 1 to indicate that data is present and that the data is transferred using the DAT line. This bit is set to 0 in the following instances: a. Command using the CMD line b. Command with no data transfer but using busy signal on the DAT[0] line c. Resume Command Values: 1'b0: No Data Present 1'b1: Data Present
4	RW	0x0	CMD_IDX_CHK_ENABLE Command Index Check Enable. This bit enables the Host Controller to check the index field in the response to verify if it has the same value as the command index. If the value is not the same, it is reported as a Command Index error. Note: a. Index Check enable must be set to 0 for the command with no response, R2 response, R3 response and R4 response. b. For the tuning command, this bit must always be set to enable the index check. Values: 1'b0: Disable 1'b1: Enable
3	RW	0x0	CMD_CRC_CHK_ENABLE Command CRC Check Enable. This bit enables the Host Controller to check the CRC field in the response. If an error is detected, it is reported as a Command CRC error. Note: a. CRC Check enable must be set to 0 for the command with no response, R3 response, and R4 response. b. For the tuning command, this bit must always be set to 1 to enable the CRC check. Values: 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
2	RW	0x0	SUB_CMD_FLAG Sub Command Flag. This bit distinguishes between a main command and a sub command. Values: 1'b0: Main Command 1'b1: Sub Command
1:0	RW	0x0	RESP_TYPE_SELECT Response Type Select. This bit indicates the type of response expected from the card. Values: 2'h0: No Response 2'h1: Response length 136 2'h2: Response length 48 2'h3: Response length 48, check Busy after response.

EMMC_RESP01

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RESP01 Command Response. These bits reflect 39-8 bits of SD/eMMC Response Field. Note: For Auto CMD, the 32-bit response (bits 39-8 of the Response Field) is updated in the RESP67 register.

EMMC_RESP23

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RESP23 Command Response. These bits reflect 71-40 bits of the SD/eMMC Response Field.

EMMC_RESP45

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	RESP45 Command Response. These bits reflect 103-72 bits of the Response Field.

EMMC_RESP67

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RESP67 Command Response These bits reflect bits 135-104 of SD/EMMC Response Field. For Auto CMD, this register also reflects the 32-bit response (bits 39-8 of the Response Field).

EMMC_BUF_DATA

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	BUF_DATA Buffer Data. These bits enable access to the Host Controller packet buffer.

EMMC_PSTATE

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x1	SUB_CMD_STAT Sub Command Status. This bit is used to distinguish between a main command and a sub command status. Values: 1'b0: Main Command Status 1'b1: Sub Command Status
27	RO	0x1	CMD_ISSUE_ERR Command Not Issued by Error. This bit is set if a command cannot be issued after setting the command register due to an error except the Auto CMD12 error. Values: 1'b0: No error for issuing a command 1'b1: Command cannot be issued
26:25	RO	0x0	reserved
24	RO	0x1	CMD_LINE_LVL Command-Line Signal Level. This bit is used to check the CMD line level to recover from errors and for debugging. These bits reflect the value of the sd_cmd_in signal.
23:20	RO	0xf	DAT_3_0 DAT[3:0] Line Signal Level. This bit is used to check the DAT line level to recover from errors and for debugging. These bits reflect the value of the sd_dat_in (lower nibble) signal.
19	RO	0x1	WR_PROTECT_SW_LVL Write Protect Switch Pin Level. This bit is supported only for memory and combo cards. This bit reflects the synchronized value of the card_write_prot signal. Values: 1'b0: Write protected 1'b1: Write enabled
18	RO	0x1	CARD_DETECT_PIN_LEVEL Card Detect Pin Level. This bit reflects the inverse synchronized value of the card_detect_n signal. Values: 1'b0: No card present 1'b1: Card Present
17	RO	0x1	CARD_STABLE Card Stable. This bit indicates the stability of the Card Detect Pin Level. A card is not detected if this bit is set to 1 and the value of the CARD_INSERTED bit is 0. Values: 1'b0: Reset or Debouncing 1'b1: No Card or Inserted

Bit	Attr	Reset Value	Description
16	RO	0x1	CARD_INSERTED Card Inserted. This bit indicates whether a card has been inserted. The Host Controller debounces this signal so that Host Driver need not wait for it to stabilize. Values: 1'b0: Reset, Debouncing, or No card 1'b1: Card Inserted
15:12	RO	0x0	reserved
11	RO	0x0	BUF_RD_ENABLE Buffer Read Enable. This bit is used for non-DMA transfers. This bit is set if valid data exists in the Host buffer. Values: 1'b0: Read disable 1'b1: Read enable
10	RO	0x0	BUF_WR_ENABLE Buffer Write Enable. This bit is used for non-DMA transfers. This bit is set if space is available for writing data. Values: 1'b0: Write disable 1'b1: Write enable
9	RW	0x0	RD_XFER_ACTIVE Read Transfer Active. This bit indicates whether a read transfer is active for SD/eMMC mode. Values: 1'b0: No valid data 1'b1: Transferring data
8	RO	0x0	WR_XFER_ACTIVE Write Transfer Active. This status indicates whether a write transfer is active for SD/eMMC mode. Values: 1'b0: No valid data 1'b1: Transferring data
7:4	RO	0x0	DAT_7_4 DAT[7:4] Line Signal Level. This bit is used to check the DAT line level to recover from errors and for debugging. These bits reflect the value of the sd_dat_in (upper nibble) signal.
3	RO	0x0	RE_TUNE_REQ Re-Tuning Request. Host Controller does not generate retuning request. The software must maintain the Retuning timer.

Bit	Attr	Reset Value	Description
2	RO	0x0	DAT_LINE_ACTIVE DAT Line Active (SD/eMMC Mode only). This bit indicates whether one of the DAT lines on the SD/eMMC bus is in use. In the case of read transactions, this bit indicates whether a read transfer is executing on the SD/eMMC bus. In the case of write transactions, this bit indicates wh ther a write transfer is executing on the SD/eMMC bus. For a command with busy, this status indicates whether the command executing busy is executing on an SD/eMMC bus. Values: 1'b0: DAT Line Inactive 1'b1: DAT Line Active
1	RO	0x0	CMD_INHIBIT_DAT Command Inhibit (DAT). This bit is applicable for SD/eMMC mode and is generated if either DAT line active or Read transfer active is set to 1. If this bit is set to 0, it indicates that the Host Controller can issue subsequent SD/eMMC commands. For the UHS-II mode, this bit is irrelevant and always returns 0. Values: 1'b0: Can issue command which used DAT line 1'b1: Cannot issue command which used DAT line
0	RO	0x0	CMD_INHIBIT Command Inhibit (CMD). If this bit is set to 0, it indicates that the CMD line is not in use and the Host controller can issue an SD/eMMC command using the CMD line. This bit is set when the command register is written. This bit is cleared when the command response is received. This bit is not cleared by the response of auto CMD12/23 but cleared by the response of read/write command. Values: 1'b0: Host Controller is ready to issue a command 1'b1: Host Controller is not ready to issue a command

EMMC_HOST_CTRL1

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
7	RW	0x0	CARD_DETECT_SIG_SEL Card Detect Signal Selection. This bit selects a source for card detection. When the source for the card detection is switched, the interrupt must be disabled during the switching period. Values: 1'b0: SDCD# (card_detect_n signal) is selected (for normal use) 1'b1: Card Detect Test Level is selected (for test purpose)
6	RW	0x0	CARD_DETECT_TEST_LVL Card Detect Test Level. This bit is enabled while the Card Detect Signal Selection is set to 1 and it indicates whether a card inserted or not. Values: 1'b0: No Card 1'b1: Card Inserted

Bit	Attr	Reset Value	Description
5	RW	0x0	EXT_DAT_XFER Extended Data Transfer Width. This bit controls 8-bit bus width mode of embedded device. Values: 1'b0: Bus Width is selected by the Data Transfer Width 1'b1: 8-bit Bus Width
4:3	RW	0x0	DMA_SEL DMA Select. This field is used to select the DMA type. When Host Version 4 Enable is 1 in Host Control 2 register: 2'h0: SDMA is selected 2'h1: Reserved 2'h2: ADMA2 is selected 2'h3: ADMA2 or ADMA3 is selected When Host Version 4 Enable is 0 in Host Control 2 register: 2'h0: SDMA is selected 2'h1: Reserved 2'h2: 32-bit Address ADMA2 is selected 2'h3: Reserved Values: 2'h0: SDMA is selected 2'h1: Reserved 2'h2: ADMA2 is selected 2'h3: ADMA2 or ADMA3 is selected
2	RW	0x0	HIGH_SPEED_EN High Speed Enable. In SD/eMMC mode, this bit is used to determine the selection of preset value for High Speed mode. Before setting this bit, the Host Driver checks the High Speed Support in the Capabilities register. Values: 1'b0: Normal Speed mode 1'b1: High Speed mode
1	RW	0x0	DAT_XFER_WIDTH Data Transfer Width. For SD/eMMC mode,this bit selects the data transfer width of the Host Controller. The Host Driver sets it to match the data width of the SD/eMMC card. Values: 1'b0: 1-bit mode 1'b1: 4-bit mode
0	RO	0x0	reserved

EMMC_PWR_CTRL

Address: Operational Base + offset (0x0029)

Bit	Attr	Reset Value	Description
7:1	RO	0x00	reserved
0	RW	0x0	SD_BUS_PWR If this bit is cleared, the Host Controller stops the SD Clock by clearing the SD_CLK_IN bit in the CLK_CTRL_R register. Values: 1'b0: Power off 1'b1: Power on

EMMC_BGAP_CTRL

Address: Operational Base + offset (0x002A)

Bit	Attr	Reset Value	Description
7:4	RO	0x0	reserved
3	RW	0x0	INT_AT_BGAP Interrupt At Block Gap. This bit is valid only in the 4-bit mode of an SDIO card and is used to select a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer.
2	RW	0x0	RD_WAIT_CTRL Read Wait Control. This bit is used to enable the read wait protocol to stop read data using DAT[2] line if the card supports read wait. Otherwise, the Host Controller has to stop the card clock to hold the read data. Values: 1'b0: Disable Read Wait Control 1'b1: Enable Read Wait Control
1	RW	0x0	CONTINUE_REQ Continue Request. This bit is used to restart the transaction, which was stopped using the Stop At Block Gap Request. The Host Controller automatically clears this bit when the transaction restarts. If stop at block gap request is set to 1, any write to this bit is ignored. Values: 1'b0: No Affect 1'b1: Restart
0	RW	0x0	STOP_BG_REQ Stop At Block Gap Request. This bit is used to stop executing read and write transactions at the next block gap for non-DMA, SDMA, and ADMA transfers. Values: 1'b0: Transfer 1'b1: Stop

EMMC_CLK_CTRL

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
15:8	RW	0x00	FREQ_SEL SDCLK/RCLK Frequency Select. These bits are used to select the frequency of the SDCLK signal. These bits depend on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, these bits are set by the Host Driver. If Preset Value Enable = 1, these bits are automatically set to a value specified in one of the Preset Value register. The value is reflected on the lower 8-bit of the card_clk_freq_selsignal. 1. 10-bit Divided Clock Mode: 10'h000: Base clock (10MHz - 255 MHz) 10'h001: 1/2 Divided Clock 10'h002: 1/4 Divided Clock ..... 10'h3ff: 1/2046 Divided clock 2. Programmable Clock Mode: 10'h000: Base clock * M 10'h001: Base clock * M /2 10'h002: Base clock * M /3 ..... 10'h3ff: Base clock * M /1024
7:6	RW	0x0	UPPER_FREQ_SEL These bits specify the upper 2 bits of 10-bit SDCLK/RCLK Frequency Select control.
5	RW	0x0	CLK_GEN_SELECT Clock Generator Select. This bit is used to select the clock generator mode in SDCLK/RCLK Frequency Select. If Preset Value Enable = 0, this bit is set by the Host Driver. If Preset Value Enable = 1, this bit is automatically set to a value specified in one of the Preset Value registers. The value is reflected on the card_clk_gen_sel signal. Values: 1'b0: Divided Clock Mode 1'b1: Programmable Clock Mode
4:3	RO	0x0	reserved
2	RW	0x0	SD_CLK_EN SD/eMMC Clock Enable. This bit stops the SDCLK or RCLK when set to 0. The SDCLK/RCLK Frequency Select bit can be changed when this bit is set to 0. Values: 1'b0: Disable providing SDCLK/RCLK 1'b1: Enable providing SDCLK/RCLK
1	RO	0x0	INTERNAL_CLK_STABLE Internal Clock Stable. This bit enables the Host Driver to check the clock stability twice after the Internal Clock Enable bit is set and after the PLL Enable bit is set. This bit reflects the synchronized value of the intclk_stable signal after the Internal Clock Enable bit is set to 1 and also reflects the synchronized value of the card_clk_stable signal after the PLL Enable bit is set to 1. Values: 1'b0: Not Ready 1'b1: Ready

Bit	Attr	Reset Value	Description
0	RW	0x0	INTERNAL_CLK_EN Internal Clock Enable. This bit is set to 0 when the Host Driver is not using the Host Controller. The Host Controller must stop its internal clock to enter a very low power state. However, registers can still be read and written to. The value is reflected on the intclk_en signal. Note: If this bit is not used to control the internal clock (base clock and master clock), it is recommended to set this bit to 1 . Values: 1'b0: Stop 1'b1: Oscillate

EMMC_TOUT_CTRL

Address: Operational Base + offset (0x002E)

Bit	Attr	Reset Value	Description
7:4	RO	0x0	reserved
3:0	RW	0x0	TOUT_CNT Data Timeout Counter Value. This value determines the interval by which DAT line time-outs are detected. Refer to the Data Time-out Error in the Error Interrupt Status register for information on factors that dictate time-out generation. Time-out clock frequency will be generated by dividing the sd clock TMCLK by this value. When setting this register, prevent inadvertent time-out events by clearing the Data Timeout Error Status Enable (in the Error Interrupt Status Enable register). Values: 4'h0: TMCLK * 2^13 4'h1: TMCLK * 2^14 ..... 4'he: TMCLK * 2^27 4'hf: Reserved

EMMC_SW_RST

Address: Operational Base + offset (0x002F)

Bit	Attr	Reset Value	Description
7:3	RO	0x00	reserved

Bit	Attr	Reset Value	Description
2	RW	0x0	SW_RST_DAT Software Reset For DAT line. This bit is used in SD/eMMC mode and it resets only a part of the data circuit and the DMA circuit is also reset. The following registers and bits are cleared by this bit: a. Buffer Data Port register: Buffer is cleared and initialized. b. Present state register: Buffer Read Enable Buffer Write Enable Read Transfer Active Write Transfer Active DAT Line Active Command Inhibit (DAT) c. Block Gap Control register: Continue Request Stop At Block Gap Request d. Normal Interrupt status register: Buffer Read Ready Buffer Write Ready DMA Interrupt Block Gap Event Transfer Complete Values: 1'b0: Work 1'b1: Reset
1	RW	0x0	SW_RST_CMD Software Reset For CMD line. This bit resets only a part of the command circuit to be able to issue a command. This reset is effective only for a command issuing circuit (including response error statuses related to Command Inhibit (CMD) control) and does not affect the data transfer circuit. Host Controller can continue data transfer even after this reset is executed while handling subcommand-response errors. The following registers and bits are cleared by this bit: a. Present State register - Command Inhibit (CMD) bit b. Normal Interrupt Status register - Command Complete bit c. Error Interrupt Status - Response error statuses related to Command Inhibit (CMD) bit Values: 1'b0: Work 1'b1: Reset
0	RW	0x0	SW_RST_ALL Software Reset For All. This reset affects the entire Host Controller except for the card detection circuit. During its initialization, the Host Driver sets this bit to 1 to reset the Host Controller. All registers are reset except the capabilities register. If this bit is set to 1, the Host Driver must issue reset command and reinitialize the card. Values: 1'b0: Work 1'b1: Reset

EMMC_NORMAL_INT_STAT

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
15	RO	0x0	ERROR_INT_STAT Error Interrupt. If any of the bits in the Error Interrupt Status register are set, then this bit is set. Values: 1'b0: No Error 1'b1: Error
14	W1C	0x0	CQE_EVENT Command Queuing Event. This status is set if Command Queuing/Crypto related event has occurred in eMMC/SD mode. Read CQHCI's CQIS/CRNQIS register for more details. Values: 1'b0: No Event 1'b1: Command Queuing Event is detected
13	RO	0x0	FX_EVENT FX Event. This status is set when R[14] of response register is set to 1 and Response Type R1/R5 is set to 0 in Transfer Mode register. This interrupt is used with response check function. Values: 1'b0: No Event 1'b1: FX Event is detected
12	RO	0x0	RE_TUNE_EVENT Re-tuning Event. This bit is set if the Re-Tuning Request changes from 0 to 1. Re-Tuning request is not supported.
11:9	RO	0x0	reserved
8	RO	0x0	CARD_INTERRUPT Card Interrupt. This bit reflects the synchronized value of DAT[1] Interrupt Input for SD Mode. Values: 1'b0: No Card Interrupt 1'b1: Generate Card Interrupt
7	W1C	0x0	CARD_REMOVAL Card Removal. This bit is set if the Card Inserted in the Present State register changes from 1 to 0. Values: 1'b0: Card state stable or Debouncing 1'b1: Card Removed
6	W1C	0x0	CARD_INSERTION Card Insertion. This bit is set if the Card Inserted in the Present State register changes from 0 to 1. Values: 1'b0: Card state stable or Debouncing 1'b1: Card Inserted
5	W1C	0x0	BUF_RD_READY Buffer Read Ready. This bit is set if the Buffer Read Enable changes from 0 to 1. Values: 1'b0: Not ready to read buffer 1'b1: Ready to read buffer

Bit	Attr	Reset Value	Description
4	W1C	0x0	BUF_WR_READY Buffer Write Ready. This bit is set if the Buffer Write Enable changes from 0 to 1. Values: 1'b0: Not ready to write buffer 1'b1: Ready to write buffer
3	W1C	0x0	DMA_INTERRUPT DMA Interrupt. This bit is set if the Host Controller detects the SDMA Buffer Boundary during transfer. In case of ADMA, by setting the Int field in the descriptor table, the Host controller generates this interrupt. This interrupt is not generated after a Transfer Complete. Values: 1'b0: No DMA Interrupt 1'b1: DMA Interrupt is generated
2	W1C	0x0	BGAP_EVENT Block Gap Event. This bit is set when both read/write transaction is stopped at block gap due to a Stop at Block Gap Request. Values: 1'b0: No Block Gap Event 1'b1: Transaction stopped at block gap
1	W1C	0x0	XFER_COMPLETE Transfer Complete. This bit is set when a read/write transfer and a command with status busy is completed. Values: 1'b0: Not complete 1'b1: Command execution is completed
0	W1C	0x0	CMD_COMPLETE Command Complete. In an SD/eMMC Mode, this bit is set when the end bit of a response except for Auto CMD12 and Auto CMD23. This interrupt is not generated when the Response Interrupt Disable in Transfer Mode Register is set to 1. Values: 1'b0: No Command Complete 1'b1: Command Complete

EMMC_ERROR_INT_STAT

Address: Operational Base + offset (0x0032)

Bit	Attr	Reset Value	Description
15:13	RO	0x0	reserved
12	W1C	0x0	BOOT_ACK_ERR Boot Acknowledgement Error. This bit is set when there is a timeout for boot acknowledgement or when detecting boot ack status having a value other than 010. This is applicable only when boot acknowledgement is expected in eMMC mode. Values: 1'b0: No Error 1'b1: Error

Bit	Attr	Reset Value	Description
11	W1C	0x0	RESP_ERR Response Error, Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver during DMA execution. If Response Error Check Enable is set to 1 in the Transfer Mode register, Host Controller Checks R1 or R5 response. If an error is detected in a response, this bit is set to 1. Values: 1'b0: No Error 1'b1: Error
10	W1C	0x0	TUNING_ERR Tuning Error. This bit is set when an unrecoverable error is detected in a tuning circuit except during the tuning procedure (occurrence of an error during tuning procedure is indicated by Sampling Clock Select in the Host Control 2 register). By detecting Tuning Error, Host Driver needs to abort a command executing and perform tuning. To reset tuning circuit, Sampling Clock Select is set to 0 before executing tuning procedure. The Tuning Error is higher priority than the other error interrupts generated during data transfer. By detecting Tuning Error, the Host Driver must discard data transferred by a current read/write command and retry data transfer after the Host Controller retrieved from the tuning circuit error. Values: 1'b0: No Error 1'b1: Error
9	W1C	0x0	ADMA_ERR ADMA Error. This bit is set when the Host Controller detects error during ADMA-based data transfer. The error could be due to following reasons: a. Error response received from System bus (Master I/F) b, ADMA3,ADMA2 Descriptors invalid c. CQE Task or Transfer descriptors invalid When the error occurs, the state of the ADMA is saved in the ADMA Error Status register. In eMMC CQE mode: The Host Controller generates this Interrupt when it detects an invalid descriptor data (Valid=0) at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error has occurred in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. Values: 1'b0: No Error 1'b1: Error

Bit	Attr	Reset Value	Description
8	W1C	0x0	AUTO_CMD_ERR Auto CMD Error. This error status is used by Auto CMD12 and Auto CMD23 in SD/eMMC mode. This bit is set when detecting that any of the bits D00 to D05 in Auto CMD Error Status register has changed from 0 to 1. D07 is effective in case of Auto CMD12. Auto CMD Error Status register is valid while this bit is set to 1 and may be cleared by clearing of this bit. Values: 1'b0: No Error 1'b0: Error
7	RO	0x0	reserved
6	W1C	0x0	DATA_END_BIT_ERR Data End Bit Error. This error occurs in SD/eMMC mode either when detecting 0 at the end bit position of read data that uses the DAT line or at the end bit position of the CRC status. Values: 1'b0: No Error 1'b1: Error
5	W1C	0x0	DATA_CRC_ERR Data CRC Error. This error occurs in SD/eMMC mode when detecting CRC error when transferring read data which uses the DAT line, when detecting the Write CRC status having a value of other than 010 or when write CRC status timeout. Values: 1'b0: No Error 1'b1: Error
4	W1C	0x0	DATA_TOUT_ERR Data Timeout Error. This bit is set in SD/eMMC mode when detecting one of the following timeout conditions: a. Busy timeout for R1b, R5b type b. Busy timeout after Write CRC status c. Write CRC Status timeout d. Read Data timeout Values: 1'b0: No Error 1'b1: Time out
3	W1C	0x0	CMD_IDX_ERR Command Index Error. This bit is set if a Command Index error occurs in the command respons in SD/eMMC mode. Values: 1'b0: No Error 1'b1: Error
2	W1C	0x0	CMD_END_BIT_ERR Command End Bit Error. This bit is set when detecting that the end bit of a command response is 0 in SD/eMMC mode. Values: 1'b0: No Error 1'b1: End Bit Error generated

Bit	Attr	Reset Value	Description
1	W1C	0x0	CMD_CRC_ERR Command CRC Error. Command CRC Error is generated in SD/eMMC mode for following two cases. a. If a response is returned and the Command Timeout Error is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. b. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller aborts the command (stop driving CMD line) and set this bit to 1. The Command Timeout Error is also set to 1 to distinguish a CMD line conflict. Values: 1'b0: No Error 1'b1: CRC Error generated
0	W1C	0x0	CMD_TOUT_ERR Command Timeout Error. In SD/eMMC Mode,this bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict, along with Command CRC Error bit, this bit is set to 1, without waiting for 64 SD/eMMC card clock cycles. Values: 1'b0: No Error 1'b1: Time out

EMMC_NORMAL_INT_STAT_EN

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description

EMMC_AUTO_CMD_STAT

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
15:8	RO	0x00	reserved
7	RO	0x0	CMD_NOT_ISSUED_AUTO_CMD12 Command Not Issued By Auto CMD12 Error. If this bit is set to 1, CMD_wo_DAT is not executed due to an Auto CMD12 Error (D04-D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. Values: 1'b0: No Error 1'b1: Not Issued
6	RO	0x0	reserved
5	RO	0x0	AUTO_CMD_RESP_ERR Auto CMD Response Error. This bit is set when Response Error Check Enable in the Transfer Mode register is set to 1 and an error is detected in R1 response of either Auto CMD12 or CMD13. This status is ignored if any bit between D00 to D04 is set to 1. Values: 1'b0: No Error 1'b1: Error
4	RO	0x0	AUTO_CMD_IDX_ERR Auto CMD Index Error. This bit is set if the command index error occurs in response to a command. Values: 1'b0: No Error 1'b1: Error
3	RO	0x0	AUTO_CMD_EBIT_ERR Auto CMD End Bit Error. This bit is set when detecting that the end bit of command response is 0. Values: 1'b0: No Error 1'b1: End Bit Error Generated
2	RO	0x0	AUTO_CMD_CRC_ERR Auto CMD CRC Error. This bit is set when detecting a CRC error in the command response. Values: 1'b0: No Error 1'b1: CRC Error Generated

Bit	Attr	Reset Value	Description
1	RO	0x0	AUTO_CMD_TOUT_ERR Auto CMD Timeout Error. This bit is set if no response is returned with 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, error status bits (D04-D01) are meaningless. Values: 1'b0: No Error 1'b1: Time out
0	RO	0x0	AUTO_CMD12_NOT_EXEC Auto CMD12 Not Executed. If multiple memory block data transfer is not started due to a command error, this bit is not set because it is not necessary to issue an Auto CMD12. Setting this bit to 1 means that the Host Controller cannot issue Auto CMD12 to stop multiple memory block data transfer, due to some error. If this bit is set to 1, error status bits (D04-D01) is meaningless. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. Values: 1'b0: Executed 1'b1: Not Executed

EMMC_HOST_CTRL2

Address: Operational Base + offset (0x003E)

Bit	Attr	Reset Value	Description
15	RW	0x0	PRESET_VAL_ENABLE Preset Value Enable. This bit enables automatic selection of SDCLK frequency and Driver strength Preset Value registers. When Preset Value Enable is set, SDCLK frequency generation (Frequency Select and Clock Generator Select) and the driver strength selection are performed by the controller. These values are selected from set of Preset Value registers based on selected speed mode. Values: 1'b0: SDCLK and Driver Strength are controlled by Host Driver 1'b1: Automatic Selection by Preset Value are Enabled
14	RW	0x0	ASYNC_INT_ENABLE Asynchronous Interrupt Enable. This bit can be set if a card supports asynchronous interrupts and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Values: 1'b0: Disabled 1'b1: Enabled
13	RW	0x0	ADDRESSING 64-bit Addressing. This bit is effective when Host Version 4 Enable is set to 1. Values: 1'b0: 32 bits addressing 1'b1: 64 bits addressing

Bit	Attr	Reset Value	Description
12	RW	0x0	HOST_VER4_ENABLE Host Version 4 Enable. This bit selects either Version 3.00 compatible mode or Version 4 mode. Functions of following fields are modified for Host Version 4 mode: a. SDMA Address: SDMA uses ADMA System Address (05Fh-058h) instead of SDMA System Address register (003h-000h) b. ADMA2/ADMA3 selection: ADMA3 is selected by DMA select in Host Control 1 register c. 64-bit ADMA Descriptor Size: 128-bit descriptor is used instead of 96-bit descriptor when 64-bit Addressing is set to 1 d. Selection of 32-bit/64-bit System Addressing: Either 32-bit or 64-bit system addressing is selected by 64-bit Addressing bit in this register e. 32-bit Block Count: SDMA System Address register (003h-000h) is modified to 32-bit Block Count register. Values: 1'b0: Version 3.00 compatible mode 1'b1: Version 4 mode
11	RW	0x0	CMD23_ENABLE CMD23 Enable. If the card supports CMD23, this bit is set to 1. This bit is used to select Auto CMD23 or Auto CMD12 for ADMA3 datatransfer. Values: 1'b0: Auto CMD23 is disabled 1'b1: Auto CMD23 is enabled
10	RW	0x0	ADMA2_LEN_MODE ADMA2 Length Mode. This bit selects ADMA2 Length mode to be either 16-bit or 26-bit. Values: 1'b0: 16-bit Data Length Mode 1'b1: 26-bit Data Length Mode
9	RO	0x0	reserved
8	RW	0x0	UHS2_IF_ENABLE This bit should be set to 0 for SD/eMMC Interface.
7	RW	0x0	SAMPLE_CLK_SEL Sampling Clock Select. This bit is used by the Host Controller to select the sampling clock in SD/eMMC mode to receive CMD and DAT. This bit is set by the tuning procedure and is valid after the completion of tuning (when Execute Tuning is cleared). Setting this bit to 1 means that tuning is completed successfully and setting this bit to 0 means that tuning has failed. Values: 1'b0: Fixed clock is used to sample data 1'b1: Tuned clock is used to sample data
6	RW	0x0	EXEC_TUNING Execute Tuning. This bit is set to 1 to start the tuning procedure in UHSI/eMMC speed modes and this bit is automatically cleared when tuning procedure is completed. Values: 1'b0: Not Tuned or Tuning completed 1'b1: Execute Tuning

Bit	Attr	Reset Value	Description
5:4	RO	0x0	reserved
3	RW	0x0	SIGNALING_EN 1.8V Signaling Enable. Values: 1'b0: 3.3V Signalling 1'b1: 1.8V Signalling
2:0	RW	0x0	UHS_MODE_SEL UHS Mode/eMMC Speed Mode Select. These bits are used to select UHS mode in the SD mode of operation. In eMMC mode, these bits are used to select eMMC Speed mode. Values: 3'h0: SDR12/Legacy 3'h1: SDR25/High Speed SDR 3'h2: SDR50 3'h3: SDR104/HS200 3'h4: DDR50/High Speed DDR 3'h7: HS400 Others: Reserved

EMMC_CAPABILITIES1

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:30	RO	0x1	SLOT_TYPE Slot Type. These bits indicate usage of a slot by a specific Host System. 2'h0: Removable Card Slot 2'h1: Embedded Slot for One Device 2'h2: Shared Bus Slot (SD mode) 2'h3: Reserved
29	RO	0x0	ASYNC_INT_SUPPORT Asynchronous Interrupt Support (SD Mode only). Values: 1'b0: Asynchronous Interrupt Not Supported 1'b1: Asynchronous Interrupt Supported
28	RO	0x0	SYS_ADDR_64_V3 64-bit System Address Support for V3. This bit sets the Host controller to support 64-bit System Addressing of V3 mode. SDMA cannot be used in 64-bit Addressing in Version 3 Mode. If this bit is set to 1, 64-bit ADMA2 with using 96-bit Descriptor can be enabled by setting Host Version 4 Enable (HOST_VER4_ENABLE = 0) and DMA select (DMA_SEL =11b). Values: 1'b0: 64-bit System Address for V3 is Not Supported 1'b1: 64-bit System Address for V3 is Supported

Bit	Attr	Reset Value	Description
27	RO	0x0	SYS_ADDR_64_V4 64-bit System Address Support for V4. This bit sets the Host Controller to support 64-bit System Addressing of V4 mode. When this bit is set to 1, full or part of 64-bit address must be used to decode the Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller registers is effective regardless of setting to 64-bit Addressing in Host Control 2. If this bit is set to 1, 64-bit DMA Addressing for version 4 is enabled by setting Host Version 4 Enable (HOST_VER4_ENABLE = 1) and by setting 64-bit Addressing (ADDRESSING =1) in the Host Control 2 register. SDMA can be used and ADMA2 uses 128-bit Descriptor. Values: 1'b0: 64-bit System Address for V4 is Not Supported 1'b1: 64-bit System Address for V4 is Supported
26:24	RO	0x0	reserved
23	RO	0x1	SUS_RES_SUPPORT Suspense/Resume Support. This bit indicates whether the Host Controller supports Suspend/Resume functionality. If this bit is 0, the Host Driver does not issue either Suspend or Resume commands because the Suspend and Resume mechanism is not supported. Values: 1'b0: Not Supported 1'b1: Supported
22	RO	0x1	SDMA_SUPPORT SDMA Support. This bit indicates whether the Host Controller is capable of using SDMA to transfer data between the system memory and the Host Controller directly. Values: 1'b0: SDMA not Supported 1'b1: SDMA Supported
21	RO	0x1	HIGH_SPEED_SUPPORT High Speed Support. This bit indicates whether the Host Controller and the Host System supports High Speed mode and they can supply the SD Clock frequency from 25 MHz to 50 MHz. Values: 1'b0: High Speed not Supported 1'b1: High Speed Supported
20	RO	0x0	reserved
19	RO	0x1	ADMA2_SUPPORT ADMA2 Support. This bit indicates whether the Host Controller is capable of using ADMA2. Values: 1'b0: ADMA2 not Supported 1'b1: ADMA2 Supported

Bit	Attr	Reset Value	Description
18	RO	0x1	Embedded_8_BIT 8-bit Support for Embedded Device. This bit indicates whether the Host Controller is capable of using an 8-bit bus width mode. Values: 1'b0: 8-bit Bus Width not Supported 1'b1: 8-bit Bus Width Supported
17:16	RO	0x1	MAX_BLK_LEN Maximum Block Length. This bit indicates the maximum block size that the Host driver can read and write to the buffer in the Host Controller. The buffer transfers this block size without wait cycles. The transfer block length is always 512 bytes for the SD Memory irrespective of this bit. Values: 2'h0: 512 Byte 2'h1: 1024 Byte 2'h2: 2048 Byte 2'h3: Reserved
15:8	RO	0xc8	BASE_CLK_FREQ Base Clock Frequency for SD clock. These bits indicate the base (maximum) clock frequency for the SD Clock. The definition of these bits depend on the Host Controller Version. (1) 6-Bit Base Clock Frequency: This mode is supported by the Host Controller version 1.00 and 2.00. The upper 2 bits are not effective and are always 0. The unit values are 1 MHz. The supported clock range is 10 MHz to 63 MHz. 8'h0: Get information through another method 8'h0: 1 MHz 8'h1: 2 MHz ..... 8'h3f: 63 MHz Others: Reserved (2) 8-Bit Base Clock Frequency: This mode is supported by the Host Controller version 3.00. The unit values are 1 MHz. The supported clock range is 10 MHz to 255 MHz. 8'h0: Get information through another method 8'h0: 1 MHz 8'h0: 2 MHz ..... 8'hff: 255 MHz
7	RO	0x1	TOUT_CLK_UNIT Timeout Clock Unit. This bit shows the unit of base clock frequency used to detect Data TImeout Error. Values: 1'b0: KHz 1'b1: MHz
6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5:0	RO	0x00	TOUT_CLK_FREQ Timeout Clock Frequency. This bit shows the base clock frequency used to detect Data Timeout Error. The Timeout Clock unit defines the unit of timeout clock frequency. It can be KHz or MHz. 6'h0: Get information through another method 6'h1: 1KHz / 1MHz 6'h2: 2KHz / 2MHz 6'h3: 3KHz / 3MHz ..... 6'h3f: 63KHz / 63MHz

EMMC_CAPABILITIES2

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RO	0x0	ADMA3_SUPPORT ADMA3 Support. This bit indicates whether the Host Controller is capable of using ADMA3. Values: 1'b0: ADMA3 not Supported 1'b1: ADMA3 Supported
24	RO	0x0	reserved
23:16	RO	0x0a	CLK_MUL Clock Multiplier. These bits indicate the clock multiplier of the programmable clock generator. Setting these bits to 0 means that the Host Controller does not support a programmable clock generator. Values: 8'h0: Clock Multiplier is not Supported 8'h1: Clock Multiplier M = 2 8'h2: Clock Multiplier M = 3 ..... 8'hFF: Clock Multiplier M = 256
15:14	RO	0x0	RE_TUNING_MODES Re-Tuning Modes. Values: These bits select the re-tuning method and limit the maximum data length. Values: 2'h0: Timer 2'h1: Timer and Re-Tuning Request (Not supported) 2'h2: Auto Re-Tuning (for transfer) 2'h3: Reserved
13	RO	0x1	USE_TUNING_SDR50 Use Tuning for SDR50. Values: 1'b0: SDR50 does not require tuning 1'b1: SDR50 requires tuning
12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11:8	RO	0x0	RETUNE_CNT Timer Count for Re-Tuning. Values: 4'h0: Re-Tuning Timer disabled 4'h1: 1 seconds 4'h2: 2 seconds 4'h3: 4 seconds ..... 4'hB: 1024 seconds 4'hC~4'hE: Reserved 4'hF: Get information from other source
7	RO	0x0	reserved
6	RO	0x1	DRV_TYPED This bit indicates support of Driver Type D for 1.8 Signaling. Values: 1'b0: Driver Type D is Not Supported 1'b1: Driver Type D is Supported
5	RO	0x1	DRV_TYPEC This bit indicates support of Driver Type C for 1.8 Signaling. Values: 1'b0: Driver Type C is Not Supported 1'b1: Driver Type C is Supported
4	RO	0x1	DRV_TYPEA This bit indicates support of Driver Type A for 1.8 Signaling. Values: 1'b0: Driver Type A is Not Supported 1'b1: Driver Type A is Supported
3	RO	0x1	UHS2_SUPPORT UHS-II Support. Values: 1'b0: UHS-II is Not Supported 1'b1: UHS-II is Supported

EMMC_ADMA_ERR_STAT

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
7:3	RO	0x00	reserved
2	RO	0x0	ADMA_LEN_ERR ADMA Length Mismatch Error States. This error occurs in the following instances: a. While the Block Count Enable is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count and Block Length; b. When the total data length cannot be divided by the block length Values: 1'b0: No Error 1'b1: Error
1:0	RO	0x0	ADMA_ERR_STATES ADMA Error States. These bits indicate the state of ADMA when an error occurs during ADMA data transfer. Values: 2'h0: Stop DMA - SYS_ADR register points to a location next to the error descriptor 2'h1: Fetch Descriptor - SYS_ADR register points to the error descriptor 2'h2: Never set this state 2'h3: Transfer Data - SYS_ADR register points to a location next to the error descriptor

EMMC_ADMA_SA

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ADMA_SA ADMA System Address. These bits indicate the 32 bits of the ADMA system address. a. SDMA: If Host Version 4 Enable is set to 1, this register stores the system address of the data location b. ADMA2: This register stores the byte address of the executing command of the descriptor table c. ADMA3: This register is set by ADMA3. ADMA2 increments the address of this register that points to the next line, every time a Descriptor line is fetched.

EMMC_PRESET_INIT

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
15:11	RO	0x00	reserved
10	RO	0x0	CLK_GEN_SEL_VAL Clock Generator Select Value. This bit is effective when the Host Controller supports a programmable clock generator. Values: 1'b0: Host Controller Ver2.0 Compatible Clock Generator 1'b1: Programmable Clock Generator
9:0	RO	0x000	FREQ_SEL_VAL SDCLK/RCLK Frequency Select Value. 10-bit preset value to be set in SDCLK/RCLK Frequency Select field of the Clock Control register described by a Host System.

EMMC_PRESET_DS

Address: Operational Base + offset (0x0062)

Bit	Attr	Reset Value	Description
9:0	RO	0x000	FREQ_SEL_VAL SDCLK/RCLK Frequency Select Value. 10-bit preset value to be set in SDCLK/RCLK Frequency Select field of the Clock Control register described by a Host System.

EMMC_ADMA_ID

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ADMA_ID ADMA Integrated Descriptor Address. These bits indicate the 32-bit of the ADMA Integrated Descriptor address. The start address of Integrated Descriptor is set to these register bits. The ADMA3 fetches one Descriptor Address and increments these bits to indicate the next Descriptor address.

EMMC_SLOT_INTR_STATUS

Address: Operational Base + offset (0x00FC)

Bit	Attr	Reset Value	Description
15:8	RO	0x00	reserved
7:0	RO	0x00	INTR_SLOT Interrupt signal for each Slot. Host Controller support single card slot. This register shall always return 0.

EMMC_HOST_CNTRL_VERS

Address: Operational Base + offset (0x00FE)

Bit	Attr	Reset Value	Description
15:8	RO	0x10	VENDOR_VERSION_NUM Vendor Version Number.
7:0	RO	0x05	SPEC_VERSION_NUM Specification Version Number. Values: 8'h0: SD Host Controller Specification Version 1.00 8'h1: SD Host Controller Specification Version 2.00 8'h2: SD Host Controller Specification Version 3.00 8'h3: SD Host Controller Specification Version 4.00 8'h4: SD Host Controller Specification Version 4.10 8'h5: SD Host Controller Specification Version 4.20 Others: Reserved

EMMC_COVER

Address: Operational Base + offset (0x0180)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RO	0x5	EMMC_VER_MAJOR eMMC Major Version Number (digit left of decimal point), in BCD format
7:4	RO	0x1	EMMC_VER_MINOR eMMC Minor Version Number(digit right of decimal point), in BCD format
3:0	RO	0x0	EMMC_VER_SUFFIX eMMC Version Suffix (2nd digit right of decimal point), in BCD format

EMMC_CQCAP

Address: Operational Base + offset (0x0184)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x0	CRYPTO_SUPPORT Crypto Support. This bit indicates whether the Host Controller supports cryptographic operations. Values: 1'b0: Crypto not Supported 1'b1: Crypto Supported
27:16	RO	0x000	reserved
15:12	RO	0x0	ITCFMUL Internal Timer Clock Frequency Multiplier. ITCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the SQS polling period. See ITCFVAL definition for details. 4'h0: 0.001 MHz 4'h1: 0.01 MHz 4'h2: 0.1 MHz 4'h3: 1 MHz 4'h4: 10 MHz Others: Reserved
11:10	RO	0x0	reserved
9:0	RO	0x000	ITCFVAL Internal Timer Clock Frequency Value. TCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the polling period when using periodic SEND_QUEUE_ STATUS (CMD13) polling. The clock frequency is calculated as ITCFVAL* ITCFMUL. For example, to encode 19.2 MHz, ITCFVAL shall be C0h (= 192 decimal) and ITCFMUL shall be 2h (0.1 MHz) 192 * 0.1 MHz=19.2 MHz

EMMC_CQCFG

Address: Operational Base + offset (0x0188)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	DCMD_EN Direct Command (DCMD) Enable. This bit indicates to the hardware whether the Task Descriptor in slot #31 of the TDL is a Data Transfer Task Descriptor, or a Direct Command Task Descriptor. CQE uses this bit when a task is issued in slot #31, to determine how to decode the Task Descriptor. Values: 1'b0: Task descriptor in slot #31 is a Data Transfer Task Descriptor 1'b1: Task descriptor in slot #31 is a DCMD Task Descriptor
11:9	RO	0x0	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	TASK_DESC_SIZE This bit indicates whether the task descriptor size is 128 bits or 64 bits as detailed in Data Structures section. This bit can only be configured when Command Queueing Enable bit is 0 (command queueing is disabled) Values: 1'b0: Task descriptor size is 64 bits 1'b1: Task descriptor size is 128 bits
7:2	RO	0x00	reserved
1	RW	0x0	CR_GENERAL_EN Crypto General Enable. Enable/Disable bit for Crypto Engine. If cryptographic operations are not supported, this status bit is reserved. Values: 1'b0: Disable cryptographic operations for all transactions 1'b1: Enable cryptographic operations for transactions where TD.CE=1 or CRNQP.CE=1
0	RW	0x0	CQ_EN Command Queueing Enable. When CQE is disable, the software controls the eMMC bus using the registers between the addresses 0x000 to 0x1FF. Before the software writes to this bit, the software verifies that the eMMC host controller is in idle state and there are no ongoing commands or data transfers. When software wants to exit command queuing mode, it clears all previous tasks (if any) before setting this bit to 0. Values: 1'b0: Disable command queuing 1'b1: Enable command queuing

EMMC_CQCTRL

Address: Operational Base + offset (0x018C)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	CLR_ALL_TASKS Clear all tasks. This bit can only be written when the controller is halted. This bit does not clear tasks in the device. The software has to use the CMDQ_TASK_MGMT command to clear device's queue. Values: 1'b0: Programming 0 has no effect 1'b1: Clears all the tasks in the controller
7:1	RO	0x00	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	HALT Halt request and resume. Values: 1'b0: RESUME_CQE. Software writes 0 to this bit to exit from the halt state and resume CQE activity 1'b1: HALT_CQE. Software writes 1 to this bit when it wants to acquire software control over the eMMC bus and to disable CQE from issuing command on the bus. For example, issuing a Discard Task command (CMDQ_TASK_MGMT). When the software writes 1, CQE completes the ongoing task (if any in progress). After the task is completed and the CQE is in idle state, CQE does not issue new commands and indicates to the software by setting this bit to 1. The software can poll on this bit until it is set to 1 and only then send commands on the eMMC bus.

EMMC_CQIS

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	W1C	0x0	TCL Task Cleared Interrupt. This status bit is asserted (if CQISTE.TCL=1) when a task clear operation is completed by CQE. The completed task clear operation is either an individual task clear (CQTCLR) or clearing of all tasks (CQCTL). Values: 1'b0: TCL Interrupt is not set 1'b1: TCL Interrupt is set
2	W1C	0x0	RED Response Error Detected Interrupt. This status bit is asserted (if CQISTE.RED=1) when a response is received with an error bit set in the device status field. Software uses CQRMEM register to configure which device status bit fields may trigger an interrupt, and which are masked. Values: 1'b0: RED Interrupt is not set 1'b1: RED Interrupt is set
1	W1C	0x0	TCC Task Complete Interrupt. This status bit is asserted(if CQISTE.TCC=1) when at least one of the following two conditions are met: a. A task is completed and the INT bit is set in its Task Descriptor b. Interrupt caused by Interrupt Coalescing logic Values: 1'b0: TCC Interrupt is not set 1'b1: TCC Interrupt is set
0	W1C	0x0	HAC Halt Complete Interrupt. This status bit is asserted (if CQISTE.HAC=1) when halt bit in CQCTL register transitions from 0 to 1 indicating that host controller has completed its current ongoing task and has entered halt state. Values: 1'b0: HAC Interrupt is not set 1'b1: HAC Interrupt is set

EMMC_CQISE

Address: Operational Base + offset (0x0194)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	TCL_STE Task Cleared Interrupt status enable. Values: 1'b0: CQIS.TCL is disabled 1'b1: CQIS.TCL is set when its interrupt condition is active
2	RW	0x0	RED_STE Response Error Detected Interrupt status enable. Values: 1'b0: CQIS.RED is disabled 1'b1: CQIS.RED is set when its interrupt condition is active
1	RW	0x0	TCC_STE Task Complete Interrupt status enable. Values: 1'b0: CQIS.TCC is disabled 1'b1: CQIS.TCC is set when its interrupt condition is active
0	RW	0x0	HAC_STE Halt Complete Interrupt status enable. Values: 1'b0: CQIS.HAC is disabled 1'b1: CQIS.HAC is set when its interrupt condition is active

3	RW	0x0	TCL_SGE Task Cleared Interrupt signal enable. Values: 1'b0: CQIS.TCL interrupt signal generation is disabled 1'b1: CQIS.TCL interrupt signal generation is active
2	RW	0x0	RED_SGE Response Error Detected Interrupt signal enable. Values: 1'b0: CQIS.RED interrupt signal generation is disabled 1'b1: CQIS.RED interrupt signal generation is active
1	RW	0x0	TCC_SGE Task Complete Interrupt signal enable. Values: 1'b0: CQIS.TCC interrupt signal generation is disabled 1'b1: CQIS.TCC interrupt signal generation is active
0	RW	0x0	HAC_SGE Halt Complete Interrupt signal enable. Values: 1'b0: CQIS.HAC interrupt signal generation is disabled 1'b1: CQIS.HAC interrupt signal generation is active

EMMC_CQIC

Address: Operational Base + offset (0x019C)

Bit	Attr	Reset Value	Description
31	RW	0x0	INTC_EN Interrupt Coalescing Enable Bit. Values: 1'b0: Interrupt coalescing mechanism is disabled 1'b1: Interrupt coalescing mechanism is active. Interrupts are counted and timed, and coalesced interrupts are generated
30:21	RO	0x000	reserved
20	RO	0x0	INTC_STAT Interrupt Coalescing Status Bit. This bit indicates to the software whether any tasks (with INT=0) have completed and counted towards interrupt coalescing (that is, this is set if and only if INTC counter > 0). Values: 1'b0: INT0 Task completions have not occurred since last counter reset (INTC counter == 0) 1'b1: At least one INT0 task completion has been counted (INTC counter > 0)
19:17	RO	0x0	reserved
16	WO	0x0	INTC_RST Counter and Timer Reset. When host driver writes 1, the interrupt coalescing timer and counter are reset. Values: 1'b0: No Effect 1'b1: Interrupt coalescing timer and counter are reset
15	WO	0x0	INTC_TH_WEN Interrupt Coalescing Counter Threshold Write Enable. When software writes 1 to this bit, the value INTC_TH is updated with the contents written on the same cycle. Values: 1'b0: Clears INTC_TH_WEN 1'b1: Sets INTC_TH_WEN
14:13	RO	0x0	reserved
12:8	WO	0x00	INTC_TH Interrupt Coalescing Counter Threshold filed. Software uses this field to configure the number of task completions (only tasks with INT=0 in the Task Descriptor), which are required in order to generate an interrupt. Counter Operation: As data transfer tasks with INT=0 complete, they are counted by CQE. The counter is reset by software during the interrupt service routine. The counter stops counting when it reaches the value configured in INTC_TH, and generates interrupt. 5'h0: Interrupt coalescing feature disabled 5'h1: Interrupt coalescing interrupt generated after 1 task when INT=0 completes 5'h2: Interrupt coalescing interrupt generated after 2 tasks when INT=0 completes ..... 5'h1f: Interrupt coalescing interrupt generated after 31 tasks when INT=0 completes To write to this field, the INTC_TH_WEN bit must be set during the same write operation.

Bit	Attr	Reset Value	Description
7	WO	0x0	TOUT_VAL_WEN When software writes 1 to this bit, the value TOUT_VAL is updated with the contents written on the same cycle. Values: 1'b0: clears TOUT_VAL_WEN 1'b1: Sets TOUT_VAL_WEN
6:0	RW	0x00	TOUT_VAL Interrupt Coalescing Timeout Value. Software uses this field to configure the maximum time allowed between the completion of a task on the bus and the generation of an interrupt. Timer Operation: The timer is reset by software during the interrupt service routine. It starts running when a data transfer task with INT=0 is completed, after the timer was reset. When the timer reaches the value configured in ICTOVAL field it generates an interrupt and stops. The timer's unit is equal to 1024 clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field CQCAP register. 7'h0: Timer is disabled. Timeout-based interrupt is not generated 7'h1: Timeout on 01x1024 cycles of timer clock frequency 7'h2: Timeout on 02x1024 cycles of timer clock frequency ..... 7'h7f: Timeout on 127x1024 cycles of timer clock frequency In order to write to this field, the TOUT_VAL_WEN bit must be set at the same write operation.

EMMC_CQTDLBA

Address: Operational Base + offset (0x01A0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TDLBA Task Descriptor List Base Address. This register stores the LSB bits (bits 31:0) of the byte address of the head of the Task Descriptor List in system memory. The size of the task descriptor list is 32 * (Task Descriptor size + Transfer Descriptor size) as configured by Host driver. This address shall be set on Byte1 KByte boundary. The lower 10 bits of this register shall be set to 0 by software and shall be ignored by CQE.

EMMC_CQTDBR

Address: Operational Base + offset (0x01A8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DBR Command Queueing Task Doorbell. Software shall configure TDLBA and TDLBAU, and enable CQE in CQCFG before using this register. Writing 1 to bit n of this register triggers CQE to start processing the task encoded in slot n of the TDL. CQE always processes tasks in-order according to the order submitted to the list by CQTDBR write transactions. CQE processes Data Transfer tasks by reading the Task Descriptor and sending QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) commands to the device. CQE processes DCMD tasks (in slot #31, when enabled) by reading the Task Descriptor, and generating the command encoded by its index and argument. The corresponding bit is cleared to 0 by CQE in one of the following events: a. When a task execution is completed (with success or error) b. The task is cleared using CQTCLR register c. All tasks are cleared using CQCTL register d. CQE is disabled using CQCFG register Software may initiate multiple tasks at the same time (batch submission) by writing 1 to multiple bits of this register in the same transaction. In the case of batch submission: CQE shall process the tasks in order of the task index, starting with the lowest index. If one or more tasks in the batch are marked with QBR, the ordering of execution will be based on said processing order.

EMMC_CQTDBN

Address: Operational Base + offset (0x01AC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TCN Task Complete Notification. Each of the 32 bits are bit mapped to the 32 tasks. Bit-N(1): Task-N has completed execution (with success or errors) Bit-N(0): Task-N has not completed, could be pending or not submitted. On task completion, software may read this register to know which tasks have finished. After reading this register, software may clear the relevant bit fields by writing 1 to the corresponding bits.

EMMC_CQDQS

Address: Operational Base + offset (0x01B0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DQS Device Queue Status. Each of the 32 bits are bit mapped to the 32 tasks. Bit-N(1): Device has marked task N as ready for execution Bit-N(0): Task-N is not ready for execution. This task could be pending in device or not submitted. Host controller updates this register with response of the Device Queue Status command.

EMMC_CQDPT

Address: Operational Base + offset (0x01B4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DPT Device Pending Tasks. Each of the 32 bits are bit mapped to the 32 tasks. Bit-N(1): Task-N has been successfully queued into the device and is awaiting execution Bit-N(0): Task-N is not yet queued. Bit n of this register is set if and only if QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) were sent for this specific task and if this task hasnt been executed yet. CQE shall set this bit after receiving a successful response for CMD45. CQE shall clear this bit after the task has completed execution. Software reads this register in the task-discard procedure to determine if the task is queued in the device.

EMMC_CQTCLR

Address: Operational Base + offset (0x01B8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TCLR Command Queueing Task Clear. Writing 1 to bit n of this register orders CQE to clear a task which software has previously issued. This bit can only be written when CQE is in Halt state as indicated in CQCFG register Halt bit. When software writes 1 to a bit in this register, CQE updates the value to 1, and starts clearing the data structures related to the task. CQE clears the bit fields (sets a value of 0) in CQTCLR and in CQTDBR once the clear operation is complete. Software must poll on the CQTCLR until it is cleared to verify that a clear operation was done.

EMMC_CQSSC1

Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:16	RW	0x1	SQSCMD_BLK_CNT Send Status Command Block Counter. This field indicates when SQS CMD is sent while data transfer is in progress. A value of 'n' indicates that CQE sends status command on the CMD line, during the transfer of data block BLOCK_CNTn, on the data lines, where BLOCK_CNT is the number of blocks in the current transaction. 4'h0: SEND_QUEUE_STATUS (CMD13) command is not sent during the transaction. Instead, it is sent only when the data lines are idle. 4'h1: SEND_QUEUE_STATUS command is to be sent during the last block of the transaction. 4'h2: SEND_QUEUE_STATUS command when last 2 blocks are pending. 4'h3: SEND_QUEUE_STATUS command when last 3 blocks are pending. ..... 4'hf: SEND_QUEUE_STATUS command when last 15 blocks are pending. Should be programmed only when CQCFG.CQ_EN is '0'.
15:0	RW	0x1000	SQSCMD_IDLE_TMR Send Status Command Idle Timer. This field configures the polling period to be used when using periodic SEND_QUEUE_STATUS (CMD13) polling. Periodic polling is used when tasks are pending in the device, but no data transfer is in progress. When a SEND_QUEUE_STATUS response indicates that no task is ready for execution, CQE counts the configured time until it issues the next SEND_QUEUE_STATUS. Timer units are clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field CQCAP register. The minimum value is 0001h (1 clock period) and the maximum value is FFFFh (65535 clock periods). For example, a CQCAP field value of 0 indicates a 19.2 MHz clock frequency (period = 52.08 ns). If the setting in CQSSC1.CIT is 1000h, the calculated polling period is 4096*52.08 ns= 213.33 ns. Should be programmed only when CQCFG.CQ_EN is '0'.

EMMC_CQSSC2

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	SQSCMD_RCA Send Queue RCA. This field provides CQE with the contents of the 16-bit RCA field in SEND_QUEUE_STATUS (CMD13) command argument. CQE copies this field to bits 31:16 of the argument when transmitting SEND_ QUEUE_STATUS (CMD13) command.

EMMC_CQCRDCT

Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DCMD_RESP Direct Command Last Response. This register contains the response of the command generated by the last direct command (DCMD) task that was sent. Contents of this register are valid only after bit 31 of CQTDBR register is cleared by the controller.

EMMC_CQRMEM

Address: Operational Base + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:0	RW	0xfdf9a080	RESP_ERR_MASK Response Mode Error Mask. The bits of this field are bit mapped to the device response. This bit is used as an interrupt mask on the device status filed that is received in R1/R1b responses. 1'b0: When a R1/R1b response is received, bit i in the device status is ignored. The reset value of this register is set to trigger an interrupt on all "Error" type bits in the device status. 1'b1: When a R1/R1b response is received, with a bit i in the device status set, a RED interrupt is generated. Note: Responses to CMD13 (SQS) encode the QSR so that they are ignored by this logic.

EMMC_CQTERRI

Address: Operational Base + offset (0x01D4)

Bit	Attr	Reset Value	Description
31	RO	0x0	TRANS_ERR_FIELDS_VALID Data Transfer Error Field Valid. This bit is updated when an error is detected while a data transfer transaction was in progress. Values: 1'b0: Ignore contents of TRANS_ERR_TASKID and TRANS_ERR_CMD_INDX 1'b1: Data transfer related error detected. Check contents of TRANS_ERR_TASKID and TRANS_ERR_CMD_INDX fields
30:29	RO	0x0	reserved
28:24	RO	0x00	TRANS_ERR_TASKID Data Transfer Error Task ID. This field captures the ID of the task that was executed and whose data transfer has errors.
23:22	RO	0x0	reserved
21:16	RO	0x00	TRANS_ERR_CMD_INDX Data Transfer Error Command Index. This field captures the index of the command that was executed and whose data transfer has errors.
15	RO	0x0	RESP_ERR_FIELDS_VALID Response Mode Error Fields Valid. This bit is updated when an error is detected while a command transaction was in progress. Values: 1'b0: Ignore contents of RESP_ERR_TASKID and RESP_ERR_CMD_INDX 1'b1: Response-related error is detected. Check contents of RESP_ERR_TASKID and RESP_ERR_CMD_INDX fields

Bit	Attr	Reset Value	Description
14:13	RO	0x0	reserved
12:8	RO	0x00	RESP_ERR_TASKID Response Mode Error Task ID. This field captures the ID of the task which was executed on the command line when the error occurred.
7:6	RO	0x0	reserved
5:0	RO	0x00	RESP_ERR_CMD_INDX Response Mode Error Command Index. This field captures the index of the command that was executed on the command line when the error occurred.

EMMC_CQCRI

Address: Operational Base + offset (0x01D8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RO	0x00	CMD_RESP_INDX Last Command Response Index This field stores the index of the last received command response. CQE shall update the value every time a command response is received.

EMMC_CQCRA

Address: Operational Base + offset (0x01DC)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	CMD_RESP_ARG Last Command Response Argument. This field stores the argument of the last received command. CQE shall update the value every time a command response is received.

EMMC_VER_ID

Address: Operational Base + offset (0x0500)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	VER_ID Current version number.

EMMC_VER_TYPE

Address: Operational Base + offset (0x0504)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	VER_TYPE Version type.

EMMC_HOST_CTRL3

Address: Operational Base + offset (0x0508)

Bit	Attr	Reset Value	Description
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	SW_CG_DIS Internal clock gating disable control. This bit must be used to disable IP's internal clock gating when required. when disabled clocks are not gated. Clocks to the core (except hclk) must be stopped when programming this bit. Values: 1'b0: Internal clock gating is disabled, clocks are not gated internally 1'b1: Internal clock gates are active and clock gating is controlled internally
3:1	RO	0x0	reserved
0	RW	0x1	CMD_CONFLICT_CHECK Command conflict check. Host Controller monitors the CMD line whenever a command is issued and checks whether the value driven on sd_cmd_out matches the value on sd_cmd_in at next subsequent edge of cclk_tx to determine command conflict error. This bit is cleared only if the feed back delay (including IO Pad delay) is more than (t_card_clk_period - t_setup), where t_setup is the setup time of a flop in Host Controller. The I/O pad delay is consistent across CMD and DATA lines, and it is within the value: (2*t_card_clk_period - t_setup) Values: 1'b0: Disable command conflict check 1'b1: Check for command conflict after 1 card clock cycle

EMMC_EMMC_CTRL

Address: Operational Base + offset (0x052C)

Bit	Attr	Reset Value	Description
15:11	RO	0x00	reserved
10	RW	0x0	CQE_PREFETCH_DISABLE Enable or Disable CQE's PREFETCH feature. This field allows Software to disable CQE's data prefetch feature when set to 1. Values: 1'b0: CQE can Prefetch data for sucessive WRITE transfers and pipeline sucessive READ transfers 1'b1: Prefetch for WRITE and Pipeline for READ are disabled
9	RW	0x0	CQE_ALGO_SEL Scheduler algorithm selected for execution. This bit selects the Algorithm used for selecting one of the many ready tasks for execution. Values: 1'b0: Priority based reordering with FCFS to resolve equal priority tasks 1'b1: First come First serve, in the order of DBR rings
8	RW	0x0	ENH_STROBE_ENABLE Enhanced Strobe Enable. This bit instructs Host to sample the CMD line using data strobe for HS400 mode. Values: 1'b0: CMD line is sampled using cclk_rx for HS400 mode 1'b1: CMD line is sampled using data strobe for HS400 mode
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3	RW	0x1	EMMC_RST_N_OE Output Enable control for EMMC Device Reset signal PAD control. Values: 1'b0: sd_rst_n_oe is 0 1'b1: sd_rst_n_oe is 1
2	RW	0x1	EMMC_RST_N EMMC Device Reset signal control. This register field controls the sd_rst_n output of Host Controller. Values: 1'b0: Reset to eMMC device asserted 1'b1: Reset to eMMC device is deasserted
1	RW	0x0	DISABLE_DATA_CRC_CHK Disable Data CRC Check. This bit controls masking of CRC16 error for Card Write in eMMC mode. This is useful in bus testing (CMD19) for an eMMC device. In bus testing, an eMMC card does not send CRC status for a block, which may generate CRC error. This CRC error can be masked using this bit during bus testing. Values: 1'b0: DATA CRC check is enabled 1'b1: DATA CRC check is disabled
0	RW	0x0	CARD_IS_EMMC eMMC Card present. This bit indicates the type of card connected. An application program this bit based on the card connected to Host Controller. Values: 1'b0: Card connected to Host Controller is a non-eMMC card 1'b1: Card connected to Host Controller is an eMMC card

EMMC_BOOT_CTRL

Address: Operational Base + offset (0x052E)

Bit	Attr	Reset Value	Description
15:12	RW	0x0	BOOT_TOUT_CNT Boot Ack Timeout Counter Value. This value determines the interval by which boot ack timeout (50 ms) is detected when boot ack is expected during boot operation. Values: 4'h0: TMCLK x 2^13 4'h1: TMCLK x 2^14 ..... 4'hE: TMCLK x 2^27 4'hF: Reserved
11:9	RO	0x0	reserved
8	RW	0x0	BOOT_ACK_ENABLE Boot Acknowledge Enable. When this bit set, Host checks for boot acknowledge start pattern of 0-1-0 during boot operation. This bit is applicable for both mandatory and alternate boot mode. Values: 1'b1: Boot Ack enable 1'b0: Boot Ack disable

Bit	Attr	Reset Value	Description
7	RW	0x0	VALIDATE_BOOT Validate Mandatory Boot Enable bit. This bit is used to validate the MAN_BOOT_EN bit. Values: 1'b1: Validate Mandatory boot enable bit 1'b0: Ignore Mandatory boot Enable bit
6:1	RO	0x00	reserved
0	RW	0x0	MAN_BOOT_EN Mandatory Boot Enable. This bit is used to initiate the mandatory boot operation. The application sets this bit along with VALIDATE_BOOT bit. Writing 0 is ignored. The Host Controller clears this bit after the boot transfer is completed or terminated. Values: 1'b1: Mandatory boot enable 1'b0: Mandatory boot disable

EMMC_AT_CTRL

Address: Operational Base + offset (0x0540)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:19	RW	0x0	POST_CHANGE_DLY Time taken for phase switching and stable clock output. Values: 2'h0: Less than 1-cycle latency 2'h1: Less than 2-cycle latency 2'h2: Less than 3-cycle latency 2'h3: Less than 4-cycle latency
18:17	RW	0x0	PRE_CHANGE_DLY Maximum Latency specification between cclk_tx and cclk_rx. Values: 2'h0: Less than 1-cycle latency 2'h1: Less than 2-cycle latency 2'h2: Less than 3-cycle latency 2'h3: Less than 4-cycle latency
16	RW	0x0	TUNE_CLK_STOP_EN Clock stopping control for Tuning and auto-tuning circuit. When enabled, clock gate control output (clk2card_on) is pulled low before changing phase select codes on tuning_cclk_sel and autotuning_cclk_sel. This effectively stops the Device/Card clock, cclk_rx. Changing phase code when clocks are stopped ensures glitch free phase switching. Values: 1'b0: Clocks not stopped 1'b1: Clocks stopped during phase code change
15:5	RO	0x000	reserved
4	RW	0x0	SW_TUNE_EN This fields enables software-managed tuning flow. Values: 1'b0: Software-managed tuning disabled 1'b1: Software-managed tuning enabled

Bit	Attr	Reset Value	Description
3	RW	0x0	RPT_TUNE_ERR Framing errors are not generated when executing tuning. This debug bit allows users to report these errors. Values: 1'b0: Default mode where as per host no errors are reported 1'b1: Debug mode for reporting framing errors
2	RW	0x0	SWIN_TH_EN Sampling window Threshold enable. Selects the tuning mode. Field should be programmed only when SAMPLE_CLK_SEL is '0'. Values: 1'b0: LARGEST_WIN_MODE. Tuning engine sweeps all taps and settles at the largest window. 1'b1: THRESHOLD_MODE. Tuning engine selects the first complete sampling window that meets the threshold set by SWIN_TH_VAL field.
1:0	RO	0x0	reserved

EMMC_AT_STAT

Address: Operational Base + offset (0x0544)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	L_EDGE_PH_CODE Left Edge Phase code. Reading this field returns the phase code value used by Auto-tuning engine to sample data on Left edge of sampling window.
15:8	RO	0x00	R_EDGE_PH_CODE Right Edge Phase code. Reading this field returns the phase code value used by Auto-tuning engine to sample data on Right edge of sampling window.
7:0	RW	0x00	CENTER_PH_CODE Centered Phase code. Reading this field returns the current value on tuning_cclk_sel output. Setting AT_CTRL.SW_TUNE_EN enables software to write to this field and its contents are reflected on tuning_cclk_sel.

EMMC_DLL_CTRL

Address: Operational Base + offset (0x0800)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	DLL_BYPASS_MODE DLL bypass mode select. 1'b0: Normal 1'b1: Bypass
23:16	RW	0x00	DLL_START_POINT DLL start point for phase detect.
15:8	RW	0x00	DLL_INCRMENT DLL increment value.
7:2	RO	0x00	reserved
1	RW	0x0	DLL_SRST DLL soft reset indication. 1'b0: Normal work 1'b1: Reset

Bit	Attr	Reset Value	Description
0	RW	0x0	DLL_START DLL working indication. 1'b0: DLL is not working 1'b1: DLL is working

EMMC_DLL_RXCLK

Address: Operational Base + offset (0x0804)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	RX_CLK_SRC_SEL RX clock source selection. 1'b0: RX clock source is inverted. 1'b1: RX clock source is no-inverted. This bit should be set to 1 for normal operation.
28	RW	0x0	RX_CLK_CHANGE_WINDOW RX clock change window. When high, RX clock is gated.
27	RW	0x0	RX_CLK_OUT_SEL RX clock output selection. 1'b0: RX clock output is from RX clock source or RX clock source with invertion, determined by RX_CLK_SRC_SEL 1'b1: RX clock output is delayed by delayline
26	RW	0x0	RX_DELAY_NUM_SEL Delay number selection for RX clock. 1'b0: Delaynum comes from hardware calculation 1'b1: Delaynum comes from software (RX_DELAY_NUM)
25	RW	0x0	RX_TAP_VALUE_SEL Tap value selection for RX clock. 1'b0: Tapvalue equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tapvalue comes from software (TX_TAP_VALUE)
24	RW	0x0	RX_TAP_NUM_SEL Tapnum selection for RX clock. 1'b0: Tapnum comes from tuning result 1'b1: Tapnum comes from software (RX_TAP_NUM)
23:16	RW	0x00	RX_DELAY_NUM Total delay number of selected tap for RX clock.
15:8	RW	0x00	RX_TAP_VALUE Tap value for RX clock. It denotes delay element number for RX clock.
7:5	RO	0x0	reserved
4:0	RW	0x00	RX_TAP_NUM Tap number for RX clock. Every clock is divided into 32 taps equably, and the max value is 31. Use tapnum to select which tap to be used for RX clock.

EMMC_DLL_TXCLK

Address: Operational Base + offset (0x0808)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	TX_CLK_OUT_SEL TX clock output selection. 1'b0: TX clock output is from TX clock source with invertion 1'b1: TX clock output is delayed by delayline

Bit	Attr	Reset Value	Description
26	RW	0x0	TX_DELAY_NUM_SEL Delay number selection for TX clock. 1'b0: Delaynum comes from hardware calculation 1'b1: Delaynum comes from software (TX_DELAY_NUM)
25	RW	0x0	TX_TAP_VALUE_SEL Tap value selection for TX clock. 1'b0: Tapvalue equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tapvalue comes from software (TX_TAP_VALUE)
24	RW	0x0	TX_TAP_NUM_SEL Tapnum selection for TX clock. 1'b0: Tapnum is 8 1'b1: Tapnum comes from software (TX_TAP_NUM)
23:16	RW	0x00	TX_DELAY_NUM Total delay number of selected tap for TX clock.
15:8	RW	0x00	TX_TAP_VALUE Tap value for TX clock. It denotes delay element number for TX clock.
7:5	RO	0x0	reserved
4:0	RW	0x00	TX_TAP_NUM Tap number for TX clock. Every clock is divided into 32 taps equably, and the max value is 31. Use tapnum to select which tap to be used for TX clock.

EMMC_DLL_STRBIN

Address: Operational Base + offset (0x080C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	STRBIN_DELAY_ENA STRBIN delay enable. 1'b0: Disable 1'b1: Enable
26	RW	0x0	STRBIN_DELAY_NUM_SEL Delay number selection for STRBIN. 1'b0: Delaynum comes from hardware calculation 1'b1: Delaynum comes from software (STRBIN_DELAY_NUM)
25	RW	0x0	STRBIN_TAP_VALUE_SEL Tap value selection. 1'b0: Tapvalue equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tapvalue comes from software (STRBIN_TAP_VALUE)
24	RW	0x0	STRBIN_TAP_NUM_SEL Tapnum selection for STRBIN. 1'b0: Tapnum is 8 1'b1: Tapnum comes from software (STRBIN_TAP_NUM)
23:16	RW	0x00	STRBIN_DELAY_NUM Total delay number of selected tap for STRBIN.
15:8	RW	0x00	STRBIN_TAP_VALUE Tap value for STRBIN. It denotes delay element number for STRBIN.
7:5	RO	0x0	reserved
4:0	RW	0x00	STRBIN_TAP_NUM Tap number for STRBIN. Every clock is divided into 32 taps equably, and the max value is 31. Use tapnum to select which tap to be used for STRBIN.

EMMC_DLL_STATUS0

Address: Operational Base + offset (0x0840)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RO	0x0	DLL_LOCK_TIMEOUT DLL phase detection is timeout or not. 1'b0: Not timeout 1'b1: Timeout
8	RO	0x0	DLL_LOCK DLL lock indication. 1'b0: DLL is not locked 1'b1: DLL is locked
7:0	RO	0x00	DLL_LOCK_VALUE DLL lock value for half sdclk cycle. It denotes the delay element number needed for DLL locked. It is valid when dll_lock is high.

EMMC_DLL_STATUS1

Address: Operational Base + offset (0x0844)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	DLL_STRBIN_DELAY_VALUE Delay element number used for STRBIN.
15:8	RO	0x00	DLL_RXCLK_DELAY_VALUE Delay element number used for RX clock.
7:0	RO	0x00	DLL_TXCLK_DELAY_VALUE Delay element number used for TX clock.

7.5 Interface Description

7.5.1 EMMC Interface Description

Table 7-1 EMC Interface Description

Module Pin	Direction	PAD Name	IOMUX Setting
emmc_cclk	O	EMMC_CLKOUT/FLASH_DQS/GPIO1_C5_d	GRF_GPIO1C_IOMUX_H[7:4]=4'h1
emmc_ccmd	I/O	EMMC_CMD/FLASH_WRn/GPIO1_C4_u	GRF_GPIO1C_IOMUX_H[3:0]=4'h1
emmc_cdata0	I/O	EMMC_D0/FLASH_D0/GPIO1_B4_u	GRF_GPIO1B_IOMUX_H[3:0]=4'h1
emmc_cdata1	I/O	EMMC_D1/FLASH_D1/GPIO1_B5_u	GRF_GPIO1B_IOMUX_H[7:4]=4'h1
emmc_cdata2	I/O	EMMC_D2/FLASH_D2/GPIO1_B6_u	GRF_GPIO1B_IOMUX_H[11:8]=4'h1
emmc_cdata3	I/O	EMMC_D3/FLASH_D3/GPIO1_B7_u	GRF_GPIO1B_IOMUX_H[15:12]=4'h1
emmc_cdata4	I/O	EMMC_D4/FLASH_D4/GPIO1_C0_u	GRF_GPIO1C_IOMUX_L[3:0]=4'h1
emmc_cdata5	I/O	EMMC_D5/FLASH_D5/GPIO1_C1_u	GRF_GPIO1C_IOMUX_L[7:4]=4'h1
emmc_cdata6	I/O	EMMC_D6/FLASH_D6/GPIO1_C2_u	GRF_GPIO1C_IOMUX_L[11:8]=4'h1

emmc_strbin	I	EMMC_DATA_STROBE/FSPI_CS1n/FLASH_CLE/GPIO1_C6_d	GRF_GPIO1C_IOMUX_H[11:8]=4'h1
emmc_rstn	O	EMMC_RSTn/FSPI_D2/FLASH_WPn/GPIO1_C7_d	GRF_GPIO1C_IOMUX_H[15:12]=4'h1

Notes: I=input, O=output, I/O=input/output, bidirectional

7.6 Application Notes

7.6.1 Clock Adjustment

Phase detection is needed if you want to know the card clock's precision before clock adjustment. The detection flow is as below:

(1) Set EMMC_DLL_CTRL[1]=1 to reset the EMMC DLL; then set EMMC_DLL_CTRL[1]=0 to dis-reset EMMC DLL;

(2) Set DLL_START_POINT in EMMC_DLL_CTRL[23:16]; set DLL_INCREMENT in EMMC_DLL_CTRL[15:8], and set EMMC_DLL_CTRL[0] to start the DLL phase detection.

(3) Wait for DLL lock until EMMC_DLL_STATUS0[8] equals to 1. Get the EMMC_DLL_STATUS0[7:0] as the locked value for the half card clock cycle time.

(4) If EMMC_DLL_STATUS0[9]=1 and EMMC_DLL_STATUS0[8]=0, the detection is timeout, you can adjust the DLL_START_POINT or DLL_INCREMENT to re-detection. You need to set EMMC_DLL_CTRL[0] to 0 before you restart phase detection as(1)~(3).

After phase detection, the clock's precision is shown in EMMC_DLL_STATUS0[7:0](DLL_LOCK_VALUE) based on delay element. We can calculate the delay element numbers requirement for TXCLK/RXLCK/STRBIN(denoted as "XX") as follows:

(1) Get tap value: if XX_TAP_VALUE_SEL=0, tap value equals to (DLL_LOCK_VALUE*2)%256; else tap value is set by software, XX_TAP_VALUE;

(2) Get tap number: if XX_TAP_NUM_SEL=0, tap number comes from Host Controller; else tap number is set by software, XX_TAP_NUM;

(3) Get required delay element numbers: if XX_DELAY_NUM_SEL=0, delay element number equals to tap value* tap number; else delay element number is set by software, XX_DELAY_NUM.

The adjustment value for every clock(XX) is equals to required delay element numbers*delay time of every element.

The delay time of every element is in the range of 32ps~70ps, varying with different voltage and temperature.

Chapter 8 Nand Flash Controller (NandC)

8.1 Overview

Nand Flash Controller (NandC) is used to control data transmission from host to flash device or from flash device to host. NandC is connected to AHB BUS through an AHB Master and an AHB Slave. The data transmission between host and external memory can be done through AHB Master interface or AHB Slave interface.

NandC supports the following features:

- Software Interface Type
  - Support directly mode
  - Support LLP(Linked List Pointer) mode
- Flash Interface Type
  - Support Asynchronous Flash Interface with 8bits data width ("Asyn8x" for short)
  - Support ONFI Synchronous Flash Interface ("ONFI Syn" for short)
  - Support Toggle Flash Interface ("Toggle" for short)
  - Support 2 flash devices at most
- Flash Type
  - Support Managed NAND Flash(LBA) and Raw NAND Flash(NO-LBA)
  - Support SLC/MLC/TLC Flash
- Flash Interface Timing
  - Asyn8x: configurable timing, one byte per two host clocks at the fastest speed
  - ONFI Syn: configurable timing, two bytes per two host clocks at the fastest speed
  - Toggle: configurable timing, two byte per two host clocks at the fastest speed
- Randomizer Ability
  - Support two randomizer mode with different polynomial
  - Support two randomizer width, 8bit and 16bit parallel
- BCH/ECC Ability
  - 24bit/1KB BCH/ECC: support 24 bit BCH/ECC, which can detect and correct up to 24 error bits in every 1K bytes data
  - 40bit/1KB BCH/ECC: support 40 bit BCH/ECC, which can detect and correct up to 40 error bits in every 1K bytes data
  - 60bit/1KB BCH/ECC: support 60 bit BCH/ECC, which can detect and correct up to 60 error bits in every 1K bytes data
  - 70bit/1KB BCH/ECC: support 70 bit BCH/ECC, which can detect and correct up to 70 error bits in every 1K bytes data
  - 24bit/512B BCH/ECC: support 24 bit BCH/ECC, which can detect and correct up to 24 error bits in every 512 bytes data
  - 40bit/512B BCH/ECC: support 40 bit BCH/ECC, which can detect and correct up to 40 error bits in every 512 bytes data
  - 60bit/512B BCH/ECC: support 60 bit BCH/ECC, which can detect and correct up to 60 error bits in every 512 bytes data
  - 70bit/512B BCH/ECC: support 70 bit BCH/ECC, which can detect and correct up to 70 error bits in every 512 bytes data
- Transmission Ability
  - Support 32K bytes data transmission at a time at most
  - Support two transfer working modes: Bypass or DMA
  - Support two transfer codewords size for Managed NAND Flash: 1024 bytes/codeword or 512 bytes/codeword
- Internal Memory
  - 2 built-in srams, and the size is 1k bytes respectively
  - Can be accessed by other masters
  - Can be operated in pingpong mode by other masters

8.2 Block Diagram

NandC comprises with:

- MIF: AHB Master Interface
- SIF : AHB Slave Interface
- SRIF : Sram Interface

- TRANSC : Transfer Controller
- LLPC : LLP Controller
- BCHENC : BCH Encoder
- BCHDEC : BCH Decoder
- RANDMZ : Randomizer
- FIF_GEN : Flash Interface Generation
- DLC : Delay Line Controller
- NAND_IO : Flash IO Interface

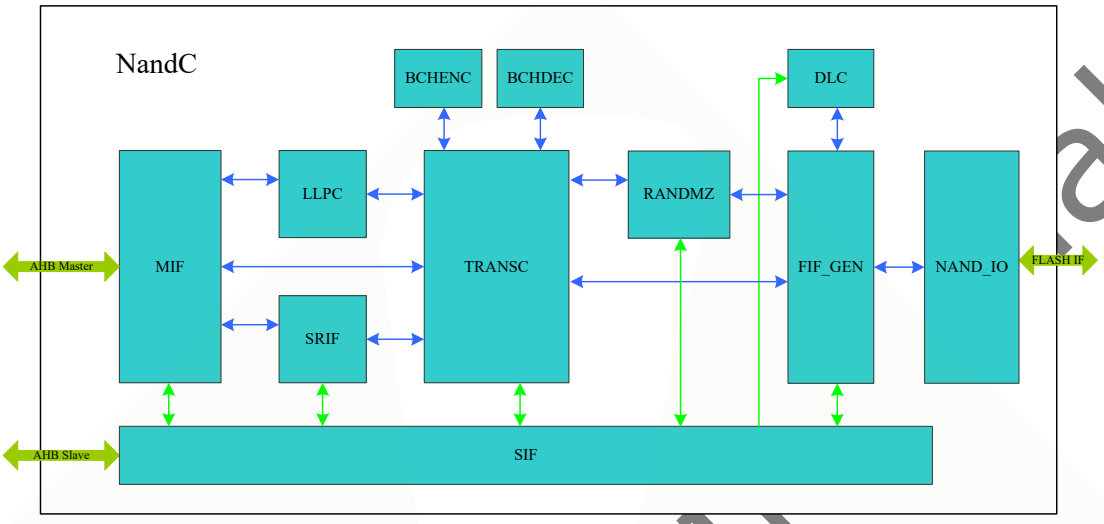

Fig. 8-1 NandC Block Diagram

8.3 Function Description

8.3.1 AHB Interface

There is an AHB master interface in NandC, which is selectable and configurable. It is responsible for transferring data from external memory to internal memory when flash program, or inverse when flash read; and transferring LLP data from external memory to internal register file when LLP is active.

There is an AHB slave interface in NandC. It is responsible for accessing registers and internal memories. The addresses of these registers and memories are listed in 1.4.1.

8.3.2 Flash Type/Flash Interface

Flash device with different types of interfaces is supported. These interfaces include: asynchronous 8bits flash interface, ONFI synchronous flash interface, toggle flash interface, and so on. You can select one of them by software (configure FMCTL) to suit for these devices. Also you can configure their timing parameters by software (configure FMWAIT_ASYN/FMWAIT_SYN) to have your desired rate.

8.3.3 Linked List Pointer Mode (LLP)

To save the software resource and improve the performance, a LLP is add, which is selectable. When LLP is selected, the flash operation instructions stored in external memory with specific format should be loaded for flash working. The detailed format and working flow are referred to 15.7.8.

8.3.4 BCH Encoder/BCH Decoder

The BCH Encoder is responsible for encoding data to be written into flash device. The max encoded length is 1152bytes, in which the data length is 1024bytes, system information is 4bytes, BCH code is 124bytes.

The BCH Decoder is responsible for decoding data read from flash device. The max decoded length is 1152bytes, in which the data length is 1024bytes, spare length is 128bytes.

8.3.5 Randomizer

To improve device lifetime, a randomizer is added in NandC. It includes two parts: Scrambler and Descrambler, which is responsible for scrambling data to be written into flash after bch encoding, and descrambling data read from flash before bch decoding.

8.3.6 Delay Line Controller

For ONFI Synchronous Flash or Toggle Flash, the data read from flash follows with a strobe

signal: DQS, where a skew between them exists. To remove the skew and improve the timing between data and DQS, a Delay Line Controller is needed. It is responsible for detecting the phase of the signal similar to DQS, determining the element number to be shifted, and then shifting the DQS with the determined number.

8.3.7 NAND_IO

Different Interface signals such as asynchronous, onfi and toggle interface are multiplexed and some related logic are included.

8.4 Register Description

8.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Name	Offset	Size	Reset Value	Description
NANDC_FMCTL	0x0000	W	0x00000A00	Flash Interface Control Register
NANDC_FMWAIT_ASYN	0x0004	W	0x3F3FF7FF	Flash Timing Control Register For Asynchronous Timing
NANDC_FMWAIT_SYN	0x0008	W	0x00000000	Flash Timing Control Register For Synchronous Timing
NANDC_FLCTL	0x0010	W	0x00100000	Internal Transfer Control Register
NANDC_FIFO_ACCESS	0x0014	W	0x00000000	FIFO access Register
NANDC_BCHCTL	0x0020	W	0x00000008	BCH Control Register
NANDC_MTRANS_CFG	0x0030	W	0x000001D0	Bus Transfer Configuration Register
NANDC_MTRANS_SADDR0	0x0034	W	0x00000000	Start Address Register For Page Data Transmission
NANDC_MTRANS_SADDR1	0x0038	W	0x00000000	Start Address Register For Spare Data Transmission
NANDC_MTRANS_STAT	0x0040	W	0x00000000	Bus Transfer Status Register
NANDC_MTRANS_STAT2	0x0044	W	0x00000000	Bus Transfer Status Register2
NANDC_DLL_CTL_REG0	0x0050	W	0x007F7F05	DLL Control Register 0
NANDC_DLL_CTL_REG1	0x0054	W	0x00000022	DLL Control Register 1
NANDC_DLL_OBS_REG0	0x0058	W	0x00000200	DLL Status Register
NANDC_NANDC_VER	0x0080	W	0x56393030	Nandc Version Register
NANDC_LLP_CTL	0x0090	W	0x00000000	LLP Control Register
NANDC_LLP_STAT	0x0094	W	0x00000001	LLP Status Register
NANDC_LLI_FOP7	0x00A0	W	0x00000000	LLI flash operation byte 7;
NANDC_LLI_FOP8	0x00A4	W	0x00000000	LLI flash operation byte 8;
NANDC_LLI_FOP9	0x00A8	W	0x00000000	LLI flash operation byte 9;
NANDC_LLI_FOP10	0x00AC	W	0x00000000	LLI flash operation byte 10;
NANDC_LLI_FOP11	0x00B0	W	0x00000000	LLI flash operation byte 11;
NANDC_LLI_FOP12	0x00B4	W	0x00000000	LLI flash operation byte 12;
NANDC_LLI_FOP13	0x00B8	W	0x00000000	LLI flash operation byte 13;
NANDC_LLI_FOP14	0x00BC	W	0x00000000	LLI flash operation byte 14;
NANDC_LLI_NXT_LLP	0x00C0	W	0x00000000	Next LLI
NANDC_LLI_FOP0	0x00C4	W	0x00000000	LLI flash operation byte 0;
NANDC_LLI_FOP1	0x00C8	W	0x00000000	LLI flash operation byte 1;

Name	Offset	Size	Reset Value	Description
NANDC_LLI_FOP2	0x00CC	W	0x00000000	LLI flash operation byte 2;
NANDC_LLI_FOP3	0x00D0	W	0x00000000	LLI flash operation byte 3;
NANDC_LLI_FOP4	0x00D4	W	0x00000000	LLI flash operation byte 4;
NANDC_LLI_FOP5	0x00D8	W	0x00000000	LLI flash operation byte 5;
NANDC_LLI_FOP6	0x00DC	W	0x00000000	LLI flash operation byte 6;
NANDC_INTEN	0x0120	W	0x00000000	NandC Interrupt Enable Register
NANDC_INTCLR	0x0124	W	0x00000000	NandC Interrupt Clear Register
NANDC_INTST	0x0128	W	0x00000000	NandC Interrupt Status Register
NANDC_BCHST0	0x0150	W	0x80000000	BCH Status Register For Codeword 0~1
NANDC_BCHST1	0x0154	W	0x00000000	BCH Status Register For Codeword 2~3
NANDC_BCHST2	0x0158	W	0x00000000	BCH Status Register For Codeword 4~5
NANDC_BCHST3	0x015C	W	0x00000000	BCH Status Register For Codeword 6~7
NANDC_BCHST4	0x0160	W	0x00000000	BCH Status Register For Codeword 8~9
NANDC_BCHST5	0x0164	W	0x00000000	BCH Status Register For Codeword 10~11
NANDC_BCHST6	0x0168	W	0x00000000	BCH Status Register For Codeword 12~13
NANDC_BCHST7	0x016C	W	0x00000000	BCH Status Register For Codeword 14~15
NANDC_BCHST8	0x0170	W	0x00000000	BCH Status Register For Codeword 16~17
NANDC_BCHST9	0x0174	W	0x00000000	BCH Status Register For Codeword 18~19
NANDC_BCHST10	0x0178	W	0x00000000	BCH Status Register For Codeword 20~21
NANDC_BCHST11	0x017C	W	0x00000000	BCH Status Register For Codeword 22~23
NANDC_BCHST12	0x0180	W	0x00000000	BCH Status Register For Codeword 24~25
NANDC_BCHST13	0x0184	W	0x00000000	BCH Status Register For Codeword 26~27
NANDC_BCHST14	0x0188	W	0x00000000	BCH Status Register For Codeword 28~29
NANDC_BCHST15	0x018C	W	0x00000000	BCH Status Register For Codeword 30~31
NANDC_SPARE0_0	0x0200	W	0xFFFFFFFF	System Information for codeword 0

Name	Offset	Size	Reset Value	Description
NANDC_SPARE1_0	0x0204	W	0xFFFFFFFF	System Information for codeword 1

NANDC_SEED_BCHST	0x020C	W	0x00000000	Bchst Seed

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

8.4.2 Detail Register Description

NANDC_FMCTL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	data_mux_sel Used to select nandc pin function. 1'b0: dq0~7 pin used as "DQ[0]~[7]" function. 1'b1: dq0~7 pin used as "DQ[7]~[0]" function.
22	RW	0x0	cmd_mux_sel Used to select nandc pin function. 1'b0: Wp pin used as "WP" function, We pin used as "WE" function, Ale pin used as "ALE" function, Cle pin used as "CLE" function. 1'b1: Wp pin used as "CLE" function, We pin used as "ALE" function, Ale pin used as "WE" function, Cle pin used as "WP" function.
21	RW	0x0	diff_mux_sel Used to select nandc pin function. 1'b0: rdn pin used as "RE" function, dqs pin used as "DQS" function. 1'b1: rdn pin used as "DQS" function, dqs pin used as "RE" function.
20:18	RW	0x0	sif_read_delay Used to control the delay time when asynchronous mode.
17	RO	0x0	flash_abort_stat Function1: flash_abort_stat, RO. Function2: flash_abort_clear, RW, auto clear. flash_abort_stat is set to 1 when flash abort if flash_abort_en=1, set to 0 when flash_abort_clear=1.

Bit	Attr	Reset Value	Description
16	RW	0x0	flash_abort_en Flash abort protect enable signal, 1 active. 1'b0: Flash abort protect disable. 1'b1: Flash abort protect enable. Notes: 1. When in dma mode, if the time from last read operation start to the last read valid exceeds 1024 cycles, flash_abort_stat is set to high. 2. When in bypass mode, if the time from current read operation start to the read valid exceed 1024 cycles, flash_abort_stat is set to high. 3. When in llp bypass read/read match mode, when the operation is long than 1024 cycles, flash_abort_stat is set to high.
15	RW	0x0	syn_mode Toggle enable signal, 1 active. 1'b0: ONFI synchronous flash 1'b1: Toggle synchronous flash
14	RW	0x0	syn_clken Synchronous flash clock enable signal, 1 active. Only available in Synchronous Mode. 1'b0: Flash clock is disabled. 1'b1: Flash clock is enabled.
13	RW	0x0	tm Timing mode indication. 1'b0: Asynchronous Mode 1'b1: Synchronous Mode (Toggle or ONFI Synchronous)
12	RO	0x0	reserved
11	RO	0x1	dma_f_flag Indication for the all f byte in the current DMA transmission. 1'b0: The transmission is not all f. 1'b1: The transmission is all f.
10	RO	0x0	fifo_empty FIFO empty signal. 1'b0: FIFO is not empty; 1'b1: FIFO is emtpy;
9	RO	0x1	frdy Flash ready/busy indicate signal. 1'b0: Flash is busy. 1'b1: Flash is ready. This bit is the sample of the pin of R/Bn.
8	RW	0x0	wp Flash write protect. 1'b0: Flash program/erase disabled. 1'b1: Flash program/erase enabled. This bit is output to the pin of WPn.

Bit	Attr	Reset Value	Description
7	RW	0x0	fcs7 Flash memory chip 7 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
6	RW	0x0	fcs6 Flash memory chip 6 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
5	RW	0x0	fcs5 Flash memory chip 5 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
4	RW	0x0	fcs4 Flash memory chip 4 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
3	RW	0x0	fcs3 Flash memory chip 3 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
2	RW	0x0	fcs2 Flash memory chip 2 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
1	RW	0x0	fcs1 Flash memory chip 1 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.
0	RW	0x0	fcs0 Flash memory chip 0 select control. 1'b1: Hold flash memory chip select activity. 1'b0: Flash memory chip select activity free.

NANDC_FMWAIT_ASYN

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	fmw_dly_en fmw_dly enable signal, 1 active.
29:24	RW	0x3f	fmw_dly The number of delay cycle between two codeword transmission.
23	RO	0x0	reserved
22:18	RW	0x0f	wait_frdy_dly The number of delay cycle to accept the flash ready signal.

Bit	Attr	Reset Value	Description
17:12	RW	0x3f	csrw When in Asynchronous mode or Toggle address/command mode, this field specifies the number of processor clock cycles from the falling edge of CSn to the falling edge of RDn or WRn. The min value of csrw is 0.
11	RW	0x0	hard_rdy Hardware handshaking controller bit. When asserted, an external device asserts signal "RDY" to extend a wait-state access and the rest bits in this register will be ignored.
10:5	RW	0x3f	rwpw When in Asynchronous mode or Toggle address/command mode, this field specifies the width of RDn or WRn in processor clock cycles, 0x0<=rwpw<=0x3f.
4:0	RW	0x1f	rwcs When in Asynchronous mode or Toggle address/command mode, this field specifies the number of processor clock cycles from the rising edge of RDn or WRn to the rising edge of CSn, 0x0<=rwcs<=0x1f.

NANDC_FMWAIT_SYN

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	ssyn_xle_sel ALE/CLE selection signal for ONFI synchronous flash. 1'b0: ALE/CLE aligned to the falling edge of WRN. 1'b1: ALE/CLE aligned to the center of WRN low level.
14:9	RW	0x00	pst Write/Read Postamble time for ONFI synchronous mode or Toggle data mode. This field specifies the number of processor clock cycle for Postamb- le time.
8:3	RW	0x00	pre Write/Read Preamble time for ONFI synchronous mode or Toggle data mode. This field specifies the number of processor clock cycle for preamble time.
2:0	RW	0x0	fclk Half hclk cycle number for flash clock for ONFI synchronous mode or Toggle data mode.

NANDC_FLCTL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	bypass_fifo_mode The enable sigal for bypass with fifo mode. 1'b0: Disable 1'b1: Enable
29	RW	0x0	async_tog_mix Nandc async mode and tog mode compatible control 1'b0: Async write data can't be read by tog read. 1'b1: Async write data can be read by tog read.
28	RW	0x0	low_power Nandc low power control 1'b0: Normal mode 1'b1: Low power mode
27:22	RW	0x00	page_num Transmission codeword number in internal DMA mode when bus-mode is master-mode. 1~32: 1~32 codeword. default: Not support. Notes: a. Only active in internal DMA mode. b. Only active when bus-mode is master-mode.
21	RW	0x0	page_size Transmission codeword size in internal DMA mode. 1'b0: 1024bytes/codeword 1'b1: 512bytes/codeword Note: only used when lba_en=1.
20	RO	0x1	tr_rdy Internal DMA transmission ready indication. 1'b0: Internal DMA transmission is busy. 1'b1: Internal DMA transmission is ready. When reading flash, tr_rdy should not be set to 1 until all data transmission and correct finished. When programing flash, tr_rdy should not be set to 1 until all data transmission finished. Notes: Only active in internal DMA mode.
19	RW	0x0	bchst_trans Transmission the status of BCH to external memory. 1'b0: Not transmission 1'b1: Transmission
18:13	RO	0x00	reserved
12	RW	0x0	lba_spare_sel Spare byte number selector when lba_en=1. 1'b0: Spare size is 0. 1'b1: Spare size is 4bytes.

Bit	Attr	Reset Value	Description
11	RW	0x0	lba_en LBA mode indication, 1 active. 1'b0: NO-LBA mode, NandC should transfer both page data and spare data in every codeword, and the page size is 1024 bytes or 512 bytes determined by BCHCTL[16](bchpage), spare size is 46/74/109 bytes or 127 bytes determined by BCHCTL[27:25]. 1'b1: LBA mode, NandC should transfer both page data and spare data in every codeword, and the page size is 1024 bytes or 512 bytes determined by FLCTL[21](page_size), spare size is determined by FLCTL[12](lba_spare_sel). Notes: a. When lba_en is active, BCH CODEC should be disabled, spare_size and page_size are configurable. b. When lba_en is active, cor_able is inactive.
10	RW	0x0	cor_able Auto correct enable indication, 1 active. 1'b0: Auto correct disable 1'b1: Auto correct enable Notes: a. Only active in internal DMA mode. b. lba_en is prior to cor_able. When lba_en=1, cor_able is ignored.
9	RW	0x0	trans_seed Transfer the randomizer seed to flash. 1'b0: Not transfer the seed to flash. 1'b1: Transfer the seed to flash.
8	RW	0x0	not_trans_data Not Transfer the data. 1'b0: Transfer the data with spare. 1'b1: Not transfer the data.
7	RW	0x0	flash_st_mod Mode for NandC to start internal data transmission in internal DMA mode. 1'b0: Busy mode: hardware should not start internal data transmission until flash is ready even flash_st is asserted. 1'b1: Ready mode: hardware should start internal data transmission directly when flash_st is asserted. Notes: Only active in internal DMA mode.

Bit	Attr	Reset Value	Description
6:5	RW	0x0	tr_count Transmission codeword number in internal DMA mode when bus-mode is slave-mode. 2'b00: 0 codeword need transferred 2'b01: 1 codeword need transferred 2'b10: 2 codeword need transferred 2'b11: Not supported Notes: a. Only active in internal DMA mode. b. Only active when bus-mode is slave-mode.
4	RW	0x0	st_addr Start buffer address. 1'b0: Start transfer from sram0. 1'b1: Start transfer from sram1. Notes: Only active in internal DMA mode.
3	RW	0x0	bypass NandC internal DMA bypass indication. 1'b0: Bypass the internal DMA, data are transferred to/from flash by direct path. 1'b1: Internal DMA active, data are transferred to/from flash by internal DMA.
2	R/W SC	0x0	flash_st Start signal for NandC to transfer data between flash and internal buffer in internal DMA mode. When asserted, it will auto cleared. 1'b0: Not start transmission. 1'b1: Start transmission. Notes: Only active in internal DMA mode.
1	RW	0x0	flash_rdn Indicate data flow direction. 1'b0: NandC read data from flash. 1'b1: NandC write data to flash
0	R/W SC	0x0	flash_rst NandC software reset indication. When asserted, it will auto cleared. 1'b0: Not software reset 1'b1: Software reset Notes: flash_rst is prior to flash_st.

NANDC_FIFO_ACCESS

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	fifo_cnt Indicate valid data number 2'b00: Indicate byte0~2 are invalid. 2'b01: Indicate byte0 is valid. 2'b10: Indicate byte0~1 are valid. 2'b11: Indicate byte0~2 are valid.
29:28	WO	0x0	byte2_attr Indicate byte2 attribute. 2'b00: Data 2'b01: Address 2'b10: Command 2'b11: Data
27:26	WO	0x0	byte1_attr Indicate byte1 attribute 2'b00: Data 2'b01: Address 2'b10: Command 2'b11: Data
25:24	WO	0x0	byte0_attr Indicate byte0 attribute 2'b00: Data 2'b01: Address 2'b10: Command 2'b11: Data
23:16	WO	0x00	fifo_byte2 Byte2 of transfer data
15:8	WO	0x00	fifo_byte1 Byte1 of transfer data
7:0	WO	0x00	fifo_byte0 Byte0 of transfer data

NANDC_BCHCTL

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:25	RW	0x0	bchmode BCH mode selection 3'b000: 70bitBCH 3'b001: 24bitBCH 3'b010: 40bitBCH 3'b011: 60bitBCH
24:17	RW	0x00	bchthres BCH error number threshold

Bit	Attr	Reset Value	Description
16	RW	0x0	bchpage The data size indication when BCH is active. 1'b0: 1024 bytes, all the 1024 bytes data in codeword are valid data to be transferred. 1'b1: 512 bytes, higher 512bytes are valid, and lower 512bytes are invalid and stuffed with 0xff. Notes: a. Only active when data transferred in internal DMA mode. b. Only active for asynchronous flash.
15:4	RO	0x000	reserved
3	RW	0x1	bchepd BCH encoder/decoder power down indication. 1'b0: BCH encoder/decoder working. 1'b1: BCH encoder/decoder not working.
2	RW	0x0	bch_gate_en Bch decoder clock gating enable, high active. 1'b0: Normal mode 1'b1: Clock gating mode
1	RW	0x0	wcnt_clear To clear the write counter of BCHST. When asserted, it will auto cleared. 1'b0: Not clear the counter. 1'b1: Clear the counter.
0	R/W SC	0x0	bchrst BCH software reset indication. When asserted, it will auto cleared. 1'b0: Not software reset 1'b1: Software reset Notes: a. BCH Decoder should be software reset before decode begin. b. bch software reset should be used with nandc software reset at the same time.

NANDC_MTRANS_CFG

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	redundance_size The num of all f byte to write to flash, the maximum of the size is 2K -1.
15	R/W SC	0x0	ahb_rst ahb master interface software reset, auto cleared.

Bit	Attr	Reset Value	Description
14	RW	0x0	fl_pwd Flash power down indication, 1 active. 1'b0: Flash power on, data transferred through master interface is data that to be written into or read from flash. 1'b1: Flash power down, data transferred through master interface is not data that to be written into or read from flash. NandC is just used as DMA for external memory and internal memory.
13:9	RW	0x00	incr_num AHB Master incr num indication. incr_num=1~16. When burst=001, software should configure incr_num. Notes: Only active for master-mode.
8:6	RW	0x7	burst AHB Master burst type indication 3'b000: Single transfer 3'b011: 4-beat burst 3'b101: 8-beat Burst 3'b111: 16-beat burst default: Not supported Notes: Only active for master-mode.
5:3	RW	0x2	hsize AHB Master data size indication. 3'b000: 8 bits 3'b001: 16 bits 3'b010: 32 bits default: Not supported Notes: Only active for master-mode.
2	RW	0x0	bus_mode Bus interface selection. 1'b0: Slave interface, flash data is transferred through slave interface. 1'b1: Master interface, flash data is transferred through master interface.
1	RW	0x0	ahb_wr Data transfer direction through master interface. 1'b0: Write direction(internal memory ->external memory). 1'b1: Read direction(external memory->internal memory). Notes: a. Only active for master-mode. b. When read flash(flash_rdn=0), ahb_wr=1; when program flash(flash_rdn=1), ahb_wr=0.

Bit	Attr	Reset Value	Description
0	R/W SC	0x0	ahb_wr_st Start indication for loading data from external memory to internal memory or storing data from internal memory to external memory through master. When asserted, it will auto cleared. Notes: a. Only active for master-mode and fl_pwd=1. b. When fl_pwd=0, flash is active, NandC start to transfer data through master interface if flash_st=1. c. When fl_pwd=1, flash is not active, NandC start to transfer data through master interface if ahb_wr_st=1.

NANDC_MTRANS_SADDR0

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	saddr0 Start address for page data transmision. Notes: a. Only active for master-mode. b. Should be aligned with hsize in MTRANS_CFG[5:3].

NANDC_MTRANS_SADDR1

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	saddr1 Start address for spare data. Notes: a. Only active for master-mode. b. Should be aligned with hsize in MTRANS_CFG[5:3].

NANDC_MTRANS_STAT

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	RO	0x00	mtrans_cnt Finished counter for codeword transmission through Master interface. Notes: Only active for master-mode.
15:0	RO	0x0000	bus_err Bus error indication for codeword0~15. Bit 0: Bus error for codeword 0. ..... Bit 15: Bus error for codeword 15. Notes: Only active for master-mode.

NANDC_MTRANS_STAT2

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x0000	bus_err2 Bus error indication for codeword16~31. Bit 0: Bus error for codeword 16 ..... Bit 15: Bus error for codeword 31 Notes: Only active for master-mode.

NANDC_DLL_CTL_REG0

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x7f	dll_dqs_dly_bypass Holds the read DQS delay setting when the DLL is operating in bypass mode.
15:8	RW	0x7f	dll_dqs_dly Holds the read DQS delay setting when the DLL is operating in normal mode. Typically, this value is 1/4 of a clock cycle. Each increment of this field represents 1/128th of a clock cycle.
7:0	RW	0x05	dll_start_point DLL Start Point Control. This value is loaded into the DLL at initialization and is the value at which the DLL will begin searching for a lock. Each increment of this field represents 1/128th of a clock cycle.

NANDC_DLL_CTL_REG1

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:4	RW	0x02	dll_incr DLL Increment Value. This sets the increment used by the DLL when searching for a lock. It is recommended keeping this field small (around 0x4) to keep the steps gradual.
3:2	RW	0x0	dll_qtren Quarter flag of DLL, active in no-bypass mode. 2'b01: 1/4 fclk, dqs_dly=128. 2'b10: 1/8 fclk, dqs_dly=64. Default: dqs_dly=dll_dqs_dly(DLL_CTL_REG0[15:8]). When dll_qtr='b01 or 'b10, software not need to configure dll_dqs_dly, and hardware should delay the input signal for 1/4 or 1/8 fclk cycle time. When dll_qtr=0, software need to configure dll_dqs_dly.

Bit	Attr	Reset Value	Description
1	RW	0x1	dll_bypass DLL Bypass Control, 1active 1'b0: DLL not bypass, dll_dqs_dleay= dqs_dly 1'b1: DLL bypass, dll_dqs_dleay= dll_dqs_dly_bypass
0	RW	0x0	dll_start Start signal for DLL, 1 active. Notes: It will keep high until dll disabled.

NANDC_DLL_OBS_REG0

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:9	RO	0x01	dll_dqs_delay_value Report the delay value for the read DQS signal.
8:1	RO	0x00	dll_lock_value Reports the DLL encoder value from the master DLL to the slave DLL's. The slaves use this value to set up their delays for the clk_wr and read DQS signals.
0	RO	0x0	dll_lock DLL Lock indication 1'b0: DLL has not locked. 1'b1: DLL is locked.

NANDC_NANDC_VER

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:0	RO	0x56393030	version Version indication for NANDC

NANDC_LLP_CTL

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	llp_loc Starting address for LLI0, 64byte align.
5	RW	0x0	llp_frdy Working time for FOP_WAIT_FRDY for all FOP in first LLP group. 1'b0: FOP_WAIT_FRDY begin working when started. 1'b1: FOP_WAIT_FRDY not begin working until 16 cycles later after started.
4:3	RO	0x0	reserved
2	R/WSC	0x0	llp_rst Reset signal for LLP. When asserted, it will auto cleared.

Bit	Attr	Reset Value	Description
1	RW	0x0	llp_mode 1'b0: Current LLI only has FOP. 1'b1: Current LLI has both CFG and FOP.
0	RW	0x0	llp_en Enable signal for LLP 1'b0: LLP disable 1'b1: LLP enable

NANDC_LLP_STAT

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	llp_stat Latest LLI_LOC finished, 64byte align.
5:2	RO	0x0	reserved
1	RO	0x0	llp_err Error status for llp load or execute 1'b0: LLP is correct. 1'b1: LLP is error.
0	RO	0x1	llp_rdy Ready status for all llp load 1'b0: LLP load is busy. 1'b1: LLP load is ready.

NANDC_LLI_FOP7

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	Fop_type Flash operation type. 3'b000: Nop operation. 3'b001: Flash bypass write operation. 3'b010: Flash bypass read operation. 3'b011: Flash bypass read with match operation. 3'b100: Flash DMA write/read operation.
28	RO	0x0	Fop_matchmod When FOP_TYPE=3'b011, match operation is active, and the PATTERN is LLI_FOP[15:0]. When FOP_MATCHMOD=0, it is matched when "RDATA|PATTERN=PATTERN" with FOP_MATCHMOD=0, or when "RDATA&PATTERN=PATTERN" with FOP_MATCHMOD=1.
27:24	RO	0x0	Fop_cs Flash chip select, "1" active. 4'b1000~4'b1111: Indicate select cs0~cs7.
23:20	RO	0x0	Fop_nxtid Next FOP ID

Bit	Attr	Reset Value	Description
19	RO	0x0	Fop_wait_frdy Indicate the current FOP will excute when flash ready, "1" active.
18	RO	0x0	Fop_wait_trdy Indicate the current FOP will excute when DMA transfer ready; "1" active.
17:16	RO	0x0	Fop_addr Flash address type, FOP_ADDR[0]-ALE, FOP_ADDR[1]-CLE.
15:0	RO	0x0000	Fop_inst Flash write operation. Indicate flash write data(command/address/data). Flash read with match operation. Indicate match pattern data.

NANDC_LLI_FOP8

Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	Fop_type Flash operation type. 3'b000: Nop operation. 3'b001: Flash bypass write operation. 3'b010: Flash bypass read operation. 3'b011: Flash bypass read with match operation. 3'b100: Flash DMA write/read operation.
28	RO	0x0	Fop_matchmod When FOP_TYPE=3'b011, match operation is active, and the PATTERN is LLI_FOP[15:0]. When FOP_MATCHMOD=0, it is matched when "RDATA|PATTERN=PATTERN" with FOP_MATCHMOD=0, or when "RDATA&PATTERN=PATTERN" with FOP_MATCHMOD=1.
27:24	RO	0x0	Fop_cs Flash chip select, "1" active. 4'b1000~4'b1111: Indicate select cs0~cs7.

19	RO	0x0	Fop_wait_frdy Indicate the current FOP will excute when flash ready, "1" active.
18	RO	0x0	Fop_wait_trdy Indicate the current FOP will excute when DMA transfer ready, "1" active.
17:16	RO	0x0	Fop_addr Flash address type, FOP_ADDR[0]-ALE, FOP_ADDR[1]-CLE.
15:0	RO	0x0000	Fop_inst Flash write operation: Indicate flash write data(command/address/data). Flash read with match operation: Indicate match pattern data.

NANDC_INTEN

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RW	0x0	Seed_bcherr_int_en Enable for seed bch error interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When seed bcherr_int_en is active, an interrupt is generated.
8	RW	0x0	Seed_bchfail_int_en Enable for seed bch fail interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When seed bchfail_int_en is active, an interrupt is generated if seed bch decode failed.
7	RW	0x0	rd_1stpage_int_en Enable for the first page read interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When sif_bus_wr is active, an interrupt is generated if the first page read operation is finished.
6	RW	0x0	master_idle_int_en Enable for master idle interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When master_idle_int_en is active, an interrupt is generated if posedge of master idle happen.

Bit	Attr	Reset Value	Description
5	RW	0x0	flash_abort_int_en Enable for flash read abort interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When flash_abort_int_en is active, an interrupt is generated if DQS input is abort. Available when flash interface is ONFI synchronous or toggle. When read data number is out of range of flash page size, dqs input is abort. An interrupt is generated if flash_abort_int_en is enable.
4	RW	0x0	llp_int_en Enable for LLP finished interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When llp_en_en is active, an interrupt is generated if LLP operation is finished.
3	RW	0x0	bchfail_int_en Enable for bch fail interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When bchfail_int_en is active, an interrupt is generated if bch decode failed.
2	RW	0x0	bcherr_int_en Enable for bch error interrupt. 1'b0: Interrupt disable. 1'b1: interrupt enable. When bcherr_int_en is active, an interrupt is generated if bch decode error bit is larger than bchthres(BCHCTL[26:19]).
1	RW	0x0	frdy_int_en Enable for flash_rdy interrupt. 1'b0: Interrupt disable. 1'b1: Interrupt enable. When frdy_int_en is active, an interrupt is generated if flash R/B# changes from 0 to 1.
0	RW	0x0	dma_int_en Enable for internal DMA transfer finished interrupt. 1'b0: Interrupt disable. 1'b0: Interrupt enable. When dma_int_en is active, an interrupt is generated if page_num(FLCTL[27:22]) of flash data transfer in DMA mode is finished.

NANDC_INTCLR

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved

flash_data[7:0]	I/O	√	√	√
flash_dqs	I/O	-	√	√
flash_rdy	I	√	√	√

8.6 Application Notes

8.6.1 BCHST/SPARE Application

8.6.1.1 BCHST

There are 16 BCHST-registers in NandC to store 32 codeword's BCH decode status(bchst) information. Every register stores 2 codeword's bchst information except BCHST0, which not only includes bchst information, but also includes one bit for *bchrdy*.

Let bchst_cwd0~bchst_cwd31 be the bchst information for 32 codewords. NandC support bchst transfer function. Software can enable the function by FLCTL[19]. When FLCTL[19]=1, Nandc will transmit the status of BCH to external memory, and software need configure spare step to 8. Detailed format for spare data and BCH status in every unit is shown in figures1.3.

8.6.1.2 SPARE

SPARE includes two register-groups, SPARE0 and SPARE1. Each group has 1 register: SPARE0_0 and SPARE1_0.

When in bch encoding, SPARE0_0 stores system information for codeword in sram0; SPARE1_0 stores system information for codeword in sram1.

When in bch decoding, SPARE0_0 stores the spare data read from flash for codeword in sram0; SPARE1_0 stores the spare data read from flash for codeword in sram1.

8.6.2 Bus Mode Application

MTRANS_CFG[2] determines whether the data load/store between internal memory and external memory is through slave interface or master interface.

8.6.2.1 Slave Mode

When MTRANS_CFG[2]=0, slave is selected. i. e. , flash data load/store between internal memory and external memory is through slave interface by cpu or external DMA.

In this mode, software should store page data into internal memory and spare data into SPARE registers before starting flash program operation; and should load page data from internal memory and spare data from SPARE registers after finishing flash read operation.

In this mode, MTRANS_CFG, MTRANS_SADDR0 and MTRANS_SADDR1 are unused. The transfer codeword number is determined by FLCTL[6:5], and the maximum number is 2.

The judgment condition for finishing data transfer is FLCTL[20]. When FLCTL[20] is high, it means that data transfer is finished.

8.6.2.2 Master Mode

When MTRANS_CFG[2]=1, master is selected. i. e. , flash data load/store between internal memory and external memory is through master interface.

In this mode, software should initialize page data and spare data into external memory, and set their addresses in MTRANS_SADDR0 and MTRANS_SADDR1 respectively before starting flash program operation. Similarly, software should configure MTRANS_SADDR0 and MTRANS_SADDR1 respectively before starting flash read operation and could read data from addresses in MTRANS_SADDR0 and MTRANS_SADDR1 after NandC transfer finish.

In this mode, MTRANS_CFG, MTRANS_SADDR0 and MTRANS_SADDR1 are used. The transfer codeword number is determined by FLCTL[27:22], and the maximum number is 32.

The judgment condition for finishing data transfer is FLCTL[20]. When FLCTL[20] is high, it means that data transmission is finished.

When MTRANS_CFG[2]=1, page data and spare data are stored in the continuous space of external memory respectively.

For page data, source address is named Saddr0, specified in MTRANS_SADDR0. The space can be divided into many continuous units, and the unit size(named PUnit) is 1024 bytes or 512 bytes determined by FLCTL[21] and FLCTL[11]:

a. when FLCTL[11]=0, PUnit is always equal to 1024 bytes
b. when FLCTL[11]=1 and FLCTL[21]=0, PUnit is equal to 1024 bytes
c. when FLCTL[11]=1 and FLCTL[21]=1, PUnit is equal to 512 bytes

For spare data, source address is named Saddr1, specified in MTRANS_SADDR1. The space can be divided into many continuous units, and the unit size(named SUnit) is 4 bytes or 8 bytes determined by FLCTL[19]:

a. When FLCTL[19]=0 , SUnit is equal to 4 bytes
b. When FLCTL[19]=1 , SUnit is equal to 8 bytes

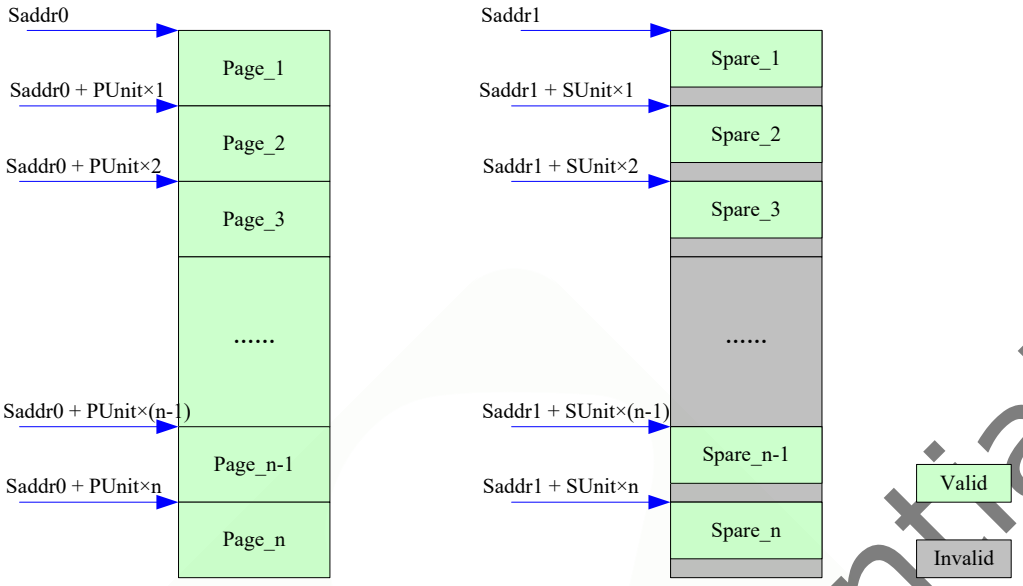

Fig.8-2 NandC Address Assignment

The detailed format for page data and spare data in every unit is shown in following figures.

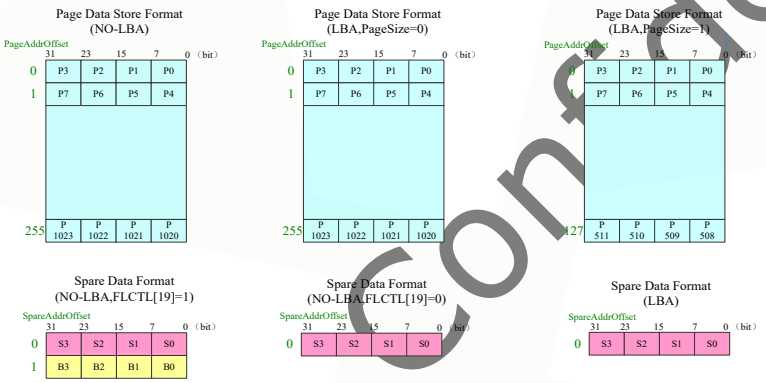

Fig.8-3 NandC Data Format

8.6.3 BchPage Application

BCHCTL[16] determines whether codeword size for page data is 1024 bytes or 512 bytes when FLCTL[11] is 0.

8.6.3.1 1024bytes

When BCHCTL[16]=0, BchPage=0, hardware needs to write 1024 bytes page data and spare data into flash or read 1024 bytes page data and spare data from flash. All the 1024 bytes page data and spare data are encoded when writing or decoded when reading.

8.6.3.2 512bytes

When BCHCTL[16]=1, BchPage=1, hardware needs to write 512 bytes page data and spare data into flash or read 512 bytes page data and spare data from flash.

In this mode, the page data unit size for BCH encoder and BCH decoder is still 1024byte. So to support BCH encoder and decoder, software should configure page data as follows:1th~512th bytes are invalid data which must be stuffed with 0xff, 513th~1024th bytes arevalid page data.

However, Randomizer function is not supported under this condition.

8.6.4 PageSize/SpareSize Application

FLCTL[21] determines whether the codeword size is 1024 bytes or 512 bytes when FLCTL[11] is 1.

8.6.4.1 Big Page

When FLCTL[11]=0(LbaEn=0), the flash to be operated is Raw NAND Flash. Every codeword size is 1024 bytes and FLCTL[21] should always be set to 0, and the PageStep in external memory is 1024 bytes if bus mode is master mode.

At this mode, the spare size and SpareStep in external memory are determined by

FLCTL[19] as follows:
FLCTL[19]=0: spare size=4bytes , SpareStep=4bytes
FLCTL[19]=1: spare size=4bytes , SpareStep=8bytes

8.6.4.2 Small Page

When FLCTL[11]=1, LbaEn=1, the flash to be operated is Managed NAND Flash. Every codeword size could be 1024 bytes or 512 bytes according to FLCTL[21]. If FLCTL[21]=0, codeword size is 1024 bytes, PageStep in external memory is 1024 bytes, and SpareStep is 4bytes. If FLCTL[21]=1, codeword size is 512 bytes, PageStep in external memory is 512 bytes, and SpareStep is 4 bytes.
At this mode, the spare size is configured in FLCTL[12], and the max available number is 4.
In the summary, the total data size in every codeword for flash or for software including page data and spare data, is determined by BCHCTL[27:25], FLCTL[11], FLCTL[21], BCHCTL[4]. Their relationship is shown as follows.

Table 8-3 NandC Page/Spare size for flash

Page/spare size for software		Page size/codeword	Spare size/codeword
FLCTL[11]=0	24bit ECC	1024 byte	(4+42)byte
	40 bit ECC	1024 byte	(4+70)byte
	60 bit ECC	1024 byte	(4+105)byte
	70 bit ECC	1024 byte	(4+123)byte
FLCTL[11]=1	FLCTL[21]=0	1024 byte	FLCTL[12]
	FLCTL[21]=1	512 byte	FLCTL[12]

Notes: that "page/spare size for flash" means that hardware should transfer these numbers of bytes in every codeword to or from flash.

8.6.5 Randomizer Application

RANDMZ_CFG[31] determines whether randomizer is enable or not. When RANDMZ_CFG[31] equals to 1, randomizer is active. Data should be scrambled before written into flash, and descrambled after read from flash.
RANDMZ_CFG[30] determines the randomizer polynomial.
When RANDMZ_CFG[30]=0, Polynomial=1+x+x^15
When RANDMZ_CFG[30]=1, Polynomial=1+x^14+x^15
RANDMZ_CFG[19:0] is the seed for randomizer. It should be ensured that data in the same page should have the same randomizer polynomial and randomizer seed when in flash program or flash read operation.
The data unit for randomizer is one codeword(data+spare).
However, Randomizer is just available for data transfer by internal DMA mode, but not by for bypass mode. Furthermore, it should not be enable if BCHCTL[16]=0 (BchPage=512bytes).

8.6.6 DLL Application

When Toggle Flash or ONFI Synchronous Flash interface is active, DLL should be used to adjust DQS input with DQ when reading flash.
There are 2 registers for DLL configuration(DLL_CFG_REG0 and DLL_CFG_REG1), and 1 register for DLL status(DLL_OBS_REG0).
The usage guide is as follows:
If bypass mode is used, you should set *dll_bypass* in DLL_CFG_REG1[1] to 1, and set *dll_dqs_dly_bypass* in DLL_CFG_REG0[23:16] to determine the dll element number needed. And then set *dll_start* in DLL_CFG_REG1[0] to 1 to start the DLL.
If auto adjusting is used, you should set *dll_bypass* in DLL_CFG_REG1[1] to 0, and set the *dll_start_point* in DLL_CFG_REG0[7:0] and *dll_incr* in DLL_CFG_REG1[11:4]. You also should set the adjusting mode *dll_qtren* in DLL_CFG_REG1[3:2] to compute the dll element number needed. If *dll_qtren*=2'b00, the dll element number is determined by *dll_dqs_dly* in DLL_CFG_REG0[15:8]; otherwise, it is 1/4 or 1/8 of the total number of dll elements used for *dll_qtren*=2'b01 or *dll_qtren*=2'b10 separately. The last step is to set *dll_start* in DLL_CFG_REG1[0] to 1 to start the DLL.
If you want to monitor the dll working status, you could read DLL_OBS_REG0. If DLL_OBS_REG0[0]=0, it means that DLL is not locked, and still in detecting status. Otherwise, it means that DLL is locked, and *dll_lock_value* in DLL_OBS_REG0[8:1] is the total number of dll elements used, *dll_dqs_delay_value* in DLL_OBS_REG0[16:9] is the total number of DQS delay used.

8.6.7 NandC Interrupt Application

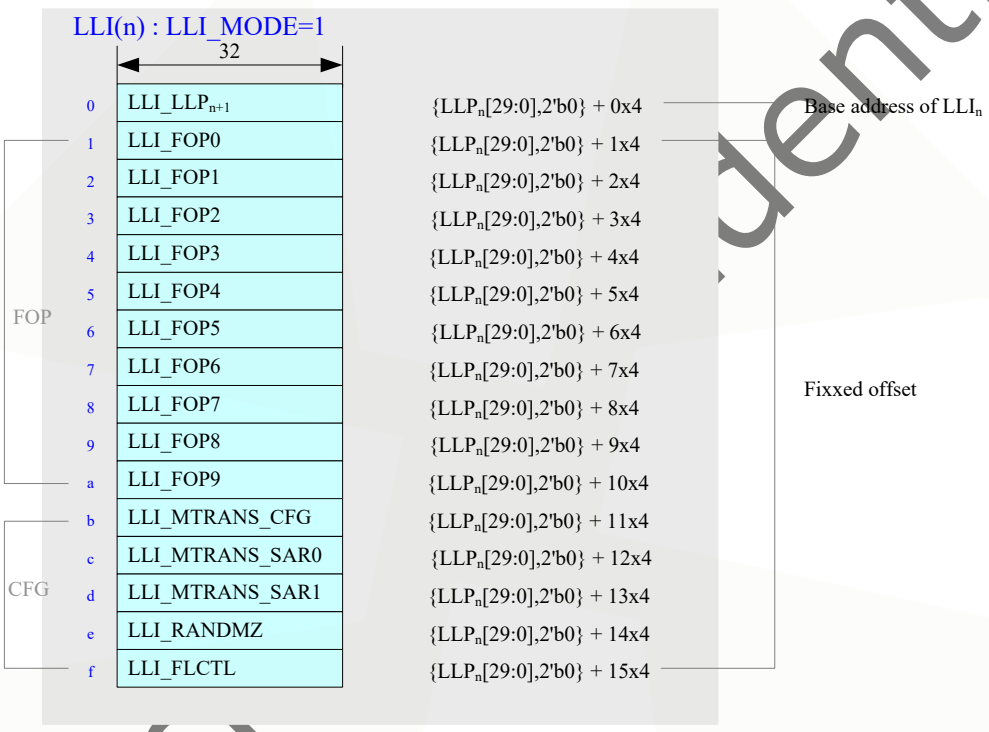
NandC has 1 interrupt output signal and 10 interrupt sources: seed bch error interrupt source, seed bch fail interrupt source, read first page interrupt source, master idle interrupt source, flash abort interrupt source, LLP interrupt source, dma finish interrupt source, flash ready interrupt source, bch error interrupt source, bchfail interrupt source. When one or more of these interrupt source are enabled, NandC interrupt is asserted if one or more interrupt source is high. Software can determine the interrupt source by reading INTST and clear interrupt by writing corresponding bit in INTCLR.

8.6.8 LLP Application

LLP is used in NandC to store and execute instruction groups configured in external memory by software. When LLPCTL[0]=1, LLP is active, NandC will load instruction groups stored in {LLPCTL[31:6], 6'h0} and execute them. Next instruction groups should not be loaded until current instruction execution finished.

8.6.8.1 LLP Structure

The structure of LLP is shown as follows:



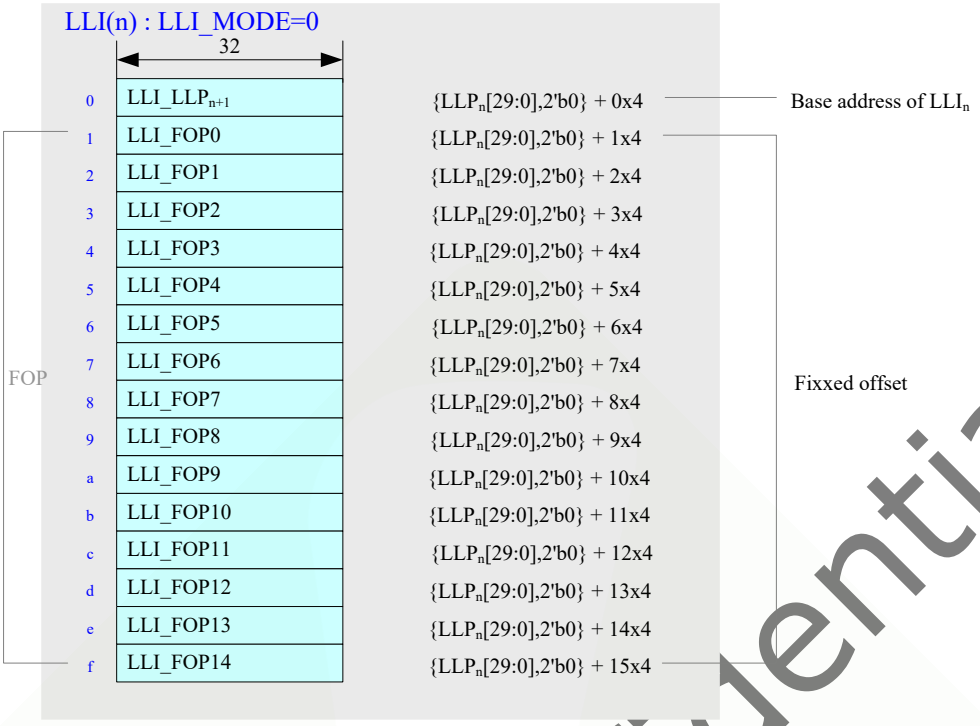


Fig.8-4 NandC LLP Data Format

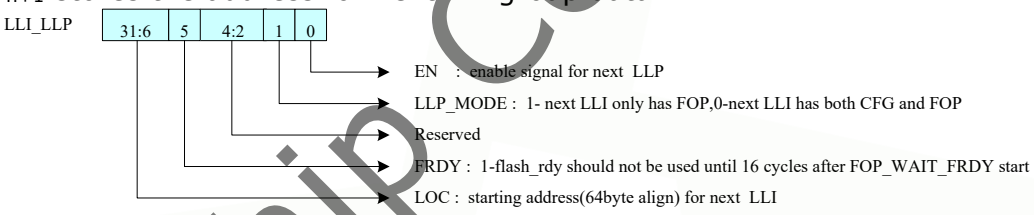
LLI_MODE is determined by LLPCTL[1]. If current operation is flash program or flash read, then LLI_MODE=1 is need; otherwise, LLI_MODE=0 is workable.

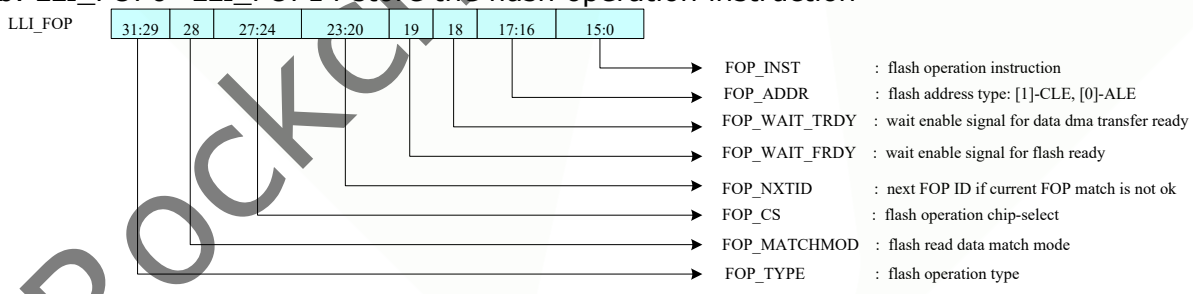
In addition, you could do more than one flash operation in one LLP group, but you should not separate one flash operation into two LLI groups.

8.6.8.2 LLI Format

a. LLI_LLP$_{n+1}$ stores the address for next LLI group data



b. LLI_FOP0~LLI_FOP14 store the flash operation instruction



FOP_TYPE:
000 : nop
001 : flash write
010 : flash read
011 : flash read with match operation
100 : DMA

When FOP_TYPE=3'b011, match operation is active, and the PATTERN is LLI_FOP[15:0]. It is matched when "RDATA|PATTERN=PATTERN" with FOP_MATCHMOD=0, or when "RDATA&PATTERN=PATTERN" with FOP_MATCHMOD=1.

c. LLI_MTRANS_CFG/LLI_MTRANS_SADDR0/LLI_MTRANS_SADDR1/ LLI_RANDMZ/ LLI_FLCTL store the configuration for MTRANS_CFG/ MTRANS_SADDR0/MTRANS_SADDR1/RANDMZ/FLCTL.

8.6.8.3 LLP Working Mode

There are two working modes for LLP:
a. Normal mode: LLPCTL[0] is kept to 1 until all LLP loading and executing finished. Software can monitor the progress by LLPSTAT[31:6], LLPSTAT[0].
b. Pause mode: LLPCTL[0] is changed from 1 to 0 during LLP loading or LLP executing. NandC should not stop working until current LLP executing finished. Software can monitor the progress by LLPSTAT[31:6], LLPSTAT[0].

8.6.9 Seed Application

Nandc supports randomizer seed transmission. When FLCTL[9]=1 and RANDMZ_CFG[31]=1,Nandc will transmit seed to flash before page data transmission and receive seed before page data receiving.
Seed has BCH encoder/decoder separately and support 1bit BCH. Software can query seed BCH result by accessing SEED_BCHST.

8.6.10 Redundance Application

Nandc supports write "FF" to flash as redundance. Software can configure redundance size by NANDC_MTRANS_CFG[26:16].

8.6.11 IOMUX Application

Nandc support IOMUX. Software can change pin function by FMCTL[23:21].

Chapter 9 NPU

9.1 Overview

NPU is the process unit which is dedicated to neural network. It is designed to accelerate the neural network arithmetic in field of AI (artificial intelligence) such as machine vision and natural language processing. The variety of applications for AI is expanding, and currently provides functionality in a variety of areas, including face tracking as well as gesture and body tracking, image classification, video surveillance, automatic speech recognition (ASR) and advanced driver assistance systems (ADAS).

NPU supports the following features:

- AHB interface used for configuration only support single
- AXI interface used to fetch data from memory
- Support integer 8, integer 16, float 16,Bfloat 16 operation
- 512 integer 8 MAC operations per cycle
- 128 integer 16 MAC operations per cycle
- 128 float 16 MAC operations per cycle
- 128 bfloat 16 MAC operations per cycle
- 256KB internal buffer
- Inference Engine : TensorFlow, Caffe, Tflite, Pytorch, Onnx NN, Android NN, etc.

9.2 Block Diagram

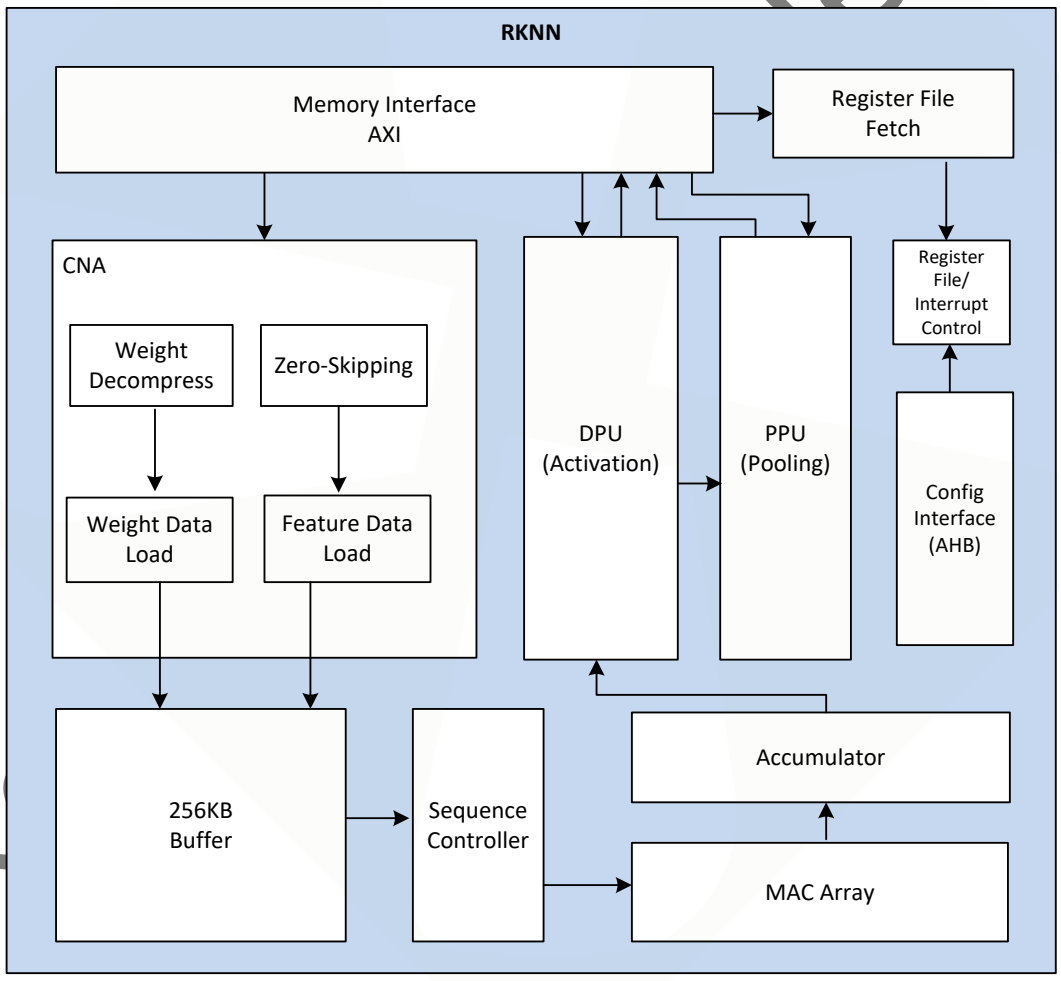


Fig. 9-1 NPU Architecture

9.3 Function Description

9.3.1 AHB/AXI Interface

The AXI master interface is used to fetch data from memory that is attached to the Soc AXI interconnect. The AHB slave interface is used to access the registers for configuration, debug and test.

9.3.2 Neural Network Accelerating Engine

As the unit name, this engine is the main process unit for Neural Network arithmetic. This unit include convolution pre-process controller, internal buffer, mac array, accumulator. It provides parallel convolution MAC for recognition functions and int8, int16, fp16 and bfloat16 are supported. It also provide function: softmax, transpose, data format conversion, …etc.

9.3.3 Dot Processing Unit

Dot Processing Unit mainly provide activate function followed by output data from accumulator cell, such as leaky_relu, relu, relux, sigmod, tanh… are supported.

9.3.4 Plane Processing Unit

Plane Processing Unit mainly provide pooling function followed by output data from dot processing unit, such as average pooling, max pooling, min pooling… are supported.

9.3.5 Register File Fetch Unit

Register File Fetch Unit fetch register configuration from external system memory through AXI
interface.

9.4 Register Description

9.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

9.4.2 PC Registers Summary

Name	Offset	Size	Reset Value	Description
PC_op_en	0x0008	W	0x00000000	Operator enable register
PC_addr	0x0010	W	0x00000000	PC source address register
PC_amount	0x0014	W	0x00000000	Amount of PC fetch data register
PC_interrupt_mask	0x0020	W	0x00000000	Interrupt mask register
PC_interrupt_clear	0x0024	W	0x00000000	Interrupt clear register
PC_interrupt_status	0x0028	W	0x00000000	Interrupt status register
PC_interrupt_raw_status	0x002C	W	0x00000000	Interrupt raw status register
PC_task_con	0x0030	W	0x00000000	Task control register
PC_task_dma_base_addr	0x0034	W	0x00000000	Task dma base address register
PC_task_status	0x003C	W	0x00000000	Task status register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

9.4.3 PC Detail Registers Description

PC_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this bit 1, to trigger the pc to fetch register setting for each task.Pc_sel must set to 0 ,to enable this bit.

PC_addr

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	base_addr This is the address for dma instruction where it located.
2:1	RO	0x0	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	pc_sel 0 : Pc mode, use axi dma to fetch register config, 1 : Slave mode, use ahb to set register.

PC_amount

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	data_amount The reigster number need to be fetched of one task. Each register takes 64bits, it is combined as following: bit[63:48] indicates which block the register forward to. bit[47:16] the register's value bit[15: 0] the register's offset address in each block. bit[56] =1 means this register is for pc block. bit[57] =1 cna bit[58] =1 cmac bit[59] =1 accu bit[60] =1 dpu bit[61] =1 dpu_rdma bit[62] =1 ppu bit[63] =1 ppu_rdma bit[55] =1 to set each block's op_en eg. 64'h0081_0000_007f_0008 will set each block's op_en(cna,cmac,...,ppu_rdma). note: op_en is strongly recommended set at the end of register list. before op_en, 64'h0041_xxxx_xxxx_xxxx must be set.

PC_interrupt_mask

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	int_mask mask[0] : Cna feature group 0 interrput mask. set 1 to enable interrupt. mask[1] : Cna feature group 1 mask[2] : Cna weight group 0 mask[3] : Cna weight group 1 mask[4] : Cna csc group 0 mask[5] : Cna csc group 1 mask[6] : Accu group 0 mask[7] : Accu group 1 mask[8] : Dpu group 0 mask[9] : Dpu group 1 mask[10] : Ppu group 0 mask[11] : Ppu group 1 mask[12] : Dma read error mask[13] : Dma write error note: In pc mode , int mask set the last one task's interrupt masking.

PC_interrupt_clear

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	W1C	0x0000	int_clr done_clr[0] : Cna feature group 0 interrupt clear done_clr[1] : Cna feature group 1 done_clr[2] : Cna weight group 0 done_clr[3] : Cna weight group 1 done_clr[4] : Cna csc group 0 done_clr[5] : Cna csc group 1 done_clr[6] : Accu group 0 done_clr[7] : Accu group 1 done_clr[8] : Dpu group 0 done_clr[9] : Dpu group 1 done_clr[10] : Ppu group 0 done_clr[11] : Ppu group 1 done_clr[12] : Dma read error done_clr[13] : Dma write error

PC_interrupt_status

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	W1C	0x0000	int_st int_st[0] : Cna feature group 0 interrupt status, which and with mask bit int_st[1] : Cna feature group 1 int_st[2] : Cna weight group 0 int_st[3] : Cna weight group 1 int_st[4] : Cna csc group 0 int_st[5] : Cna csc group 1 int_st[6] : Accu group 0 int_st[7] : Accu group 1 int_st[8] : Dpu group 0 int_st[9] : Dpu group 1 int_st[10] : Ppu group 0 int_st[11] : Ppu group 1 int_st[12] : Dma read error int_st[13] : Dma write error

PC_interrupt_raw_status

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	W1C	0x0000	int_raw_st int_st[0] : Cna feature group 0 interrupt raw status int_st[1] : Cna feature group 1 int_st[2] : Cna weight group 0 int_st[3] : Cna weight group 1 int_st[4] : Cna csc group 0 int_st[5] : Cna csc group 1 int_st[6] : Accu group 0 int_st[7] : Accu group 1 int_st[8] : Dpu group 0 int_st[9] : Dpu group 1 int_st[10] : Ppu group 0 int_st[11] : Ppu group 1 int_st[12] : Dma read error int_st[13] : Dma write error

PC_task_con

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	W1C	0x0	task_last_layer_clear 1: Clear the task last layer signal to 0. Before task started , it is suggestted to clear.
13	W1C	0x0	task_count_clear Clear the counter that counting current task. Before task started , it is suggestted to clear.
12	RW	0x0	task_pp_off 1 : Tasks' register are fetched in ping-pong mode The second group register setting is fetched immedidately after first group's register fetching is finished. 0 : Ping-pong mode off The second group register setting is fetched after first group task operation is finished.
11:0	RW	0x000	task_number Set the total task number to be exected.

PC_task_dma_base_addr

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dma_base_addr This is for each dma's base addr. For feature dma, weight dma, dpu dma, ppu dma, the address is set as offset address. Final address appear on axi bus is base_addr+offset_address.

PC_task_status

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	task_status [11:0] : Current task counter value, [12] : Indicate the first task is operating, [13] : Indicate the last task is operating, [12] : Indicate the first task's register is fetching, [13] : Indicate the last task's register is fetching.

9.4.4 CNA Registers Summary

Name	Offset	Size	Reset Value	Description
CNA_s_status	0x0000	W	0x00000000	Statue register
CNA_s_pointer	0x0004	W	0x00000000	Single Pointer Register
CNA_op_en	0x0008	W	0x00000000	Operator enable register
CNA_conv_con1	0x000C	W	0x00000000	Convolution control register 1
CNA_conv_con2	0x0010	W	0x00000000	Convolution control register 2
CNA_conv_con3	0x0014	W	0x00000000	Convolution control register 3
CNA_conv_con4	0x0018	W	0x00000000	Convolution control register 4
CNA_data_size0	0x0020	W	0x00000000	Feature size register 0
CNA_data_size1	0x0024	W	0x00000000	Feature size register 1
CNA_data_size2	0x0028	W	0x00000000	Feature size register 2
CNA_data_size3	0x002C	W	0x00000000	Feature size register 3
CNA_weight_size0	0x0030	W	0x00000000	Weight size register 0
CNA_weight_size1	0x0034	W	0x00000000	Weight size register 1
CNA_weight_size2	0x0038	W	0x00000000	Weight size register 2
CNA_cbuf_con0	0x0040	W	0x00000000	Cbuf control register 0
CNA_cbuf_con1	0x0044	W	0x00000000	Cbuf control register 0
CNA_cvt_con0	0x004C	W	0x00000000	Convert control register 0
CNA_cvt_con1	0x0050	W	0x00000000	Convert control register 1
CNA_cvt_con2	0x0054	W	0x00000000	Convert control register 2
CNA_cvt_con3	0x0058	W	0x00000000	Convert control register 3
CNA_cvt_con4	0x005C	W	0x00000000	Convert control register 4
CNA_fc_con0	0x0060	W	0x00000000	Full connected control register 0
CNA_fc_con1	0x0064	W	0x00000000	Full connected control register 1
CNA_pad_con0	0x0068	W	0x00000000	Convolution pad control register
CNA_feature_data_addr	0x0070	W	0x00000000	Feature data source address
CNA_fc_con2	0x0074	W	0x00000000	Full connected control register 2
CNA_dma_con0	0x0078	W	0x00000000	DMA control register 0
CNA_dma_con1	0x007C	W	0x00000000	DMA control register 1
CNA_dma_con2	0x0080	W	0x00000000	DMA control register 2
CNA_fc_data_size0	0x0084	W	0x00000000	Full connected feature size control register 0
CNA_fc_data_size1	0x0088	W	0x00000000	Full connected feature size control register 1
CNA_clk_gate	0x0090	W	0x00000000	Clock gating register
CNA_dcomp_ctrl	0x0100	W	0x00000000	Decompress control register
CNA_dcomp_regnum	0x0104	W	0x00000000	Decompress register numbers register
CNA_dcomp_addr0	0x0110	W	0x00000000	Weight decompress source address 0 register
CNA_dcomp_addr1	0x0114	W	0x00000000	Weight decompress source address 1 register
CNA_dcomp_addr2	0x0118	W	0x00000000	Weight decompress source address 2 register
CNA_dcomp_addr3	0x011C	W	0x00000000	Weight decompress source address 3 register
CNA_dcomp_addr4	0x0120	W	0x00000000	Weight decompress source address 4 register
CNA_dcomp_addr5	0x0124	W	0x00000000	Weight decompress source address 5 register

Name	Offset	Size	Reset Value	Description
CNA_dcomp_addr6	0x0128	W	0x00000000	Weight decompress source address 6 register
CNA_dcomp_addr7	0x012C	W	0x00000000	Weight decompress source address 7 register
CNA_dcomp_amount4	0x0130	W	0x00000000	Weight decompress source data amount 4 register
CNA_dcomp_amount5	0x0134	W	0x00000000	Weight decompress source data amount 5 register
CNA_dcomp_amount6	0x0138	W	0x00000000	Weight decompress source data amount 6 register
CNA_dcomp_amount7	0x013C	W	0x00000000	Weight decompress source data amount 7 register
CNA_dcomp_amount0	0x0140	W	0x00000000	Weight decompress source data amount 0 register
CNA_dcomp_amount1	0x0144	W	0x00000000	Weight decompress source data amount 1 register
CNA_dcomp_amount2	0x0148	W	0x00000000	Weight decompress source data amount 2 register
CNA_dcomp_amount3	0x014C	W	0x00000000	Weight decompress source data amount 3 register
CNA_CBUF_DBG_CON	0x0210	W	0x00000000	Debug control register
CNA_CBUF_DBG_STA0	0x0214	W	0x00000000	Cbuf debug status register 0
CNA_CBUF_DBG_STA1	0x0218	W	0x00000000	Cbuf debug status register 1
CNA_CBUF_DBG_STA2	0x021C	W	0x00000000	Cbuf debug status register 2
CNA_CBUF_DBG_STA3	0x0220	W	0x00000000	Cbuf debug status register 3
CNA_CBUF_DBG_STA4	0x0224	W	0x00000000	Cbuf debug status register 4
CNA_CBUF_DBG_STA5	0x0228	W	0x00000000	Cbuf debug status register 5
CNA_CBUF_DBG_STA6	0x022C	W	0x00000000	Cbuf debug status register 6
CNA_CBUF_DBG_STA7	0x0230	W	0x00000000	Cbuf debug status register 7

9.4.5 CNA Detail Registers Description

CNA_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

CNA_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved

Bit	Attr	Reset Value	Description
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.
0	RW	0x0	pointer Which register group ready to be setted.

CNA_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

CNA_conv_con1

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	de_conv Enable deconvolution function 1'h0 : Disable 1'h1 : Enable
15:12	RW	0x0	argb_in 4'h8: 1 channel input mode, 4'ha: 3 channel input mode, 4'hb: 4 channel input mode.
11:10	RO	0x0	reserved
9:8	RW	0x0	proc_precision Process precision 2'h0 : Input precision is int 8 2'h1 : Input data precision is int 16 2'h2 : Input data precision is float 16 2'h3 : reserved
7:6	RO	0x0	reserved
5:4	RW	0x0	in_precision Input precision 2'h0 : Input precision is int 8 2'h1 : Input data precision is int 16 2'h2 : Input data precision is float 16 2'h3 : reserved
3:0	RW	0x0	conv_mode Convolution mode: 4'h0: Direct convolution, 4'h3: Depthwise convolution.

CNA_conv_con2

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	kernel_group In int8, 32 kernels form 1 group , in int16 or fp16, 16 kernels form 1 group. Eg, weight kernel is 256, in int8, you can set this register to be 256/32 -1 = 15.
15:14	RO	0x0	reserved
13:4	RW	0x000	feature_grains Feature data rows needs to be buffered before convolution start. It's suggested to set this field as y_stride+weight_height+1.
3:0	RO	0x0	reserved

CNA_conv_con3

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:21	RW	0x00	atrous_y_dilation Pad numbers inserted in feature map column between 2 pixels.
20:16	RW	0x00	atrous_x_dilation Pad numbers inserted in feature map row between 2 pixels. Set this register value >0 will enable atrous convolution.
15:14	RO	0x0	reserved
13:11	RW	0x0	deconv_y_stride Pad numbers inserted in feature map column between 2 pixels.
10:8	RW	0x0	deconv_x_stride Pad numbers inserted in feature map row between 2 pixels.
7:6	RO	0x0	reserved
5:3	RW	0x0	conv_y_stride Stride value in y direction.
2:0	RW	0x0	conv_x_stride Stride value in x direction.

CNA_conv_con4

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:0	RW	0x000000	rgb_bytelength Byte length of argb feature map.

CNA_data_size0

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	datain_width Input feature data width.
15:11	RO	0x00	reserved
10:0	RW	0x000	datain_height Input feature data height.

CNA_data_size1

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0000	dat_channel_true If the input channel is not integer times of 8(int8) or 4(int 16/float 16), set the real channel number in this field.
15:0	RW	0x0000	datain_channel Input feature data channel number. Int 8 mode, this number should be integer times of 8. Int 16/float 16 mode, should be integer times of 4.

CNA_data_size2

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	dataout_width Data width after convolution.
15:0	RO	0x0000	reserved

CNA_data_size3

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:0	RW	0x000000	dataout_automics Data automics after convolution which is data out total pixels number.

CNA_weight_size0

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	weight_bytes Weight bytes in total for this convlution.

CNA_weight_size1

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:0	RW	0x00000	weight_bytes_per_kernel Weight bytes for one kernel group.

CNA_weight_size2

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RW	0x00	weight_width Kernel width.
23:21	RO	0x0	reserved
20:16	RW	0x00	weight_height Kernel height.
15:14	RO	0x0	reserved
13:0	RW	0x0000	weight_kernels Weight kernels.

CNA_cbuf_con0

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13	RW	0x0	weight_reuse Weight data reuse enable. 1'b0 : disable , 1'b1 : enable data reuse. fetching weight directly from internal buffer.
12	RW	0x0	data_reuse Feature data reuse enable 1'b0 : disable , 1'b1 : enable data reuse. fetching data directly from internal buffer.
11	RO	0x0	reserved
10:8	RW	0x0	data_bank2 Bank numbers for fc zero-skipping feature data. In FC zero-skipping mode, set to be 1, Otherwise, must set to be 0.
7	RO	0x0	reserved
6:4	RW	0x0	weight_bank Bank numbers for weight data. 3'h1 : Bank 7 occupied by weight data, 3'h2 : Bank 6/7 occupied by weight data, ... 3'h7 : Bank 1-7 occupied by weight data.
3	RO	0x0	reserved
2:0	RW	0x0	data_bank Bank numbers for feature data 3'h0 : Bank 0 occupied by feature data, 3'h1 : Bank 0 and bank 1 occupied by feature data, 3'h2 : Bank 0/1/2 occupied by feature data, ... 3'h6 : Bank 0-6 occupied by feature data.

CNA_cbuf_con1

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	entries_per4surf Entries per 4 surface. How many bank space needed to stor 4 surface feature map row. actually, it equals to datain_width.
15:13	RO	0x0	reserved
12:0	RW	0x0000	data_entries How many bank space needed to store one feature map row.

CNA_cvt_con0

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:22	RW	0x00	cvt_truncate_3 Cvt truncate value 3.
21:16	RW	0x00	cvt_truncate_2 Cvt truncate value 2.
15:10	RW	0x00	cvt_truncate_1 Cvt truncate value 1.
9:4	RW	0x00	cvt_truncate_0 Cvt truncate value 0.

Bit	Attr	Reset Value	Description
3	RW	0x0	data_sign Feature data is signed or unsigned. 1'b0 : unsigned, 1'b1 : signed.
2	RW	0x0	round_type 0 : odd in , even not, 1 : round-up 0.5 to 1.
1	RW	0x0	cvt_type 1: cvt function will do add first, then multiply, 0: multiply first, then add.
0	RW	0x0	cvt_en Enable cvt function. 1'b0 : diable, 1'b1 : enable cvt function.

CNA_cvt_con1

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	cvt_scale1 Multiplier operand for 1st layer .
15:0	RW	0x0000	cvt_offset1 Adder operand for 1st layer .

CNA_cvt_con2

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	cvt_scale2 Multiplier operand for 2nd layer.
15:0	RW	0x0000	cvt_offset2 Adder operand for 2nd layer.

CNA_cvt_con3

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	cvt_scale3 Multiplier operand for 3rd layer.
15:0	RW	0x0000	cvt_offset3 Adder operand for 3rd layer.

CNA_cvt_con4

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	cvt_scale4 Multiplier operand for 4th layer.
15:0	RW	0x0000	cvt_offset4 Adder operand for 4th layer.

CNA_fc_con0

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	fc_skip_data FC zero skipping data. Skipped feature data value, normally set to 0.
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	fc_skip_enable FC zero skipping enable. 1'b0 : disable, 1'b1: enable skip some feature data value, normally skip zero. When one pixel feature data is 0, the corresponding weight data is not fetched from system memory.

CNA_fc_con1

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	dat_offset Feature data offset in fc skip mode.

CNA_pad_con0

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	RW	0x00	pad_value Pad value.
15:8	RO	0x00	reserved
7:4	RW	0x0	pad_left Pad numbers in left of the feature map.
3:0	RW	0x0	pad_top Pad numbers in top of the feature map.

CNA_feature_data_addr

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	feature_base_addr Read feature data address.
2:0	RO	0x0	reserved

CNA_fc_con2

Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	wt_offset Weight offset in fc skip mode.

CNA_dma_con0

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:16	RW	0x0	wt_burst_len Read weight data axi burst len.
15:8	RW	0x00	fetch_pixel_len Length of feature data for each surface.
7:4	RO	0x0	reserved
3:0	RW	0x0	dat_burst_len Read feature data axi burst len.

CNA_dma_con1

Address: Operational Base + offset (0x007C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:0	RW	0x0000000	line_stride Feature map actual width.

CNA_dma_con2

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:0	RW	0x0000000	surf_stride Feature map actual surface areo.

CNA_fc_data_size0

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	datain_width_dma Width of feature map for fc mode.
15:11	RO	0x00	reserved
10:0	RW	0x000	datain_height_dma Height of feature map for fc mode.

CNA_fc_data_size1

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	datain_channel_dma Channel of feature map for fc mode.

CNA_clk_gate

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	sbuf_cs_disable_clkgate 1: Disable sbuf clock auto gate, 0: Auto clock gate is enabled.
4	RW	0x0	cbuf_cs_disable_clkgate 1: Disable cbuf clock auto gate, 0: Auto clock gate is enabled.
3	RO	0x0	reserved
2	RW	0x0	csc_disable_clkgate 1 : Disable csc block clk gate, 0 : Auto clock gate is enabled.
1	RW	0x0	cna_wt_disable_clkgate 1 : Disable weight block clk gate, 0 : Auto clock gate is enabled.
0	RW	0x0	cna_feature_disable_clkgate 1 : Disable feature block clk gate, 0 : Auto clock gate is enabled.

CNA_dcomp_ctrl

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
2:0	RW	0x0	decomp_control 3'h0 : Disable weight decompress, 3'h1 : Enable weight decompress.

CNA_dcomp_regnum

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:0	RW	0x000000	dcomp_regnum Decompress register numbers register.

CNA_dcomp_addr0

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr0 Weight decompress source address 0.
2:0	RO	0x0	reserved

CNA_dcomp_addr1

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr1 Weight decompress source address 1.
2:0	RO	0x0	reserved

CNA_dcomp_addr2

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr2 Weight decompress source address 2.
2:0	RO	0x0	reserved

CNA_dcomp_addr3

Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr3 Weight decompress source address 3.
2:0	RO	0x0	reserved

CNA_dcomp_addr4

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr4 Weight decompress source address 4.
2:0	RO	0x0	reserved

CNA_dcomp_addr5

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr5 Weight decompress source address 5.
2:0	RO	0x0	reserved

CNA_dcomp_addr6

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr6 Weight decompress source address 6.
2:0	RO	0x0	reserved

CNA_dcomp_addr7

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	decompress_addr7 Weight decompress source address 7.
2:0	RO	0x0	reserved

CNA_dcomp_amount4

Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount4 Weight decompress source data amount 4.

CNA_dcomp_amount5

Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount5 Weight decompress source data amount 5.

CNA_dcomp_amount6

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount6 Weight decompress source data amount 6.

CNA_dcomp_amount7

Address: Operational Base + offset (0x013C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount7 Weight decompress source data amount 7.

CNA_dcomp_amount0

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount0 Weight decompress source data amount 0.

CNA_dcomp_amount1

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount1 Weight decompress source data amount 1.

CNA_dcomp_amount2

Address: Operational Base + offset (0x0148)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount2 Weight decompress source data amount 2.

CNA_dcomp_amount3

Address: Operational Base + offset (0x014C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dcomp_amount3 Weight decompress source data amount 3.

CNA_CBUF_DBG_CON

Address: Operational Base + offset (0x0210)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13	RW	0x0	reg2dp_dbg_cbuf_rdsel Reg2dp_dbg_cbuf_rdsel.
12:0	RW	0x0000	reg2dp_dbg_cbuf_raddr Reg2dp_dbg_cbuf_raddr.

CNA_CBUF_DBG_STA0

Address: Operational Base + offset (0x0214)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data0 Cbuf_debug_data0.

CNA_CBUF_DBG_STA1

Address: Operational Base + offset (0x0218)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data1 Cbuf_debug_data1.

CNA_CBUF_DBG_STA2

Address: Operational Base + offset (0x021C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data2 Cbuf_debug_data2.

CNA_CBUF_DBG_STA3

Address: Operational Base + offset (0x0220)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data3 Cbuf_debug_data3.

CNA_CBUF_DBG_STA4

Address: Operational Base + offset (0x0224)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data4 Cbuf_debug_data4.

CNA_CBUF_DBG_STA5

Address: Operational Base + offset (0x0228)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data5 Cbuf_debug_data5.

CNA_CBUF_DBG_STA6

Address: Operational Base + offset (0x022C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data6 Cbuf_debug_data6.

CNA_CBUF_DBG_STA7

Address: Operational Base + offset (0x0230)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cbuf_debug_data7 Cbuf_debug_data7.

9.4.6 CMAC Registers Summary

Name	Offset	Size	Reset Value	Description
CMAC_s_status	0x0000	W	0x00000000	Statue register
CMAC_s_pointer	0x0004	W	0x00000000	Single Pointer Register
CMAC_op_en	0x0008	W	0x00000000	Operator enable register
CMAC_misc ctrl	0x000C	W	0x00000000	CMAC misc control register
CMAC_gat_ctrl	0x0010	W	0x00000000	Clock gating control register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

9.4.7 CMAC Detail Registers Description

CMAC_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

CMAC_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.

Bit	Attr	Reset Value	Description
0	RW	0x0	pointer Which register group ready to be setted.

CMAC_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

CMAC_misc ctrl

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13:12	RW	0x0	proc_precision Process precision. 2'h0 : Int8, 2'h1 : Int16, 2'h2 : Fp16, 2'h3 : Bf16.
11:2	RO	0x000	reserved
1	RW	0x0	dw_en If enable depthwise convolution.
0	RW	0x0	reg_qd_en Enable calculate feature data summury.

CMAC_gat_ctrl

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:0	RW	0x000000	slcg_op_en Gating enable signal.

9.4.8 ACCU Registers Summary

Name	Offset	Size	Reset Value	Description
ACCU_s_status	0x0000	W	0x00000000	Statue register
ACCU_s_pointer	0x0004	W	0x00000000	Single Pointer Register
ACCU_op_en	0x0008	W	0x00000000	Operator enable register
ACCU_misc_cfg	0x000C	W	0x00000000	ACCU misc control register
ACCU_dataout_size_0	0x0010	W	0x00000000	Dataout size register 0
ACCU_dataout_size_1	0x0014	W	0x00000000	Dataout size register 1
ACCU_clip_truncate	0x002C	W	0x00000000	Truncate register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

9.4.9 ACCU Detail Registers Description

ACCU_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

ACCU_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.
0	RW	0x0	pointer Which register group ready to be setted.

ACCU_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

ACCU_misc_cfg

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:14	RW	0x00	soft_gating Soft_gating.
13:10	RO	0x0	reserved

Bit	Attr	Reset Value	Description
9:8	RW	0x0	proc_precision Process precision. 2'h0 : Int8, 2'h1 : Int16, 2'h2 : Fp16, 2'h3 : Bf16.
7:2	RO	0x00	reserved
1	RW	0x0	dw_en If enable depthwise convolution.
0	RW	0x0	reg_qd_en Enable calculate feature data summury.

ACCU_dataout_size_0

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dataout_height Output height of feature data.
15:0	RW	0x0000	dataout_width Output width of feature data.

ACCU_dataout_size_1

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	dataout_channel Output channel of feature data.

ACCU_clip_truncate

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	cvt_round Truncate type.
4:0	RW	0x00	clip_truncate Truncate value.

9.4.10 DPU Registers Summary

Name	Offset	Size	Reset Value	Description
DPU_s_status	0x0000	W	0x00000000	Statue register
DPU_s_pointer	0x0004	W	0x00000000	Single Pointer Register
DPU_op_en	0x0008	W	0x00000000	Operator enable register
DPU_feature_mode_cfg	0x000C	W	0x00000000	Feature mode configuration register
DPU_data_format	0x0010	W	0x00000000	Data format control register
DPU_offset_pend	0x0014	W	0x00000000	Offset pend register
DPU_dst_base_addr	0x0020	W	0x00000000	Destination address register
DPU_dst_surface_stride	0x0024	W	0x00000000	Destination surface stride register
DPU_data_cube_width	0x0030	W	0x00000000	Feature width register
DPU_data_cube_height	0x0034	W	0x00000000	Feature height register
DPU_data_cube_notch_addr	0x0038	W	0x00000000	Feature notch address register
DPU_data_cube_channel	0x003C	W	0x00000000	Feature channel register

Name	Offset	Size	Reset Value	Description
DPU_bs_cfg	0x0040	W	0x00000000	BS control register
DPU_bs_alu_cfg	0x0044	W	0x00000000	BS ALU control register
DPU_bs_mul_cfg	0x0048	W	0x00000000	BS MUL control register
DPU_bs_relux_cmp_value	0x004C	W	0x00000000	BS RELUX compare data register
DPU_bs_ow_cfg	0x0050	W	0x00000000	BS offset of weight control register
DPU_bs_ow_op	0x0054	W	0x00000000	BS offset of weight register
DPU_bn_cfg	0x0060	W	0x00000000	BN control register
DPU_bn_alu_cfg	0x0064	W	0x00000000	BN ALU control register
DPU_bn_mul_cfg	0x0068	W	0x00000000	BN MUL control register
DPU_bn_relux_cmp_value	0x006C	W	0x00000000	BN RELUX compare data register
DPU_ew_cfg	0x0070	W	0x00000000	EW control register
DPU_ew_op_cvt_offset_value	0x0074	W	0x00000000	Convert offset in EW
DPU_ew_op_cvt_scale_value	0x0078	W	0x00000000	Convert scale in EW
DPU_ew_relux_cmp_value	0x007C	W	0x00000000	EW RELUX compare data register
DPU_out_cvt_offset	0x0080	W	0x00000000	Out convert offset register
DPU_out_cvt_scale	0x0084	W	0x00000000	Out scale offset register
DPU_out_cvt_shift	0x0088	W	0x00000000	Out shift offset register
DPU_ew_op_src_value_0	0x0090	W	0x00000000	Configuration value for ew operator 0
DPU_ew_op_src_value_1	0x0094	W	0x00000000	Configuration value for ew operator 1
DPU_ew_op_src_value_2	0x0098	W	0x00000000	Configuration value for ew operator 2
DPU_ew_op_src_value_3	0x009C	W	0x00000000	Configuration value for ew operator 3
DPU_ew_op_src_value_4	0x00A0	W	0x00000000	Configuration value for ew operator 4
DPU_ew_op_src_value_5	0x00A4	W	0x00000000	Configuration value for ew operator 5
DPU_ew_op_src_value_6	0x00A8	W	0x00000000	Configuration value for ew operator 6
DPU_ew_op_src_value_7	0x00AC	W	0x00000000	Configuration value for ew operator 7
DPU_lut_access_cfg	0x0100	W	0x00000000	LUT access configuration register
DPU_lut_access_data	0x0104	W	0x00000000	LUT access data register
DPU_lut_cfg	0x0108	W	0x00000000	LUT configuration register
DPU_lut_info	0x010C	W	0x00000000	LUT info register
DPU_lut_le_start	0x0110	W	0x00000000	LE LUT start address register
DPU_lut_le_end	0x0114	W	0x00000000	LE LUT end address register
DPU_lut_lo_start	0x0118	W	0x00000000	LO LUT start address register
DPU_lut_lo_end	0x011C	W	0x00000000	LO LUT end address register
DPU_lut_le_slope_scale	0x0120	W	0x00000000	LE LUT slope scale register
DPU_lut_le_slope_shift	0x0124	W	0x00000000	LE LUT slope offset register
DPU_lut_lo_slope_scale	0x0128	W	0x00000000	LO LUT slope scale register
DPU_lut_lo_slope_shift	0x012C	W	0x00000000	LO LUT slope offset register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

9.4.11 DPU Detail Registers Description

DPU_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

DPU_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.
0	RW	0x0	pointer Which register group ready to be setted.

DPU_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

DPU_feature_mode_cfg

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	tp_en If enable transpose .

Bit	Attr	Reset Value	Description
29:26	RW	0x0	rgp_type Regroup type. 4'h0: Cut all input (64bit), 4'h1: Cut 8bit, 4'h2: Cut 16bit, 4'h3: Cut 32bit.
25	RW	0x0	nonalign If nonalign mode is enable.If the output data flow is sampe with the input data flow, this mode can be used.
24:9	RW	0x0000	surf_len In nonalign mode, how many 8bytes to be stored.
8:7	RW	0x0	burst_len Burst length, 0:burst4, 1:burst8, 2:burst16.
6	RO	0x0	reserved
5:4	RW	0x0	conv_mode 0: Direct convolution mode, 3: Depthwise convlution mode.
3:1	RW	0x0	output_mode Where the dpu core output goes. 0: If the output goes to ppu, high is active, 2: If the output goes to outside, high is active.
0	RW	0x0	flying_mode If flying mode is enable.

DPU_data_format

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	out_precision Output precision. 3'h0 : Int8, 3'h1 : Int16, 3'h2 : Fp16, 3'h3 : Bf16, 3'h4 : Int32, 3'h5 : Fp32.
28:26	RW	0x0	in_precision Input precision same with dpu_rdma. 3'h0 : Int8, 3'h1 : Int16, 3'h2 : Fp16, 3'h3 : Bf16, 3'h4 : Int32, 3'h5 : Fp32.
25:16	RW	0x000	ew_truncate_neg Shift value in ew core for negtive data.
15:10	RW	0x00	bn_mul_shift_value_neg Shift value in bn core for negtive data.
9:4	RW	0x00	bs_mul_shift_value_neg Shift value in bs core for negtive data.
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	proc_precision Process precision. Same as proc_precision above.

DPU_offset_pend

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	offset_pend What value the extra channel be set.

DPU_dst_base_addr

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dst_base_addr Destination address of output feature map.

DPU_dst_surface_stride

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	dst_surface_stride Output shape surface stride.
2:0	RO	0x0	reserved

DPU_data_cube_width

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	width Feature width (minus 1).

DPU_data_cube_height

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:25	RW	0x00	areo How many pixel to be processed in minmax op once.
24:22	RW	0x0	minmax_ctl Minmax control signal. [0]: enable minmax op; [1]: minmax type; [2]: probability only;
21:13	RO	0x000	reserved
12:0	RW	0x0000	height Feature height (minus 1).

DPU_data_cube_notch_addr

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	notch_addr_1 How many pixel from the end of width to the end of the shape line end 1.
15:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12:0	RW	0x0000	notch_addr_0 How many pixel from the end of width to the end of the shape line end 0.

DPU_data_cube_channel

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	ori_channel Original output channel(minus 1).
15:13	RO	0x0	reserved
12:0	RW	0x0000	channel Feature channel(minus 1). Rules are list following: dc 16b: Align to 8, dc 8b : Align to 16, dw 16b:Align to 16, dw 8b : Align to 32.

DPU_bs_cfg

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	bs_alu_src Where the alu operand from. 1'h0:From configure register, 1'h1:From outside.
7	RW	0x0	bs_relux_en If enable relu x.
6	RW	0x0	bs_relu_bypass Bypass relu op.
5	RW	0x0	bs_mul_prelu If enable prelu.
4	RW	0x0	bs_mul_bypass Bypass bs core mul op.
3:2	RW	0x0	bs_alu_algo BS core alu op type. 2'h0: Max, 2'h1: Min, 2'h2: Add.
1	RW	0x0	bs_alu_bypass Bypass bs core alu op.
0	RW	0x0	bs_bypass Bypass bs core.

DPU_bs_alu_cfg

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bs_alu_operand Bs core alu operand.

DPU_bs_mul_cfg

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	bs_mul_operand BS core mul operand.
15:14	RO	0x0	reserved
13:8	RW	0x00	bs_mul_shift_value Shift value in bs core for positive data.
7:1	RO	0x00	reserved
0	RW	0x0	bs_mul_src Where the mul operand from. 0: from configure register, 1: from outside.

DPU_bs_relux_cmp_value

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bs_relux_cmp_dat Relux compare data in bs core.

DPU_bs_ow_cfg

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	rgp_cnter Regroup counter. 3'h0 : Select all data, 3'h1 : Select 1 from every 2, 3'h2 : Select 1 from every 4, 3'h3 : Select 1 from every 8.
28:11	RO	0x00000	reserved
10:8	RW	0x0	size_e_2 How many 8channel in a row the last output line(minus 1).
7:5	RW	0x0	size_e_1 How many 8channel in a row the middle output line(minus 1).
4:2	RW	0x0	size_e_0 How many 8channel in a row the first output line(minus 1).
1	RW	0x0	od_bypass Bypass cpend.
0	RW	0x0	ow_src Where the cpend operand from. 1'b0: From configure register, 1'b1: From outside.

DPU_bs_ow_op

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ow_op Cpend operand.

DPU_bn_cfg

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	bn_alu_src Where the alu operand from. 1'b0: From configure register, 1'b1: From outside.

Bit	Attr	Reset Value	Description
7	RW	0x0	bn_relux_en If enable relux.
6	RW	0x0	bn_relu_bypass Bypass relu.
5	RW	0x0	bn_mul_prelu If enable prelu.
4	RW	0x0	bn_mul_bypass Bypass bn core mul op.
3:2	RW	0x0	bn_alu_algo BN core alu op type. 2'h0: Max, 2'h1: Min, 2'h2: Add.
1	RW	0x0	bn_alu_bypass Bypass bn alu op.
0	RW	0x0	bn_bypass Bypass bn core.

DPU_bn_alu_cfg

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bn_alu_operand BN core alu operand.

DPU_bn_mul_cfg

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	bn_mul_operand BN core mul operand.
15:14	RO	0x0	reserved
13:8	RW	0x00	bn_mul_shift_value Shift value in bs core for positive data.
7:1	RO	0x00	reserved
0	RW	0x0	bn_mul_src Where the mul operand from. 1'b0: From configure register, 1'b1: From outside.

DPU_bn_relux_cmp_value

Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bn_relux_cmp_dat Relux compare data in bs core.

DPU_ew_cfg

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31	RW	0x0	ew_cvt_type Convert type of ew input convert when if 0.5. 1'b0 : Mul first, 1'b1 : Add first.

Bit	Attr	Reset Value	Description
30	RW	0x0	ew_cvt_round rounding type of ew input convert. 1'h0 : If the integer is odd, carr 1, 1'h1 : Carry 1 no matter what the integer is.
29:28	RW	0x0	ew_data_mode 2'h0 : Per channel, 2'h1 : Per pixel, 2'h2 : Per channel by pixel.
27:11	RO	0x00000	reserved
10	RW	0x0	ew_relux_en If enable relux.
9	RW	0x0	ew_relu_bypass Bypass relu.
8	RW	0x0	ew_op_cvt_bypass Bypass ew core operand convert.
7	RW	0x0	ew_lut_bypass Bypass lut.
6	RW	0x0	ew_op_src Where the operator operand from. 1'h0 : Configure register, 1'h1 : Outside.
5	RW	0x0	ew_mul_prelu If enable prelu.
4:3	RW	0x0	ew_alu_algo BS core alu op type. 2'h0: Max, 2'h1: Min, 2'h2: Add.
2	RW	0x0	ew_op_type Operator type. 1'b0:Alu, 1'b1:Mul.
1	RW	0x0	ew_op_bypass Bypass ew core alu and mul op.
0	RW	0x0	ew_bypass Bypass ew core.

DPU_ew_op_cvt_offset_value

Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_op_cvt_offset EW convert offset.

DPU_ew_op_cvt_scale_value

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:22	RW	0x000	ew_truncate EW core shift value.
21:16	RW	0x00	ew_op_cvt_shift EW convert shift value.
15:0	RW	0x0000	ew_op_cvt_scale EW convert scale.

DPU_ew_relux_cmp_value

Address: Operational Base + offset (0x007C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_relux_cmp_dat EW relux compare data.

DPU_out_cvt_offset

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	out_cvt_offset Out convert offset.

DPU_out_cvt_scale

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	out_cvt_scale Out convert scale.

DPU_out_cvt_shift

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31	RW	0x0	cvt_type Convert type of out convert when if 0.5. 0'b0 : Mul first, 1'b1 : Add first.
30	RW	0x0	cvt_round Rounding type of out convert when if 0.5 1'b0 : If the integer is odd, carry 1, 1'b1 : Carry 1 no matter what the integer is.
29:12	RO	0x00000	reserved
11:0	RW	0x000	out_cvt_shift Out convert shift value.

DPU_ew_op_src_value_0

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_0 The 1st ew operand for ew core op.

DPU_ew_op_src_value_1

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_1 The 2nd ew operand for ew core op.

DPU_ew_op_src_value_2

Address: Operational Base + offset (0x0098)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_2 The 3thd ew operand for ew core op.

DPU_ew_op_src_value_3

Address: Operational Base + offset (0x009C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_3 The 4th ew operand for ew core op.

DPU_ew_op_src_value_4

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_4 The 5th ew operand for ew core op.

DPU_ew_op_src_value_5

Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_5 The 6th ew operand for ew core op.

DPU_ew_op_src_value_6

Address: Operational Base + offset (0x00A8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_6 The 7th ew operand for ew core op.

DPU_ew_op_src_value_7

Address: Operational Base + offset (0x00AC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_operand_7 The 8th ew operand for ew core op.

DPU_lut_access_cfg

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x0	lut_access_type LUT access type.
16	RW	0x0	lut_table_id LUT access id.
15:10	RO	0x00	reserved
9:0	RW	0x000	lut_addr LUT access address.

DPU_lut_access_data

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	lut_access_data LUT access data.

DPU_lut_cfg

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lut_hybrid_priority LUT priority when hybrid happened.
5	RW	0x0	lut_oflow_priority LUT priority when over flow happened.
4	RW	0x0	lut_uflow_priority LUT priority when under flow happened.

Bit	Attr	Reset Value	Description
3:2	RW	0x0	lut_lo_le_mux LUT lo le mux control.
1:0	RO	0x0	reserved

DPU_lut_info

Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	lut_lo_index_select LUT LO index select.
15:8	RW	0x00	lut_le_index_select LUT LE index select.
7:0	RO	0x00	reserved

DPU_lut_le_start

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lut_le_start LUT LE start point.

DPU_lut_le_end

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lut_le_end LUT LE end point.

DPU_lut_lo_start

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lut_lo_start LUT LO start point.

DPU_lut_lo_end

Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lut_lo_end LUT LO end point.

DPU_lut_le_slope_scale

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	lut_le_slope_oflow_scale LUT LE slope scale when over flow happened.
15:0	RW	0x0000	lut_le_slope_uflow_scale LUT LE slope scale when under flow happened.

DPU_lut_le_slope_shift

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:5	RW	0x00	lut_le_slope_oflow_shift LUT LE slope shift when over flow happened.
4:0	RW	0x00	lut_le_slope_uflow_shift LUT LE slope shift when under flow happened.

DPU_lut_lo_slope_scale

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	lut_lo_slope_oflow_scale LUT LO slope scale when over flow happened.
15:0	RW	0x0000	lut_lo_slope_uflow_scale LUT LO slope scale when under flow happened.

DPU_lut_lo_slope_shift

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:5	RW	0x00	lut_lo_slope_oflow_shift LUT LO slope shift when over flow happened.
4:0	RW	0x00	lut_lo_slope_uflow_shift LUT LO slope shift when under flow happened.

9.4.12 DPU_RDMA Registers Summary

Name	Offset	Size	Reset Value	Description
DPU_RDMA_s_status	0x0000	W	0x00000000	Statue register
DPU_RDMA_s_pointer	0x0004	W	0x00000000	Single Pointer Register
DPU_RDMA_op_en	0x0008	W	0x00000000	Operator enable register
DPU_RDMA_data_cube_width	0x000C	W	0x00000000	Feature width register
DPU_RDMA_data_cube_height	0x0010	W	0x00000000	Feature height register
DPU_RDMA_data_cube_channel	0x0014	W	0x00000000	Feature channel register
DPU_RDMA_src_base_addr	0x0018	W	0x00000000	Source address of feature map
DPU_RDMA_brdma_cfg	0x001C	W	0x00000000	BRDMA control register
DPU_RDMA_bs_base_addr	0x0020	W	0x00000000	BRDMA source address
DPU_RDMA_bs_data_amount	0x0024	W	0x00000000	BRDMA data amount
DPU_RDMA_nrdma_cfg	0x0028	W	0x00000000	NRDMA control register
DPU_RDMA_bn_base_addr	0x002C	W	0x00000000	NRDMA source address register
DPU_RDMA_bn_data_amount	0x0030	W	0x00000000	BRDMA data amount
DPU_RDMA_erdma_cfg	0x0034	W	0x00000000	ERDMA control register
DPU_RDMA_ew_base_addr	0x0038	W	0x00000000	ERDMA source address
DPU_RDMA_ew_areo_stride	0x003C	W	0x00000000	ERDMA areo stride register
DPU_RDMA_ew_surf_stride	0x0040	W	0x00000000	ERDMA surface stride register
DPU_RDMA_feature_mode_cfg	0x0044	W	0x00000000	Feature mode control register
DPU_RDMA_src_dma_cfg	0x0048	W	0x00000000	Source DMA configuration register
DPU_RDMA_surf_notch	0x004C	W	0x00000000	Surf notch address control register

Name	Offset	Size	Reset Value	Description
DPU_RDMA_pad_cfg	0x0064	W	0x00000000	Pad configuration register
DPU_RDMA_weight	0x0068	W	0x00000000	ARB weight register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

9.4.13 DPU_RDMA Detail Registers Description

DPU_RDMA_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

DPU_RDMA_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.
0	RW	0x0	pointer Which register group ready to be setted.

DPU_RDMA_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

DPU_RDMA_data_cube_width

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	width Width(need to minus 1).

DPU_RDMA_data_cube_height

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	height Height(need to minus 1).

DPU_RDMA_data_cube_channel

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	channel Channel(need to minus 1).

DPU_RDMA_src_base_addr

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	src_base_addr Fly_mode src address.

DPU_RDMA_brdma_cfg

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:1	RW	0x0	brdma_data_use How many data type need to be read. [0]:If read alu operand, set 1 to enable, [1]:If read cpend operand, set 1 to enable, [2]:If read mul operand, set 1 to enable.
0	RW	0x0	brdma_disable If disable brdma.

DPU_RDMA_bs_base_addr

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bs_base_addr Base addr to read bs alu,bs cpend,bs mul operand.

DPU_RDMA_bs_data_amount

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bs_data_amount How many 8bytes need to be read, need to minus 1.

DPU_RDMA_nrdma_cfg

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3:1	RW	0x0	nrdma_data_use How many data type need to be read. [0]:If read alu operand, set 1 to enable; [1]:If read cpend operand, set 1 to enable, (tie to 0, cause BN do not have cpend) [2]:If read mul operand, set 1 to enable.
0	RW	0x0	nrdma_disable If disable nrdma.

DPU_RDMA_bn_base_addr

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bn_base_addr Base addr to read bn alu,bn mul operand.

DPU_RDMA_bn_data_amount

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bn_data_amount How many 8bytes need to be read, need to minus 1.

DPU_RDMA_erdma_cfg

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	erdma_data_mode If the read data is per channel or per pixel. 0: Per channel, 1: Per pixel. 2: Per channel by pixel.
29:3	RO	0x0000000	reserved
2	RW	0x0	erdma_data_size If the read data is 8bit. 0: 8bit, 1: 16bit.
1	RO	0x0	reserved
0	RW	0x0	erdma_disable If disable erdma.

DPU_RDMA_ew_base_addr

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ew_base_addr Base addr to read ew operand.

DPU_RDMA_ew_areo_stride

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	ew_areo_stride The feature areo need to be read by erdma.If erdma_data_mode is per channel, it need set to be 0, else is (width+1)*(height+1).
2:0	RO	0x0	reserved

DPU_RDMA_ew_surf_stride

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	ew_surf_stride The surface stride of the element wise feature map; If erdma_data_mode is per channel, it need set to be 1.
2:0	RO	0x0	reserved

DPU_RDMA_feature_mode_cfg

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18	RW	0x0	shrink_enable If in_precision is i16 or fp16, and out_precision is i8, this bit need set to be high. And it is flymode only.
17:15	RW	0x0	in_precision Input data precision. 0:INT8, 1:INT16, 2:FP16, 3:INT32, 4:FP32.
14:13	RW	0x0	burst_len Burst length 0: Burst4, 1: Burst8, 2: Burst16.
12:7	RO	0x00	reserved
6:5	RW	0x0	proc_precision Process precision 0:INT8 1:INT16 2:FP16.
4:3	RO	0x0	reserved
2:1	RW	0x0	conv_mode Convolution mode. 0:Dc 3:Depthwise
0	RW	0x0	flying_mode Flying_mode enable. 0:Dpu core main data is from convolution output; 1:Dpu core main data is from mrdma.

DPU_RDMA_src_dma_cfg

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:19	RW	0x0000	line_notch_addr How many pixel from the end of width end to the shape feature line end.
18:14	RO	0x00	reserved
13	RW	0x0	pooling_method Pooling method. 0: Average pooling(up sampling can use this mode), 1: Min or max pooling.
12	RW	0x0	up_en If enable unpooling.
11:9	RW	0x0	ker_stride_height Unpooling kernel stride height(minus 1).

Bit	Attr	Reset Value	Description
8:6	RW	0x0	ker_stride_width Unpooling kernel stride width(minus 1).
5:3	RW	0x0	ker_height Unpooling kernel height(minus 1).
2:0	RW	0x0	ker_width Unpooling kernel width(minus 1).

DPU_RDMA_surf_notch

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	surf_notch_addr How many pixel from the end of this process feature map to the end of the shape feature map.
2:0	RO	0x0	reserved

DPU_RDMA_pad_cfg

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	pad_value Pad value.
15:7	RO	0x000	reserved
6:4	RW	0x0	pad_top Unpooling top pad.
3	RO	0x0	reserved
2:0	RW	0x0	pad_left Unpooling left pad.

DPU_RDMA_weight

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	e_weight The arbiter weight for erdma.
23:16	RW	0x00	n_weight The arbiter weight for nrdma.
15:8	RW	0x00	b_weight The arbiter weight for brdma.
7:0	RW	0x00	m_weight The arbiter weight for mrdma.

9.4.14 PPU Registers Summary

Name	Offset	Size	Reset Value	Description
PPU_s_status	0x0000	W	0x00000000	Statue register
PPU_s_pointer	0x0004	W	0x00000000	Single Pointer Register
PPU_op_en	0x0008	W	0x00000000	Operator enable register
PPU_data_cube_in_width	0x000C	W	0x00000000	Feature width register
PPU_data_cube_in_height	0x0010	W	0x00000000	Feature height register
PPU_data_cube_in_channel	0x0014	W	0x00000000	Feature channel register
PPU_data_cube_out_width	0x0018	W	0x00000000	Output width register
PPU_data_cube_out_height	0x001C	W	0x00000000	Output height register

Name	Offset	Size	Reset Value	Description
PPU_data_cube_out_channel	0x0020	W	0x00000000	Output channel register
PPU_operation_mode_cfg	0x0024	W	0x00000000	PPU operation register
PPU_pooling_kernel_cfg	0x0034	W	0x00000000	Pooling kernel control register
PPU_recip_kernel_width	0x0038	W	0x00000000	Recipe width register
PPU_recip_kernel_height	0x003C	W	0x00000000	Recipe height register
PPU_pooling_padding_cfg	0x0040	W	0x00000000	Pooling pad configuration register
PPU_pooling_padding_value_1_cfg	0x0044	W	0x00000000	Pooling pad value register 0
PPU_pooling_padding_value_2_cfg	0x0048	W	0x00000000	Pooling pad value register 1
PPU_pooling_padding_value_3_cfg	0x004C	W	0x00000000	Pooling pad value register 2
PPU_pooling_padding_value_4_cfg	0x0050	W	0x00000000	Pooling pad value register 3
PPU_dst_base_addr	0x0070	W	0x00000000	Destination address register
PPU_dst_surface_stride	0x007C	W	0x00000000	Destination surface stride
PPU_data_format	0x0084	W	0x00000000	Data format control register
PPU_misc_ctrl	0x00DC	W	0x00000000	Misc control register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

9.4.15 PPU Detail Registers Description

PPU_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

PPU_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.

Bit	Attr	Reset Value	Description
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.
0	RW	0x0	pointer Which register group ready to be setted.

PPU_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_en Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

PPU_data_cube_in_width

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_in_width Pooling cube width (need to minus 1).

PPU_data_cube_in_height

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_in_height Pooling cube height (need to minus 1).

PPU_data_cube_in_channel

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_in_channel Pooling cube channel (need to minus 1).

PPU_data_cube_out_width

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_out_width Pooling output cube width (need to minus 1).

PPU_data_cube_out_height

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_out_height Pooling output cube height (need to minus 1).

PPU_data_cube_out_channel

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_out_channel Pooling output cube channel (need to minus 1).

PPU_operation_mode_cfg

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31	RW	0x0	bf16_en If bf16 mode, cfg:1 else cfg: 0
30	RW	0x0	index_en If enable output the position of each kernel.
29	RO	0x0	reserved
28:16	RW	0x0000	notch_addr How many pixel from the end of the width end to the shape line end.
15:8	RO	0x00	reserved
7:5	RW	0x0	use_cnt Use count .
4	RW	0x0	flying_mode Where the pooling cube from 0: Dpu 1: Outside
3:2	RO	0x0	reserved
1:0	RW	0x0	pooling_method Pooling method 0: Average pooling; 1: Max pooling 2: Min pooling

PPU_pooling_kernel_cfg

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:20	RW	0x0	kernel_stride_height Pooling kernel stride height (need to minus 1).
19:16	RW	0x0	kernel_stride_width Pooling kernel stride width (need to minus 1).
15:12	RO	0x0	reserved
11:8	RW	0x0	kernel_height Pooling kernel height (need to minus 1).
7:4	RO	0x0	reserved
3:0	RW	0x0	kernel_width Pooling kernel width (need to minus 1).

PPU_recip_kernel_width

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	recip_kernel_w The Reciprocal of the shape kernel width multiple 2^16.

PPU_recip_kernel_height

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	recip_kernel_height The Reciprocal of the shape kernel height multiple 2^16.

PPU_pooling_padding_cfg

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:12	RW	0x0	pad_bottom Pooling bottom pad.
11	RO	0x0	reserved
10:8	RW	0x0	pad_right Pooling right pad.
7	RO	0x0	reserved
6:4	RW	0x0	pad_top Pooling top pad.
3	RO	0x0	reserved
2:0	RW	0x0	pad_left Pooling left pad.

PPU_pooling_padding_value_1_cfg

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:0	RW	0x00000	pad_value_1x Pad_value*1.

PPU_pooling_padding_value_2_cfg

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:0	RW	0x00000	pad_value_2x Pad_value*2.

PPU_pooling_padding_value_3_cfg

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:0	RW	0x00000	pad_value_3x Pad_value*3.

PPU_pooling_padding_value_4_cfg

9.4.17 Detail Registers Description

PPU_RDMA_s_status

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RO	0x0	status_1 0: Executer 1 is in idle state, 1: Executer 1 is operating, 2: Executer 1 is operating, executer 0 is waiting to operate .
15:2	RO	0x0000	reserved
1:0	RO	0x0	status_0 0: Executer 0 is in idle state, 1: Executer 0 is operating, 2: Executer 0 is operating, executer 1 is waiting to operate .

PPU_RDMA_s_pointer

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x0	executer Which register group to be used.
15:6	RO	0x000	reserved
5	W1C	0x0	executer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
4	W1C	0x0	pointer_pp_clear 1: Set this bit to 1 to clear pointer to 0.
3	RW	0x0	pointer_pp_mode 1: Pointer ping-pong by pointer, eg. if current pointer is 0, next pointer will toggle to 1, 0: Pointer ping-pong by executer, eg. if current executer is 0, next pointer will toggle to 1.
2	RW	0x0	executer_pp_en 1: Enable executer auto ping-pong.
1	RW	0x0	pointer_pp_en 1: Enable pointer auto ping-pong.
0	RW	0x0	pointer Which register group ready to be setted.

PPU_RDMA_op_en

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	op_enable Set this register will trigger cna block operate. This register and after this are all shadowed for ping-pong operation.

PPU_RDMA_data_cube_in_width

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_in_width Pooling cube width (need to minus 1).

PPU_RDMA_data_cube_in_height

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_in_height Pooling cube height (need to minus 1).

PPU_RDMA_data_cube_in_channel

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	cube_in_channel Pooling cube channel(need to minus 1).

PPU_RDMA_flying_mode

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	fly_mode Where the pooling cube from. 0: From dpu, 1: From outside.

PPU_RDMA_src_base_addr

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	source_base_addr Base address of the pooling cube .

PPU_RDMA_src_line_stride

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	source_line_stride Pooling cube shape width.
2:0	RO	0x0	reserved

PPU_RDMA_src_surface_stride

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	source_surface_stride Pooling cube shape areo.
2:0	RO	0x0	reserved

PPU_RDMA_data_format

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	in_precision Input precision, 0: INT8 1: INT16 2: FP16.

9.4.18 DMA Registers Summary

Name	Offset	Size	Reset Value	Description
DMA_CFG_OUTSTANDING	0x0000	W	0x00000000	Outstanding control register

1	RW	0x0	cmac_op_en CMAC enable.
0	RW	0x0	cna_op_en Cna enable.

9.5 Application Notes

9.5.1 ping-pong registers

In order to reduce the time of fetch registers, every Calculate Core and Control Core of NPU has its owner ping-pong registers. Configure the group 0 when use the group 1, and configure the group 1 when use group 0. As a result of hiding the time of fetch registers. Writing S_POINTER of every block can enable this function.

9.5.2 Clock and Reset

- Clock Domains

NPU has two clock domains, one is AHB clock, the other is AXI clock. AHB clock, which is the

clock for AHB interface, while AXI clock, which is the clock for AXI interface. AXI clock also used for core clock for every Calculate Core and Control Core. Clock frequency can be controlled by CRU, please refer to the relevant sections. Automatic localized clock gating is employed throughout the design in order to minimize the dynamic power consumption. Almost all of the flip-flops are clock gated in the design. Block level clock gating also implemented in every separate block. If a block and the interface to the block are both idle, then the clock of that block will be gated automatically. This feature can be disabled by software.

- NPU Reset

Correspond to the clock domain, there are two reset signals. Aresetn, the reset signal for AXI interface and every Calculate Core and Control Core.Hresetn is the AHB interface reset pin and which is synchronized to the AHB clock domain.
All the two signals must be asserted for a minimum of 32 core clock cycles, using the slowest of the two clocks. Then two signals must be release at the same time.

9.5.3 NPU Interrupt Application

NPU has 1 interrupt output signal and it remains asserted until the host processor clears the interrupt. Each bit of PC_INTERRUPT_STATUS represents one of the 17 possible events that the NPU can signal to the host processor. By setting the bits of the interrupt enable register (PC_INTERRUPT_MASK) the programmer can control which of those events will generate an interrupt.

9.5.4 NPU Debugging Support

NPU provide some debug registers help figure out the problem when NPU crashed or some else happened. These register are list below.

Table 9-1 Debug register list

Registers	Describe
pc_interrupt_status	int_st[0] : cna feature group 0 interrupt status, which and with mask bit int_st[1] : cna feature group 1 int_st[2] : cna weight group 0 int_st[3] : cna weight group 1 int_st[4] : cna csc group 0 int_st[5] : cna csc group 1 int_st[6] : accu group 0 int_st[7] : accu group 1 int_st[8] : dpu group 0 int_st[9] : dpu group 1 int_st[10] : ppu group 0 int_st[11] : ppu group 1 int_st[12] : dma read error int_st[13] : dma write error int_st[16] : mmu error
cna_dc_status	[14:3] buffer full or empty signal; [2:0] fetch data and weight status
cna_csc_status	[2:0] which condition is missed for normal work.

9.5.5 NPU operate flow

NPU has two types of work mode: slave configured mode and PC work mode. PC work mode need to initial register information to the system memory, then obey flowing flows as Fig. 1-2 shows.
The information of registers initial to the system memory need to generate by the op you want to specify. So we describe the normal work flows by describe the slave configured mode.

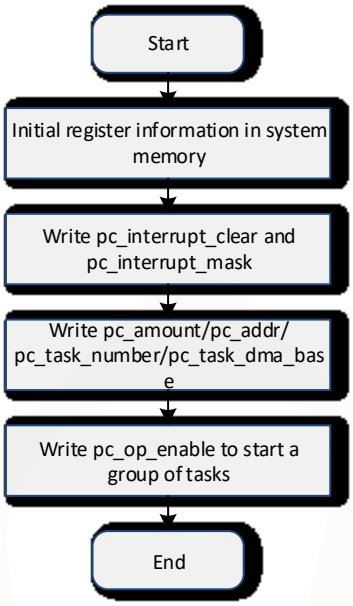

Fig. 9-2 PC flow

convolution flow

NPU supports variety of convolution and matrix multiplication. If use the MAC array to calculate, the work flow obey the Fig. 1-3, and if use DPU CORE calculate, work flow obey the Fig. 1-4.

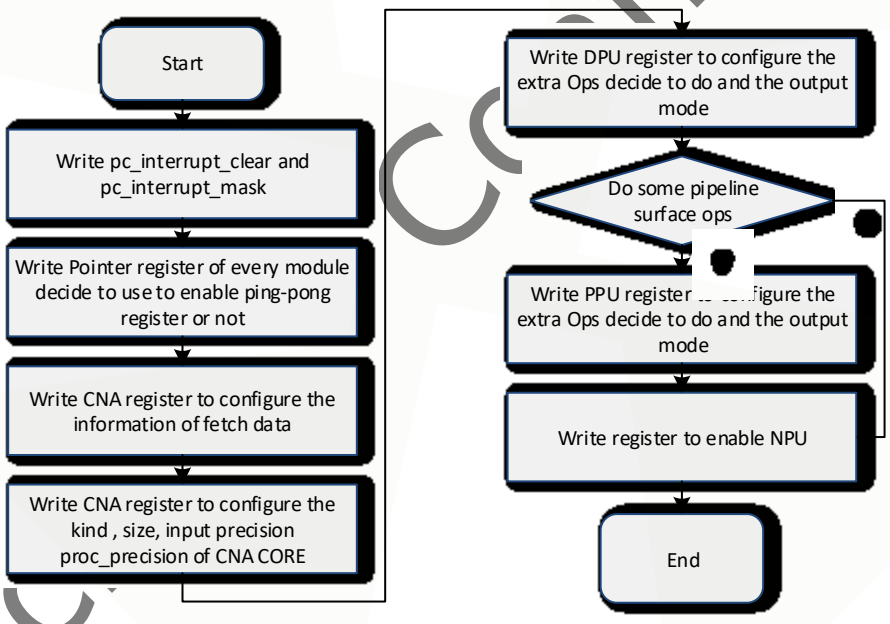

Fig. 9-3 convolution flow 1

In step 1, do not set PPU mask bit if don't use PPU.

In step 3, you need to configure the size of feature map, and the input precision, process precision, grains, entries and weight size, including weight height, weight width, kernels and weight bytes etc.

In step 4, you need to configure process precision, conv_mode and auto gating registers of CMAC and CNA sequence controller.

In step 5, you can specify some operators to the outputs of convolution according to configure the DPU_CORE. DPU CORE has some fixed operators, also you can specify some programmed operators.

In step 6, you can do some extra operators to the outputs of DPU, pooling for example.

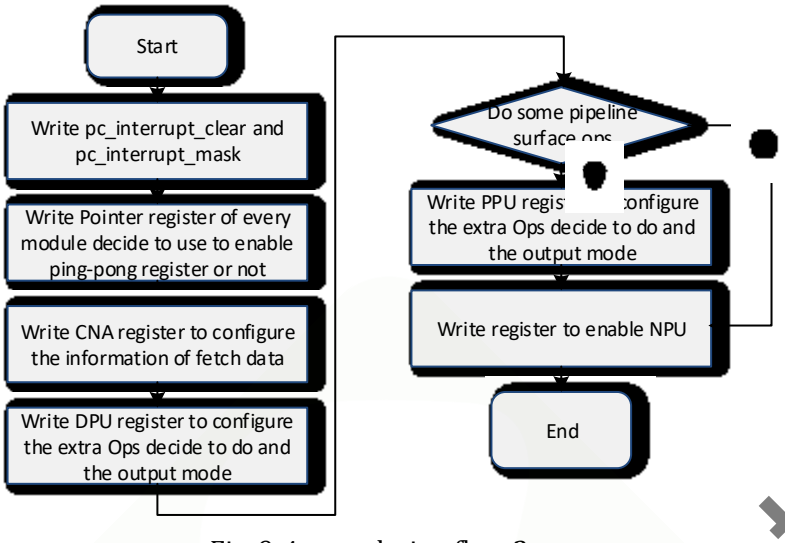

Fig. 9-4 convolution flow 2

In step 3, you need to configure the size of feature map, and the input precision, process precision, grains, entries and weight size, including height, width, kernels and weight bytes etc. Here we supply zero skipping switch, if there's a lot of zero or some number else in the feature map, you can enable zero skipping by writing cna_fc_con0, cna_fc_con1 and cna_fc_con2, as a result of without reading the weights correspond to the pixel in the feature map. In zero skipping mode, you can specify the feature map size for read different from the feature map size for calculate.

If enable zero skipping, the conv_mode of DPU must configure to be 3, and must bypass the BS_CORE. The alu_src must set to be 0, the mul_src must set to be 1, and the alu_algo must set be 3. We bypass BS_CORE, and use BN_CORE to calculate convolution, so the extra operators have to achive by EW_CORE. But we use NRDMA to read operands to EW_CORE when ew_src is 1.

- Pooling flow

You can use PPU in two ways, pipeline with DPU, and flying mode separately. The first one is described above, we describe the second flow below.

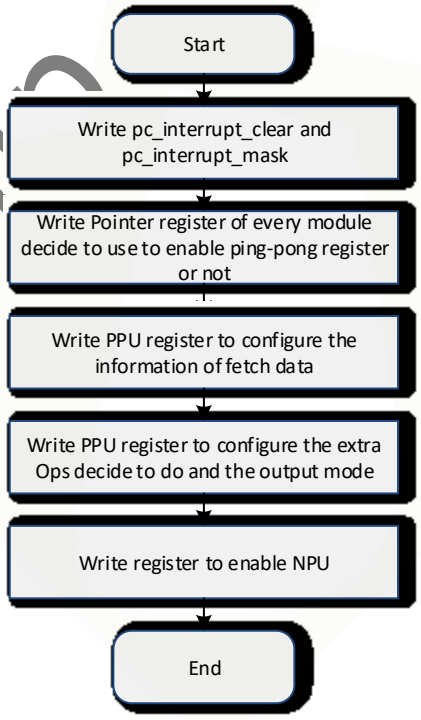

Fig. 9-5 Pooling flow

In step 4, we supply two type of output mode, 8byte align per pixel and nonalign mode. In some cases with uncomfortable feature map size, you can enable nonalign mode by writing ppu_misc_ctrl_nonalign and ppu_misc_ctrl_surf_len.

- separate op flow

As for the operators that NPU do not fixed, you can combine DPU and PPU to achieve it. Following

we describe the DPU flying mode flow.

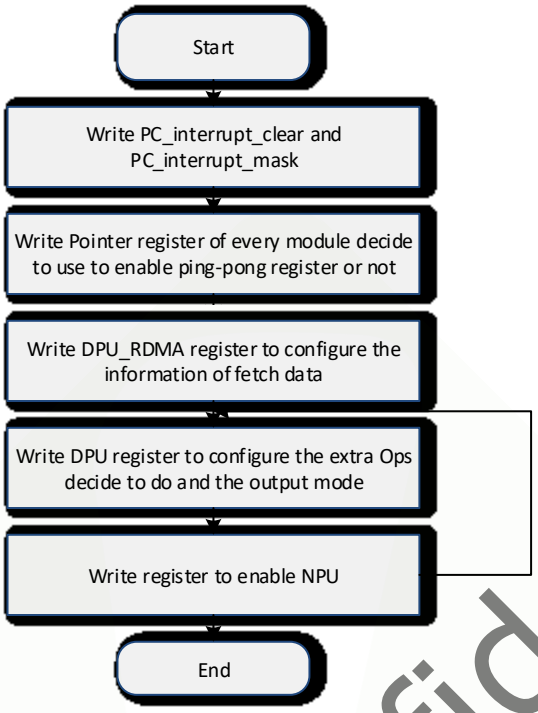

Fig. 9-6 DPU flying mode flow

In step 3, you can enable MRDMA , BRDMA, NRDMA, ERDMA to fetch data. NPU supports 6 types of data input precision.

In step 4, you can configure BS_ALU_BYPASS, BS_MUL_BYPASS, BS_RELU_BYPASS, BS_MUL_PRELU, BS_MUL_SHIFT, BS_RELUX_EN etc. to specify the operators you want to achive.

Chapter 10 Multi-format Video Encoder and Decoder

10.1 Overview

VPU_Combo is composed by the VDPU121,VDPU346, VEPU121(JPEG encoder only) and VEPU540 to realize the high quality video decoding and encoding.
VDPU121 can support such as H.263,MPEG1/2/4 and so on,max solution is up to 1920x1088.
VDPU346 can support such as H265 and H264 and VP9 decoder,max solution is up to 4096x2304.
VDPU720 can support JPEG decoder.
VEPU121 can support JPEG encoder.
VEPU540 can support H265 and H264 encoder encoder,max resolution is up to 4096x4096.

10.1.1 Feature

The features of VDPU121 and VDPU346 decoder are listed as follows:

- MMU embedded with MMU interrupt support
- H.265 HEVC/MVC Main10 Profile yuv420@L5.1 up to 4096x2304@60fps
- H.264 AVC/MVC Main10 Profile yuv400/yuv420/yuv422/@L5.1 up to 4096x2304@30fps
- VP9 Profile0/2 yuv420@L5.1 up to 4096x2304@60fps
- VP8 verision2,up to 1920x1088@60fps
- VC1 Simple Profile@low,medium,high levels,Main Profile@low,medium,high levels, Advanced Profile@level0~3,up to 1920x1088@60fps
- MPEG-4 Simple Profile@L0~6,Advanced Simple Profile@L0~5,up to 1920x1088@60fps
- MPEG-2 Main Profile,low medium and high levels,up to 1920x1088@60fps
- MPEG-1 Main Profile,low,medium and high levels,up to 1920x1088@60fps
- H.263 Profile0,levels 10-70,up to 720x576@60fps
- JPEG Baseline interleaved,up to 8176x8176@76 milion pixels per second

The features of VDPU720 decoder are listed as follows:

- Supports JPEG decoding
  - 48x48 to 65536x65536(4295Mpixels)，Step size 8 pixels
  - Baseline interleaved, and supports ROI (region of image) decode

The features of VEPU12X encoder are listed as follows:

- JPEG:
  - Baseline Non-progressive
  - up to 8192x8192 resolution
  - up to 90 million pixels per second

The features of VEPU540 encoder are listed below:

- HEVC main profile encoding, up to level 5.0
- H.264 high profile encoding, up to level 5.1
- Resolution up to 4096x4096
- Intelligent encoding to improve subjective quality
- Block level bitrate control
- Slice split
- Block based ROI configuration
- 8-area OSD
- Support link table mode
- YUV/RGB video source with rotation and mirror
- Frame buffer compression
- MMU inside

10.2 Block Diagram

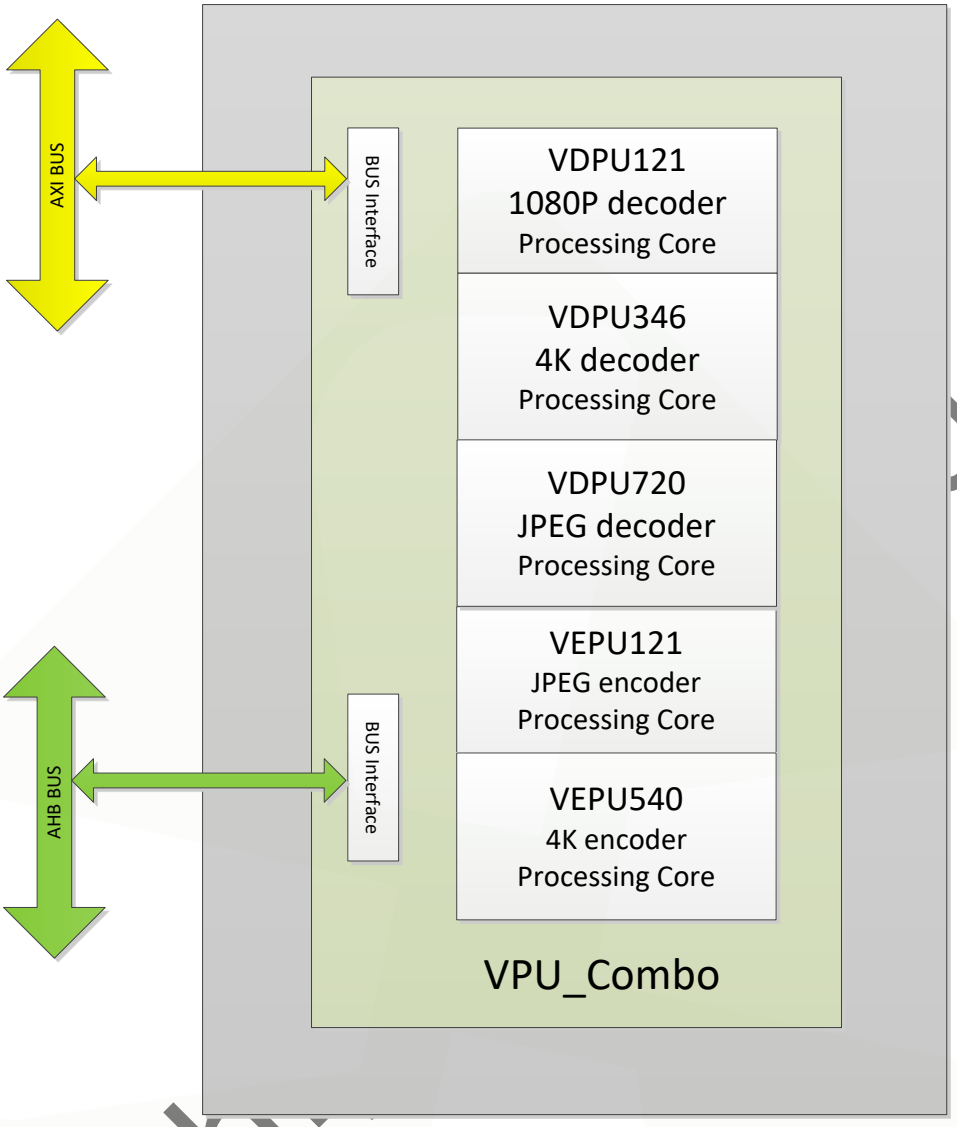

Fig. 10-1 VPU Combo Block Diagram

As shown in the figures above, CPU accesses to the decoder register bank through AHB bus. Bitstream and other necessary data are fed into processing core though AXI read channel, and after several steps of decoding process, decoded pictures and other information data are transferred to designated location in the DDR through AXI write channel.

VDPU121 1080P processing core support multi-format decoder,such as mpeg4,h.263 and so on.

VDPU720 processing core support jpeg decoder.

VEPU121 1080P processing core support jpeg encoder.

VDPU346 4K decoder processing core can support h.265/vp9/h.264 video standard decoder,max solution size is 4096x2304.

VEPU540 4K encoder processing core can support HEVC/H.264 video encoder，max solution size is 4096x4096

Please note that VDPU121 and VEPU121 and VDPU346 and VEPU540 is four IP cores, so such four processing core can be work together.

10.3 Video frame format

This chapter describes different input and output video frame formats supported by VCODEC. Each function module has its own supported video frame formats, and this chapter describes all the video frame formats.

10.3.1 YCbCr 4:2:0 Planar Format

In the planar format, each video sample component forms one memory plane. Within one plane, the data has to be stored linearly and contiguously in the memory as shown in fellows. The luminance samples are stored in raster-scan order (Y0Y1 Y2Y3 Y4….). The chrominance samples are stored in two planes also in raster scan order (Cb0Cb1 Cb2Cb3 Cb4…. and Cr0Cr1 Cr2Cr3 Cr4….). In this format each pixel takes 12 bits of memory.

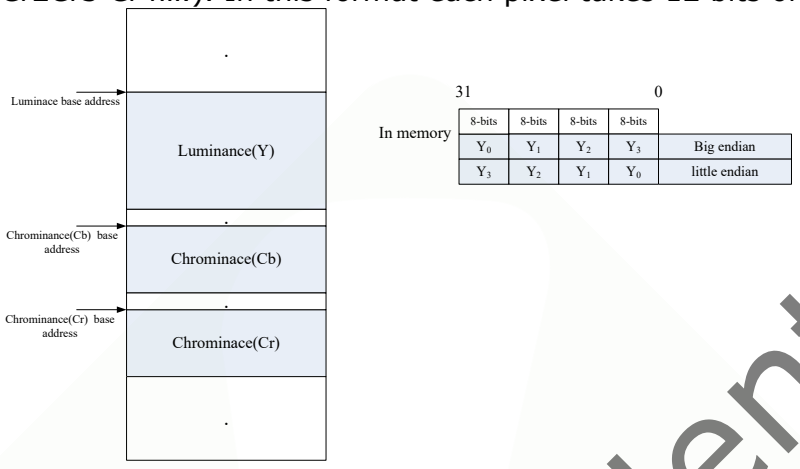

Fig. 10-2 VCODEC YCbCr 4:2:0 planar format

10.3.2 YCbCr 4:2:0 Semi-Planar format

In semi-planar YcbCr4:2:0 format the luminance samples from one plane in memory, and chrominance samples from another. Within one plane, the data has to be stored linearly and contiguously in the memory. The luminance pixels are stored in raster-scan order (Y0Y1 Y2Y3 Y4….). The interleaved chrominance CbCr samples are stored in raster-scan order in memory as Cb0Cr0 Cb1Cr1 Cb2 Cr2 Cb3Cr3 Cb4 Cr4….

Semi-Planar format supports both progressive and interlaced format as presented in Fig.10-3. The interlaced format may be alternative line or each line.

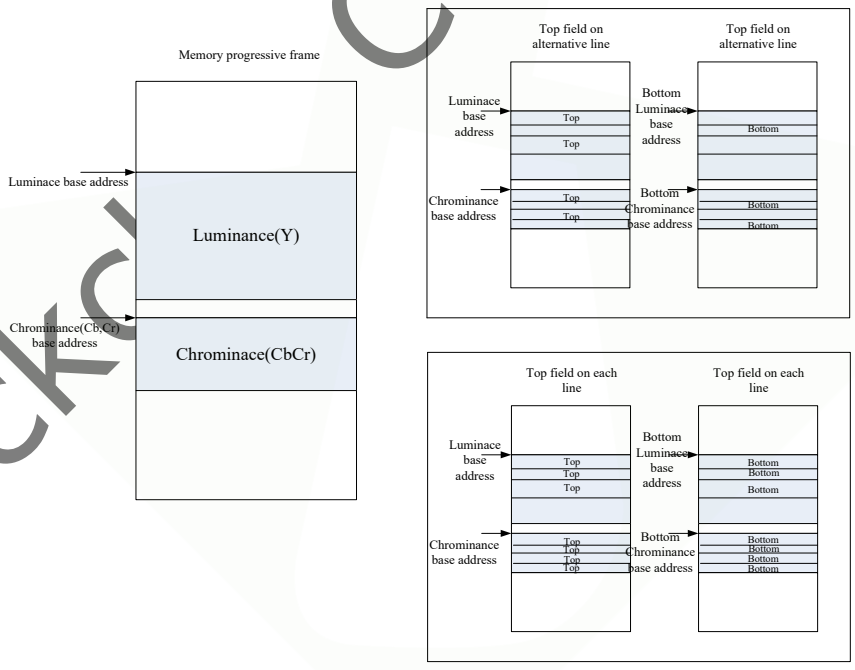

Fig. 10-3 VCODEC YCbCr 4:2:0 Semi-planar format

10.3.3 YCbCr 4:2:0 Tiled Semi-Planar Format

Like the YCbCr 4:2:0 semi-planar format, the tiled semi-planar format is also organized in the memory on two separate planes. The difference between these formats is that in tiled format the pixel samples are not anymore in raster-scan order but are stored macroblock (16x16 pixels) by macroblock. The samples of each macroblock are stored in consecutive addresses and the macroblocks are ordered from left to right and from top to down as Fi.10-4. When this format used as input data format, it causes the lowest bus load to the system

as there is minimal amount of non-sequential memory addressing required when reading the input data to the post-processor.

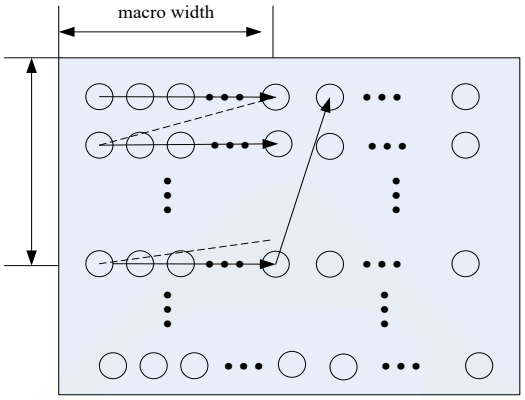

Fig. 10-4 VCODEC Tile scan mode

10.3.4 YCbCr 4:2:2 Interleaved Format

In the interleaved YCbCr 4:2:2 format the pixel samples from a single plane in which the data has to be stored linearly and contiguously as shown in Fig.10-5. The pixel data is in raster scan order and the chrominance samples are interleaved between the luminance samples as Y0Cb0 Y1Cr0 Y2 Cb1 Y3Cr1 Y4 Cb2…. YCrCb, CbYCrY and CrYCbY component orders are supported also. In this format, each pixel takes 16 bits in the memory.

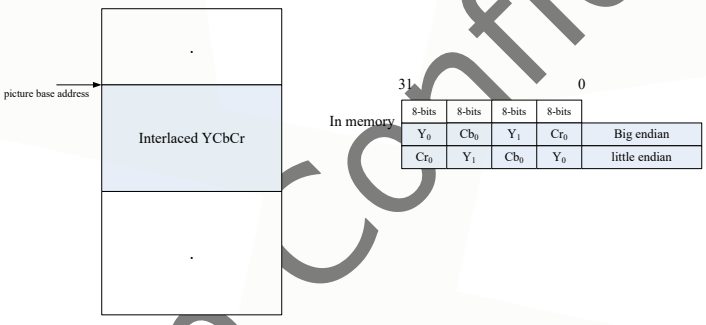

Fig. 10-5 VCODEC YCbCr4:2:2 Interleaved format

10.3.5 AYCbCr 4:4:4 Interleaved Format

In the interleaved YcbCr 4:2:2 format, the pixel samples from a single plane in which the data has to be stored linearly and contiguously as show in Fig.10-6. The pixel data is in raster scan order and the chrominance and alpha channel samples are interleaved between the luminance samples as A0Y0 Cb0Cr0 A1 Y1 Cb1Cr1….

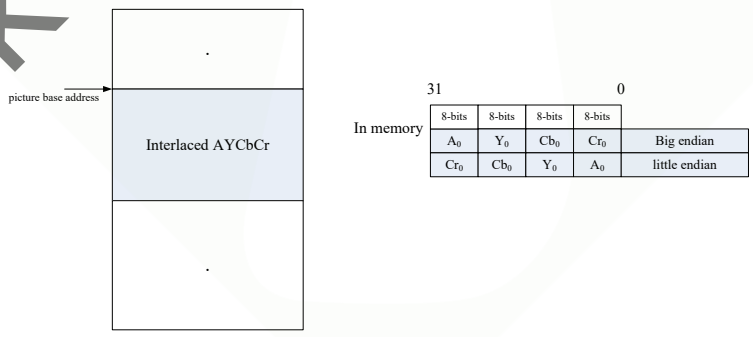

Fig. 10-6 VCODEC AYCbCr 4:4:4 Interleaved format

10.3.6 RGB 16bpp Format

In this format each pixel is represented by 16 or less bits containing the red, blue and green samples. There are several 16bpp formats which use different number of bits for each sample. For example the RGB 5-5-5 format uses 5 bits for each sample and 1 bit is left unused or can represent a transparency flag, where RGB 5-6-5 uses 6 bits for the G sample and 5 bits for R and B samples. Common for all 16bpp types is that two pixels fit into one

32-bit space.

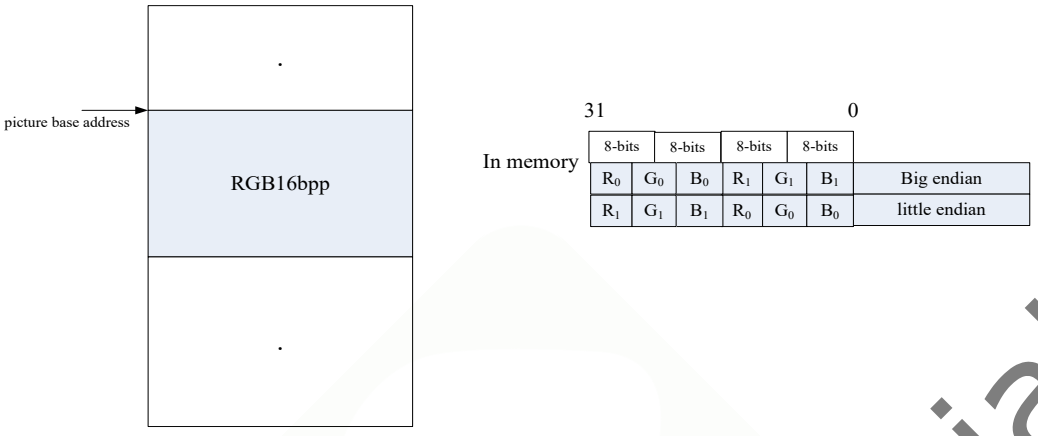

Fig. 10-7 VCODEC RGB 16bpp format

10.3.7 RGB 32bpp Format

Any RGB format that has its pixels represented by more than 16bits each is considered to be of 32bpp type. Typically in this format each pixel is represented by three bytes containing a red, blue and green sample and a 4th byte which can be empty or hold an alpha blending value. Common for all 32bpp types is that only one pixel fit into one 32-bit space. The data has to be stored linearly and contiguously in the memory.

10.3.8 Frame Buffer Compress (FBC) Format

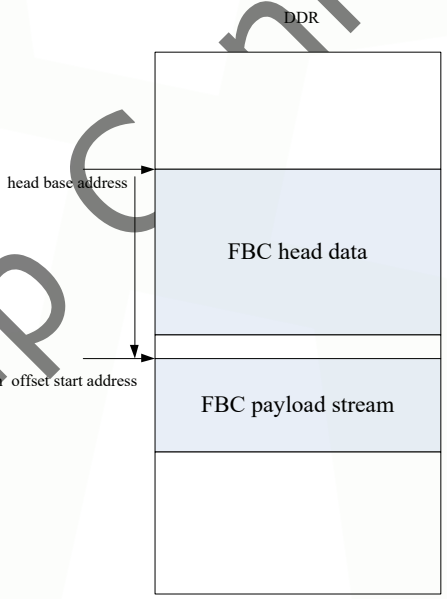

Fig. 10-9 FBC output format

As shown in the figures above,FBC output format include FBC head data and FBC payload stream.Every 16x16 block used one FBC head,every FBC head will take up 128bit ddr space, FBC HEAD is raster store and can support virtual stride .The payload stream use compact mode ,and the maximum ddr space which be required is equal to uncompress picture size.

10.4 Function Description

10.4.1 MMU

The MMU divides memory into 4KB pages, where each page can be individually configured. For each page the following parameters are specified:

- Address translation of virtual memory, this enables the processor to work using address that differ from the physical address in the memory system.
- The permitted types of accesses to that page. Each page can permit read, write, both, or none.

The MMU use 2-level page table structure:
1. The first level, the page directory consists of 1024 directory table entries(DTEs), each pointing to a page table.
2. The second level, the page table consists of 1024 page table entries(PTEs), each pointing to a page in memory.

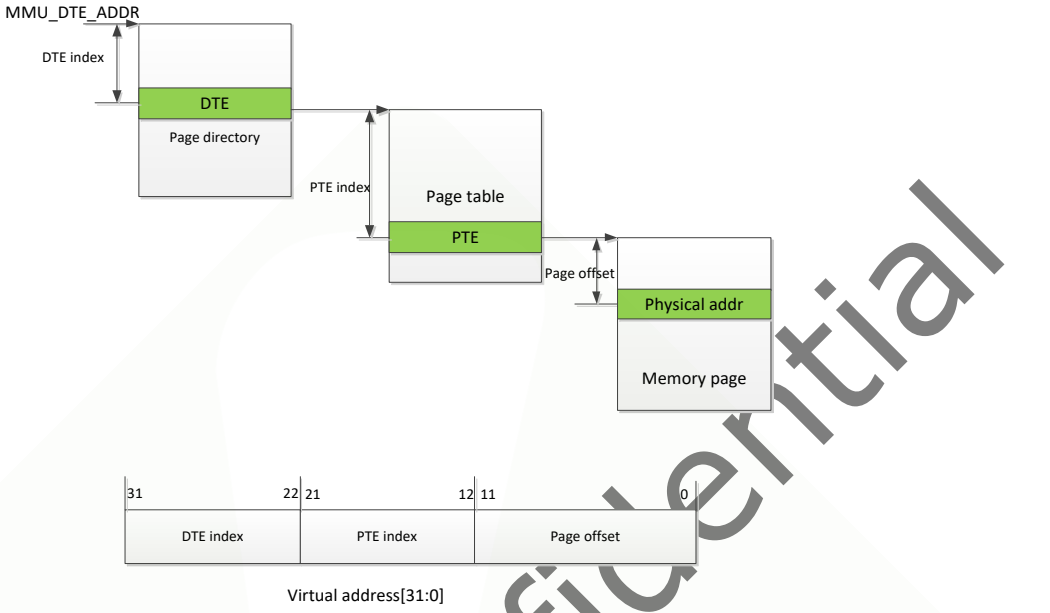

Fig. 10-8 structure of two-level page table

10.4.2 VDPU121 feature supported

1. MPEG-4 decoder

The features that video decoder supports about MPEG-4/H.263 shows as below Table 10-1.

Table 10-1 MPEG-4/H.263 feature

Feature	Decoder support
Input data format	MPEG-4/H.263 elementary video stream
Decoding scheme	Frame by frame(or field by field) Video packet by video packet
Output data format	YCbCr 4:2:0 semi-planar
Supported image size	48x48 to 1920x1088(MPEG-4) 48x48 to 720x576(H.263) Step size 16 pixels
Maximum frame rate	60fps at 1920x1088
Maximum bit rate	As specified by MPEG-4 ASP level5
Error detection and concealment	Supported

The decoder of MPEG-4/H.263 has two operating modes: in the primary mode the HW performs entropy decoding, and in the secondary mode SW performs entropy decoding. Secondary mode is used in MPEG-4 data partitioned stream decoding.

2. MPEG-2/MPEG-1 decoder

The features of MPEG-2/MPEG-1 supported by decoder are shown as Table 10-2.

Table 10-2 MPEG-2/MPEG-1 features

Feature	Decoder support
Input data format	MPEG-2/MPEG-1 elementary video stream
Decoding scheme	Frame by frame(or field by field)

Feature	Decoder support
	Video packet by video packet
Output data format	YCbCr 4:2:0 semi-planar
Supported image size	48x48 to 1920x1088 Step size 16 pixels
Maximum frame rate	60fps at 1920x1088
Maximum bit rate	As specified by MPEG-2 MP high level
Error detection and concealment	Supported

The dataflow of MPEG-2/MPEG-1 is the same of H.264 HW performs entropy decoding as Table 10-9.

10.4.3 VDPU346 feature supported

1. H265/MVC

Table 10-3 Video H.265 decoder features

Feature	Decoder support
Input data format	H265 byte unit stream/MVC stream
Decoding scheme	Frame by frame
Output data format	YCbCr 4:2:0 Semi-Planar FBC output format
Supported image size	64x64 to 4096x2304 step size 16pixels
Profile/level	Main10 level 5.1
Maximum frame rate	YCbCr 4:2:0 4096x2304 @60fps
Maximum bit rate	800MBPS
Error detection And concealment	Supported

2. H264/MVC

Table 10-4 Video H.264 decoder features

Feature	Decoder support
Input data format	H264byte or NAL unit stream/SVC stream/MVC stream
Decoding scheme	Frame by frame(or field by field) Slice by slice
Output data format	YCbCr 4:0:0 (monochrome) YCbCr 4:2:0 semi-planar raster-scan YCbCr 4:2:2 semi-planar raster-scan
Supported image size	16x16 to 4096x2304 step size 16 pixels
Profile and Level	Main10 level 5.1
Maximum frame rate	4096x2304 @30fps
Maximum bit rate	-
Error detection And concealment	Supported

3. VP9

Table 10-5 Video H.265 decoder features

Feature	Decoder support
Input data format	VP9 byte unit stream
Decoding scheme	Frame by frame
Output data format	YCbCr 4:2:0 Semi-Planar FBC output format
Supported image size	64x64 to 4096x2304

Feature	Decoder support
	step size 16pixels
Profile/level	Profile0/2 level5.1
Maximum frame rate	YCbCr 4:2:0 4096x2304 @60fps
Maximum bit rate	-
Error detection And concealment	Supported

10.4.4 VDPU346 Config Register Linked List Pointer mode(LLP mode)

VDPU346 Video decoder support link table mode to improve decoder continuity and reduce CPU participate and interrupt response time. In this mode, the register which used for config will be prepare into DDR, after that user enable link table mode, and then our decoder will fetch the register config information through AXI bus frame by frame. On link table mode, the decoder will auto finish all the frame decoder which be prepared in DDR, and not need CPU participate.

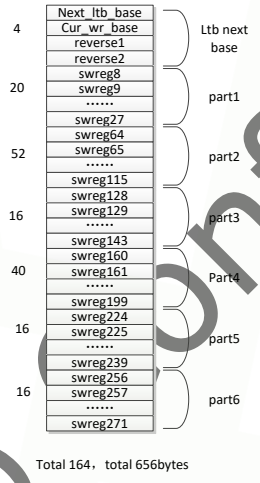

Fig. 10-9 Link table register prepare in DDR format

As show in the above Fig, Link table register prepare in DDR format, each frame config information need 656bytes in DDR. When Link table register work mode be actived,MMU should be config in first,and then parpare register to ddr,at last to config LLP ctrl register to start decoder.

After hardware decoder one frame, will write back some information to DDR where the write back base address is current config storage addr base. All the write back information are listed in the follows table.

Table 10-6 Link table write back register

offset	Description
0x0	swreg224_sta_int

0x90	swreg275_sta_ pix_range_u

offset	Description
0x94	swreg276_sta_ pix_range_v

The base address of config link table mode is RKVDEC_BASE+0x100.

10.4.5 VDPU346 Qos mode

In VDPU34X hardware, we support QOS mode, in this mode, we can request high priority to fetch data, you can control QOS work by config swreg270 and swreg271.For more detail, you can see the register description.
User should accord to the soc system to select appropriate level.

10.4.6 VDPU346 Error Processing

1. Error types

Table 10-7 VDPU346 Error Types

Error type	Description
timeout error	The VDPU34X IP will monitor if it was always be hold on idle state,and if it stay on IDLE too much long times, will give timeout error.
bus error	It will detect the axi data read and write,if there have any error happened, if it done, it will give bus error.
refer frame error	If the reference frame required by the decoder which is invalid, the hardware will give reference frame error.
stream error	If the stream meet some error, such as stream packet loss, some syntax elements value are irrationality, it will give an stream error.
mmu page fault	If the mmu page is not ready, but used by decoder, the decoder will give an mmu page fault interrupt, and after that, the software should go to prepare the missing mmu page on DDR and config hardware continue to decoder.
LLP work error	If any error happened when LLP work mode be actived, the decoder will stop next frame decoding, and then give an error interrupt, wait soft to process.

The decoder should need to be reset no matter what error types be detected. For decoder reset,it have two reset mode,you can let hardware reset itself if any error happened, or you also can select use software to config cru reset, you can config swreg2[23] to select the mode.

10.4.7 VDPU346 Decoder Output Frame Buffer Size Requested

We define variables ceilM(N) as follows:

$$\text{ceil(M,N)}=ceilM(N)=((N+M-1)/M)*M$$

1）. LLP register buffer size
For LLP work mode, LLP register buffer will be required. Every frame will require 512 byte DDR space. Then, buffer size calculate formula be defined as follows:

$$LLP\_register\_buffer\_size=frame\_num*512byte$$

There frame_num is the number of frame will be prepare in DDR when work on LLP mode.
2). Output frame decoder buffer size
If output select YCbCr 4:2:0 semi-planar raster-scan format, you can use follows formula to calculate the decoder frame buffer size.

$$luma\_frame\_buffer\_size=y\_vir\_hor\_stride*pic\_h*bit\_depth\_y/8$$

$$chroma\_frame\_buffer\_size=uv\_vir\_hor\_stride*(pic\_h/2)*bit\_depth\_c/8$$

$$frame\_buffer\_size=luma\_frame\_buffer\_size+chroma\_frame\_buffer\_size$$

There:

- y_vir_hor_stirde: The virtual stride of luma, it must should more bigger than picture width
- uv_vir_hor_stride: The virtual stride of chroma, it must should more big than picture width for YCbCr 4:2:0
- bit_depth_y/c: Main10 or main, its value will be 10 or 8

Second, if FBC format be selected,you can use follows formula to calculate the decoder

frame buffer size.

$$fbc\_head\_buffer\_size = vir\_hor\_fbc\_head * (pic\_h + 19) / 16$$

$$payload\_buffer\_size = ceil64(pic\_w) * (ceil64(pic\_h) + 16)$$

$$max\_fbc\_buffer\_size = fbc\_head\_buffer\_size + payload\_buffer\_size$$

There:

- vir_hor_fbc_head:the horizontal virtual stride of fbc head,its valud should more bigger than $ceil64(pic\_w)/16$.

But payload real buffer size space used will less than payload_buffer_size,it will according to FBC compress rate.

3). Output frame colmv buffer size

If colmv compress be disabled, you can use follows formula to calculate the decoder frame buffer size.

Table 10-8 Colmv uncompress info

Format	Colmv_size	Colmv space(bytes unit)
h264	4x4	8
hevc	16x16	16
vp9	8x8	16
avs2	16x16	8

So, the colmv uncompress size is:

$$colmv\_buffer\_size0 = (ceil64(pic\_w) * ceil64(pic\_h) / (colmv\_size * colmv\_size)) * colmv\_bytes$$

The buffer size unit is byte unit.

If colmv compress be active, you can use follows formula to calculate the decoder frame buffer size.

segment_w = (64 * colmv_size * colmv_size) / ctu_size

segment_h = ctu_size

pic_w_align = *ceil*(pic_w, segment_w)

pic_h_align = *ceil*(pic_h, segment_h)

seg_cnt_w=pic_w_align/segment_w

seg_cnt_h=pic_h_align/segment_h

segment_head_line_size=ceil（seg_cnt_w,16）

seg_head_size=segment_head_line_size*seg_cnt_h

seg_payload_size=seg_cnt_w*seg_cnt_h*64*colmv_bytes

colmv_compress_size=seg_head_size+seg_payload_size

where:

- *c*tu_*size*:*ct*u size;
- colmv_size：the block size for each colmv
- colmv_bytes：each colmv space used

4). Error info buffer size

If error infomation be enable write to DDR, the error info buffer size will be required, and we can use the follows formula to calculate the error info buffer size.

$$error\_info\_buffer\_size = ceil2(slice\_num) * 8$$

only h264 and h265 support error info output.

10.4.8 VDPU346 Decoder temporary Buffer Size Requested

The temporary buffer only used when VDPU346 on working status.The data write to temporary buffer size is row and col buffer data,we suggest row buffer used internal sram buffer will enhance the decoder performance.

Row buffer and Col buffer size require are listed as fellows.

Table 10-9 Row or Col buffer size required

data type	required condtion	buffer size
Inter Row	H.265/H.264/VP9	6*pic_width
	H.264,mbaff	6*pic_width

data type	required condtion	buffer size
Recon Row	H.265/H.264,not mbaff/VP9	3* pic_width
Dblk Row	H.265	9*pic_width
	H.264	16*pic_width
	VP9	22* pic_width
Sao Row	H.265	4* pic_width
Fbc Row	H.264	3* pic_width
	VP9	10* pic_width
Inter Col	H.265/VP9, have col tile	3* pic_height
Filterd Col	H.265,have col tile	36* pic_height
	VP9,have col tile	31* pic_height

10.4.9 VDPU720 feature supported

1. JPEG Decoder
JPEG features supported by decoder are as shown in Table 10-10.

Table 10-10 JPEG features

Feature	Decoder support
Input data format	JFIF file format 1.02 YCbCr 4:0:0, 4:2:0, 4:2:2, 4:4:0, 4:1:1 and 4:4:4 semi-planar
Decoding scheme	frame by frame
Output data format	YCbCr 4:0:0, 4:2:0, 4:2:2, 4:4:0, 4:1:1 and 4:4:4 semi-planar
Supported image size	48x48 to 65536x65536(4295Mpixels) Step size 8 pixels
Maximum frame rate	Up to 240 million pixels pre second
Thumbnail decoding	JPEG compressed thumbnails supported
Restart marker frequency decoding	Supported
MJPEG	Supported
Error detection	Supported

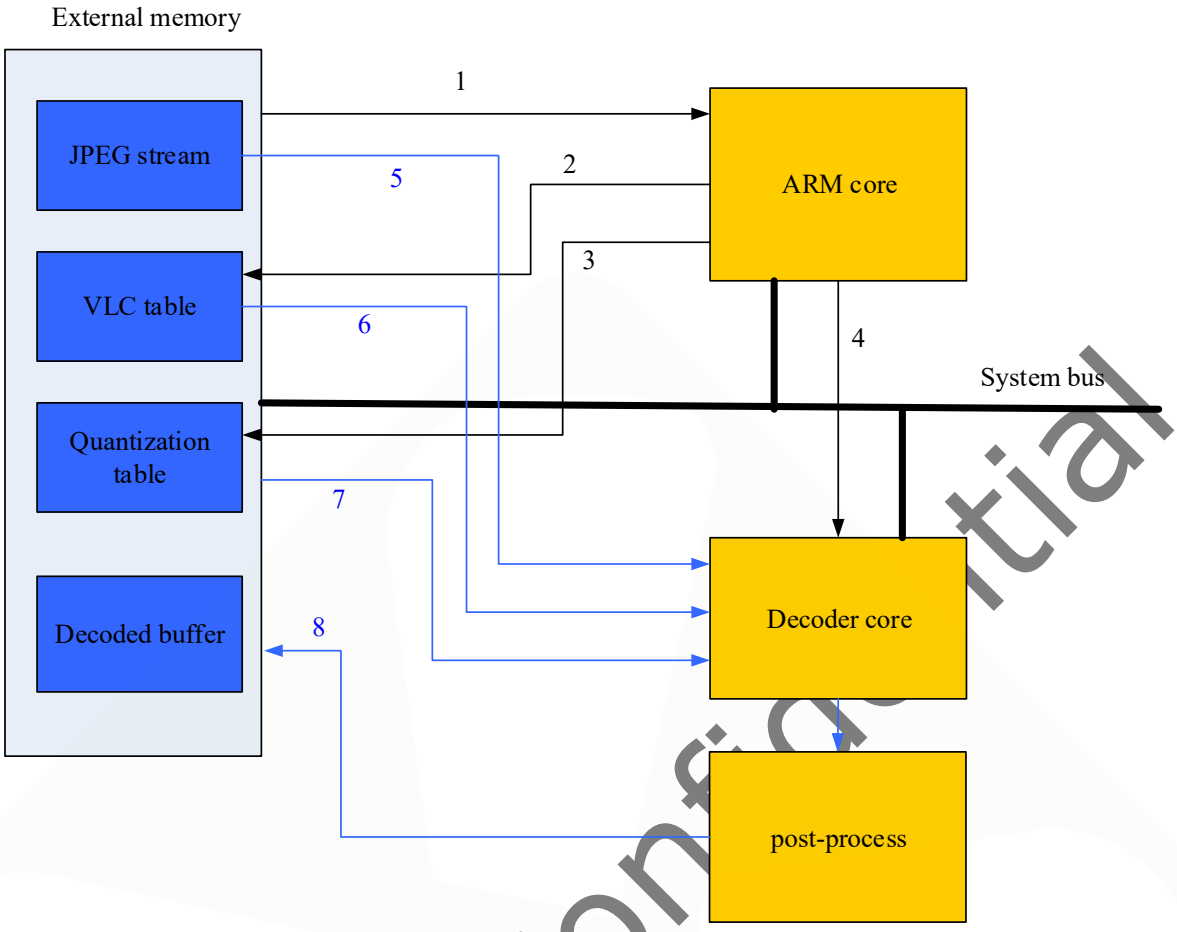

Fig. 10-10 The dataflow of JPEG decoder and post-processor

The data flow of jpeg decoder is as Fig. 10-10 shown. The decoder software starts decoding the picture by parsing the stream headers (1) and then writes the following items to external memory:
VLC tables (2)
Quantization tables (3)
Last step for the software is to write the hardware control registers and to enable the hardware (4). After starting hardware, SW waits interrupt from HW.
Hardware decodes the picture by reading stream (5), VLC (6) and QP (7) tables. Hardware writes the decoded output picture memory one macroblock at a time (8). When the picture has been fully decoded, or the hardware has run out of stream data, it gives an interrupt with a proper status flag and provides stream end address for software to continue and returns to initial state.
The follow image post-processor only support combined mode.

2. Image Post-processor
The features supported by Post-processor are as show in Table 10-11.

Table 10-11 Post-processor features

Feature	Post-processor support
Input data format	Any format generated by the decoder in combined mode YCbCr 4:2:0 semi-planar YCbCr 4:2:0 planar YCbYCr 4:2:2 YCrYCb 4:2:2 CbYCrY 4:2:2 CrYCbY 4:2:2

Feature	Post-processor support
Post-processor scheme	Frame by frame. Post-processor handles the image macroblock by macroblock.
Input image source	Internal source
Output data format	YCbCr 4:2:0 semi-planar YCbCr 4:2:2 YCrYCb 4:2:2 CbYCrY 4:2:2 CrYCbY 4:2:2 Fully configurable RGB channel lengths and locations inside 24 bits, e.g. RGB 24-bit (8-8-8), RGB 16-bit(5-6-5).
Input image size	48x48 to 65536x65536 Step size 8 pixels
Output image size	16x16 to 65536x65536 Horizontal step size 1 Vertical step size 1
Image down-scaling	Proprietary averaging filter Arbitrary, integer scaling ratio separately for both dimensions 0/2/4/8 down-scaling ratio
YCbCr to RGB color conversion	BT.601 compliant BT.709 compliant User definable conversion coefficient
Dithering	2x2 ordered spatial dithering for 4,5 and 6 bit RGB channel precision
Output picture	support raster or tile mode picture out luma 8x8 block tile

In pipe-line mode, the post-processor works together with the multi-format decoder. The PP will take its input directly from the decoder. The dataflow is as Fig. 10-11 show.

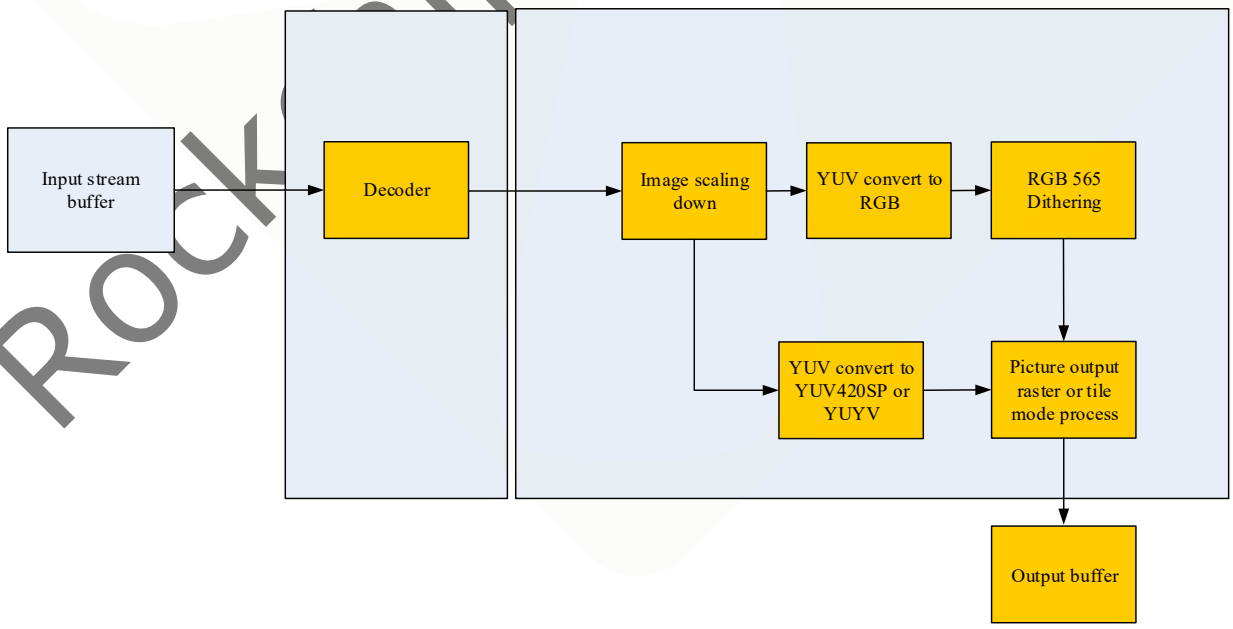

Fig. 10-11 Post-process Dataflow

10.4.10 VEPU121 feature supported

1. JPEG encoder

The JPEG features supported by encoder are shown as follows.

Table 10-12 Video Jpeg encoder feature

Feature	Encoder support
Input data format	YCbCr formats: YCbCr 4:2:0 planar YCbCr 4:2:0 semi-planar YCbYCr 4:2:2① CbYCrY 4:2:2 Interleaved① RGB formats:① RGB444 to BGR444 RGB555 to BGR555 RGB565 to BGR565 RGB888 to BRG888 RGB101010 and BRG 101010
Output data format	JFIF FILE format 1.02 Non-progressive JPEG
Supported image size	96x96 to 8192x8192(64 million pixels) Step size 4 pixels
Maximum Data rate	Up to 90 million pixels per second

①internally encoder handles image only in 4:2:0 format

1.4.10 VEPU540 H.264 or HEVC Encoding

VEPU can perform one frame H.264 or HEVC encoding by register configuration. User should allocate DDR buffer, configure VEPU through AHB slave port, and then wait for frame finish interrupt.

VEPU also have batch processing mode (the so called link-table mode). User should configure the link table node in DDR, start VEPU, and then wait for frame or sequence finish. User can also add new frames to be encoded while VEPU is processing the previous one.

1.4.11 VEPU540 Video Source Pre-process

VEPU can read video source of different color formats such as ARGB, RGB, YUV422/420 P/SP, and Arm AFBC YUV422/420. It also supports image clipping, rotation, mirror and OSD insertion.

1.4.12 VEPU540 ROI Configuration

User can configure QP and I/P selection for each 16x16 block through VEPU ROI configuration.

10.5 Register Description

10.5.1 Internal Address Mapping

This section describes the control/status registers of the codec.

If VDPU121 decoder is chosen to work, the register base address is VDPU121_base.
If VDPU346 decoder is chosen to work, the register base address is VDPU346_base.
If VDPU720 decoder is chosen to work, the register base address is VDPU720_base.
If VEPU121 encoder is chosen to work, the register base address is VEPU121_base.
If VEPU540 encoder is chosen to work, the register base address is VEPU540_base.
All the register config base are listed as follows:

Table 10-13 Base address of config

Config Register	Base addr
VDPU121 function config base	VDPU121_base
VDPU121 mmu config base	VDPU121_base+0x400
VDPU346 link table config base	VDPU346_base+0x100
VDPU346 function config base	VDPU346_base+0x200
VDPU346 cache config base	VDPU346_base+0x700 for luma channel VDPU346_base+0x740 for chroma channel

Config Register	Base addr
VDPU346 mmu config base	VDPU346_base+0x800 for read channel VDPU346_base+0x840 for write channel
VDPU720 function config base	VDPU720_base
VDPU720 mmu config base	VDPU720_base+0x480
VDPU720 link table config base	VDPU720_base+0x300
VEPU121 function config base	VEPU121_base
VEPU121 mmu config base	VEPU121_base+0x800
VEPU540 function config base	VEPU540_base
VEPU540 mmu config base	VEPU540_base+0xF00

Table 10-14 Base address value

Base addr	value
VDPU121_base	0xFDEA_0400
VDPU346_base	0xFDF8_0000
VDPU720_base	0xFDED_0000
VEPU121_base	0xFDEE_0000
VEPU540_base	0XFDF4_0000

10.5.2 VDPU121 Registers Summary

Name	Offset	Size	Reset Value	Description
VDPU_SWREG0_NEW_VERSION	0x0000	W	0x03680000	ID register(read only)when vpu share memory with hevc, this register is not be used.
VDPU_SWREG0	0x0000	W	0x00000000	Register0000 Description
VDPU_SWREG1	0x0004	W	0x00000000	Interrupt register decoder
VDPU_SWREG2	0x0008	W	0x01000400	Device configuration register decoder
VDPU_SWREG3	0x000c	W	0x00000001	Device control register 0 (decode, picture type etc)
VDPU_SWREG4_H264	0x0010	W	0x00000000	Decoder control register 1 (picture parameters)
VDPU_SWREG4	0x0010	W	0x00000000	Decoder control register 1(picture parameters)
VDPU_SWREG5	0x0014	W	0x00000000	Decoder control register2 (stream decoding table selects)
VDPU_SWREG5_H264	0x0014	W	0x00000000	Decoder control register2 (stream decoding table selects)
VDPU_SWREG6	0x0018	W	0x00000000	Decoder control register 3 (stream buffer information)
VDPU_SWREG7	0x001c	W	0x00000000	Decoder control register 4 (H264, VC-1 control)

Name	Offset	Size	Reset Value	Description
VDPU_SWREG8	0x0020	W	0x00000000	Decoder control register 5(H264, VC-1 control)
VDPU_SWREG9	0x0024	W	0x00000000	Base address for MB-control (RLC) /VC-1 intensity control 0.
VDPU_SREG10_H264_RLC	0x0028	W	0x00000000	Base address for differential motion vector base address (RLC-mode)/H264 P initial fwd ref pic list register(4-9)/ VC-1 intensity control 1.
VDPU_SREG10_H264	0x0028	W	0x00000000	Base address for differential motion vector base address (RLC-mode)/H264 P initial fwd ref pic list register(4-9)/VC-1 intensity control 1.
VDPU_SWREG11_H264_RLC	0x002c	W	0x00000000	Base address for H.264 intra prediction 4x4/base address for MPEG-4 DC component (RLC)/H264 P initial fwd ref pic list register(10-15)/VC-1 intensity control 2
VDPU_SWREG11_H264	0x002c	W	0x00000000	Base address for H.264 intra prediction 4x4/base address for MPEG-4 DC component (RLC)/H264 P initial fwd ref pic list register(10-15)/VC-1 intensity control 2
VDPU_SWREG12	0x0030	W	0x00000000	Base address for RLC data (RLC)/ stream start address/decoded end addr register (VLC)
VDPU_SWREG13	0x0034	W	0x00000000	Base address for decoded picture/ base address for JPEG decoder output luminance picture
VDPU_SWREG14	0x0038	W	0x00000000	Base address for reference picture index 0/base address for JPEG decoder output chrominance picture
VDPU_SWREG15_JPEG_ROI	0x003c	W	0x00000000	JPEG roi control
VDPU_SWREG15	0x003c	W	0x00000000	Base address for reference picture index 1/JPEG control

Name	Offset	Size	Reset Value	Description
VDPU_SWREG16	0x0040	W	0x00000000	Base address for reference picture index 2/List of VLC code lengths in first JPEG AC table
VDPU_SWREG17	0x0044	W	0x00000000	Base address for reference picture index 3/List of VLC code lengths in first JPEG AC table
VDPU_SWREG18	0x0048	W	0x00000000	Base address for reference picture index 4/VC1 control/MPEG4 MVD control/List of VLC code lengths in first JPEG AC table/VC-1 intensity control 4.
VDPU_SWREG19	0x004c	W	0x00000000	Base address for reference picture index 5/MPEG4 TRB/TRD delta 0/VC-1 intensity control 3 List of VLC code lengths in first/second JPEG AC table.
VDPU_SWREG20	0x0050	W	0x00000000	Base address for reference picture index 6/MPEG4 TRB/TRD delta -1/List of VLC code lengths in second JPEG AC table. Note: The h264 decoder will use these bits.
VDPU_SWREG21	0x0054	W	0x00000000	Base address for reference picture index 7/MPEG4 TRB/TRD delta 1 / List of VLC code lengths in second JPEG AC table. Note: The h264 decoder will use these bits.
VDPU_SWREG22	0x0058	W	0x00000000	Base address for reference picture index 8/List of VLC code lengths in second JPEG AC table. Note: The h264 decoder will use these bits.
VDPU_SWREG23	0x005c	W	0x00000000	Base address for reference picture index 9 / List of VLC code lengths in first JPEG DC table. Note: The h264 decoder will use these bits.
VDPU_SWREG24	0x0060	W	0x00000000	Base address for reference picture index 10/List of VLC code lengths in first JPEG DC table. Note: The h264 decoder will use these bits.

Name	Offset	Size	Reset Value	Description
VDPU_SWREG25	0x0064	W	0x00000000	Base address for reference picture index 11/List of VLC code lengths in second JPEG DC table. Note: The h264 decoder will use these bits.
VDPU_SWREG26	0x0068	W	0x00000000	Base address for reference picture index 12/list of VLC code lengths in second JPEG DC table. Note: The h264 decoder will use these bits.
VDPU_SWREG27	0x006c	W	0x00000000	Base address for reference picture index 13/VC-1 bitpl mbctrl. Note: the h264 decoder will use these bits.
VDPU_SWREG28	0x0070	W	0x00000000	Base address for reference picture index14. Note: The h264 decoder will use these bits.
VDPU_SWREG29	0x0074	W	0x00000000	Base address for reference picture index15. Note: The h264 decoder will use these bits.
VDPU_SWREG30	0x0078	W	0x00000000	Reference picture numbers for index 0 and 1 (H264 VLC).
VDPU_SWREG31	0x007c	W	0x00000000	Reference picture numbers for index 2 and 3 (H264 VLC).
VDPU_SWREG32	0x0080	W	0x00000000	Reference picture numbers for index 4 and 5 (H264 VLC).
VDPU_SWREG33	0x0084	W	0x00000000	Reference picture numbers for index 6 and 7 (H264 VLC).
VDPU_SWREG34	0x0088	W	0x00000000	Reference picture numbers for index 8 and 9 (H264 VLC)/MPEG4, VC1 prediction filter taps
VDPU_SWREG35_JPEG_ROI	0x008c	W	0x00000000	JPEG roi offset/dc base address
VDPU_SWREG35	0x008c	W	0x00000000	Reference picture numbers for index 10 and 11 (H264 VLC)/VC1 prediction filter taps

Name	Offset	Size	Reset Value	Description
VDPU_SWREG36	0x0090	W	0x00000000	Reference picture numbers for index 12 and 13 (H264 VLC)/VC1 prediction filter taps
VDPU_SWREG36_JPEG_ROI	0x0090	W	0x00000000	JPEG roi offset/dc length
VDPU_SWREG37	0x0094	W	0x00000000	Reference picture numbers for index 14 and 15 (H264 VLC).
VDPU_SWREG38	0x0098	W	0x00000000	Reference picture long term flags (H264 VLC).
VDPU_SWREG38_H264	0x0098	W	0x00000000	Reference picture numbers for index 12 and 13 (H264 VLC)/VC1 prediction filter taps
VDPU_SWREG39	0x009c	W	0x00000000	Reference picture valid flags (H264 VLC).
VDPU_SWREG39_H264	0x009c	W	0x00000000	Reference picture numbers for index 12 and 13 (H264 VLC)/VC1 prediction filter taps
VDPU_SWREG40	0x00a0	W	0x00000000	Base address for standard dependent tables
VDPU_SWREG41	0x00a4	W	0x00000000	Base address for direct mode motion vectorsNote: The h264 decoder will use these bits.
VDPU_SWREG42	0x00a8	W	0x00000000	Bi_dir initial ref pic list register (0-2). Note: The h264 decoder will use these bits.
VDPU_SWREG43	0x00ac	W	0x00000000	Bi-dir initial ref pic list register (3-5). Note: The h264 decoder will use these bits.
VDPU_SWREG44	0x00b0	W	0x00000000	Bi-dir initial ref pic list register (6-8). Note: The h264 decoder will use these bits.
VDPU_SWREG45	0x00b4	W	0x00000000	Bi-dir initial ref pic list register (9-11). Note: The h264 decoder will use these bits.
VDPU_SWREG46	0x00b8	W	0x00000000	Bi-dir initial ref pic list register (12- 14). Note: The h264 decoder will use these bits.

Name	Offset	Size	Reset Value	Description
VDPU_SWREG47	0x00bc	W	0x00000000	Bi-dir and P fwd initial ref pic list register (15 and P 0-3). Note: The h264 decoder will use these bits.
VDPU_SWREG48	0x00c0	W	0x00000000	Error concealment register
VDPU_SWREG49	0x00c4	W	0x00000000	Prediction filter tap register for H264, MPEG4, VC1
VDPU_SWREG50	0x00c8	W	0xfbb56f80	Synthesis configuration register decoder 0 (read only)
VDPU_SWREG51	0x00cc	W	0x00000000	Reference picture buffer control register
VDPU_SWREG52	0x00d0	W	0x00000000	Reference picture buffer information register 1 (read only)
VDPU_SWREG53	0x00d4	W	0x00000000	Reference picture buffer information register 2 (read only)
VDPU_SWREG54	0x00d8	W	0xe5da0000	Synthesis configuration register decoder 1 (read only)
VDPU_SWREG55	0x00dc	W	0x00000000	Reference picture buffer 2/Advanced prefetch control register
VDPU_SWREG56	0x00e0	W	0x00000000	Reference buffer information register 3 (read only)
VDPU_SWREG57_INTRA_INTER	0x00e4	W	0x00000000	Intra_dll3t,intra_dblspeed, inter_dblspeed, stream_len_hi
VDPU_SWREG57	0x00e4	W	0x00000000	Intra_dll3t,intra_dblspeed, inter_dblspeed, stream_len_hi
VDPU_SWREG58	0x00e8	W	0x00000000	Decoder debug register 0 (read only)
VDPU_SWREG59	0x00ec	W	0x00000000	H264 Chrominance 8 pixel interleaved data base
VDPU_SWREG60	0x00f0	W	0x00000000	Interrupt register post-processor
VDPU_SWREG61	0x00f4	W	0x01010100	Device configuration register post-processor
VDPU_SWREG62	0x00f8	W	0x00000000	Deinterlace control register

Name	Offset	Size	Reset Value	Description
VDPU_SWREG63	0x00fc	W	0x00000000	Base address for reading post-processing input picture uminance (top field/frame)
VDPU_SWREG64	0x0100	W	0x00000000	Base address for reading post-processing input picture Cb/Ch (topfield/frame)
VDPU_SWREG65	0x0104	W	0x00000000	Base address for reading post-processing input picture Cr
VDPU_SWREG66	0x0108	W	0x00000000	Base address for writing post-processed picture luminance/RGB
VDPU_SWREG67	0x010c	W	0x00000000	Base address for writing post-processed picture Ch
VDPU_SWREG68	0x0110	W	0x00000000	Register for contrast adjusting
VDPU_SWREG69	0x0114	W	0x00000000	Register for colour conversion and contrast adjusting
VDPU_SWREG70	0x0118	W	0x00000000	Register for colour conversion 0
VDPU_SWREG71	0x011c	W	0x00000000	Register for colour conversion 1 + rotation mode
VDPU_SWREG72	0x0120	W	0x00000000	PP input size and cropping register
VDPU_SWREG73	0x0124	W	0x00000000	PP input picture base address for Y bottom field
VDPU_SWREG74	0x0128	W	0x00000000	PP input picture base for Ch bottom field
VDPU_SWREG79	0x013c	W	0x00000000	Scaling ratio register 1 & padding for B
VDPU_SWREG80	0x0140	W	0x00000000	Scaling register 0 ratio & padding for R and G
VDPU_SWREG81	0x0144	W	0x00000000	Scaling ratio register 2
VDPU_SWREG82	0x0148	W	0x00000000	Rmask register
VDPU_SWREG83	0x014c	W	0x00000000	Gmask register
VDPU_SWREG84	0x0150	W	0x00000000	Bmask register

Name	Offset	Size	Reset Value	Description
VDPU_SWREG85	0x0154	W	0x00000000	Post-processor control register
VDPU_SWREG86	0x0158	W	0x00000000	Mask 1 start coordinate register
VDPU_SWREG87	0x015c	W	0x00000000	Mask 2 start coordinate register
VDPU_SWREG88	0x0160	W	0x00000000	Mask 1 size and PP original width register
VDPU_SWREG89	0x0164	W	0x00000000	Mask 2 size register
VDPU_SWREG90	0x0168	W	0x00000000	PiP register 0
VDPU_SWREG91	0x016c	W	0x00000000	PiP register 1 and dithering control
VDPU_SWREG92	0x0170	W	0x00000000	Display width and PP input size extension register
VDPU_SWREG93	0x0174	W	0x00000000	Display width and PP input size extension register
VDPU_SWREG94	0x0178	W	0x00000000	Base address for alpha blend 2 gui component
VDPU_SWREG95	0x017c	W	0x00000000	Base address for alpha blend 2 gui component
VDPU_SWREG98	0x0188	W	0x00000000	PP outupt width/height extension
VDPU_SWREG99	0x018c	W	0xe000f000	PP fuse register (read only)
VDPU_SWREG100	0x0190	W	0xff874780	Synthesis configuration register post-processor (read only)

VDPU_SWREG105	0x01a4	W	0x00000000	Monitor signal sellected
VDPU_SWREG106	0x01a8	W	0x00000000	Performance montor cnt0
VDPU_SWREG107	0x01ac	W	0x00000000	Performance montor cnt1

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

10.5.3 VDPU121 Detail Registers Description

VDPU_SWREG0_NEW_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	Reserved
27:24	RO	0x3	Major_version 1'b0: 1080p support 1'b1: 2160p support
23:16	RO	0x68	Minor_version 0: Audis 1: Audi 2: Maybach 3: Audib FF: Share memory with hevc, so should read version from hevc register
15:0	RW	0x0000	Build The rtl's svn num in ic server

VDPU_SWREG0

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Pro_num project number
15:12	RW	0x0	Major_version Major version
11:4	RW	0x00	Minor_version Minor version
3	RW	0x0	ID_ASCII_EN ASCII type product ID enable
2:0	RW	0x0	Build_version Build version

VDPU_SWREG1

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	Reserved

Bit	Attr	Reset Value	Description
24	RW	0x0	Sw_dec_pic_inf B slice detected. This signal is driven high during picture ready interrupt if B-type slice is found. This bit does not launch interrupt but is used to inform SW about h264 tools. Note: The h264 decoder will use these bits.
23:19	RO	0x00	Reserved
18	RW	0x0	Sw_dec_timeout Interrupt status bit decoder timeout. When high the decoder 0 has been idling for too long. HW will self reset. Possible only if timeout interrupt is enabled. Note: The h264 decoder will use these bits.
17	RW	0x0	Sw_dec_slice_int Interrupt status bit dec_slice_decoded. When high SW must set new base addresses for Sw_dec_out_base and. Sw_jpg_ch_out_base before reseting this status bit. Used for JPEG snapshot modes. Note: The JPEG decoder will use these bits.
16	RW	0x0	Sw_dec_error_int Interrupt status bit input stream error. When high, an error is found in input data stream decoding. HW will self reset. Note: The h264 decoder will use these bits.
15	RW	0x0	Sw_dec_aso_int Interrupt status bit ASO (Arbitrary Slice Ordering) detected.When high, ASO detected in input data stream decoding. HW will self reset. Note: The h264 decoder will use these bits.
14	RW	0x0	Sw_dec_buffer_int Interrupt status bit input buffer empty. When high, Input stream buffer is empty but picture is not ready. HW will not self reset. Note: The h264 decoder will use these bits.
13	RW	0x0	Sw_dec_bus_int Interrupt status bit bus. Error response from bus. HW will self reset. Note: The h264 decoder will use these bits.
12	RW	0x0	Sw_dec_rdy_int Interrupt status bit decoder. When this bit is high decoder has decoded a picture. HW will self reset. Note: The h264 decoder will use these bits.
11:9	RO	0x0	Reserved
8	RW	0x0	Sw_dec_irq Decoder IRQ. When high, decoder requests an interrupt. SW will reset this after interrupt is handled. Note: The h264 decoder will use these bits.
7:5	RO	0x0	Reserved
4	RW	0x0	Sw_dec_irq_dis Decoder IRQ disable. When high, there are no interrupts concerning decoder from HW. Polling must be used to see the interrupt statuses. Note: The h264 decoder will use these bits.

Bit	Attr	Reset Value	Description
3:1	RO	0x0	Reserved
0	RW	0x0	Sw_dec_en Decoder enable. Setting this bit high will start the decoding operation. HW will reset this when picture is processed or ASO or stream error is detected or bus error or timeout interrupt is given. Note: The h264 decoder will use these bits.

VDPU_SWREG2

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RW	0x01	Sw_dec_axi_rd_id Read ID used for decoder reading services in AXI bus (if connected to AXI). Note: The h264 decoder will use these bits.
23	RW	0x0	Sw_dec_timeout_e Timeout interrupt enable. If enabled HW may return timeout interrupt in case HW gets stucked while decoding picture. Note: The h264 decoder will use these bits.
22	RW	0x0	Sw_dec_strswap32_e Decoder input 32bit data swap for stream data (may be used for 64 bit environment): 1'b0: No swapping of 32 bit words 1'b1: 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled)). Note: The h264 decoder will use these bits.
21	RW	0x0	Sw_dec_strendian_e Decoder input endian mode for stream data: 1'b0: Big endian (0-1-2-3 order) 1'b1: Little endian (3-2-1-0 order) Note: The h264 decoder will use these bits.
20	RW	0x0	Sw_dec_inswap32_e Decoder input 32bit data swap for other than stream data (may be used for 64 bit environment): 1'b0: No swapping of 32 bit words 1'b1: 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled)) Note: The h264 decoder will use these bits.
19	RW	0x0	Sw_dec_outswap32_e Decoder output 32bit data swap (may be used for 64 bit environment): 1'b0: No swapping of 32 bit words 1'b1: 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled)). Note: The h264 decoder will use these bits.

Bit	Attr	Reset Value	Description
18	RW	0x0	Sw_dec_data_disc_e Data discard enable. Precise burst lengths are used with reading services. Extra data is discarded internally. Note: The h264 decoder will use these bits.
17	RW	0x0	sw_tiled_mode_msb Tiled mode msb. Concanated to Tiled mode lsb which form 2 bit tiled mode. Definition of tiledmode: 2'd0: Tiled mode not enabled 2'd1: Tiled mode enabled for 8x4 tile size 2'd2, 2'd3: Reserved Note: The h264 decoder will use these bits.
16:11	RW	0x00	Sw_dec_latency Decoder master interface additional latency. Can be used to slow down decoder HW between services in steps of 8 clock cycles: 6'd0: No latency 6'd1: Minimum 8 cycles of IDLE between services 6'd2: Minimum 16 cycles of IDLE between services ... 6'd63: Minimum latency of 504 cycles of IDLE between services Note: The h264 decoder will use these bits.
10	RW	0x1	Sw_dec_clk_gate_e Decoder dynamic clock gating enable: 1'b0: Clock is running for all structures 1'b1: Clock is gated for decoder structures that are not used Note: Clock gating value can be changed only when decoder is disabled.
9	RW	0x0	Sw_dec_in_endian Decoder input endian mode for other than stream data: 1'b0: Big endian (0-1-2-3 order) 1'b1: Little endian (3-2-1-0 order) Note: The h264 decoder will use these bits.
8	RW	0x0	Sw_dec_out_endian Decoder output endian mode: 1'b0: Big endian (0-1-2-3 order) 1'b1: Little endian (3-2-1-0 order) Note: The h264 decoder will use these bits.
7	RW	0x0	Sw_tiled_mode_lsb Tiled mode lsb. Concatenated to Tiled mode msb which form 2 bit tiled mode. Defined in tiled_mode_msb. Note: The h264 decoder will use these bits.
6	RW	0x0	Sw_dec_adv_pre_dis Advanced PREFETCH mode disable (advanced reference picture reading mode for video). Note: The h264 decoder will use these bits.
5	RW	0x0	Sw_dec_scmd_dis AXI Single Command Multiple Data 0 disable. (where only the first addresses of the burst are given from address generator). This bit is used to disable the feature (possible SW workaround if something is not working correctly). Note: The h264 decoder will use these bits.

Bit	Attr	Reset Value	Description
4:0	RW	0x00	Sw_dec_max_burst Maximum burst length for decoder bus transactions. Valid values: AXI: 1-16 Note: The h264 decoder will use these bits.

VDPU_SWREG3

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	Sw_dec_mode Decoding mode: 0 = H.264, 1 = MPEG-4, 2 = H.263, 3 = JPEG, 4 = VC-1, 5 = MPEG-2, 6 = MPEG-1, 11 = AVS, Others = reserved Note: All the decoder mode will use these bits.
27	RW	0x0	Sw_rlc_mode_e RLC mode enable: 1'b1: HW decodes video from RLC input data + side information (Differential MV's, separate DC coeffs, Intra 4x4 modes, MB control). Valid only for H.264 Baseline and MPEG- 4 SP. 1'b0: HW decodes video from bit stream (VLC mode) + side information (bitplane data in VC-1). Note: The h264 and MPEG4 decoder will use these bits.
26	RW	0x0	Sw_skip_mode AVS: 1'b0: Special MB type code indicates skipped mbs 1'b1: Means that skipped mbs are indicated using skip_run - syntax element like in
24	RW	0x0	Sw_pjpeg_e Progressive JPEG enable: 1'b0: Baseline JPEG 1'b1: Progressive JPEG
23	RW	0x0	Sw_pic_interlace_e Coding mode of the current picture: 1'b0: Progressive 1'b1: Interlaced Note: The h264 decoder will use these bits.
22	RW	0x0	Sw_pic_fieldmode_e Structure of the current picture (residual structure) 1'b0: Frame structure, this means MBAFF structured picture for interlaced sequence 1 = field structure Note: The h264 decoder will use these bits.

Bit	Attr	Reset Value	Description
21	RW	0x0	Sw_pic_b_e B picture enable for current picture: 1'b0: Picture type is I or P depending on sw_pic_inter_e 1'b1: Picture type is BI (vc1)/D (mpeg1) or B depending on sw_pic_inter_e (not valid for H264 since its slice based information)
20	RW	0x0	Sw_pic_inter_e Picture type. 1'b1: Inter type (P) 1'b0: Intra type (I) See also sw_pic_b_e
19	RW	0x0	Sw_pic_topfield_e If field structure is enabled this bit informs which one of the fields is being decoded: 1'b0: Bottom field 1'b1: Top field Note: The h264 decoder will use these bits.
18	RW	0x0	Sw_fwd_interlace_e Coding mode of forward reference picture: 1'b0: Progressive 1'b1: Interlaced Note: For backward reference picture the coding mode is always same as for current picture.
16	RW	0x0	Sw_ref_topfield_e Indicates which field should be used as reference if sw_ref_frames = 0 : 1'b0: Bottom field 1'b1: Top field Used only in VC-1 mode
15	RW	0x0	Sw_dec_out_dis Disable decoder output picture writing: 1'b0: Decoder output picture is written to external memory 1'b1: Decoder output picture is not written to external memory Note: The h264 decoder will use these bits.
14	RW	0x0	Sw_filtering_dis De-block filtering disable 1'b1: Filtering is disabled for current picture 1'b0: Filtering is enabled for current picture Note: The h264 decoder will use these bits.
13	RW	0x0	Sw_pic_fixed_quant Sw_pic_fixed_quant (DEC mode is VC-1 and AVS) 1'b0: Quantization parameter can vary inside picture 1'b1: Quantization parameter is fixed (pquant) Sw_mvc_e(DEC mode is H264) Multi view coding enable. Possible for H264 only Note: The h264 decoder will use these bits.

Bit	Attr	Reset Value	Description
12	RW	0x0	Sw_write_mvs_e Direct mode motion vector write enable for current picture / MPEG2 motion vector write enable for error concealment Purposes: 1'b0: Writing disabled for current picture 1'b1: The direct mode motion vectors are written to external Memory. H264 direct mode motion vectors are written to DPB aside with the corresponding reference picture. Other decoding mode dir mode mvs are written to external memory starting from Sw_dir_mv_base. Note: The h264 decoder will use these bits.
11	RW	0x0	Sw_reftopfirst_e Indicates which FWD reference field has been decoded first. 1'b0: FWD reference bottom field 1'b1: FWD reference top field Note: The h264 decoder will use these bits.
10	RW	0x0	Sw_seq_mbaff_e Sequence includes MBAFF coded pictures. Note: The h264 decoder will use these bits.
9	RW	0x0	Sw_picord_count_e H264_high config: Picture order count table read enable. If enabled HW will read picture order counts from memory in the beginning of picture. Note: The h264 decoder will use these bits.
8	RW	0x0	Sw_dec_timeout_mode When 1'b0 , timeout cycle is 181'b1 When 1'b1, timeout cycle is 221'b1 Note: The h264 decoder will use these bits.
7:0	RW	0x01	Sw_dec_axi_wr_id Write ID used for decoder writing services in AXI bus (if connected to AXI). Note: The h264 decoder will use these bits.

VDPU_SWREG4_H264

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	Sw_pic_mb_width Picture width in macroblocks = ((width in pixels + 15) /16) Note: The h264 decoder will use these bits.
22:19	RO	0x0	Reserved
18:11	RW	0x00	Sw_pic_mb_height_p Picture height in macroblocks =((height in pixels+15)/16). Picture height is informed as size of the (progressive) frame also For single field (of interlaced content) is being decoded Note: The h264 decoder will use these bits.
10:5	RO	0x00	Reserved

Bit	Attr	Reset Value	Description
4:0	RW	0x00	Sw_ref_frames H.264: Num_ref_frames, maximum number of short and long term reference frames in decoded picture buffer.

VDPU_SWREG4

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	Sw_pic_mb_width Picture width in macroblocks = ((width in pixels + 15)/16).
22:19	RW	0x0	Sw_mb_width_off The amount of meaningfull horizontal pixels in last MB (width offset) 0 if exactly 16 pixels multiple picture and all the horizontal pixels in last MB are meaningfull.
18:11	RW	0x00	Sw_pic_mb_height_p Picture height in macroblocks =((height in pixels+15)/16). Picture height is informed as size of the (progressive) frame also for single field (of interlaced content) is being decoded.
10:7	RW	0x0	Sw_mb_height_off The amount of meaningfull vertical pixels in last MB (height offset 0 if exactly 16 pixels multiple picture and all the vertical pixels in last MB are meaningfull.
6	RW	0x0	Sw_alt_scan_e Indicates alternative vertical scan method used for interlaced frames.
5:3	RW	0x0	Sw_pic_mb_w_ext Picture mb width extension. If sw_pic_mb_width does not fit to 9 bits then these bits are used to increase the range up to 11 bits (used as 3 msb).
2:0	RW	0x0	Sw_pic_mb_h_ext Picture mb height extension. If sw_pic_mb_height_p does not fit to 9 bits then these bits are used to increase the range up to 11 bits (used as 3 msb).

VDPU_SWREG5

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Sw_strm_start_bit Exact bit of stream start word where decoding can be started (associates with sw_rlc_vlc_base).
25	RW	0x0	Sw_sync_marker_e Sync markers enable: 1'b0: Synch markers are not used. 1'b1: Synch markers are used. For progressive JPEG this indicates that there are restart markers in the stream after restart interval steps.

Bit	Attr	Reset Value	Description
24	RW	0x0	Sw_type1_quant_e MPEG4: Type 1 quantization enable 1'b0: Type 2 inverse Q method 1'b1: Type 1 inverse Q method (Q-tables used) H264 (h264_high config), scaling matrix enable: 1'b0: Normal transform 1'b1: Use scaling matrix for transform (read from external
23:19	RW	0x00	Sw_ch_qp_offset Chroma Qp filter offset. (For H.264 this offset concerns Cb only)
18:14	RW	0x00	Sw_ch_qp_offset2 Chroma Qp filter offset for cr type.
13:1	RO	0x0000	Reserved
0	RW	0x0	Sw_fieldpic_flag_e Flag for stream that field_pic_flag exists in stream.

VDPU_SWREG5_H264

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Sw_strm_start_bit Exact bit of stream start word where decoding can be started (associates with sw_rlc_vlc_base).
25	RO	0x0	Reserved
24	RW	0x0	Sw_type1_quant_e MPEG4: Type 1 quantization enable 1'b0: Type 2 inverse Q method 1'b1: Type 1 inverse Q method (Q-tables used) H264 (h264_high config), scaling matrix enable: 1'b0: Normal transform 1'b1: Use scaling matrix for transform (read from external
23:19	RW	0x00	Sw_ch_qp_offset Chroma Qp filter offset. (For H.264 this offset concerns Cb only)
18:14	RW	0x00	Sw_ch_qp_offset2 Chroma Qp filter offset for cr type.
13:1	RO	0x0000	Reserved
0	RW	0x0	Sw_fieldpic_flag_e Flag for stream that field_pic_flag exists in stream.

VDPU_SWREG6

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31	RW	0x0	Sw_start_code_e Bit for indicating stream start code existence: 1'b0: Stream doesn't contain start codes 1'b1: Stream contains start codes Note: The h264 decoder will use these bits.
30:25	RW	0x00	Sw_init_qp Initial value for quantization parameter (picture quantizer). Note: The h264 decoder will use these bits.
24	RW	0x0	Sw_ch_8pix_ileav_e Enable for additional chrominance data format writing where decoder writes chrominance in group of 8 pixels of Cb and then corresponding 8 pixels of Cr. Data is written to sw_dec_ch8pix_base. Cannot be used if tiled mode is enabled. Note: The h264 decoder will use these bits.
23:0	RW	0x000000	Sw_stream_len Amount of stream data bytes in input buffer. If the given buffer size is not enough for finishing the picture the corresponding interrupt is given and new stream buffer base address and stream buffer size information should be given (associates with Sw_rlc_vlc_base). For VC-1 the buffer must include data for one picture/slice of the picture. For H264/MPEG4/H263/MPEG2/MPEG1 the buffer must include at least data for one slice/VP of the picture. For JPEG the buffer size must be a multiple of 256 bytes or the amount of data for one picture. Note: The h264 decoder will use these bits.

VDPU_SWREG7

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31	RW	0x0	Sw_cabac_e CABAC enable Note: The h264 decoder will use these bits.
30	RW	0x0	Sw_blackwhite_e 1'b0: 4:2:0 sampling format 1'b1: 4:0:0 sampling format (H264 monochroma) Note: The h264 decoder will use these bits.
29	RW	0x0	Sw_dir_8x8_infer_e Specifies the method to use to derive luma motion vectors in B_skip, B_Direct_16x16 and B_direct_8x8_inference_flag (see direct_8x8_inference flag). Note: The h264 decoder will use these bits.
28	RW	0x0	Sw_weight_pred_e Weighted prediction enable for P slices. Note: The h264 decoder will use these bits.

Bit	Attr	Reset Value	Description
27:26	RW	0x0	Sw_weight_bipr_idc Weighted prediction specification for B slices: 2'b00: Default weighted prediction is applied to B slices 2'b01: Explicit weighted prediction shall be applied to B slices 2'b10: Implicit weighted prediction shall be applied to B slices Note: The h264 decoder will use these bits.
25:21	RO	0x00	Reserved
20:16	RW	0x00	Sw_framenum_len H.264: Bit length of frame_num in data stream. Note: The h264 decoder will use these bits.
15:0	RW	0x0000	Sw_framenum Current frame_num, used to identify short-term reference frames. Used in reference picture reordering. Note: The h264 decoder will use these bits.

VDPU_SWREG8

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31	RW	0x0	Sw_const_intra_e Constrained_intra_pred_flag equal to 1 specifies that intra prediction uses only. Neighbouring intra macroblocks in prediction. When equal to 0 also neighbouring. Inter macroblocks are used in intra prediction process. Note: The h264 decoder will use these bits.
30	RW	0x0	Sw_filt_ctrl_pres Deblocking_filter_control_present_flag indicates whether extra variables controlling characteristics of the deblocking filter are present in the slice header. Note: The h264 decoder will use these bits.
29	RW	0x0	Sw_rdpic_cnt_pres Redundant_pic_cnt_present_flag specifies whether. Redundant_pic_cnt syntax elements. Note: The h264 decoder will use these bits.
28	RW	0x0	Sw_8x8trans_flag_e 8x8 transform flag enable for stream decoding. Note: The h264 decoder will use these bits.
27:17	RW	0x000	Sw_refpic_mk_len Length of decoded reference picture marking bits. Note: The h264 decoder will use these bits.
16	RW	0x0	Sw_idr_pic_e IDR (instantaneous decoding refresh) picture flag. Note: The h264 decoder will use these bits.
15:0	RW	0x0000	Sw_idr_pic_id Idr_pic_id, identifies IDR (instantaneous decoding refresh) picture. Note: The h264 decoder will use these bits.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

10.5.5 VDPU121 MMU Detail Registers Description

VCODEC_MMU_DTE_ADDR

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	MMU_DTE_ADDR MMU current page Table address

VCODEC_MMU_STATUS

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	Reserved
10:6	RO	0x00	PAGE_FAULT_BUS_ID Index of master responsible for last page fault
5	RO	0x0	PAGE_FAULT_IS_WRITE The direction of access for last page fault: 1'b0: Read 1'b1: Write
4	RO	0x1	REPLAY_BUFFER_EMPTY 1'b1:The MMU replay buffer is empty
3	RO	0x1	MMU_IDLE The MMU is idle when accesses are being translated and there are no unfinished translated accesses. 1'b1: MMU is idle
2	RO	0x0	STAIL_ACTIVE MMU stall mode currently enabled. The mode is enabled by command 1'b1: MMU is in stall active status
1	RO	0x0	PAGE_FAULT_ACTIVE MMU page fault mode currently enabled. The mode is enabled by command. 1'b1: Page fault is active
0	RO	0x0	PAGING_ENABLED 1'b0: Paging is disabled 1'b1: Paging is enabled

VCODEC_MMU_COMMAND

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	Reserved
2:0	WO	0x0	MMU_CMD MMU_CMD. This can be: 3'd0: MMU_ENABLE_PAGING 3'd1: MMU_DISABLE_PAGING 3'd2: MMU_ENABLE_STALL 3'd3: MMU_DISABLE_STALL 3'd4: MMU_ZAP_CACHE 3'd5: MMU_PAGE_FAULT_DONE 3'd6: MMU_FORCE_RESET

VCODEC_MMU_PAGE_FAULT_ADDR

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PAGE_FAULT_ADDR Address of last page fault

VCODEC_MMU_ZAP_ONE_LINE

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	MMU_ZAP_ONE_LINE ddress to be invalidated from the page table cache

VCODEC_MMU_INT_RAWSTAT

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	RW	0x0	READ_BUS_ERROR Read bus error status
0	RW	0x0	PAGE_FAULT Page fault status

VCODEC_MMU_INT_CLEAR

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	WO	0x0	READ_BUS_ERROR Write 1 to clear read bus error
0	WO	0x0	PAGE_FAULT Write 1 to page fault clear

VCODEC_MMU_INT_MASK

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	RW	0x0	READ_BUS_ERROR Enable the read bus interrupt source when this bit is set to 1'b1
0	RW	0x0	PAGE_FAULT Enable the page fault interrupt source when this bit is set to 1'b1

VCODEC_MMU_INT_STATUS

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	RO	0x0	READ_BUS_ERROR 1'b1: Read bus error status
0	RO	0x0	PAGE_FAULT 1'b1: Page fault

VCODEC_MMU_AUTO_GATING

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	Reserved
0	RW	0x1	Mmu_auto_clkgating When it is 1'b1, the mmu will auto gating it self

10.5.6 VDPU346 Registers Summary

Name	Offset	Size	Reset Value	Description
Rkvdec_Swreg0_id	0x0000	W	0x00000000	ID register (read only)
Rkvdec_Swreg8_in_out	0x0020	W	0x00000000	Data input and output endian setting and sys ctrl.

10.5.7 VDPU346 Detail Registers Description

Rkvdec_Swreg0_id

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	Prod_num Prod code
15:8	RO	0x00	Major_ver Major verision
7:0	RO	0x00	Minor_ver Minor version

Rkvdec_Swreg8_in_out

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:10	RO	0x0	reserved
9	RW	0x0	Sw_out_swap64_e May be used for 64 or 128 bit environment. 1'b0: No swapping of 64 bit words. 1'b1: 64 bit data words are swapped.
8	RW	0x0	Sw_out_cbcr_swap 1'b0: Cb(u) is in the lower address, cr(v) is in the higher address. 1'b1: Cb(u) is in the higher address,cr(v) is in the lower address. Sw_in_cbcr_swap is the same with sw_out_cbcr_swap.
7	RW	0x0	Sw_out_swap32_e May be used for 64 or 128 bit environment. 1'b0: No swapping of 32 bit words. 1'b1: 32 bit data words are swapped.
6	RW	0x0	Sw_out_endian 1'b0: Little endian 1'b1: Big endian For litter enadian, a data 0x12345678, 0x78 is stored in lower address, 0x12 is stored in higher address.
5	RW	0x0	Sw_str_swap64_e May be used for 128 bit environment. 1'b0: No swapping of 64 bit words. 1'b1: 64 bit data words are swapped.

RKDJPEG_swreg0_id

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	prod_num RKDJPEG verision
15:9	RO	0x0	reserved
8	RO	0x0	bit_depth max bit_depth support 0: 8bits 1: 12bits
7:0	RO	0x00	minor_ver 0: default 1: 8k

RKDJPEG_swreg1_int
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	reserved
16	RW	0x0	sw_care_strm_error_e use for sw_error_prc_mode=1 0:not care stream error,when sw_care_strm_error_e=0, sw_dec_error_sta will not valid, mmu will not be reset at frame end, link table mode will continue without care stream error, only active error info registers; 1:care stream error;
15	RW	0x0	sw_buf_empty_force_end_flag 0:invalid 1:valid buffer empty interrupt with stream real empty so should force hardware decoder current frame end
14	RW	0x0	sw_softreset_rdy when it is 1'b1, it says that softreset has been done
13	RW	0x0	sw_dec_buf_empty_sta buffer empty status, only when sw_buf_empty_e is 1'b1 , this bit is valid software should clean stream buffer empty state and set sw_buf_empty_reload_p enbale at the same time
12	RW	0x0	sw_dec_timeout_sta When high the decoder has been idling for too long. it will self reset the hardware only when sw_dec_timeout_e is 1'b1, this bit is valid
11	RW	0x0	sw_dec_error_sta when high, an error is found in input data stream decoding.when sw_error_prc_mode is 1'b0, it will self reset the hardware, otherwise it will not

10	RW	0x0	sw_dec_bus_sta When this bit is high, there is error on the axi bus, it will self reset hardware
9	RW	0x0	sw_dec_rdy_sta when this bit is high, decoder has decoded a picture (the output module send out a frame rdy)
8	RW	0x0	sw_dec_irq when high, decoder requests an interrrupt. sw_dec_irq = sw_dec_irq_raw && (sw_dec_irq_dis == 1'b0)
7	RW	0x0	sw_wait_reset_e the enable flag of wait software system to reset flag 0: hardware will auto reset when error occur 1: wait software process reset when error occur
6	RW	0x0	sw_dec_irq_raw the raw status of sw_dec_irq,SW should reset this bit after interrupt is handled
5	RW	0x0	sw_softrst_en_p softreset enable signal write 1 to soft reset, write 0 invalid puls register

4	RW	0x0	sw_buf_empty_reload_p buffer empty stream reload enable signal write 1 to reload stream data ready pulse register with hardware auto clean valid at next cycle before reload enable,strm_len register should be reset and start_of_type is zero sw_strm_base addr may be reset also. note:sw_error_prc_mode should be set to 1 when sw_buf_empty_e valid otherwise the hardware would be reset and not support buffer buffer empty reload
3	RW	0x0	sw_buf_empty_e buffer empty interrupt enable
2	RW	0x0	sw_dec_timeout_e If enabled HW may return timeout interrupt in case HW gets stucked while decoding picture.
1	RW	0x0	sw_dec_irq_dis When hight, there are no interrupts concerning decoder from HW. Polling must be used to see the interrupt status
0	RW	0x0	sw_dec_e Decoder enable. Setting this bit high will start the decoding operation. HW will reset this when the picture is decoded ready or bus error or time out interrupt is given for all decode format.

10.5.21 VEPU121 Detail Registers Description

VEPU_swreg_0

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant1 Jpeg luma quantization 1

VEPU_swreg_1

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant2 Jpeg luma quantization 2

VEPU_swreg_2

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant3 Jpeg luma quantization 3

VEPU_swreg_3

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant4 Jpeg luma quantization 4

VEPU_swreg_4

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant5 Jpeg luma quantization 5

VEPU_swreg_5

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant6 Jpeg luma quantization 6

VEPU_swreg_6

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant7 Jpeg luma quantization 7

VEPU_swreg_7

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant8 Jpeg luma quantization 8

VEPU_swreg_8

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant9 Jpeg luma quantization 9

VEPU_swreg_9

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant10 Jpeg luma quantization 10

VEPU_swreg_10

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant11 Jpeg luma quantization 11

VEPU_swreg_11

Address: Operational Base + offset (0x002c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant12 Jpeg luma quantization 12

VEPU_swreg_12

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant13 Jpeg luma quantization 13

VEPU_swreg_13

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant14 Jpeg luma quantization 14

VEPU_swreg_14

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_luma_quant15 Jpeg luma quantization 15

VEPU_swreg_15

Address: Operational Base + offset (0x003c)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	Reserved
7:0	RW	0x00	Sw_jpeg_luma_quant16 Jpeg luma quantization 16

VEPU_swreg_16

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant1 Jpeg chroma quantization 1

VEPU_swreg_17

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant2 Jpeg chroma quantization 2

VEPU_swreg_18

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant3 Jpeg chroma quantization 3

VEPU_swreg_19

Address: Operational Base + offset (0x004c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant4 Jpeg chroma quantization 4

VEPU_swreg_20

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant5 Jpeg chroma quantization 5

VEPU_swreg_21

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant6 Jpeg chroma quantization 6

VEPU_swreg_22

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant7 Jpeg chroma quantization 7

VEPU_swreg_23

Address: Operational Base + offset (0x005c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant8 Jpeg chroma quantization 8

VEPU_swreg_24

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant9 Jpeg chroma quantization 9

VEPU_swreg_25

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant10 Jpeg chroma quantization 10

VEPU_swreg_26

31:12	RO	0x00000	Reserved
11:0	RW	0x000	Sw_jpeg_chroma_quant15 Jpeg chroma quantization 15

VEPU_swreg_31

Address: Operational Base + offset (0x007c)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Sw_jpeg_chroma_quant16 Jpeg chroma quantization 16

VEPU_swreg_44

Address: Operational Base + offset (0x00b0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Intra_slice_bmp0 Bit0 : Slices0 Bit1 : Slices1 Bit2 : Slices2 ..... Bit31 : Slices31

VEPU_swreg_45

Address: Operational Base + offset (0x00b4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Intra_slice_bmp1 Bit0 : Slices32 Bit1 : Slices33 Bit2 : Slices34 ..... Bit31 : Slices63

VEPU_swreg_46

Address: Operational Base + offset (0x00b8)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Intra_up_mb_area The top intra macro block's area used in row.
23:16	RW	0x00	Intra_down_mb_area The bottom intra macro block's area used in row.
15:8	RW	0x00	Intra_left_mb_area The left intra macro block's area used in column.
7:0	RW	0x00	Intra_right_mb_area The right intra macro block's area used in column.

VEPU_swreg_47

Address: Operational Base + offset (0x00bc)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Cir_first_intra 16'd0: Disable Other: Enable and be set
15:0	RW	0x0000	Cir_intra_mb_itvl 16'd0: Disable Other: Enable and be set

VEPU_swreg_48

Address: Operational Base + offset (0x00c0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Luma_in_st_adr Input luma start address

VEPU_swreg_49

Address: Operational Base + offset (0x00c4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Cb_in_st_adr Input cb start address

VEPU_swreg_50

Address: Operational Base + offset (0x00c8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Cr_in_st_adr Input cr start address

VEPU_swreg_51

Address: Operational Base + offset (0x00cc)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Strm_header_left_hbits The high 32 bit of stram header be left.

VEPU_swreg_52

Address: Operational Base + offset (0x00d0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Strm_header_left_lbits The low 32 bit of stram header be left.

VEPU_swreg_53

Address: Operational Base + offset (0x00d4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Strm_bufsize_lmt The limit size of steam buffer.

VEPU_swreg_54

Address: Operational Base + offset (0x00d8)

Bit	Attr	Reset Value	Description
31:24	RW	0x01	Axi_rd_id If config 0,it will be modify as 1 by HW auto
23:16	RW	0x01	Axi_wr_id If config 0,it will be modify as 1 by HW auto
15:14	RO	0x0	Reserved
13:8	RW	0x00	Burst_len Burst length
7:3	RO	0x00	Reserved

VCODEC_MMU_AUTO_GATING	0x0024	W	0x00000001	mmu auto gating

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

10.5.23 VEPU121 MMU Detail Registers Description

VCODEC_MMU_DTE_ADDR

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	MMU_DTE_ADDR MMU current page Table address

VCODEC_MMU_STATUS

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	Reserved
10:6	RO	0x00	PAGE_FAULT_BUS_ID Index of master responsible for last page fault
5	RO	0x0	PAGE_FAULT_IS_WRITE The direction of access for last page fault: 1'b0: Read 1'b1: Write
4	RO	0x1	REPLAY_BUFFER_EMPTY 1'b1:The MMU replay buffer is empty
3	RO	0x1	MMU_IDLE The MMU is idle when accesses are being translated and there are no unfinished translated accesses. 1'b1: MMU is idle
2	RO	0x0	STAIL_ACTIVE MMU stall mode currently enabled. The mode is enabled by command 1'b1: MMU is in stall active status
1	RO	0x0	PAGE_FAULT_ACTIVE MMU page fault mode currently enabled. The mode is enabled by command. 1'b1: Page fault is active
0	RO	0x0	PAGING_ENABLED 1'b0: Paging is disabled 1'b1: Paging is enabled

VCODEC_MMU_COMMAND

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	Reserved
2:0	WO	0x0	MMU_CMD MMU_CMD. This can be: 3'd0: MMU_ENABLE_PAGING 3'd1: MMU_DISABLE_PAGING 3'd2: MMU_ENABLE_STALL 3'd3: MMU_DISABLE_STALL 3'd4: MMU_ZAP_CACHE 3'd5: MMU_PAGE_FAULT_DONE 3'd6: MMU_FORCE_RESET

VCODEC_MMU_PAGE_FAULT_ADDR

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PAGE_FAULT_ADDR Address of last page fault

VCODEC_MMU_ZAP_ONE_LINE

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	MMU_ZAP_ONE_LINE ddress to be invalidated from the page table cache

VCODEC_MMU_INT_RAWSTAT

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	RW	0x0	READ_BUS_ERROR Read bus error status
0	RW	0x0	PAGE_FAULT Page fault status

VCODEC_MMU_INT_CLEAR

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	WO	0x0	READ_BUS_ERROR Write 1 to clear read bus error
0	WO	0x0	PAGE_FAULT Write 1 to page fault clear

VCODEC_MMU_INT_MASK

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	RW	0x0	READ_BUS_ERROR Enable the read bus interrupt source when this bit is set to 1'b1
0	RW	0x0	PAGE_FAULT Enable the page fault interrupt source when this bit is set to 1'b1

VCODEC_MMU_INT_STATUS

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	Reserved
1	RO	0x0	READ_BUS_ERROR 1'b1: Read bus error status
0	RO	0x0	PAGE_FAULT 1'b1: Page fault

VCODEC_MMU_AUTO_GATING

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	Reserved
0	RW	0x1	Mmu_auto_clkgating When it is 1'b1, the mmu will auto gating it self

10.5.24 VEPU540 LAYER1 Register Address Mapping

The summary of LAYER1 register is listed below.

Table 10-15 VEPU LAYER1 Address Mapping

Name	Offset	Size	Reset Value	Description
VEPU_VERSION	0x0000	W	0x50600311	VEPU version. It contains IP function summary and sub-version informations.
VEPU_ENC_STRT	0x0004	W	0x00000000	Start cmd register.(auto clock gating enable, auto reset enable and tmvp adjust enable when frame done are also allocated here.)
VEPU_ENC_CLR	0x0008	W	0x00000000	VEPU clear register
VEPU_LKT_ADDR	0x000C	W	0x00000000	Link table
VEPU_INT_EN	0x0010	W	0x00000000	VEPU interrupt enable
VEPU_INT_MSK	0x0014	W	0x00000000	VEPU interrupt mask
VEPU_INT_CLR	0x0018	W	0x00000000	VEPU interrupt clear
VEPU_INT_STA	0x001C	W	0x00000000	VEPU interrupt state
VEPU_ENC_IDLE_EN	0x0020	W	0x00000000	
VEPU_ENC_RSL	0x0030	W	0x00000000	Resolution
VEPU_ENC_PIC	0x0034	W	0x00000000	VEPU common configuration
VEPU_ENC_WDG	0x0038	W	0x00000000	VEPU watch dog configure register
VEPU_DTRNS_MAP	0x003C	W	0x00000000	Data transaction mapping (endian and order)
VEPU_DTRNS_CFG	0x0040	W	0x00000000	(AXI bus) Data transaction configuration
VEPU_SRC_FMT	0x0044	W	0x00000000	Video source format
VEPU_SRC_UDFY	0x0048	W	0x00000000	Weight of user defined formula for RGB to Y conversion
VEPU_SRC_UDFU	0x004C	W	0x00000000	Weight of user defined formula for RGB to U conversion
VEPU_SRC_UDFV	0x0050	W	0x00000000	Weight of user defined formula for RGB to V conversion

Name	Offset	Size	Reset Value	Description
VEPU_SRC_UDFO	0x0054	W	0x00000000	Offset of user defined formula for RGB to YUV conversion
VEPU_SRC_PROC	0x0058	W	0x00000000	Video source process

10.5.25 VEPU540 LAYER1 Detail Register Description

VEPU_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:24	RO	0x50	ip_id VEPU ID. It is contant 0x50.
23	RO	0x0	reserved
22:21	RO	0x3	fbc_cap FBC capability: 2'h0: No FBC 2'h3: Support AFBC for video source and FBC for reconstructed picture Others: Reserved
20	RO	0x0	bfrm_cap B frame encoding capability. 1 means VEPU supports B frame encoding while 0 means not.
19:18	RO	0x0	filtr_cap Pre-process filter capability 2'h0: Basic pre-process filter 2'h3: No pre-process filter Others: Reserved
17:16	RO	0x0	osd_cap OSD capability. 2'h0: 8-area OSD with 256-color palette 2'h3: No OSD Others: Reserved

Bit	Attr	Reset Value	Description
15:12	RO	0x0	res_cap Max resolution 4'h0: 4096x2304 4'h1: 1920x1088 Others: Reserved
11:10	RO	0x0	reserved
9	RO	0x1	hevc_cap HEVC encoding capability. 1 means VEPU supports HEVC encoding while 0 means not
8	RO	0x1	h264_cap H.264 encoding capability. 1 means VEPU supports H.264 encoding, while 0 means not.
7:0	RO	0x11	sub_ver VEPU sub-version. 0x11 for PUMA

VEPU_ENC_STRT

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18	RW	0x0	enc_done_tmvp_en Enc_done need wait tmvp write done by dma.
17	RW	0x0	resetn_hw_en Encoder auto reset core clock domain when frame finished.
16	RW	0x0	cke VEPU auto clock gating enable
15:10	RO	0x00	reserved
9:8	RW	0x0	vepu_cmd VEPU command: 2'h0: N/A 2'h1: One frame encoding by register configuration 2'h2: Multi-frame encoding start with link table mode 2'h3: Multi-frame encoding update (with link table mode)

Bit	Attr	Reset Value	Description
7:0	RW	0x00	lkt_num Number of new nodes in link table. only for link table mode.

VEPU_ENC_CLR

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	force_clr Force clear. Clear all sub-modules besides regfile and AHB data path.
0	R/W SC	0x0	safe_clr Safe clr. It only clears DMA module to confirm AXI transaction integrity. 1'h0: Safe clear is not performing. 1'h1: Safe clear is performing.

VEPU_LKT_ADDR

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	lkt_addr High 28 bits of the address for the first node in link table.
3:0	RO	0x0	reserved

VEPU_INT_EN

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	wdg_en Watch dog(time out) interrupt enable.
7	RW	0x0	rbus_err_en AXI read channel error interrupt enable.

Bit	Attr	Reset Value	Description
6	RW	0x0	wbus_err_en AXI write channel error interrupt enable.
5	RW	0x0	brsp_otsd_en AXI write response outstanding overflow interrupt enable.
4	RW	0x0	bsf_oflw_en Bit stream buffer overflow enable.
3	RW	0x0	slc_done_en One slice encoding finish interrupt enable.
2	RW	0x0	sclr_done_en Safe clear finish interrupt enable.
1	RW	0x0	lkt_done_en Link table (node) finish interrupt enable.
0	RW	0x0	enc_done_en One frame encoding finish interrupt enable.

VEPU_INT_MSK

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	wdg_msk Watch dog(time out) interrupt mask.
7	RW	0x0	rbus_err_msk AXI read channel error interrupt mask.
6	RW	0x0	wbus_err_msk AXI write channel error interrupt mask.
5	RW	0x0	brsp_otsd_msk AXI write response outstanding overflow interrupt mask.
4	RW	0x0	bsf_oflw_msk Bit stream buffer overflow mask.
3	RW	0x0	slc_done_msk One slice encoding finish interrupt mask.

Bit	Attr	Reset Value	Description
2	RW	0x0	sclr_done_msk Safe clear finish interrupt mask.
1	RW	0x0	lkt_done_msk Link table (node) finish interrupt mask.
0	RW	0x0	enc_done_msk One frame encoding finish interrupt mask.

VEPU_INT_CLR

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	W1C	0x0	wdg_clr Watch dog(time out) interrupt clear.
7	W1C	0x0	rbus_err_clr AXI read channel error interrupt clear.
6	W1C	0x0	wbus_err_clr AXI write channel error interrupt clear.
5	W1C	0x0	brsp_otsd_clr AXI write response outstanding overflow interrupt clear.
4	W1C	0x0	bsf_oflw_clr Bit stream buffer overflow clear.
3	W1C	0x0	slc_done_clr One slice encoding finish interrupt clear.
2	W1C	0x0	sclr_done_clr Safe clear finish interrupt clear.
1	W1C	0x0	lkt_done_clr Link table (node) finish interrupt clear.
0	W1C	0x0	enc_done_clr One frame encoding finish interrupt clear.

VEPU_INT_STA

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RO	0x0	wdg_sta Watch dog(time out) interrupt status.
7	RO	0x0	rbus_err_sta AXI read channel error interrupt status.
6	RO	0x0	wbus_err_sta AXI write channel error interrupt status.
5	RO	0x0	brsp_otsd_sta AXI write response outstanding overflow interrupt status.
4	RO	0x0	bsf_oflw_sta Bit stream buffer overflow status.
3	RO	0x0	slc_done_sta One slice encoding finish interrupt status.
2	RO	0x0	sclr_done_sta Safe clear finish interrupt status.
1	RO	0x0	lkt_done_sta Link table (node) finish interrupt status.
0	RO	0x0	enc_done_sta One frame encoding finish interrupt status.

VEPU_ENC_IDLE_EN

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x0	idle_en_ahb
1	RW	0x0	idle_en_axi
0	RW	0x0	idle_en_core

VEPU_ENC_RSL

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	pic_hfill Filling pixels to keep (encoding) picture height is 8 pixels aligned for HEVC and 16 pixels aligned for H.264.
25	RO	0x0	reserved
24:16	RW	0x000	pic_hd8_m1 Ceil(encoding picture height/8) -1
15:10	RW	0x00	pic_wfill Filling pixels to keep (encoding) picture width is 8 pixels aligned for HEVC and 16 pixels aligned for H.264.
9	RO	0x0	reserved
8:0	RW	0x000	pic_wd8_m1 Ceil(encoding picture width/8) -1

VEPU_ENC_PIC

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31	RW	0x0	node_int Node interrupt enable (only for link table node configuration).
30	RW	0x0	slen_fifo Slice length fifo enable.
29	RW	0x0	dchs_txe Dual-core handshake tx enable.
28	RW	0x0	dchs_rxe Dual-core handshake rx enable.
27:26	RW	0x0	dchs_txid Dual-core handshake tx ID.
25:24	RW	0x0	dchs_rxid Dual-core handshake Rx ID.
23	RW	0x0	atr_thd_sel 1'h0: Select atr_thd group0. 1'h1: Select atr_thd group1.

Bit	Attr	Reset Value	Description
22:19	RW	0x0	log2_ctu_num Logarithm of bit width to express ctu number in current picture, HEVC only.
18:14	RW	0x00	num_pic_tot_cur NumPicTotalCurr for HEVC reference picture list modification.
13:8	RW	0x00	pic_qp QP value for current frame encoding.
7:6	RO	0x0	reserved
5	RW	0x0	rdo_wgt_sel Select the group of RDO weight parameters(VEPU2_RDO_WGTA_QP* and VEPU2_RDO_WGTB*). 1'h0: Select weight group A (VEPU2_RDO_WGTA_QP*] 1'h1: Select weight group B(VEPU2_RDO_WGTB_QP*)
4	RW	0x0	bs_scp Output start code prefix.
3	RW	0x0	mei_stor Output ME(motion estimation) information.
2	RW	0x0	cur_frm_ref Current frame should be referenced in future.
1	RW	0x0	roi_en ROI(region of interest) encoding enable.
0	RW	0x0	enc_stnd Video standard. 1'h0: H.264 encoding 1'h1: HEVC encoding

VEPU_ENC_WDG

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	rfp_load_thd Reference picture loading timeout threshold. 8'h0: No time limit 8'hx: x*256 core clock cycles

Bit	Attr	Reset Value	Description
23:0	RW	0x000000	vs_load_thd Video source loading timeout threshold. 24'h0: No time limit 24'hx: x*256 core clock cycles

VEPU_DTRNS_MAP

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	afbc_bsize AFBC video source loading burst size. 1'h0: 32 bytes 1'h1: 64 bytes
26:23	RW	0x0	lktw_bus_edin Data swap for link table write channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
22:19	RW	0x0	roir_bus_edin Data swap for ROI configuration read channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
18:15	RW	0x0	lktr_bus_edin Data swap for link table read channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits

Bit	Attr	Reset Value	Description
14:12	RW	0x0	bsw_bus_edin Data swap for bis stream write channel. [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
11:8	RW	0x0	meiw_bus_edin Data swap for ME information write channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
7:4	RW	0x0	src_bus_edin Data swap for video source loading channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
3	RW	0x0	rfpw_bus_ordr Swap the position of 64 bits in 128 bits for reference picture.
2	RW	0x0	dspw_bus_ordr Swap the position of 64 bits in 128 bits for down-sampled picture.
1	RW	0x0	cmvw_bus_ordr Swap the position of 64 bits in 128 bits for co-located Mv(HEVC only).
0	RW	0x0	lpfw_bus_ordr Swap the position of 64 bits in 128 bits for loop-filter write-back data between tiles(HEVC only).

VEPU_DTRNS_CFG

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x00	axi_brsp_cke AXI write response channel check enable. [7]: Lpf write response check enable. [6]: Reconstructed picture write response check enable. [5]: ME information write response check enable. [4]: CTU information write response check enable. [3]: Down-sampled picture write response check enable. [2]: Bit stream write response check enable. [1]: Link table mode write reponse check enable. [0]: Reserved for video preprocess.
15:8	RO	0x00	reserved
7	RW	0x0	dspr_otsd Down sampled reference picture read outstanding enable. 1'h0: No outstanding 1'h1: Outstanding read, which improves data transaction efficiency, but core clock frequency should not lower than bus clock frequency.
6:0	RO	0x00	reserved

VEPU_SRC_FMT

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	src_range Video source clip (low active). 1'h0: [16:235] for luma and [16:240] for chroma. 1'h1: [0:255] for both luma and chroma.

Bit	Attr	Reset Value	Description
5:2	RW	0x0	src_cfmt Video source color format. 4'h0: BGRA8888 4'h1: RGB888 4'h2: RGB565 4'h4: YUV422 SP 4'h5: YUV422 P 4'h6: YUV420 SP 4'h7:YUV420 P 4'h8: YUYV422 4'h9: UYVY422 4'ha: YUV400 Others: Reserved
1	RW	0x0	rbuv_swap Swap the position of R and B for BGRA8888, RGB888, RGB 656 format; Swap the position of U and V for YUV422-SP, YUV420-SP, YUYV422 and UYUV422 format. 1'h0: RGB or YUYV or UYVY. 1'h1: BGR or YVYU or VYUY.
0	RW	0x0	alpha_swap Swap the position of alpha and RGB for ARBG8888. 1'h0: BGRA8888 or RGBA8888. 1'h1: ABGR8888 or ARGB8888.

VEPU_SRC_UDFY

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:18	RW	0x000	csc_wgt_r2y Weight of RED in RGB to Y conversion formula.
17:9	RW	0x000	csc_wgt_g2y Weight of GREEN in RGB to Y conversion formula.

Bit	Attr	Reset Value	Description
8:0	RW	0x000	csc_wgt_b2y Weight of BLUE in RGB to Y conversion formula.

VEPU_SRC_UDFU

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:18	RW	0x000	csc_wgt_r2u Weight of RED in RGB to U conversion formula.
17:9	RW	0x000	csc_wgt_g2u Weight of GREEN in RGB to U conversion formula.
8:0	RW	0x000	csc_wgt_b2u Weight of BLUE in RGB to U conversion formula.

VEPU_SRC_UDFV

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:18	RW	0x000	csc_wgt_r2v Weight of RED in RGB to V conversion formula.
17:9	RW	0x000	csc_wgt_g2v Weight of GREEN in RGB to V conversion formula.
8:0	RW	0x000	csc_wgt_b2v Weight of BLUE in RGB to V conversion formula.

VEPU_SRC_UDFO

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:16	RW	0x00	csc_ofst_y Offset of RGB to Y conversion formula.

Bit	Attr	Reset Value	Description
15:8	RW	0x00	csc_ofst_u Offset of RGB to U conversion formula.
7:0	RW	0x00	csc_ofst_v Offset of RGB to V conversion formula.

VEPU_SRC_PROC

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	afbcd_en AFBC decompress enable (for AFBC format video source).
29	RW	0x0	txa_en Video source texture analysis enable.
28:27	RW	0x0	src_rot Video source rotation mode. 2'h0: 0 degree 2'h1: Clockwise 90 degree 2'h2: Clockwise 180 degree 2'h3: Clockwise 270 degree
26	RW	0x0	src_mirr Video source mirror mode enable.
25:0	RO	0x0000000	reserved

VEPU_SLI_CFG_H264

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31	RW	0x0	sli_crs_en Slice cut cross lines enable, using for breaking the resolution limit, h264 only.
30:0	RO	0x00000000	reserved

VEPU_TILE_CFG_HEVC

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31	RW	0x0	tile_en Tile cut enable, hevc only.
30:22	RO	0x000	reserved
21:16	RW	0x00	tile_h_m1 The height of current tile minus 1, based on 64 pixel, hevc only.
15:6	RO	0x000	reserved
5:0	RW	0x00	tile_w_m1 The width of current tile minus 1, based on 64 pixel, hevc only.

VEPU_TILE_POS

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	RW	0x00	tile_y The top-left point of current tile in the vertical dirction, based on 64 pixel, hevc only.
15:6	RO	0x000	reserved
5:0	RW	0x00	tile_x The top-left point of current tile in the horizontal dirction, based on 64 pixel, hevc only.

VEPU_KLUT_OFST

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	chrm_klut_ofst Offset of (RDO) chroma cost weight table, values from 0 to 6.

VEPU_KLUT_WGT0

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	chrm_klut_wgt1_l9 Low 9 bits of data1 in chroma cost weight table.
22:18	RO	0x00	reserved
17:0	RW	0x00000	chrm_klut_wgt0 Data0 in chroma cost weight table.

VEPU_KLUT_WGT1

Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:14	RW	0x00000	chrm_klut_wgt2 Data2 in chroma cost weight table.
13:9	RO	0x00	reserved
8:0	RW	0x000	chrm_klut_wgt1_h9 High 9 bits of data1 in chroma cost weight table.

VEPU_KLUT_WGT2

Address: Operational Base + offset (0x0070)

17:12	RW	0x00	qpmin_area6 Min QP for 16x16 CU inside ROI area6.
11:6	RW	0x00	qpmax_area5 Max QP for 16x16 CU inside ROI area5.

Bit	Attr	Reset Value	Description
5:0	RW	0x00	qpmin_area5 Min QP for 16x16 CU inside ROI area5.

VEPU_ROI_QTHD3

Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	qpmap_mode QP theshold generation for the CUs whose size is bigger than 16x16. 2'h0: Mean value of 16x16 CU QP thesholds 2'h1: Max value of 16x16 CU QP thesholds 2'h2: Min value of 16x16 CU QP thesholds 2'h3: Reserved
29:6	RO	0x000000	reserved
5:0	RW	0x00	qpmax_area7 Max QP for 16x16 CU inside ROI area7.

VEPU_PIC_OFST

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	pic_ofst_x Horizontal offset for encoding picture.
15:13	RO	0x0	reserved
12:0	RW	0x0000	pic_ofst_y Vertical offset for encoding picture.

VEPU_SRC_STRD

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	src_strd1 CHROMA stride of video source, only for YUV format. Note that U and V stride must be the same when color format is YUV planar.
15:0	RW	0x0000	src_strd0 Video source stride0, based on pixel (byte). Note that if the video format is YUYV/UYVY/RGB/ARGB, src_strd0 is the only one component stride, if the video format is YUV420P/YUV420SP/YUV422P/YUV422SP, src_strd0 is the LUMA component stride. Note that if the video source is compressed by AFBC, src_strd0 is the header stride and it is 16-byte aligned.

VEPU_ADR_SRC0

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	adr_src0 Base address of the 1st storage area for video source, based on byte. ARGB8888, BGR888, RGB565, YUYV422 and UYUV422 have only one storage area, while adr_src0 is configured as the base address of video source frame buffer. YUV422/420 semi-planar have 2 storage area, while adr_src0 is configured as the base address of Y frame buffer. YUV422/420 planar have 3 storage area, while adr_src0 is configured as the base address of Y frame buffer. Note that if the video source is compressed by AFBC, adr_src0 is configured as the base address of header buffer, and it is 16-byte aligned.

VEPU_ADR_SRC1

Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	adr_src1 Base address of the 2nd storage area for video source. ARGB8888, BGR888, RGB565, YUYV422 and UYUV422 have only one storage area, while adr_src1 is reserved. YUV422/420 semi-planar have 2 storage area, while adr_src1 is configured as the base address of CHROMA frame buffer. YUV422/420 planar have 3 storage area, while adr_src1 is configured as the base address of U frame buffer. Note that if the video source is compressed by AFBC, adr_src1 is configured as the base address of body buffer.

VEPU_ADR_SRC2

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	adr_src2 Base address of V frame buffer when video source is uncompress and color format is YUV422/420 planar.

VEPU_ADR_ROI

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	roi_addr High 28 bits of base address for ROI configuration.
3:0	RO	0x0	reserved

VEPU_ADR_RFPW_H

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	rfpw_h_addr High 20 bits of the header_block base address for compressed reference frame write.
11:0	RO	0x000	reserved

VEPU_ADR_RFPW_B

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	rfpw_b_addr High 20 bits of the body_block base address for compressed reference frame write.
11:0	RO	0x000	reserved

VEPU_ADR_RFPR_H

Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	rfpr_h_addr High 20 bits of the header_block base address for compressed reference frame read.
11:0	RO	0x000	reserved

VEPU_ADR_RFPR_B

Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	rfpr_b_addr High 20 bits of the body_block base address for compressed reference frame read.
11:0	RO	0x000	reserved

VEPU_ADR_CMVW

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	cmvw_addr High 22 bits of base address for col-located Mv write, HEVC only.
9:0	RO	0x000	reserved

VEPU_ADR_CMVR

Address: Operational Base + offset (0x013C)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	cmvr_addr High 22 bits of base address for col-located Mv read, HEVC only.
9:0	RO	0x000	reserved

VEPU_ADR_DSPW

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	dspw_addr High 22 bits of base address for down-sampled reference frame write.
9:0	RO	0x000	reserved

VEPU_ADR_DSPR

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	dspr_addr High 22 bits of base address for down-sampled reference frame read.
9:0	RO	0x000	reserved

VEPU_ADR_MEIW

Address: Operational Base + offset (0x0148)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	meiw_addr High 22 bits of base address for ME information write.
9:0	RO	0x000	reserved

VEPU_ADR_BSBT

Address: Operational Base + offset (0x014C)

Bit	Attr	Reset Value	Description
31:7	RW	0x0000000	bsbt_addr High 25 bits of the top address of bit stream buffer.
6:0	RO	0x00	reserved

VEPU_ADR_BSBB

Address: Operational Base + offset (0x0150)

Bit	Attr	Reset Value	Description
31:7	RW	0x0000000	bsbb_addr High 25 bits of the bottom address of bit stream buffer.
6:0	RO	0x00	reserved

VEPU_ADR_BSBR

Address: Operational Base + offset (0x0154)

Bit	Attr	Reset Value	Description
31:7	RW	0x0000000	bsbr_addr Read address of bit stream buffer, 128B aligned. VEPU will pause when write address meets read address and then send an interrupt. SW should move some data out from bit stream buffer and change this register accordingly. After that VEPU will continue processing automatically.
6:0	RO	0x00	reserved

VEPU_ADR_BSBS

Address: Operational Base + offset (0x0158)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	adr_bsbs Start address of bit stream buffer. VEPU begins to write bit stream from this address and increase address automatically. Note that the VEPU's real-time write address is marked in BSB_STUS.

VEPU_SLI_SPLT

Address: Operational Base + offset (0x015C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	sli_splt_cnum_m1 Number of CTU/MB for slice split. Valid when slice is splited by CTU/MB.
15:14	RO	0x0	reserved
13	RW	0x0	sli_flsh Slice flush. Flush all the bit stream after each slice finished.
12:3	RW	0x000	sli_max_num_m1 Max slice num in one frame.
2	RW	0x0	sli_splt_cpst Slice split compensation when slice is splited by byte. Byte distortion of current slice will be compensated in the next slice.
1	RW	0x0	sli_splt_mode Slice split mode. 1'h0: Slice splited by byte. 1'h1: Slice splited by number of MB(H.264)/CTU(HEVC).
0	RW	0x0	sli_splt Slice split enable.

VEPU_SLI_BYTE

Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:0	RW	0x00000	sli_splt_byte Byte number for each slice when slice is splited by byte.

VEPU_ME_RNGE

Address: Operational Base + offset (0x0164)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dlt_frm_num Frame number difference value between current and reference frame, HEVC only.
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13:11	RW	0x0	rme_srch_v RME vertical search range, values from 4 to 5.
10:8	RW	0x0	rme_srch_h RME horizontal search range, values from 3 to 7.

2	RO	0x0	mmu_stl MMU1 stall.
1	RO	0x0	mmu_flt MMU1 page fault.
0	RO	0x0	mmu_e MMU1 is enabled.

VEPU_MMU1_CMD

Address: Operational Base + offset (0x0F48)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	mmu_cmd MMU1 command. 3'h0: MMU mapping enable. 3'h1: MMU mapping disable. 3'h2: MMU stall enable. 3'h3: MMU stall disable. 3'h4: Zap(disable) page table cache line. 3'h5: Leave fault mode. 3'h6: MMU reset.

VEPU_MMU1_PFA

Address: Operational Base + offset (0x0F4C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mmu_pfa Address of the last page fault.

VEPU_MMU1_ZAP

Address: Operational Base + offset (0x0F50)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	mmu_zpa Invalid address for page table cache mapping.

VEPU_MMU1_ERR

Address: Operational Base + offset (0x0F54)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	pf_err Page fault error.

VEPU_MMU1_INT_CLR

Address: Operational Base + offset (0x0F58)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	rbe_clr Read bus error interrupt clear.
0	RW	0x0	pfe_clr Page fault error interrupt clear.

VEPU_MMU1_INT_MSK

Address: Operational Base + offset (0x0F5C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	rbe_msk Read bus error interrupt mask.
0	RW	0x0	pfe_msk Page fault error interrupt mask.

VEPU_MMU1_INT_STA

Address: Operational Base + offset (0x0F60)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	rbe_sta Read bus error interrupt status.
0	RO	0x0	pfe_sta Page fault error interrupt status.

VEPU_MMU1_ACKG

Address: Operational Base + offset (0x0F64)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	mmu_ackg Auto clock gating enable.

10.5.26 VEPU540 LAYER2 Register Address Mapping

Table 10-16 VEPU LAYER2 Address Mapping

Name	Offset	Size	Reset Value	Description
VEPU2_IPRD_TTHDY4_0_H264	0x0004	W	0x00000000	Texture thredsholds register0 for H.264 LUMA 4x4 intra prediction, share address with HEVC.
VEPU2_IPRD_TTHD32_0_HEVC	0x0004	W	0x00000000	Texture thredshold register0 for HEVC 32x32 intra prediction, share address with H.264.
VEPU2_IPRD_TTHDY4_1_H264	0x0008	W	0x00000000	Texture thredsholds register1 for H.264 LUMA 4x4 intra prediction, share address with HEVC.
VEPU2_IPRD_TTHD32_1_HEVC	0x0008	W	0x00000000	Texture thredsholds register1 for HEVC 32x32 intra prediction, share address with H.264.
VEPU2_IPRD_TTHDC8_0_H264	0x000C	W	0x00000000	Texture thredsholds register0 for H.264 CHROMA 8x8 intra prediction, share address with HEVC.
VEPU2_IPRD_TTHD16_0_HEVC	0x000C	W	0x00000000	Texture thredshold register0 for HEVC 16x16 intra prediction, share address with H.264.
VEPU2_IPRD_TTHDC8_1_H264	0x0010	W	0x00000000	Texture thredsholds register1 for H.264 CHROMA 8x8 intra prediction, share address with HEVC.

VEPU2_IPRD_TTHDY4_0_H264

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthdy4_1 The 2nd texture threshold for H.264 LUMA 4x4 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthdy4_0 The 1st texture threshold for H.264 LUMA 4x4 intra prediction.

VEPU2_IPRD_TTHD32_0_HEVC

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthd32_1 The 2nd texture threshold for HEVC 32x32 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthd32_0 The 1st texture threshold for HEVC 32x32 intra prediction.

VEPU2_IPRD_TTHDY4_1_H264

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthdy4_3 The 4th texture threshold for H.264 LUMA 4x4 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthdy4_2 The 3rd texture threshold for H.264 LUMA 4x4 intra prediction.

VEPU2_IPRD_TTHD32_1_HEVC

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthd32_3 The 4th texture threshold for HEVC 32x32 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthd32_2 The 3rd texture threshold for HEVC 32x32 intra prediction.

VEPU2_IPRD_TTHDC8_0_H264

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthdc8_1 The 2nd texture threshold for H.264 CHROMA 8x8 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthdc8_0 The 1st texture threshold for H.264 CHROMA 8x8 intra prediction.

VEPU2_IPRD_TTHD16_0_HEVC

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthd16_1 The 2nd texture threshold for HEVC 16x16 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthd16_0 The 1st texture threshold for HEVC 16x16 intra prediction.

VEPU2_IPRD_TTHDC8_1_H264

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthdc8_3 The 4th texture threshold for H.264 CHROMA 8x8 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthdc8_2 The 3rd texture threshold for H.264 CHROMA 8x8 intra prediction.

VEPU2_IPRD_TTHD16_1_HEVC

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthd16_3 The 4th texture threshold for HEVC 16x16 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthd16_2 The 3rd texture threshold for HEVC 16x16 intra prediction.

VEPU2_IPRD_TTHDY8_0_H264

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthdy8_1 The 2nd texture threshold for H.264 LUMA 8x8 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthdy8_0 The 1st texture threshold for H.264 LUMA 8x8 intra prediction.

VEPU2_IPRD_TTHDY8_1_H264

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	iprd_tthdy8_3 The 4th texture threshold for H.264 LUMA 8x8 intra prediction.
15:12	RO	0x0	reserved
11:0	RW	0x000	iprd_tthdy8_2 The 3rd texture threshold for H.264 LUMA 8x8 intra prediction.

VEPU2_IPRD_TTHD_UL_H264

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:0	RW	0x000	iprd_tthd_ul Texture thredsholds of up and left MB for H.264 LUMA intra prediction.

VEPU2_IPRD_WGTY8_H264

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	iprd_wgty8_3 The 4th cost weight for H.264 LUMA 8x8 intra prediction
23:16	RW	0x00	iprd_wgty8_2 The 3rd cost weight for H.264 LUMA 8x8 intra prediction.
15:8	RW	0x00	iprd_wgty8_1 The 2nd cost weight for H.264 LUMA 8x8 intra prediction.
7:0	RW	0x00	iprd_wgty8_0 The 1st cost weight for H.264 LUMA 8x8 intra prediction.

VEPU2_IPRD_WGTY32_0_HEVC

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	iprd_wgty32_3 The 4th cost weight for HEVC LUMA 32x32 intra prediction
23:16	RW	0x00	iprd_wgty32_2 The 3rd cost weight for HEVC LUMA 32x32 intra prediction.
15:8	RW	0x00	iprd_wgty32_1 The 2nd cost weight for HEVC LUMA 32x32 intra prediction.
7:0	RW	0x00	iprd_wgty32_0 The 1st cost weight for HEVC LUMA 32x32 intra prediction.

VEPU2_IPRD_WGTY4_H264

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	iprd_wgty4_3 The 4th cost weight for H.264 LUMA 4x4 intra prediction
23:16	RW	0x00	iprd_wgty4_2 The 3rd cost weight for H.264 LUMA 4x4 intra prediction.
15:8	RW	0x00	iprd_wgty4_1 The 2nd cost weight for H.264 LUMA 4x4 intra prediction.
7:0	RW	0x00	iprd_wgty4_0 The 1st cost weight for H.264 LUMA 4x4 intra prediction.

VEPU2_IPRD_WGTY32_1_HEVC

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	iprd_wgty32_6 The 7th cost weight for HEVC LUMA 32x32 intra prediction.
15:8	RW	0x00	iprd_wgty32_5 The 6th cost weight for HEVC LUMA 32x32 intra prediction.
7:0	RW	0x00	iprd_wgty32_4 The 5th cost weight for HEVC LUMA 32x32 intra prediction.

VEPU2_IPRD_WGTY16_H264

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	iprd_wgty16_3 The 4th cost weight for H.264 LUMA 16x16 intra prediction.
23:16	RW	0x00	iprd_wgty16_2 The 3rd cost weight for H.264 LUMA 16x16 intra prediction.
15:8	RW	0x00	iprd_wgty16_1 The 2nd cost weight for H.264 LUMA 16x16 intra prediction.
7:0	RW	0x00	iprd_wgty16_0 The 1st cost weight for H.264 LUMA 16x16 intra prediction.

VEPU2_IPRD_WGTY16_0_HEVC

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	iprd_wgty16_3 Tthe 4th cost weight for HEVC LUMA 16x16 intra prediction.
23:16	RW	0x00	iprd_wgty16_2 The 3rd cost weight for HEVC LUMA 16x16 intra prediction.
15:8	RW	0x00	iprd_wgty16_1 The 2nd cost weight for HEVC LUMA 16x16 intra prediction.
7:0	RW	0x00	iprd_wgty16_0 The 1st cost weight for HEVC LUMA 16x16 intra prediction.

VEPU2_IPRD_WGTC8_H264

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	iprd_wgtc8_3 The 4th cost weight for H.264 CHROMA 8x8 intra prediction.
23:16	RW	0x00	iprd_wgtc8_2 The 3rd cost weight for H.264 CHROMA 8x8 intra prediction.
15:8	RW	0x00	iprd_wgtc8_1 The 2nd cost weight for H.264 CHROMA 8x8 intra prediction.
7:0	RW	0x00	iprd_wgtc8_0 The 1st cost weight for H.264 CHROMA 8x8 intra prediction.

VEPU2_IPRD_WGTY16_1_HEVC

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	iprd_wgty16_6 The 7th cost weight for HEVC LUMA 16x16 intra prediction, share address with H.264.
15:8	RW	0x00	iprd_wgty16_5 The 6th cost weight for HEVC LUMA 16x16 intra prediction.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	iprd_wgty16_4 The 5th cost weight for HEVC LUMA 16x16 intra prediction.

VEPU2_QNT_BIAS_COMB

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:10	RW	0x000	qnt_bias_p Quantization bias for HEVC and H.264 P frame.
9:0	RW	0x000	qnt_bias_i Quantization bias for HEVC and H.264 I frame.

VEPU2_ATR_THD0_H264

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	atr_thd1 The 2nd threshold for H.264 anti-ringing-noise.
15:12	RO	0x0	reserved
11:0	RW	0x000	atr_thd0 The 1st threshold for H.264 anti-ringing-noise.

VEPU2_ATR_THD1_H264

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	RW	0x00	atr_qp QP threshold of P frame for H.264 anti-ringing-nois.
15:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11:0	RW	0x000	atr_thd2 The 3rd threshold for H.264 anti-ringing-noise.

VEPU2_ATR_WGT16_H264

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	atr_lv16_wgt2 The 3rd weight for H.264 16x16 anti-ringing-noise.

10.6 Application Notes

10.6.1 MMU Config Flow

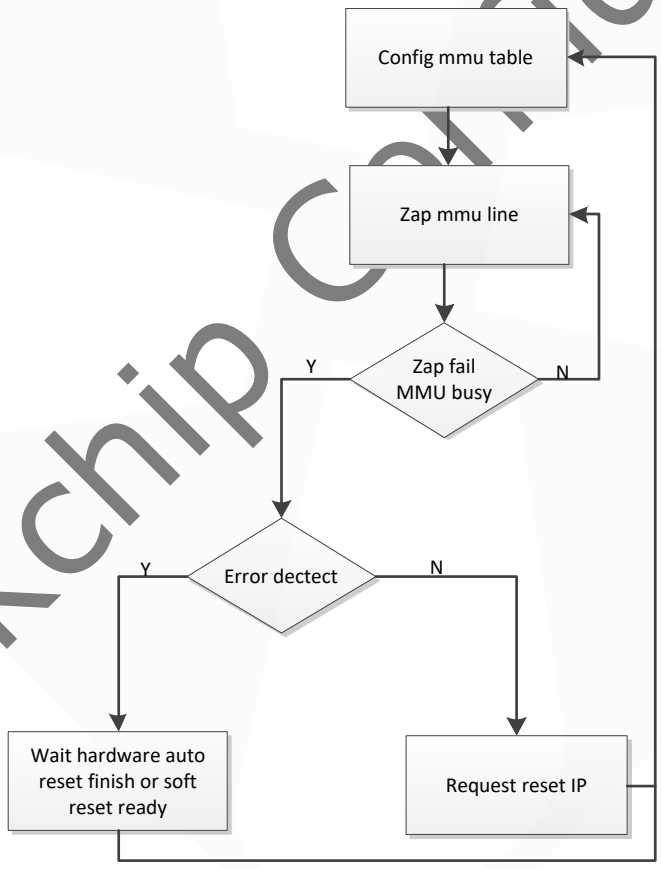

Fig. 10-12 MMU config flow

1. Prepare mmu table to ddr and config DTE address before begin to decoder.
2. If the mmu table have been changed, you will zap one mmu line.
3. If you zap successed, you can continus to zap next line.
4. If you zap fail, maybe some error happened, then you should check if there any error happen when decoding.
5. If some error happen, you should wait reset finish, and then re-start mmu config.

6. If don’t have any error find, it will still need to reset, and then re-start mmu config.

10.6.2 VDPU121 decoder Configuration flow

1. Prepare the decoder data in the DDR memory, and in decoder other than JPEG decoder, the input stream buffer should at least contain a slice or a frame data, otherwise the decoder will produce an interrupt and show error and then reset itself.
2. Config all the registers will be used. The decoder can support ref buffer mode or cacheable mode, but they can’t be both enabled. We can config the swreg57[28],swreg57[29] to enable cache and config the swreg65 to control the ref buffer.
3. You should config VDPU_SWREG57[0] as 1’b1 to enable video decoder. And config VDPU_SWREG41[0] as 1’b1 to enable pp. If pp performed in pipeline with decoder, you should config VDPU_SWREG41[4] as 1’b1 and then config VDPU_SWREG57[0] as 1’b1 to enable decoder and pp.
4. Wait for the frame interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~4 to start a new frame decoder or encoder.

10.6.3 VDPU346 decoder Configuration Flow

1. Prepare the data in the DDR.
2. Set the H265 general system configuration. such as working mode in RKVDEC.swreg9, in/out endian in RKVDEC.swreg8.
3. Set the picture parameters with RKVDEC.swreg0~ RKVDEC.swreg63.
4. Set the input and output data base address and H265 reference configuration with RKVDEC.swreg64~RKVDEC.swreg204.
5. If CABAC error detection is desired, set the RKVDEC.swreg21 to enable the corresponding error detection.
6. Set the interrupt configuration with RKVDEC.swreg11 and start the H265 with RKVDEC.swreg10.
7. Wait for the frame interrupt, and then get the processed results in the target DDR.
8. Clear all the interrupts, and repeat Process2~Process8 to start a new frame decoding if the decoding is not finished yet.

10.6.4 VDPU346 Link table Pointer mode configuration flow

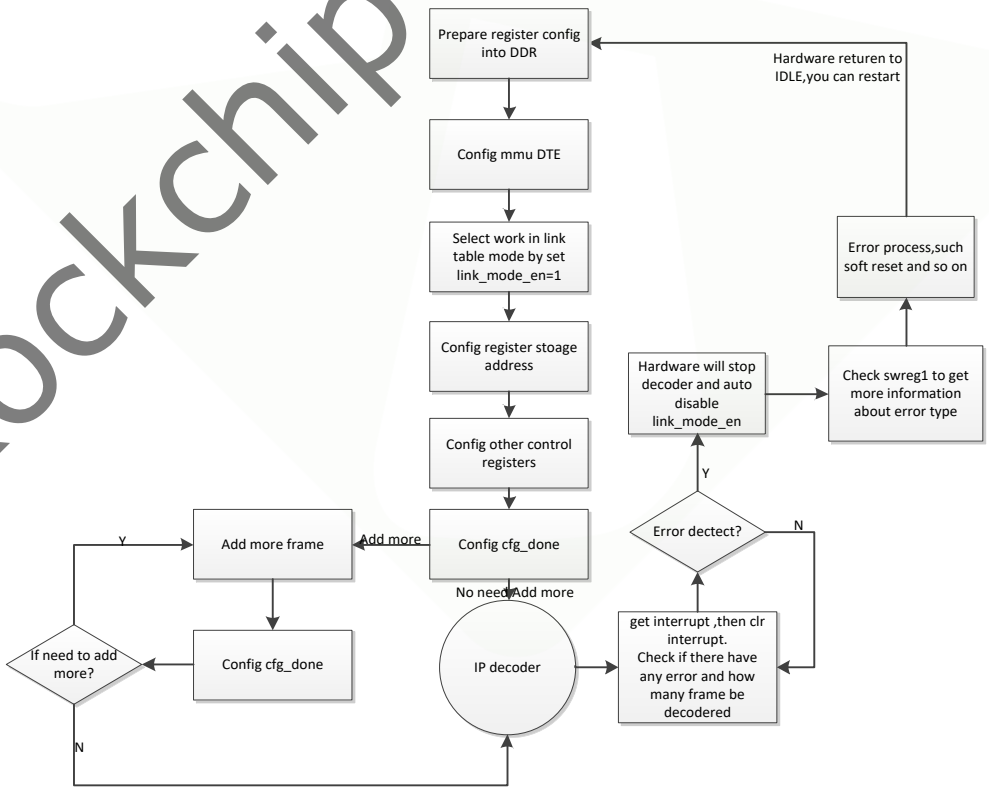

Fig. 10-13 Link table Pointer mode work flow

1. Prepare all the register config value into DDR.
2. Config mmu DTE and enable mmu before config link table mode.
3. Config link_mode_irq and other link table mode register. The register is from link_tale_swreg0~link_table_swreg2.
4. Config config_done(set link_table_swreg3[0]=1'b1) to make the link table register configuration effect, after that,hardware will begin to decoder frame by frame.
5. If you need to add more frame, you can use superaddition mode, you can add more frame when decoder at any status.
6. If all config be rdy, you should enable the working flag by config link_mode_en (link_table_swreg6[0]) to 1.
7. If all the frame be decodered, the hardware will hold the working status wait user to process, you can add more frame or set link_mode_en=0(need to set config_done=1'b1) to finish link table mode.
8. When you get interrupt, at first, you should clear the irq, and then, goto check if there have any error by check link_table_swreg4[31]=1'b1 or not. If any error found by hardware, the hardware will disable link table mode and stop decoder until user restart next link table mode. And then you can get more information about error type from normal register swreg225.
9. When you get interrupt, if there doesn't have any error, you may be to check the frame number which have been decoded.
10. Please note that: Any link table register be config, you need to config swreg3[0]=1'b1 to make it effective.

10.6.5 VDPU720 JPEG decoder Configuration flow

1. Prepare the decoder data in the DDR memory, and in decoder other than JPEG decoder, the input stream buffer should at least contain a slice or a frame data, otherwise the decoder will produce an interrupt and show error and then reset itself.
2. Config all the registers will be used.
3. You should config VDPU720_SWREG1[0] as 1'b1 to enable JPEG decoder.
4. Wait for the frame interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~4 to start a new frame decoder or encoder.

10.6.6 VEPU121 JPEG encoder Configuration flow

1. Prepare the encoder data in the DDR memory
2. Config all the registers will be used. And please notice that which be list as follows:
   - For encoder: We can configure the registers to control the input picture data format (such as endian and swap), but some input data format are fixed, such as cabac_table data. And the register VEPU_SWREG0~31 are JPEG quantization registers. They are write only registers. When you want to write these registers, you should first set VEPU_SWREG103[0] to 1'b0 and VEPU_SWREG103[5:4] to 2'b10(select JPEG mode).
3. VEPU_SWREG103[0] set to 1'b1 to enable encoder.
4. Wait for the frame interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~5 to start a new frame decoder or encoder.

10.6.7 VEPU540 Layer2 Register Access

User can access VEPU Layer2 registers through VEPU_L2CFG_ADDR(0x03f0), VEPU_L2CFG_WDATA(0x03f4) and VEPU_L2CFG_RDATA(0x03f8) in Layer1.

Example1: write "DATAx" into layer2 address "ADDRx"

- Write(VEPU_L2CFG_ADDR, "ADDRx")
- Write(VEPU_L2CFG_WDATA, "DATAx")

Example2: read back "DATAx" from layer2 register "ADDRx"

- Write(VEPU_L2CFG_ADDR, "ADDRx")
- Read(VEPU_L2CFG_RDATA, "DATAx")

To increase configuration speed, VEPU also support "burst mode" which auto increase VEPU_L2CFG_ADDR after write to VEPU_L2CFG_WDATA or read L2CFG_RDATA if VEPU_L2CFG_WDATA.burst_mode is 1.

Example3: write DATA[0~3] into layer2 address "ADDRx", "ADDRx+4", "ADDRx+8",

"ADDRx+12" continuously.

- Write(VEPU_L2CFG_ADDR, "ADDRx"|32'h1)
- Write(VEPU_L2CFG_WDATA, "DATA[0]")
- Write(VEPU_L2CFG_WDATA, "DATA[1]")
- Write(VEPU_L2CFG_WDATA, "DATA[2]")
- Write(VEPU_L2CFG_WDATA, "DATA[3]")

Example4: read 4 "DATA[0~4]" from layer2 registers with the address of "ADDRx", "ADDRx+4", "ADDRx+8" and "ADDRx+12" continuously.

- Write(VEPU_L2CFG_ADDR, "ADDRx"|32'h1)
- Read(VEPU_L2CFG_RDATA, "DATA[0]")
- Read(VEPU_L2CFG_RDATA, "DATA[1]")
- Read(VEPU_L2CFG_RDATA, "DATA[2]")
- Read(VEPU_L2CFG_RDATA, "DATA[3]")

10.6.8 VEPU540 Buffer Allocation

User should allocates the following buffers and informs VEPU before the corresponding frame encoding starts.

- Video source buffer
- (ROI) block level configuration buffer
- Reference frame buffer
- Current frame buffer
- Collocated MV buffer
- Current MV buffer
- Down-sampled reference frame buffer
- Down-sampled current frame buffer
- Motion information buffer
- Bitstream buffer

10.6.8.1 Video Source Buffer

Depending on different video source format, there're up to 3 buffers should be configured.
When video source format is BGRA8888, RGB888, RGB565, YUYV422 or UYVY422, only one buffer should be allocated and LAYER1.VEPU_ADR_SRC0(0x0118) should be set to the buffer start address.
When video source format is arm AFBC (YUV420 or YUV422), LAYER1.VEPU_ADR_SRC0 should be set to the start address of "AFBC header portion". LAYER1.VEPU_ADR_SRC1 should be set to the address of which the "AFBC body portion" offset base on (layer1.ADR_SRC0 and layer1.ADR_SRC1 are the same in most cases).
When video source format is YUV420 or YUV 422 semi-planar, LAYER1.VEPU_ADR_SRC0 should be set to the LUMA component start address, LAYER1.VEPU_ADR_SRC1 should be set to the CHROMA component start address.
Otherwise (YUV420 or YUV422 planar), LAYER1.VEPU_ADR_SRC0 should be set to the Y component start address, LAYER1.ADR_SRC1 should be set to the U component start address, and LAYER1.VEPU_ADR_SRC2 should be set to the V component start address.

10.6.8.2 Block Level Configure Buffer

This buffer should be allocated and configured when LAYER1.VEPU_ENC_PIC.roi_en is 1.
The size of block level configure buffer is:
((LAYER1.VEPU_ENC_RSL.pic_wd8_m1+8)/8) x
((LAYER1.VEPU_ENC_RSL.pic_hd8_m1+8)/8) x 32Bytes.

10.6.8.3 Current And Reference Frame Buffer

Reference frame buffer and current frame buffer store the reconstructed frame data for motion estimation. Because of that frame buffer compression is implemented, each buffer has head portion and body portion. LAYER1.VEPU_ADR_RFPW_H and LAYER1.VEPU_ADR_RFPW_B should be set to the head portion and body portion start address of current frame buffer separately. LAYER1.VEPU_ADR_RFPR_H and LAYER1.VEPU_ADR_RFPR_B should be set to the header portion and body portion start

address of reference frame buffer.
The size of head portion of current and reference frame buffer is:
(((LAYER1.VEPU_ENC_RSL.pic_wd8_m1+2)/2) x
((LAYER1.VEPU_ENC_RSL.pic_hd8_m1+1)x2) +15)/16 x 16Bytes.
The size of body portion of current and reference frame buffer is:
((LAYER1.VEPU_ENC_RSL.pic_wd8_m1+2)/2) x
((LAYER1.VEPU_ENC_RSL.pic_hd8_m1+1)x2) x 96Bytes.
Note that the head and body start address should be 4K byte aligned.

10.6.8.4 Col-Mv Buffer And Cur-Mv buffer

Col-Mv buffer and Cur-Mv buffer stores the col-mv information for HEVC encoding.
When LAYER1.VEPU_ME_CFG.colmv_stor is 1, the LAYER1.VEPU_ADR_CMVW should be set to the start address of Cur-Mv buffer. VEPU will store the col-mv information of current encoding frame into Cur-Mv buffer.
When LAYER1.VEPU_ME_CFG.colmv_load is 1, the LAYER1.VEPU_ADR_CMVR should be set to the start address of Col-Mv buffer. VEPU will load the col-mv information for MVP generation.
The size of Col-Mv buffer and Cur-Mv buffer is calculated by the following function:
((LAYER1.VEPU_ENC_RSL.pic_wd8_m1+8)/8) x
((LAYER1.VEPU_ENC_RSL.pic_hd8_m1+8)/8) x 32Bytes.
Note that the start address of col-mv and cur-mv buffer should be 1K byte aligned.

10.6.8.5 Down-sampled Current and Reference Frame Buffer

Down-sampled frame buffer is for VEPU coarse motion estimation. If current frame will be referred in subsequent encoding, the down-sampled current frame buffer should be allocated and set the start address to LAYER1.VEPU_ADR_DSPW. If current frame is P frame, a reference frame buffer should be selected and set the start address to LAYER1.VEPU_ADR_DSPR.
The size of down-sampled frame buffer is:
((LAYER1.VEPU_ENC_RSL.pic_wd8_m1+8)/8) x
(LAYER1.VEPU_ENC_RSL.pic_hd8_m1+2)/2) x 64Bytes.
Note that the start address of down-sampled frame buffer should be 1KB aligned.

10.6.8.6 Motion Information Buffer

When LAYER1.VEPU_ENC_PIC.mei_stor is 1, the motion information buffer should be allocated and set the start address to LAYER1.VEPU_ADR_MEIW. VEPU stores best motion vector and corresponding SAD into this buffer just for user extended extraction.
The size of motion information buffer is:
((LAYER1.VEPU_ENC_RSL.pic_wd8_m1+32)/32) x
(LAYER1.VEPU_ENC_RSL.pic_hd8_m1+1)x2) x 64Bytes.

10.6.8.7 Bit Stream Buffer

VEPU stores the encoding result (bit stream) into bit stream buffer.
There are 4 address pointers for one bit stream buffer management:

- LAYER1.VEPU_ADR_BSBT: buffer top address, not included.
- LAYER1.VEPU_ADR_BSBB: buffer bottom address, included.
- LAYER1.VEPU_ADR_BSBR: buffer read address to avoid overlap.
- LAYER1.VEPU_ADR_BSBW: buffer write start address.

Two types of buffer management strategy can be implemented by configuring the four address pointers: single buffer and cyclic buffer management.
Single buffer management allocates a new buffer for each frame while cyclic buffer management allocates a shared cyclic buffer for all encoding frames.
Interrupt LAYER1.VEPU_INT_STUS.bs_ovflr will assert when write address meets read address (which indicates buffer is full) and encoding process is paused. Driver should allocated a new buffer to continue current frame encoding by setting new values to the four address pointers or change buffer read address (read out the bitstream before that), and then the encoding process will continue.

Note that LAYER1.VEPU_ADR_BSBW must be configured after the other 3 address pointers.

10.6.8.8 Cur-LPF Row Buffer and Left-LPF Row Buffer

Cur-LPF row buffer and Left-LPF row buffer stores the data between tiles for loop-filter and sao when the current picture is partitioned into several tiles for HEVC coding. If current tile is not the right tile of the picture, the cur-LPF row buffer should be allocated and set the start address to LAYER1.VEPU_ADR_LPFW. If the current tile is not the left tile of the picture, the left-LPF row buffer should be selected and set the start address to LAYER1.VEPU_ADR_LPFR.

The size of Cur-LPF Row buffer and Left-LPF Row buffer is:
(LAYER1.VEPU_TILE_CFG_HEVC.tile_h_m1+1) x 128 x 16Byte.

10.6.9 VEPU540 Link Table Mode

VEPU540 supports a batch process mode named "link table mode". It will increase the interaction efficiency between hardware and software. CPU can stores the configuration for several frames in DDR before encoding or add new frames to be encoded when VEPU is processing the previous one. This will save the time of interrupt response and register configuration and let VEPU and software process in parallel.

The struct contains one frame configuration in DDR is called node. It contains the LAYER1 register configuration and status from address 0x0030 to 0x002C. VEPU will load the node and replace corresponding LAYER1 registers automatically.

Note that only the registers between LAYER1 0x0030 to 0x002C can be re-configured in link table mode, other configurations can not be changed.

When LAYER1. VEPU_INT_EN.lkt_done_en is 1, the interrupt of LAYER1.VEPU_INT_STA.lkt_done_sta will assert after each frame encoding whose LAYER1.VEPU_ENC_PIC.node_int is 1. User can set dedicated frame interrupt such as the last node of link table. LAYER1.VEPU_ST_LKT.fnum_int contains the number of frames have been encoded when interrupt is assert.

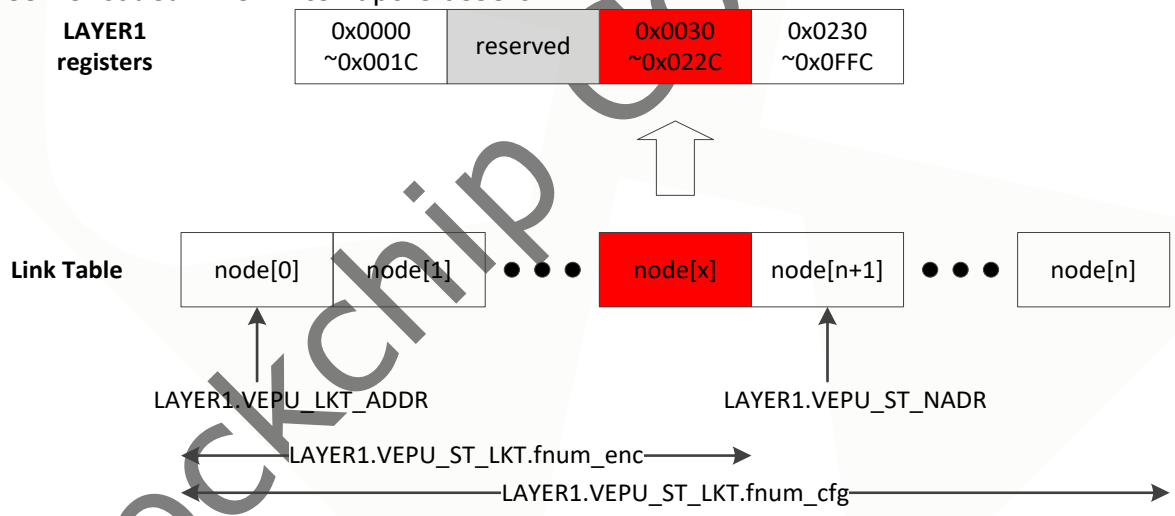

Fig. 10-14 VEPU Link Table Introduction

10.6.10 VEPU540 ROI

User can adjust QP and inter/intra selection base on 16x16 block and stores the configurations in block level configuration buffer. Each 16x16 block has 16 bits ROI configuration struct as the table listed below.

Table 10-17 ROI Configuration Structure

Bit	Field	Description
15	qp_mode	QP adjustment mode 0: absolute QP 1: relative QP

Bit	Field	Description
14:8	qp_value	QP adjustment value This field is the absolute QP when qp_mode is 0, otherwise it's the relative QP base on corresponding 16x16 block's QP
7	amap_en	Area map enable
6:4	amap_idx	Area map index. QP clip is implemented base on area map index, each map index has its dedicated threshold. ROI configuration mapping will use amap_idx to arbitrate the final configure when CU size is bigger than 16x16. Bigger amap_idx has higher priority.
3:1	reserved	Reserved
0	force_intra	Force intra encoding

The configuration structures of different blocks are stored in the order of raster scanning within a frame.

10.6.11 VEPU540 OSD

VEPU has 8 rectangular OSD areas, which insert user defined picture into encoding frames. The top left and bottom right ordinate for each OSD area is assigned by LAYER1.VEPU_OSD0~7_POS, and the materials buffer assigned by LAYER1.VEPU_ADR_OSD0~7.

VEPU's OSD material bases on palette. LAYER1.VEPU_OSD_CFG.osd_plt_typ selects the type of palette: default OSD palette has only 8 colors while user defined OSD palette (configured by LAYER1.VEPU_OSD_PLT0~255) supports up to 256 colors.

Note that LAYER1.VEPU_OSD_CFG.osd_plt_cks should be 0 when configure and be 1 when encoding.

10.6.12 VEPU540 Safe Clear

Safe Clear confirms the integrity of BUS transaction. It will discard the (AXI) transactions have not sent out and complete all outstanding ones. To implement safe clear, software should set LAYER1.VEPU_ENC_CLR to 1, and wait for LAYER1.VEPU_ST_STUS.clr_fnsh interrupt. After that pull down VEPU asynchronous reset port to perform force reset.

10.6.13 VEPU540 Large Resolution Encoding

The typical resolution supported by VEPU is 1080P while the maximum resolution is 4096x4096. When encoding the video with resolution above 1080P, large resolution encoding strategy is needed.

For HEVC encoding, TILE partition is used to support the large resolution video encoding which above 1080P. Layer1.TILE_CFG_HEVC and Layer1.TILE_POS contain the configuration of TILE size and position.

For H.264 encoding, slice line split is used to support the large resolution video encoding which above 1080P. Layer1.SLI_CFG_H264.sli_crs_en should be 0, and Layer1.SLI_SPLT set each MB line into a slice. Meanwhile, Layer1.sli_max_num_m1 should be bigger than the maximum number of MB lines in current picture.

Chapter 11 Video Capture (VICAP)

11.1 Overview

The Video Capture, receives the data from Camera via DVP/MIPI, and transfers the data into system main memory by AXI bus.

The features of VICAP are as follow:

- Support BT601 YCbCr 422 8bit input、RAW 8/10/12bit input
- Support BT656 YCbCr 422 8bit input
- Support BT1120 YCbCr 422 8bit input, single/dual-edge sampling
- Support 2/4 mixed BT656/BT1120 YCbCr 422 8bit input
- Support YUYV sequence configurable
- Support the polarity of pixel_clk, hsync and vsync configurable
- Support receiving CSI2 protocol data(up to four IDs)
- Support receiving DSI protocol data(Video mode/Command mode)
- Support window cropping
- Support virtual stride when write to DDR
- Support NV16/NV12 output for YUV data
- Support compact/non-compact output for RAW data
- Support MMU

11.2 Block Diagram

VICAP/VICAP_LITE comprises with:

- AHB Slave

Host configure the registers via the AHB Slave

- AXI Master

Transmit the data to chip memory via the AXI Master

- MMU

Map the virtual address to physical address

- INTERFACE

Translate the input video data(DVP/CSI/LVDS) into the requisite data format

- CROP

Bypass or crop the source video data to a smaller size destination

- DMA

Control the operation of AXI Master

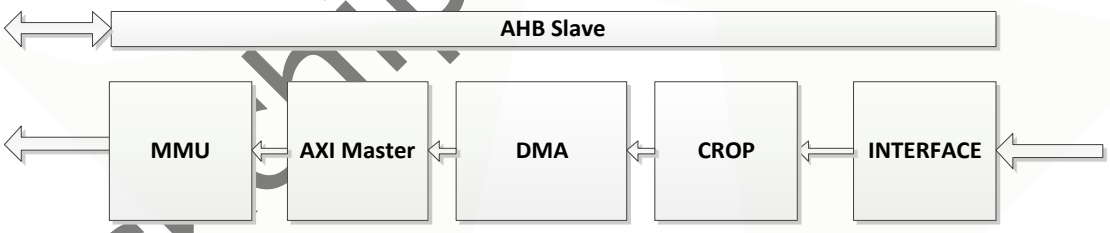

Fig. 11-1 VICAP Block Diagram

11.3 Function Description

11.3.1 Interface

Interface module is designed to receive DVP/CSI/LVDS data and transfer to pixel data.

11.3.2 Crop

Crop module is used to crop the received image.

11.3.3 DMA

The DMA is used to transfer the data from crop module to the AXI master block which will send the data to the AXI bus.

11.3.4 AXI Master

There is an AXI master in VICAP, it is responsible for transferring the DMA output data to AXI bus.

11.3.5 MMU

There is a MMU in VICAP, it is responsible for mapping the virtual address to physical address.

11.4 VICAP Register Description

11.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

11.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
VICAP_DVP_CTRL	0x0000	W	0x00007000	DVP path control
VICAP_DVP_INTEN	0x0004	W	0x00000000	DVP path interrupt status
VICAP_DVP_INTSTAT	0x0008	W	0x00000000	DVP path interrupt status
VICAP_DVP_FOR	0x000C	W	0x00000000	DVP path format
VICAP_DVP_MULTI_ID	0x0010	W	0x00000000	Channel ID for multi-ID mode
VICAP_DVP_FRM0_ADDR_Y	0x0014	W	0x00000000	DVP path frame0 y address
VICAP_DVP_FRM0_ADDR_UV	0x0018	W	0x00000000	DVP path frame0 uv address
VICAP_DVP_FRM1_ADDR_Y	0x001C	W	0x00000000	DVP path frame1 y address
VICAP_DVP_FRM1_ADDR_UV	0x0020	W	0x00000000	DVP path frame1 uv address
VICAP_DVP_VIR_LINE_WIDTH	0x0024	W	0x00000000	DVP path virtual line width
VICAP_DVP_SET_SIZE	0x0028	W	0x01E002D0	The expected width and height of received image
VICAP_DVP_LINE_INT_NUM	0x002C	W	0x00000040	DVP path line interrupt number
VICAP_DVP_LINE_CNT	0x0030	W	0x00000000	DVP path line count
VICAP_DVP_CROP	0x0034	W	0x00000000	The start point of DVP path cropping
VICAP_DVP_FIFO_ENTRY	0x0038	W	0x00000000	DVP path FIFO entry
VICAP_DVP_FRAME_STATUS	0x003C	W	0x00000000	DVP path frame status
VICAP_DVP_CUR_DST	0x0040	W	0x00000000	DVP path current destination address
VICAP_DVP_LAST_LINE	0x0044	W	0x00000000	DVP path last frame line number
VICAP_DVP_LAST_PIX	0x0048	W	0x00000000	DVP path last line pixel number
VICAP_DVP_FRM0_ADDR_Y_ID1	0x0050	W	0x00000000	DVP path frame0 y address for ID1
VICAP_DVP_FRM0_ADDR_UV_ID1	0x0054	W	0x00000000	DVP path frame0 uv address for id1
VICAP_DVP_FRM1_ADDR_Y_ID1	0x0058	W	0x00000000	DVP path frame1 y address for id1
VICAP_DVP_FRM1_ADDR_UV_ID1	0x005C	W	0x00000000	DVP path frame1 uv address for id1
VICAP_DVP_FRM0_ADDR_Y_ID2	0x0060	W	0x00000000	DVP path frame0 y address for id2
VICAP_DVP_FRM0_ADDR_UV_ID2	0x0064	W	0x00000000	DVP path frame0 uv address for id2
VICAP_DVP_FRM1_ADDR_Y_ID2	0x0068	W	0x00000000	DVP path frame1 y address for id2
VICAP_DVP_FRM1_ADDR_UV_ID2	0x006C	W	0x00000000	DVP path frame1 uv address for id2

Name	Offset	Size	Reset Value	Description
VICAP_DVP_FRM0_ADDR_Y_ID3	0x0070	W	0x00000000	DVP path frame0 y address for id3

VICAP_MIPI_FRAME0_VLW_Y_ID3	0x0114	W	0x00000000	Virtual line width of even frame for ID3 Y/RAW/RGB path
VICAP_MIPI_FRAME1_VLW_Y_ID3	0x0118	W	0x00000000	Virtual line width of odd frame for ID3 Y/RAW/RGB path
VICAP_MIPI_FRAME0_VLW_UV_ID3	0x011C	W	0x00000000	Virtual line width of even frame for ID3 UV path
VICAP_MIPI_FRAME1_VLW_UV_ID3	0x0120	W	0x00000000	Virtual line width of odd frame for ID3 UV path
VICAP_MIPI_INTEN	0x0124	W	0x00000000	MIPI path interrupt enable
VICAP_MIPI_INTSTAT	0x0128	W	0x00000000	MIPI path interrupt status
VICAP_MIPI_LINE_INT_NUM_ID0_1	0x012C	W	0x00400040	Line number of the MIPI path ID0/1 line interrupt
VICAP_MIPI_LINE_INT_NUM_ID2_3	0x0130	W	0x00400040	Line number of the MIPI path ID2/3 line interrupt
VICAP_MIPI_LINE_CNT_ID0_1	0x0134	W	0x00000000	Line count of the MIPI path ID0/1
VICAP_MIPI_LINE_CNT_ID2_3	0x0138	W	0x00000000	Line count of the MIPI path ID2/3
VICAP_MIPI_ID0_CROP_START	0x013C	W	0x00000000	The start point of MIPI ID0 cropping
VICAP_MIPI_ID1_CROP_START	0x0140	W	0x00000000	The start point of MIPI ID1 cropping
VICAP_MIPI_ID2_CROP_START	0x0144	W	0x00000000	The start point of MIPI ID2 cropping
VICAP_MIPI_ID3_CROP_START	0x0148	W	0x00000000	The start point of MIPI ID3 cropping
VICAP_MIPI_FRAME_NUM_VC0	0x014C	W	0x00000000	The frame number of virtual channel 0
VICAP_MIPI_FRAME_NUM_VC1	0x0150	W	0x00000000	The frame number of virtual channel 1
VICAP_MIPI_FRAME_NUM_VC2	0x0154	W	0x00000000	The frame number of virtual channel 2

Name	Offset	Size	Reset Value	Description
VICAP_MIPI_FRAME_NUM_VC3	0x0158	W	0x00000000	The frame number of virtual channel 3
VICAP_Y_STAT_CONTROL	0x0190	W	0x00000000	Y statistics control
VICAP_Y_STAT_VALUE	0x0194	W	0x00000000	Y statistics value
VICAP_MMU_DTE_ADDR	0x0800	W	0x00000000	MMU current page table address
VICAP_MMU_STATUS	0x0804	W	0x00000000	MMU status register
VICAP_MMU_COMMAND	0x0808	W	0x00000000	MMU command register
VICAP_MMU_PAGE_FAULT_ADDR	0x080C	W	0x00000000	MMU logical address of last page fault
VICAP_MMU_ZAP_ONE_LINE	0x0810	W	0x00000000	MMU Zap cache line register
VICAP_MMU_INT_RAWSTAT	0x0814	W	0x00000000	MMU raw interrupt status register
VICAP_MMU_INT_CLEAR	0x0818	W	0x00000000	MMU interrupt status clear
VICAP_MMU_INT_MASK	0x081C	W	0x00000000	MMU interrupt mask
VICAP_MMU_INT_STATUS	0x0820	W	0x00000000	MMU interrupt status
VICAP_MMU_AUTO_GATING	0x0824	W	0x00000000	MMU auto gating

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3 Detail Registers Description

VICAP_DVP_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:12	RW	0x7	axi_burst_type Burst1~16.
11:5	RO	0x00	reserved
4	RW	0x0	dma_idle_req Write 1 will stop VICAP DVP path dma. When this bit change to 0,dma is stopped really.
3	RO	0x0	reserved
2:1	RW	0x0	work_mode 2'b00: One frame stop mode 2'b01: Ping-pong mode 2'b10: Reserved 2'b11: Reserved Note: BT1120 only support ping-pong mode.
0	RW	0x0	cap_en 1'b0: Disable 1'b1: Enable

VICAP_DVP_INTEN

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13	RW	0x0	dma_frame_end_id3_en ID3 dma frame end interrupt enable. 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
12	RW	0x0	dma_frame_end_id2_en ID2 dma frame end interrupt enable. 1'b0: Disable 1'b1: Enable
11	RW	0x0	dma_frame_end_id1_en ID1 dma frame end interrupt enable. 1'b0: Disable 1'b1: Enable
10	RW	0x0	line_int_en The specified line end interrupt enable. 1'b0: Disable 1'b1: Enable
9	RW	0x0	pst_inf_frame_end_en Frame end after interface FIFO interrupt enable. 1'b0: Disable 1'b1: Enable
8	RW	0x0	pre_inf_frame_end_en Frame end before interface FIFO interrupt enable. 1'b0: Disable 1'b1: Enable
7	RO	0x0	reserved
6	W1C	0x0	bus_err_en Axi master or ahb slave response error interrupt enable. 1'b0: Disable 1'b1: Enable
5	RW	0x0	dfifo_of_en DMA FIFO overflow interrupt enable. 1'b0: Disable 1'b1: Enable
4	RW	0x0	ififo_of_en Interface FIFO overflow interrupt enable. 1'b0: Disable 1'b1: Enable
3	W1C	0x0	pix_err_en The pixel number of last line not equal to the set height interrupt enable. 1'b0: Disable 1'b1: Enable
2	W1C	0x0	line_err_en The line number of last frame not equal to the set height interrupt enable. 1'b0: Disable 1'b1: Enable
1	W1C	0x0	line_end_en Line end interrupt enable. 1'b0: Disable 1'b1: Enable
0	W1C	0x0	dma_frame_end_en Dma frame end interrupt enable. 1'b0: Disable 1'b1: Enable

VICAP_DVP_INTSTAT

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13	W1C	0x0	dma_frame_end_id3 ID3 dma frame end interrupt. 1'b0: No interrupt 1'b1: Interrupt
12	W1C	0x0	dma_frame_end_id2 ID2 dma frame end interrupt. 1'b0: No interrupt 1'b1: Interrupt
11	W1C	0x0	dma_frame_end_id1 ID1 dma frame end interrupt. 1'b0: No interrupt 1'b1: Interrupt
10	RW	0x0	line_int The specified line end interrupt. 1'b0: No interrupt 1'b1: Interrupt
9	RW	0x0	pst_inf_frame_end Frame end after interface FIFO interrupt. 1'b0: No interrupt 1'b1: Interrupt
8	RW	0x0	pre_inf_frame_end Frame end before interface FIFO interrupt. 1'b0: No interrupt 1'b1: Interrupt
7	RO	0x0	reserved
6	W1C	0x0	bus_err Axi master or ahb slave response error interrupt. 1'b0: No interrupt 1'b1: Interrupt
5	RW	0x0	dfifo_of DMA FIFO overflow interrupt. 1'b0: No interrupt 1'b1: Interrupt
4	RW	0x0	ififo_of Interface FIFO overflow interrupt. 1'b0: No interrupt 1'b1: Interrupt
3	W1C	0x0	pix_err The pixel number of last line not equal to the set height interrupt. 1'b0: No interrupt 1'b1: Interrupt
2	W1C	0x0	line_err The line number of last frame not equal to the set height interrupt. 1'b0: No interrupt 1'b1: Interrupt
1	W1C	0x0	line_end Line end interrupt. 1'b0: No interrupt 1'b1: Interrupt
0	W1C	0x0	dma_frame_end Dma frame end interrupt. 1'b0: No interrupt 1'b1: Interrupt

VICAP_DVP_FOR

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	sw_multi_id_mode 2'd0: 1to1 (ID0 will work) 2'd1: 1to2 (ID0/ID1 will work) 2'd2: 1to4 (ID0/ID1/ID2/ID3 will work) 2'd3: Reserved
29	RW	0x0	sw_multi_id_sel Only for BT1120. 1'b0: Parse the id by data[11:8] 1'b1: Parse the id by data[3:0]
28	RW	0x0	sw_multi_id_en 1'b0: Disable multi-ID bt656/bt1120 received 1'b1: Enable multi-ID bt656/bt1120 received
27	RO	0x0	reserved
26	RW	0x0	sw_yc_swap 1'b0: No swap for y and c 1'b1: Swap for y and c Only for BT1120 mode.
25	RW	0x0	sw_progress_en 1'b0: Interlace 1'b1: Progress Only for BT1120 mode.
24	RW	0x0	sw_dualedge_en 1'b0: Only use single edge of clock 1'b1: Use double edges of clock Only for BT1120 mode.
23:20	RO	0x0	reserved
19	RW	0x0	uv_store_order 1'b0: UVUV 1'b1: VUVU
18	RW	0x0	raw_end 1'b0: Little end 1'b1: Big end
17	RW	0x0	out_420_order 1'b0: UV in the even line 1'b1: UV in the odd line Note: The first line is even line(line 0).
16	RW	0x0	output_420 1'b0: Output is 422 1'b1: Output is 420
15:13	RO	0x0	reserved
12:11	RW	0x0	raw_width 2'b00: 8bit raw data 2'b01: 10bit raw data 2'b10: 12bit raw data 2'b11: Reserve
10	RO	0x0	reserved
9	RW	0x0	field_order 1'b0: Odd field first 1'b1: Even field first
8:7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:5	RW	0x0	yuv_in_order 2'b00: UYVY 2'b01: YVYU 2'b10: VYUY 2'b11: YUYV
4:2	RW	0x0	input_mode 3'b000: BT601 YUV422 3'b010: BT656 YUV422 3'b100: BT601 RAW 3'b101: SONY RAW 3'b111: BT1120 YUV422 others: Reserved
1	RW	0x0	href_pol 1'b0: High active 1'b1: Low active
0	RW	0x0	vsync_pol 1'b0: Low active 1'b1: High active

VICAP_DVP_MULTI_ID

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	sw_chid_bit_en_id3 Bit enable for chid_id3. Eg: chid_id3 = 4'b1111 and chid_bit_en_id3 = 4'b0011.Then the data[3:0] = 4'bxx11 will be detected.
27:24	RW	0x0	sw_chid_id3 The channel id for id3.
23:20	RW	0x0	sw_chid_bit_en_id2 Bit enable for chid_id2. Eg: chid_id2 = 4'b1111 and chid_bit_en_id2 = 4'b0011.Then the data[3:0] = 4'bxx11 will be detected.
19:16	RW	0x0	sw_chid_id2 The channel id for id2.
15:12	RW	0x0	sw_chid_bit_en_id1 Bit enable for chid_id1. Eg: chid_id1 = 4'b1111 and chid_bit_en_id1 = 4'b0011.Then the data[3:0] = 4'bxx11 will be detected.
11:8	RW	0x0	sw_chid_id1 The channel id for id1.
7:4	RW	0x0	sw_chid_bit_en_id0 Bit enable for chid_id0. Eg: chid_id0 = 4'b1111 and chid_bit_en_id0 = 4'b0011.Then the data[3:0] = 4'bxx11 will be detected.
3:0	RW	0x0	sw_chid_id0 The channel id for id0.

VICAP_DVP_FRM0_ADDR_Y

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	frm0_addr_y DVP path frame0 y address.

VICAP_DVP_FRM0_ADDR_UV

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	frm0_addr_uv DVP path frame0 uv address.

VICAP_DVP_FRM1_ADDR_Y

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	frm1_addr_y DVP path frame1 y address.

VICAP_DVP_FRM1_ADDR_UV

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	frm1_addr_uv DVP path frame1 uv address.

VICAP_DVP_VIR_LINE_WIDTH

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:0	RW	0x0000	vir_line_width DVP path virtual line width.

VICAP_DVP_SET_SIZE

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x01e0	set_height The expected height of received image.
15:13	RO	0x0	reserved
12:0	RW	0x02d0	set_width The expected width of received image.

VICAP_DVP_LINE_INT_NUM

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13:0	RW	0x0040	line_int_num If line_int_num=100,then vicap receive 100th line200th line300th line.....the line_int will be 1.

VICAP_DVP_LINE_CNT

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13:0	RO	0x0000	line_cnt Current line count.

VICAP_DVP_CROP

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	start_y The vertical ordinate of the start point.
15:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12:0	RW	0x0000	start_x The horizontal ordinate of the start point.

VICAP_DVP_FIFO_ENTRY

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24:16	RW	0x000	uv_fifo_entry Write 0 clear.
15:9	RO	0x00	reserved
8:0	RO	0x000	y_fifo_entry Write 0 clear.

VICAP_DVP_FRAME_STATUS

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	frame_num Completed frame number Write 0 to clear.
15:14	RO	0x0	reserved
13	RO	0x0	f1_sts_id3 1'b0: Frame 1 not ready 1'b1: Frame 1 ready Write 0 clear.

15:14	RO	0x0	reserved
13:0	RW	0x0000	sw_start_x_id3 The start x coordinate for id3,if sw_wrddr_type is rgb888,then the start x is measured in byte. The start x value must be 8 aligned when sw_wrddr_type is raw8/yuv422, must be 4 aligned when sw_wrddr_type is raw10/raw12,and must be 24 aligned when sw_wrddy_type is rgb888.

VICAP_MIPI_FRAME_NUM_VC0

Address: Operational Base + offset (0x014C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	ro_frame_num_end_vc0 The frame number of frame end of virtual channel 0.
15:0	RO	0x0000	ro_frame_num_start_vc0 The frame number of frame start of virtual channel 0.

VICAP_MIPI_FRAME_NUM_VC1

Address: Operational Base + offset (0x0150)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	ro_frame_num_end_vc1 The frame number of frame end of virtual channel 1.
15:0	RO	0x0000	ro_frame_num_start_vc1 The frame number of frame start of virtual channel 1.

VICAP_MIPI_FRAME_NUM_VC2

Address: Operational Base + offset (0x0154)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	ro_frame_num_end_vc2 The frame number of frame end of virtual channel 2.
15:0	RO	0x0000	ro_frame_num_start_vc2 The frame number of frame start of virtual channel 2.

VICAP_MIPI_FRAME_NUM_VC3

Address: Operational Base + offset (0x0158)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	ro_frame_num_end_vc3 The frame number of frame end of virtual channel 3.
15:0	RO	0x0000	ro_frame_num_start_vc3 The frame number of frame start of virtual channel 3.

VICAP_Y_STAT_CONTROL

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:26	RW	0x00	sw_black_level_b Black level for B channel.
25:21	RW	0x00	sw_black_level_g Black level for G channel.
20:16	RW	0x00	sw_black_level_r Black level for R channel.
15:14	RO	0x0	reserved
13:12	RO	0x0	ro_block_id2 The number of block of id2.
11:10	RO	0x0	ro_block_id1 The number of block of id1.
9:8	RO	0x0	ro_block_id0 The number of block of id0.
7:6	WO	0x0	sw_y_stat_rd_block Point to the specified block.
5:4	WO	0x0	sw_y_stat_rd_id 2'b00: Point to ID0 2'b01: Point to ID1 2'b10: Point to ID2 2'b11: Reserved

Bit	Attr	Reset Value	Description
3	WO	0x0	sw_y_stat_rd Chanege the y statistics read pointer according to sw_y_stat_rd_id/sw_y_stat_rd_block.
2:1	RW	0x0	sw_bayer_pattern 2'b00: RGGB 2'b01: GRBG 2'b10: GBRG 2'b11: BGGR
0	RW	0x0	sw_y_stat_en 1'b0: Disable y statistics 1'b1: Enable y statistics

VICAP_Y_STAT_VALUE

Address: Operational Base + offset (0x0194)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	sw_y_stat_value Y statistics value.

VICAP_MMU_DTE_ADDR

Address: Operational Base + offset (0x0800)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	mmu_dte_addr MMU current page Table address.

VICAP_MMU_STATUS

Address: Operational Base + offset (0x0804)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:6	RO	0x00	page_fault_bus_id Index of master reponsible for last page fault.
5	RO	0x0	page_fault_is_write The direction of access for last page fault: 1'b0: Read 1'b1: Write
4	RO	0x0	replay_buffer_empty The MMU replay buffer is empty.
3	RO	0x0	mmu_idle The MMU is idle when accesses are being translated and there are no unfinished translated accesses.
2	RO	0x0	stail_active MMU stall mode currently enabled. The mode is enabled by command.
1	RO	0x0	page_fault_active MMU page fault mode currently enabled . The mode is enabled by command.
0	RO	0x0	paging_enabled Paging is enabled.

VICAP_MMU_COMMAND

Address: Operational Base + offset (0x0808)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
2:0	WO	0x0	mmu_cmd MMU_CMD. This can be: 3'b000: MMU_ENABLE_PAGING 3'b001: MMU_DISABLE_PAGING 3'b010: MMU_ENABLE_STALL 3'b011: MMU_DISABLE_STALL 3'b100: MMU_ZAP_CACHE 3'b101: MMU_PAGE_FAULT_DONE

VICAP_MMU_PAGE_FAULT_ADDR

Address: Operational Base + offset (0x080C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	page_fault_addr Address of last page fault.

VICAP_MMU_ZAP_ONE_LINE

Address: Operational Base + offset (0x0810)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	mmu_zap_one_line Address to be invalidated from the page table cache.

VICAP_MMU_INT_RAWSTAT

Address: Operational Base + offset (0x0814)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	read_bus_error Read bus error.
0	RW	0x0	page_fault Page fault.

VICAP_MMU_INT_CLEAR

Address: Operational Base + offset (0x0818)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	WO	0x0	read_bus_error Read bus error.
0	WO	0x0	page_fault Page fault.

VICAP_MMU_INT_MASK

Address: Operational Base + offset (0x081C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	read_bus_error Read bus error
0	RW	0x0	page_fault Page fault

VICAP_MMU_INT_STATUS

Address: Operational Base + offset (0x0820)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	read_bus_error Read bus error.

Bit	Attr	Reset Value	Description
0	RO	0x0	page_fault Page fault.

VICAP_MMU_AUTO_GATING

Address: Operational Base + offset (0x0824)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	mmu_auto_gating When it is 1'b1, the mmu will auto gating it self

vicap_data12	I	CIF_D12/EBC_SDDO12/GMAC1_RXD3_M1/UART7_TX_M2/PDM_SDI2_M1/GPIO4_A2_d	GRF_GPIO4A_IOMUX_L[11:8]=4'h1
vicap_data13	I	CIF_D13/EBC_SDDO13/GMAC1_RXCLK_M1/UART7_RX_M2/PDM_SDI3_M1/GPIO4_A3_d	GRF_GPIO4A_IOMUX_L[15:12]=4'h1
vicap_data14	I	CIF_D14/EBC_SDDO14/GMAC1_TXD0_M1/UART9_TX_M2/I2S2_LRCK_TX_M1/GPIO4_A4_d	GRF_GPIO4A_IOMUX_H[3:0]=4'h1
vicap_data15	I	CIF_D15/EBC_SDDO15/GMAC1_TXD1_M1/UART9_RX_M2/I2S2_LRCK_RX_M1/GPIO4_A5_d	GRF_GPIO4A_IOMUX_H[7:4]=4'h1

Notes: I=input, O=output, I/O=input/output, bidirectional

Furthermore, different IOs are selected and connected to different flash interface, which is shown as follows.

11.6 Application Notes

11.6.1 DVP receiving Application

The most important configuration requirement of all operations is the DVP_CAP_EN bit must be set after all the mode selection is ready. The configuration order of the input/output data format, YUV order, the address, frame size/width, AXI burst length and other options do not need to care.

There are many debug registers to make it easy to read the internal operation information of VICAP. The line number of last frame and the pixel number of last line can be known by read the DVP_LAST_LINE and DVP_LAST_PIX.

If 1/2/4 mixed BT656/BT1120 is received, sw_multi_id_en/sw_multi_id_mode must be configured. And sw_chid_idx/sw_chid_bit_en_idx should be configured according the encoding rules. Eg: the different videos are distinguished by the [3:2] bits in sync code, so we can configure sw_chid_bit_en_idx=4'b1100.

If DVP data is double edge sampling, GRF_VI_CON1[9] should be configured to 1. And the user can adjust the clock phase by GRF_VI_CON1[6:0].

11.6.2 MIPI receiving Application

VICAP support receiving up to four MIPI IDs at the same time. VICAP could receive all ID value via configuring the sw_vc_id0/1/2/3 and sw_dt_id0/1/2/3, but VICAP could only transform MIPI data to RAW8/10/12, RGB888, YUV422SP, YUV420SP, YUV400 via configuring the sw_wrddr_type. The register sw_height must be same as the received image, and the register sw_width is useless when sw_crop_en is disable. If sw_wrddr_type is rgb888, then the sw_width and sw_start_x are equal to the number of bytes.

If AXI bus is too busy to transfer sensor data, you can enable sw_hurry_en/sw_press_en and sw_water_line_en.

Chapter 12 Image Signal Processing（ISP）

12.1 Introduction

12.1.1 Overview

The Image Signal Processing (ISP) is a complete video and still picture input unit which contains standard sensor picture data processing functions, such as image processing, scaling. This unit supports image sensors with integrated YCbCr processing and also simple CMOS sensors delivering RGB Bayer pattern without any integrated image processing.

Image processing contains many functions, such as HDR_MGE, HDR_DRC, RAWNR, GIC, DEBAYER and so on.Scaling is used for downsizing the sensor data for either displaying them on the LCD. Scaling also can be used for digital zoom effects, because the scalers are capable of up-scaling as well. The camera interface provides Parallel-data and MIPI support, so that ISP can be connected to PHY devices or IP blocks directly. All data is transmitted via the memory interface to a AXI bus system using a bus master interface. Programming is done by register read/write transactions using an AHB slave interface.

ISP supports the following features:

- DVP input: ITU-R BT601/656 with raw8/raw10/raw12, YUV422; BT1120
- MIPI input: RX lane x1/x2/4; raw8/raw10/raw12; YUV422;
- Maximum input: 4096x2304
- 3A: include AE/Histogram, AF, AWB statistics output
- FPN: Fixed Pattern Noise removal
- BLC: Black Level Correction
- DPCC: Static/Dynamic defect pixel cluster correction
- PDAF: Phase Detection Auto Focus
- LSC: Lens shading correction
- Bayer-2DNR: Spatial Bayer-raw De-noising
- Bayer-3DNR: Temporal Bayer-raw De-noising
- HDR: 2-Frame Merge into High-Dynamic Range
- DRC: HDR Dynamic Range Compression , Tone mapping
- GIC: Green Imbalance Correction
- Debayer: Advanced Adaptive Demosaic with Chromatic Aberration Correction
- CCM/CSM: Color correction matrix; RGB2YUV etc
- Gamma: Gamma out correction
- Dehaze/Enhance: Automatic Dehaze and Effect enhancement
- 3DLUT: 3D-Lut Color Palette for Customer
- LDCH: Lens-distortion only in the horizontal direction
- YUV-2DNR: Spatial YUV De-noising
- Sharp: image Sharpening and boundary filtering
- Multi-sensor reuse ISP;
- BUS interface: 32 bit AHB configuration; AXI-128 RW; MMU table
- Low power, auto-gating for each block

12.1.2 Using constrains

1. If the virtual width is randomly allocated, the 30th bit of 0x00001808 must be set to the old mode. If the virtual width is equal to the real width, the virtual width is not configured or the real width is configured, at this time, the 30th bit of 0x00001808 should be set to 0, and the hardware will adaptively optimize the transmission of MI at the end of the line.
2. The auto-gating of RAWAWB need to be enabled in the default automatic 3a-gating mode, if the auto-gating is closed by software, the module will continue to count the next frame and cause an error. (only constraint for version 2.1)

3. The enable of BAY3D and the enable of BAYNR must be switched on and off together.
4. The DEHAZE on or off needs to force update its sys_itself_force_upd at the idle of frame.(only constraint for version 2.1)
5. The YNR、CNR and SHARP should be on or off at the same time. Each of these three modules has its own bypass control. If you want to bypass a module, you can turn on its bypass of the module. The bypass signal of YNR has sw_ynr_bft3x3_bypass, sw_ynr_lbft5x5_bypass, sw_ynr_lgft3x3_bypass, sw_ynr_flt1x1_bypass, sw_ynr_sft5x5_bypass, sw_ynr_flt1x1_bypass_sel to choose. The bypass signal of CNR has sw_cnr_exgain_bypass, sw_cnr_hq_bila_bypass, sw_cnr_lq_bila_bypass to choose. The bypass control of SHARP is sw_sharp_bypass.

12.2 Block Diagram

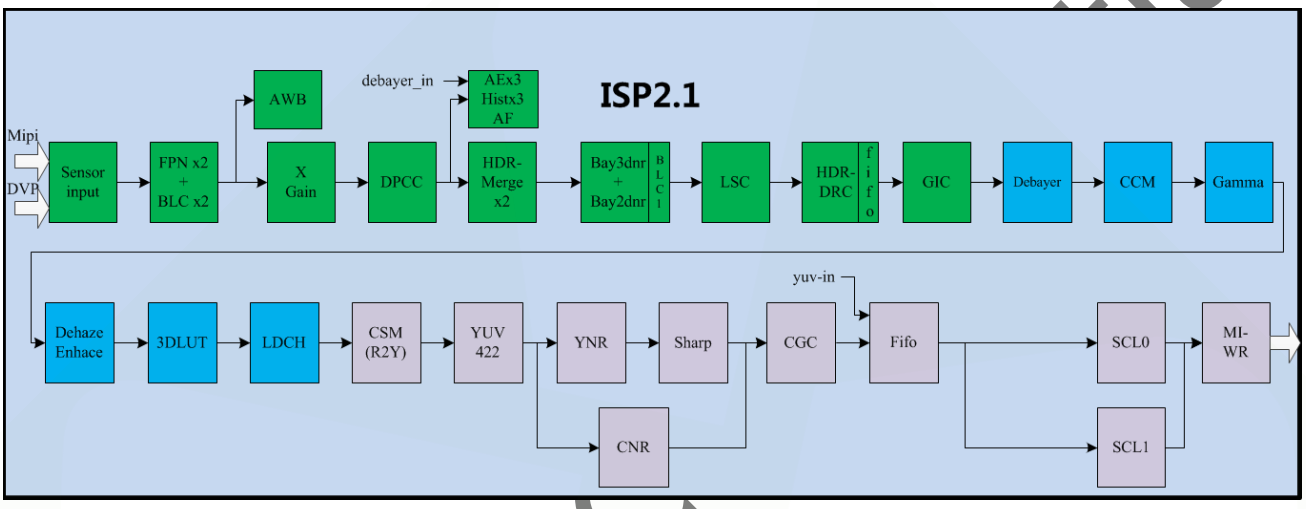

Fig. 12-1 ISP Block Diagram

ISP comprises with:

- MIPI serial camera interface(MIPI)
- RAW Processing
- RGB Processing
- YUV Processing
- Memory Interface(MI)

12.3 Function Description

12.3.1 CSI2RX(MIPI)

（1）Overview

CSI2RX is a MIPI controller, which parses raw data from D-PHY into each pixel output.

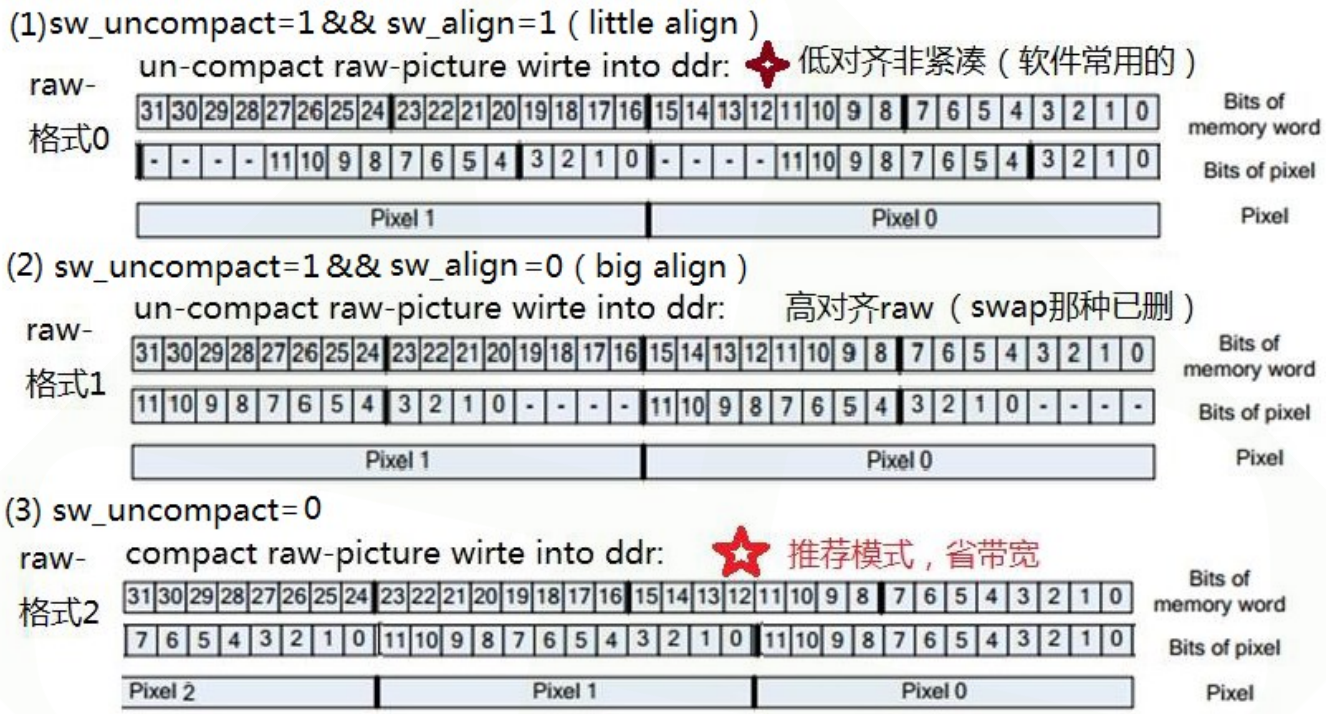
（2）Features

- Compliant with MIPI Alliance Standard for Camera Serial2(CSI2),version 1.00-29 Nov 2005
- Interface with MIPI D-PHY following PHY Protocol Interface(PPI), version 1.00-14 May 2009
- Support VC sensor, HDR sensor(AR0239, IMX327)
- Support x1/x2/x4 DPHY RX data lanes, and merge into word align
- Support RAW8,RAW10,RAW12 transfer(compatible with the old method)
- Support RAW14,RAW16 clip into RAW12, then into ISP pipeline or into DDR
- Support RAW8. RAW10,RAW12,YUV422_8 and RGB888 direct to DDR
- Support auto correct single-ecc error
- Support multiple ecc, crc error, and all phy error interrupts
- Frequency-->500Mhz pix rate
- Support four mipi_tx channels and three mipi_rx channels

- Support embed_data(RAW8/10/12/14/16 use 2byte align) into DDR & read back pixels into ISP
- Support ppi_data(word align) into DDR for debug
- Multi-ID separately into DDR and into ISP, HDR or PDAF
- Ppi_data read back, ppi2pix into ISP, low priority (save bandwidth)
- Support hdr stream: frame mode; line mode
- Support DVP data input
- Support LVDS data input
- Support MIPI raw readback framex1, framex2
- Support FPN (Fixed Pattern Noise)

12.3.1.1 Block Descriptions

Raw-picture into DDR support un-compact and compact (including swap) mode:



The function mode of csi2rx depend on the configuration of sw_ibuf_op_mode, which are shown in the following table.

Table 12-1 csi2rx function mode

Sw_ibuf_op_mode	Function	Interval mode	HDR mode	Need DDR
0	normal	NA	N	N
3	user_mode	NA/frame/line	N/Y	N/Y
4	raw_rdback_framex1	frame	N	Y
5	raw_rdback_framex2	frame	Y	Y
6	raw_rdback_framex3	frame	N	N
8	frame_x2_ddr	frame	Y	Y
9	line_x2_ddr	line	Y	Y
10	line_x2_noddr	line	Y	N
12	frame_x3_ddr	frame	N	N
13	line_x3_ddr	line	N	N

(1) frame_x2_ddr mode (2IDs--hdr mode)
The 2IDs interframe mode has L-data and S-data, which is similar to the 3IDs interframe mode.
(2) line_x2_ddr_mode (2IDs--hdr mode)
The 2IDs interline mode has L-data and S-data, which is similar to the 3IDs interline mode.
(3) line_x2_noddr mode (2IDs--hdr mode)

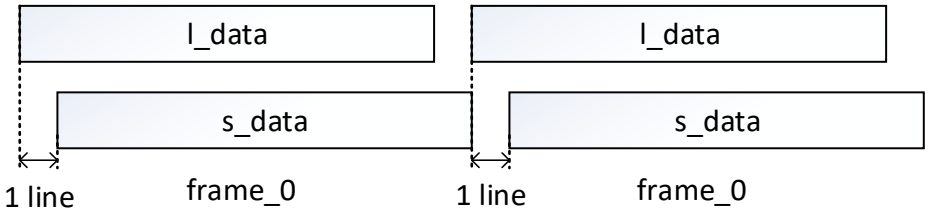


Fig. 12-2 2IDs interline mode data flow (no DDR)

In line_x2_noddr mode interline mode, both ID data are input from phy interface to csi2rx. The data of the two IDs is input at intervals of lines, and the order of L-data and S-data. When the L-data arrives, the data will not be output to DDR. After 1 line of phy's L-data is transferred, S-data is transferred. S-data is directly processed into pix data of pipeline without DDR.

(4) user mode

User defined mode. All dmatx and dmarx are available. If do not configure any dmarx, user mode is equal to normal mode.

(5) raw_rdback_framex3 mode (hdr mode)

The difference between frame_x3_ddr mode and raw_rdback_framex3 mode is that S-data also needs to go in and out of DDR. S-data is output from dmatx2 (all dmatx configurable, recommend dmatx2) to DDR. Then S-data is read back through channel dmarx2 (dmarxs). The time to start readback is up to the user. Start once, read back one frame of L-data, M-data and S-data.

(6) raw_rdback_framex2 mode (hdr mode)

The mode raw_rdback_framex2 is similar to mode frame_x2_ddr mode. It refers to raw_rdback_framex3 mode.

(7) raw_rdback_framex1 mode

Under raw_rdback_framex1 mode, S-data is processed by csi2word module and output from dmatx2 (all dmatx configurable, recommend dmatx2) to DDR. Then S-data is read back through channel dmarx2 (dmarxs). The time to start dmarxs is up to the user. Start once, read back one frame of S-data.

(8) normal mode (Single ID)

The single ID mode is the normal sensor mode. The single ID data is input to csi2rx controller through d-phy interface. Csi2rx decodes the PPI stream data of d-phy, then output pixel to ISP.

12.3.2 Memory Interface(MI)

The memory interface unit (MI) is responsible for reading/writing image data from/to the system memory(DDR). The MI has six main tasks, which can operate independently:

- Take image data from the main path, either in YCbCr or RAW format, and write it into DDR.
- Take image data from MIPI module, and take it back from the DDR to MIPI module.
- Take image data from DBR module, and take it back from the DDR to DBR module.
- Take image data of LUT data from the DDR to 3D_LUT/LDCH/LSC module.

Memory Interface is as following:

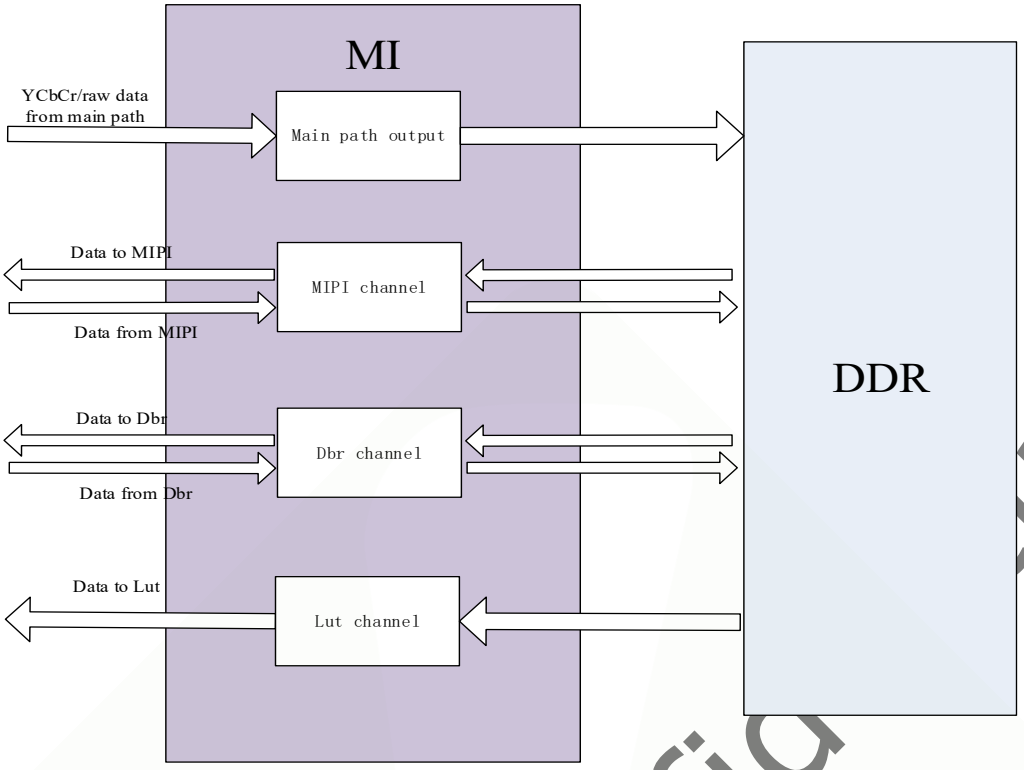

Fig. 12-3 Memory Interface

The following registers need to be configured to use different channels:

（1）Main path

The registers need to be configured are as follows(xx means Y, CB ,and CR):

- MI_MP_WR_xx_BASE

This is the base address of the memory area to use for that buffer.
This register protects from non-aligned access. The bits 0 to 2 are hard wired to "000". As a consequence any byte address that is written to the register will automatically be re-mapped to the next lower 64 bit aligned address: write(MI_MP_WR_xx_BASE, address_value) is equivalent to write (MI_MP_WR_xx_BASE, address_value & 0xFFFFFFF8). Anyhow, in order to avoid confusion it is not recommended to use non-aligned address values for access. It is also not recommended to actively consider the register slice for register access in order to avoid unneccessary mask and shift operations.
In addition, the programmed base address shall be burst aligned with respect to the burst length configured in MI_WR_CTRL .
Set control bit init_base_en before updating so that a forced or automatic update can take effect.

- MI_MP_WR_xx_SIZE

Size of main picture ring buffer or raw data ring buffer.
Programmed value becomes effective (visible in corresponding shadow register) after a soft reset, a forced software update or an automatic config update.
Set control bit init_base_en before updating so that a forced or automatic update can take effect.
Note: This register protects from non-aligned access.

- MI_MP_xx_OFFS_CNT_INIT

This is the initial offset (in bytes) for writing to the buffer after e.g. a soft reset. Usually, to write to the buffer from the very beginning, an offset of zero is to be programmed into this register.

- MI_MP_xx_OFFS_CNT_START

This is a read-only register, which holds the offset at which the MI had written the last processed frame. This register is updated at frame end, so at any given time, it contains always the starting offset of the last completely processed frame.

- MI_WR_CTRL

This register is a global write control register of main path, include path_enable, wr_format

and so on. Refer to MI_WR_CTRL register description for details.

(2)MIPI/DBR/LUT channel

The registers need to be configured are as follows(xx include RAW0~RAW3, LUT, and DBR):

- xx_WR_BASE

DDR write base address, similar to MI_SP_WR_xx_BASE.Refer to register description for details.

- xx_WR_SIZE

DDR write size, similar to MI_SP_WR_xx_SIZE.Refer to register description for details.

- xx_WR_LENGHT

Line length of DDR write in pixel, also known as line stride.If no line stride is used, line length must match image width.For example, raw8 mode must be a multiple of 8.

- xx_RD_BASE

Image read start address.

- xx_RD_LENGTH

Line length of DDR read in pixel, also known as line stride.

- MI_WR_CTRL2

This register is a global write control register of MIPI/DBR/LUT channel. Refer to register description for details.

- MI_RD_CTRL2

This register is a control register of MIPI/DBR/LUT channel, Refer to MI_WR_CTRL register description for details.

12.3.3 ISP_CORE

12.3.3.1 INFORM

The input formatter module is responsible for sampling data from the sensor device and providing it to the other blocks in the processing pipelines.

12.3.3.2 OUTFORM

At the output of the ISP sub module the image data may be cropped a third time.
The following figure illustrates the different possible regions which can be defined by register settings. Some of these regions may have the same size and offset (settings), if a differentiation is not needed.

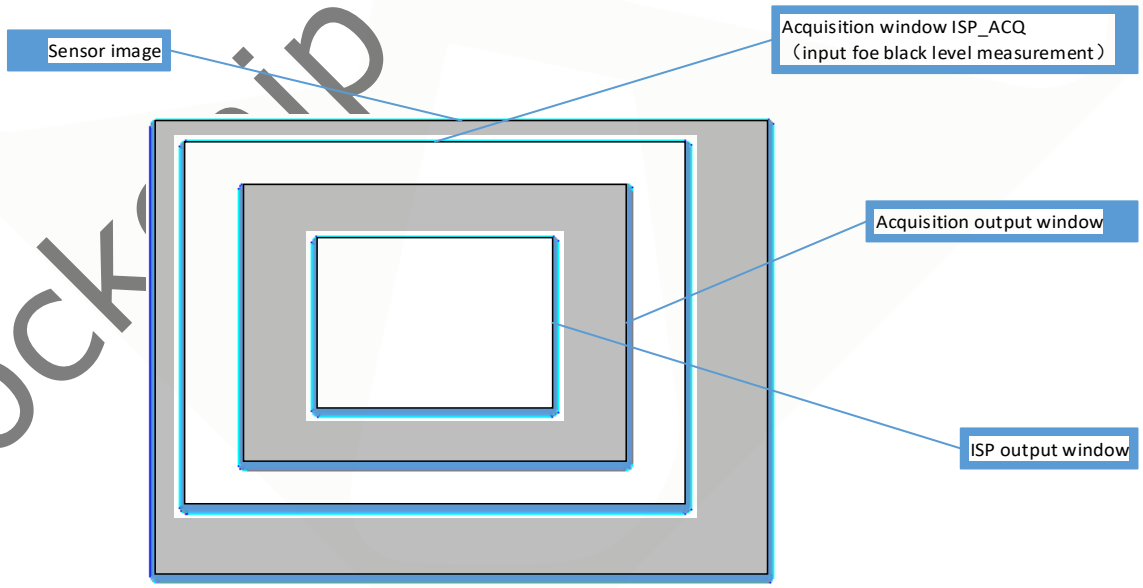

Fig. 12-4 Possible cropping regions of ISP

12.3.3.3 BLC

Black-level-control block is a function to subtract a DC offset from picture data.
A CMOS sensor always has a so-called black level shift. So that pixels with no light on them will not read out the value zero. This value varies with different setting for the exposure.
This black level can easily be detected by special pixels on the sensor that are permanently covered, i.e. they are always black.
The black level subtraction block reads out the values of these pixels, calculates their mean

value and then subtracts these values from all pixels that represent the picture frame (in automatic mode).

12.3.3.4 GAMMA_IN

The gamma_in module is used to adapt the image signal processing to the characteristics of the attached sensor device.
There are three gamma curves can be defined, one for each color component red, green, and blue.

12.3.3.5 DPCC

The DPCC (Static/Dynamic defect pixel cluster correction) module is used to correct the defect pixels of the sensor, and supports both static and dynamic DPCC. The DPCC supports detection and correction of single pixels and small cluster defects (up to 3x3 pixels). It detects and corrects single pixels and small cluster defects on raw Bayer image data. An integrated defect pixel table allows the correction of up to 2048 fix positions independently from the on-the-fly detection.

12.3.3.6 HDR

HDR(High Dynamic Range) refers to the ratio of "brightest value" and "darkest value" contained in an image, that is, the number of levels of gray scale division between "brightest" and "darkest".
Dynamic range calculation formula: Dynamic_range = 20log(MaxIntensity / MinIntensity), which means maximum brightness value.
Version 2.1 HDR*2 support 17bit, the dynamic range is 102db. The larger the dynamic range, the richer the level of representation and the wider the color space. High Dynamic Range means the ratio of "brightest" to "darkest" is very high.
HDR is composed of HDRMGE and HDR-DRC two module. HDRMGE realize the function of three/two frames synthesizing one frame. HDR-DRC realize wide dynamic compression.

12.3.3.7 Bayer-NR

Bay2DNR module mainly realizes non-local mean noise reduction of image in raw format, so as to achieve the purpose of noise removal.
Bay3DNR module mainly realizes Advanced Temporal Noise reduce noise of image in raw format, so as to achieve the purpose of noise removal.

12.3.3.8 LSC

Lens shade correction(LSC) is designed to deal the problems of lens shading and vignette. It is done during input data processing: If the lens shading correction is enabled, each pixel is processed and corrected according to the stored settings. The lens shading correction is done by multiplying each input pixel with its respective correction value. Only the correction factors at predefined sector corners as well as the sector positions are stored. The pixel position specific correction values are calculated using bilinear interpolation. The correction factors at the sector corners are calculated during a calibration process which uses one or more reference frames which have to be captured under dedicated light conditions and at a dedicated position of the sensor. The captured frames are evaluated by software and the calculated parameters for lens shading correction are stored in multiple illumination specific tables e.g. in external memory or on a flash device. The software controls the lens shading process by loading or updating the correct tables into the hardware module.
It is also possible to use different lens shading correction parameters for different environment conditions, e.g. lightness, light direction or sensor position.

12.3.3.9 GIC

GIC(Green Imbalance Correction) is a method to correct the color imbalance in captured images. The principle is that each pixel in the captured image is used to represent a set of colors, and there is a selected specific color pixel in the set of colors. The horizontal and vertical gradient data are derived from a set of pixel blocks surrounding the single pixel, and the pixel blocks are classified according to the visual characteristics of the part of the image. A compensation value based on gradient data and visual characteristics is determined, and the compensation value is applied to the pixel block.

12.3.3.10 DEBAYER

The debayer module outputs RGB data after interpolation and filtering operation of the input Bayer data. The filtering operation can be bypassed by software configuration, and debayer module can also output three RGB components of the same value in black-and-white mode.

12.3.3.11 CCM

CCM(Color Correct Matrix) is used to correct the color crosstalk because of three channel response of sensor when only one channel color input.For example,when the sensor input is red,the other two channel GB not only R is also response too.CCM is working to reduce this crosstalk to make color more bright in color.The adjustment factor is added to adjust CCM working strength.The factor is works at dark range and bright range,this two range is symmetry.

12.3.3.12 GAMMA_OUT

Because the human eye's perception of natural brightness is non-linear, the dynamic range and gray-scale budget of the medium we use to record and display the picture are limited. In this premise, gamma is produced which is the mapping relationship between the natural brightness and the subjective gray-scale experience.

12.3.3.13 DEHAZE_ENHANCE

Dehaze: The process of dehaze is that the input pixel first goes through the dark channel defogging treatment, then goes through a histogram equalization module, and finally outputs the defogging results. In addition, a dehaze gain is also output to guide the noise reduction module.The module supports two modes of parameter adaptation and parameter external configuration. The parameters of the adaptive mode are calculated by the module itself, without external intervention, and the adaptive parameters are conservative.
Enhance: Dhaz algorithm can't enhance the image effect at night, so an enhance enable is added. When the enable is turned on, it can enhance the image at night.

12.3.3.14 3DLUT

3D_LUT(3D look up table) is a technical means of color calibration. Because the 3D LUT has RGB channels for each coordinate direction, the biggest advantage of 3D LUT in color calibration can affect both gamut, color temperature and gamma(this is a 1D LUT, 2D LUT or matrix can't be achieved), and more accurate than traditional matrix calibration methods. In addition, the 3D LUT can map and process all color information, whether it is a color that exists or does not exist, or a color gamut that cannot be reached by film.

12.3.3.15 LDCH

This module achieves distortion correction under fisheye lens.
This module needs to take table from DDR through MI module. When the resolution is small, it is recommended that the image's MI configuration burst length be greater than the table's width; otherwise, the fetching will hang.https://fanyi.baidu.com/?aldtype=16047 -zh/en/javascript:void(0);

12.3.3.16 2DNR-YUV

2DNR consists of two modules, YNR and UVNR. YNR is used to filter the noise of Y component, and UVNR is used to filter the color noise.
2DNR supports the following features:
Support the independent configuration of Y component and UV component denoising intensity
Support the independent configuration of high-frequency and low-frequency noise suppression

12.3.3.17 Sharp

Sharp includes two functions: image Sharpening and boundary filtering. Sharpening can sharpen the intermediate frequency and high frequency respectively. Boundary filtering is to do another level of filtering on the Sharpening results, remove the boundary burrs, and finally add a level of general Sharpening to supplement the image details.
Sharp supports the following features:

Support image Sharpening and boundary filtering
Support Sharpening of medium-low frequency and high frequency respectively
Support adaptive filtering and specified coefficient filtering
Support detail enhancement

12.3.3.18 CSM

CSM module realizes data conversion from RGB to YUV format.

12.3.3.19 CONV422

CONV422 module change YUV444 format data to YUV422 format.

12.3.3.20 SCL-RESIZE

The Resize Modules get pictures in YCbCr 4:2:2 format, and scale them by an arbitrary factor up or down to a new format. See following Figure for a module overview:

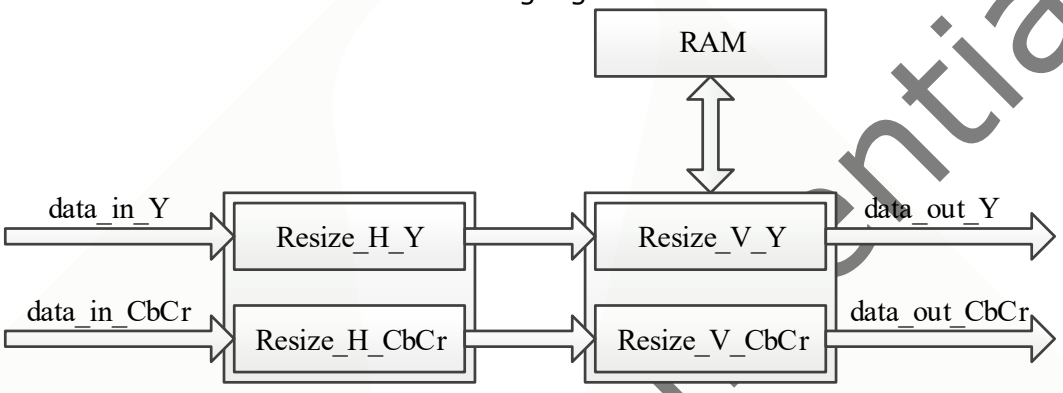

Fig. 12-5 Block Diagram of the Resize Module

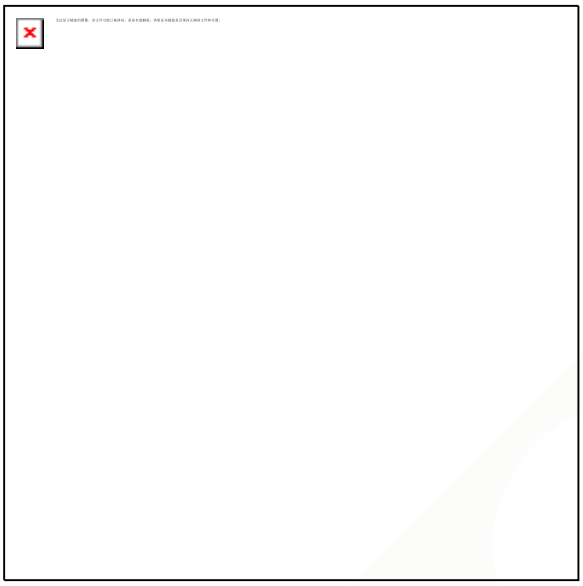
The Resize module is configurable for horizontal and vertical up- or down-scaling. Discrete values for the scaling factors of the luminance and the two chrominance components allow conversion between YUV4:2:2 and YUV4:2:0 color format and support of uneven line width.
Phase shift registers are provided to shift the output pixel positions with respect to the input pixel positions. This allows for e.g. format conversion between cosited and non-cosited color schemes.
In sensor mode this block supports only down-scaling because of the sensor cannot be stopped from delivering data during one frame.
The Resize module is able to process luminance and chrominance data independently, i.e. there are separate pipelines for luminance and chrominance processing using dedicated scale factors and phase offsets. This allows format conversion to be done by the Resize block (YCbCr 4:2:2 to 4:2:0, 4:1:1, 4:1:0).

12.3.3.21 FLASH_LIGHT

The sensor interface supports triggering of a LED or tube flash light. To control a flash light device, the flash light output and the prelight output can be used. A trigger event could active both the flash light and the prelight. This event may either be a positive or negative edge from the camera or a positive edge from any other trigger source at the input port 'vds_vsync'.
Programming respective configuration register can determind the signal polarity, flash delay time and flash light time.

12.3.4 3A



12.3.4.1 AF

AF realizes the function of auto focus. The main part of auto focus control will be completed in the software: the search algorithm for the maximum definition in the image will be realized in the software, and the motion of the lens will be controlled by the software. The hardware AF module mainly realizes the measurement of image definition by configuring the configuration register. Filtering and gamma are added to facilitate the dark field processing.It supports a 15x15 size window and a separate window. Because it's input data format is raw, AF here is named RAWAF.

12.3.4.2 AE

AE realizes the function of automatic exposure processing. The input source is raw format. Two versions of AE are used here named RAWAE_BIG and RAWAE_LITE here. There are three AE modules here, two are RAWAE_BIG and one is RAWAE_LITE.The difference between RAWAE_BIG and RAWAE_LITE is that RAWAE_BIG supports 15x15 statistics window while RAWAE_LITE supports 5x5 statistics window.

12.3.4.3 AWB

The AWB module provides the white balance function, and configures the gains of the R, Gr, Gb, and B components. Because it's input data format is raw, AWB here is named RAWAWB. RAWAWB has 3 engines for finding valid white points(XY UV and 3DYUV domain).
It supports a 15x15 size window for white points or all points. It accumulates R G B channel data of all white points in XY domain for small normal and big window and for 7source lights.

12.3.4.4 HIST

Hist counts the number of pixels with the same or similar values. In general, a histogram is a graphical representation of the pattern of change that exists in the intensity value of a color or luminance plane. It is often shown as a vertical bar chart to indicate the frequency level of data collected over a specific range. The measurement can be used in different applications. The common application is to display the information of the end user, or to improve the exposure control and so on.
Two versions of HIST are named RAWHIST_BIG and RAWHIST_LITE here. Each AE follows a HIST, RAWAE_BIG follows RAWHIST_BIG, RAWAE_LITE follows RAWHIST_LITE. Both HIST have 256 bins for R G B or Y channel. The difference between RAWHIST_BIG and RAWHIST_LITE is same with AE.

12.3.4.5 PDAF

PDAF(Phase Detection Auto Focus) module here replaces the PDAF points inside the raw input data with corresponding 3x3 median data.

12.4 Register Description

The ISP uses a distributed configuration register scheme. So there is no central unit containing all programming registers, but all sub-modules contain their own programming

registers. An address space is reserved for each sub-module inside the total ISP Controller

Table 12-2 ISP module base address

Module	Description	Offset Address
BLS	Black-level-subtraction	0x3000
AWB_GAIN	Auto White Balance Gain	0x3200
DPCC	Defect Pixel Cluster Correction	0x3400
HDRMGE	High Dynamic Range Merge	0x3800
BAYNR	RAW noise reduction	0X3A00
BAY3D	Temporal noise reduction in raw space	0x3A80
LSC	Lens shade correction	0X2200
HDRTMO	High Dynamic Range Tone mapping	0x3900
GIC	Color imbalance correction	0X2F00
DEBAYER	Debayer	0X2500
CCM	Color Correct Matrix	0X0700
GAMMA_OUT	GAMMA OUT	0X0900
2DNR-YNR	filter the noise of Y component	0X2700
2DNR-CNR	filter the noise of C component	0X2800
SHARP	image Sharpening and boundary filtering	0X2900
LDCH	Lens-distortion in Horizontal	0X2B00
DHAZ	De-haze	0X3C00
3DLUT	3D look up table	0X3E00
SELF_RESIZE	main resize	0X0C00
	Scale self-resize	0X1000
ISP_Core	ISP top module	0X0400
FLASH	ISP flash light	0x0660
SHUTTER	ISP mech shutter	0x0680
CTRL	Marvin top ctrl	0X0000
RAWAF	auto focus measurement	0x4D00
RAWAE_LITE	auto exposure lite version	0x4500
RAWAE_BIG	auto exposure big version	0X4400
RAWAWB	auto white balancing	0X5000
RAWHIST_LITE	histogram calculation lite	0x4900

12.4.1 Registers Summary

12.4.1.1 MIPI

Name	Offset	Size	Reset Value	Description
CSI2RX_1C00_CTRL0	0x0000	W	0x20820000	Version of the CSI-2 host controller 0
CSI2RX_1C00_CTRL1	0x0004	W	0x00032103	Version of the CSI-2 host controller 1
CSI2RX_1C00_CTRL2	0x0008	W	0x00000000	Version of the CSI-2 host controller 2
CSI2RX_1C00_CSI2_RESETN	0x0010	W	0x00000003	CSI-2 controller reset
CSI2RX_1C00_PHY_STATE_RO	0x0014	W	0x00000000	General settings for all blocks
CSI2RX_1C00_DATA_IDS_1	0x0018	W	0x0000002b	List of Data Ids for which IDI reports line boundary matching errors (CSI2_HOST_N_DATA_IDS > 0)Data IDs for which IDI reports line boundary matching errors
CSI2RX_1C00_DATA_IDS_2	0x001c	W	0x00000000	List of Data Ids for which IDI reports line boundary matching errors (CSI2_HOST_N_DATA_IDS > 1)Data IDs for which IDI reports line boundary matching errors
CSI2RX_1C00_ERR_PHY	0x0020	W	0x00000000	Phy error state register
CSI2RX_1C00_ERR_PACKET	0x0024	W	0x00000000	Error of packet analysis
CSI2RX_1C00_ERR_OVERFLOW	0x0028	W	0x00000000	Error state overflow register
CSI2RX_1C00_ERR_STAT	0x002c	W	0x00000000	Error state
CSI2RX_1C00_MASK_PHY	0x0030	W	0x00000000	Phy error state register
CSI2RX_1C00_MASK_PACKET	0x0034	W	0x00000000	Error state register 2
CSI2RX_1C00_MASK_OVERFLOW	0x0038	W	0x00000000	Error state overflow register
CSI2RX_1C00_MASK_STAT	0x003c	W	0x00000000	Error state register 3
CSI2RX_1C00_RAW0_WR_CTRL	0x0040	W	0x002e0200	RAW0_WR control register. the channel that write csi pic data to ddr
CSI2RX_1C00_RAW0_WR_LINECNT_RO	0x0044	W	0x00000000	RAW0_WR line counter
CSI2RX_1C00_RAW0_WR_PIC_SIZE	0x0048	W	0x00000000	RAW0_WR picture size
CSI2RX_1C00_RAW0_WR_PIC_OFF	0x004c	W	0x00000000	RAW0_WR picture offset

CSI2RX_1C00_RAW1_WR_CTRL	0x0050	W	0x00000200	RAW1_WR control register
CSI2RX_1C00_RAW1_WR_LINECNT_RO	0x0054	W	0x00000000	RAW1_WR line counter
CSI2RX_1C00_RAW1_WR_PIC_SIZE	0x0058	W	0x00000000	RAW1_WR picture size
CSI2RX_1C00_RAW1_WR_PIC_OFF	0x005c	W	0x00000000	RAW1_WR picture offset
CSI2RX_1C00_RAW2_WR_CTRL	0x0060	W	0x00000100	RAW2_WR control register
CSI2RX_1C00_RAW2_WR_LINECNT_RO	0x0064	W	0x00000000	RAW2_WR line counter
CSI2RX_1C00_RAW2_WR_PIC_SIZE	0x0068	W	0x00000000	RAW2_WR picture size
CSI2RX_1C00_RAW2_WR_PIC_OFF	0x006c	W	0x00000000	RAW2_WR picture offset
CSI2RX_1C00_RAW3_WR_CTRL	0x0070	W	0x00000800	RAW3_WR control register
CSI2RX_1C00_RAW3_WR_LINECNT_RO	0x0074	W	0x00000000	RAW3_WR line counter
CSI2RX_1C00_RAW3_WR_PIC_SIZE	0x0078	W	0x00000000	RAW3_WR picture size
CSI2RX_1C00_RAW3_WR_PIC_OFF	0x007c	W	0x00000000	RAW3_WR picture offset
CSI2RX_1C00_RAW_RD_CTRL	0x0080	W	0x00000000	RAW_RD control register, the channel that read pic data from ddr
CSI2RX_1C00_RAW_RD_LINECNT_RO	0x0084	W	0x00000000	RAW_RD line counter
CSI2RX_1C00_RAW_RD_PIC_SIZE	0x0088	W	0x00000000	RAW_RD picture size
CSI2RX_1C00_RAW2_RD_LINECNT_RO	0x008c	W	0x00000000	RAW2_RD line counter
CSI2RX_1C00_RAWFBC_CTRL	0x0090	W	0x00000011	Raw fbc enable register
CSI2RX_1C00_ESPHDR_LCNT	0x0094	W	0x00010004	Parameter configuration of line counter mode
CSI2RX_1C00_ESPHDR_IDCD	0x0098	W	0x12121211	Parameter configuration of identification code mode
CSI2RX_1C00_ESPHDR_CTRL	0x009c	W	0x00000000	Especial HDR control
CSI2RX_1C00_VC0_FRAME_NUM_RO	0x00a0	W	0x00000000	VC0 current Frame Number
CSI2RX_1C00_VC1_FRAME_NUM_RO	0x00a4	W	0x00000000	VC1 current Frame Number

CSI2RX_1C00_VC2_FRAME_NUM_RO	0x00a8	W	0x00000000	VC2 current Frame Number
CSI2RX_1C00_VC3_FRAME_NUM_RO	0x00ac	W	0x00000000	VC3 current Frame Number
CSI2RX_1C00_ISP_LINECNT_RO	0x00b0	W	0x00000000	Current Line Counter
CSI2RX_1C00_RAW_WR_IBUF_STATUS_RO	0x00b4	W	0x00000000	HDR ibuf status
CSI2RX_1C00_RAW_WR_IBUF3_STATUS_RO	0x00b8	W	0x00000000	HDR ibuf3 status
CSI2RX_1C00_CUR_HEADER_RO	0x00c4	W	0x00000000	Read onlysw_csi_ro_phyio_en == 1'b1 :rxdatahssw_csi_ro_phyio_en == 1'b0 :ro_csi_cur_header
CSI2RX_1C00_FPN_CTRL	0x00d0	W	0x00000000	FPN ctrl register
CSI2RX_1C00_FPN_TABLE_CTRL	0x00d4	W	0x00000001	FPN data write ctrl registerthe memory write address celars when finish
CSI2RX_1C00_FPN_TABLE_DATA	0x00d8	W	0x00000000	FPN data register to memoryFPN data to memory, the memory write address add 1 after write
CSI2RX_1C00_CSI_Y_STAT_CTRL	0x00f0	W	0x00000003	Y statistic ctrl
CSI2RX_1C00_CSI_Y_STAT_RO	0x00f4	W	0x00000000	Y statistic value read out with ahb
CSI2RX_1C00_VERSION	0x00fc	W	0x02021812	Version of the CSI-2 host controller

12.4.1.2 MI

Name	Offset	Size	Reset Value	Description
MI_1400_MI_WR_CTRL	0x0000	W	0x000a0000	Global write control register
MI_1400_MI_WR_INIT	0x0004	W	0x00000020	Control register for address init and skip function
MI_1400_MI_MP_WR_Y_BASE	0x0008	W	0x00000000	Base address for main picture Y component, JPEG or raw data
MI_1400_MI_MP_WR_Y_SIZE	0x000c	W	0x00000000	Size of main picture Y component, JPEG or raw data
MI_1400_MI_MP_WR_Y_OFFS_CNT	0x0010	W	0x00000000	Offset counter init value for main picture Y, JPEG or raw data
MI_1400_MI_MP_WR_Y_OFFS_CNT_START	0x0014	W	0x00000000	Offset counter start value for main picture Y, JPEG or raw data
MI_1400_MI_MP_WR_Y_IRQ_OFFS	0x0018	W	0x00000000	Fill level interrupt offset value for main picture Y, JPEG or raw data
MI_1400_MI_MP_WR_CB_BASE	0x001c	W	0x00000000	Base address for main picture Cb component ring buffer
MI_1400_MI_MP_WR_CB_SIZE	0x0020	W	0x00000000	Size of main picture Cb component ring buffer
MI_1400_MI_MP_WR_CB_OFFS_CNT	0x0024	W	0x00000000	Offset counter init value for main picture Cb component ring buffer
MI_1400_MI_MP_WR_CB_OFFS_CNT_START	0x0028	W	0x00000000	Offset counter start value for main picture Cb component ring buffer
MI_1400_MI_MP_WR_CR_BASE	0x002c	W	0x00000000	Base address for main picture Cr component ring buffer
MI_1400_MI_MP_WR_CR_SIZE	0x0030	W	0x00000000	Size of main picture Cr component ring buffer
MI_1400_MI_MP_WR_CR_OFFS_CNT	0x0034	W	0x00000000	Offset counter init value for main picture Cr component ring buffer
MI_1400_MI_MP_WR_CR_OFFS_CNT_START	0x0038	W	0x00000000	Offset counter start value for main picture Cr component ring buffer
MI_1400_MI_SP_WR_Y_BASE	0x003c	W	0x00000000	Base address for self picture Y component ring buffer
MI_1400_MI_SP_WR_Y_SIZE	0x0040	W	0x00000000	Size of self picture Y component ring buffer
MI_1400_MI_SP_WR_Y_OFFS_CNT	0x0044	W	0x00000000	Offset counter init value for self picture Y component ring buffer
MI_1400_MI_SP_WR_Y_OFFS_CNT_START	0x0048	W	0x00000000	Offset counter start value for self picture Y component ring buffer
MI_1400_MI_SP_WR_Y_LLENGTH	0x004c	W	0x00000000	Line length of self picture Y component
MI_1400_MI_SP_WR_CB_BASE	0x0050	W	0x00000000	Base address for self picture Cb component ring buffer

MI_1400_MI_SP_WR_CB_SIZE	0x0054	W	0x00000000	Size of self picture Cb component ring buffer
MI_1400_MI_SP_WR_CB_OFFS_CNT	0x0058	W	0x00000000	Offset counter init value for self picture Cb component ring buffer
MI_1400_MI_SP_WR_CB_OFFS_CNT_START	0x005c	W	0x00000000	Offset counter start value for self picture Cb component ring buffer
MI_1400_MI_SP_WR_CR_BASE	0x0060	W	0x00000000	Base address for self picture Cr component ring buffer
MI_1400_MI_SP_WR_CR_SIZE	0x0064	W	0x00000000	Size of self picture Cr component ring buffer
MI_1400_MI_SP_WR_CR_OFFS_CNT	0x0068	W	0x00000000	Offset counter init value for self picture Cr component ring buffer
MI_1400_MI_SP_WR_CR_OFFS_CNT_START	0x006c	W	0x00000000	Offset counter start value for self picture Cr component ring buffer
MI_1400_MI_WR_BYTE_CNT	0x0070	W	0x00000000	Counter value of JPEG or RAW data bytes
MI_1400_MI_WR_CTRL_SHD	0x0074	W	0x00000000	Global control internal shadow register
MI_1400_MI_MP_WR_Y_BASE_SHD	0x0078	W	0x00000000	Base address shadow register for main picture Y component, JPEG or raw data ring buffer
MI_1400_MI_MP_WR_Y_SIZE_SHD	0x007c	W	0x00000000	Size shadow register of main picture Y component, JPEG or raw data
MI_1400_MI_MP_WR_Y_OFFS_CNT_SHD	0x0080	W	0x00000000	Current offset counter of main picture Y component, JPEG or raw data ring buffe
MI_1400_MI_MP_WR_Y_IRQ_OFFS_SHD	0x0084	W	0x00000000	Shadow register of fill level interrupt offset value for main picture Y component, JPEG or raw data
MI_1400_MI_MP_WR_CB_BASE_SHD	0x0088	W	0x00000000	Base address shadow register for main picture Cb component ring buffer
MI_1400_MI_MP_WR_CB_SIZE_SHD	0x008c	W	0x00000000	Size shadow register of main picture Cb component ring buffer
MI_1400_MI_MP_WR_CB_OFFS_CNT_SHD	0x0090	W	0x00000000	Current offset counter of main picture Cb component ring buffer
MI_1400_MI_MP_WR_CR_BASE_SHD	0x0094	W	0x00000000	Base address shadow register for main picture Cr component ring buffer
MI_1400_MI_MP_WR_CR_SIZE_SHD	0x0098	W	0x00000000	Size shadow register of main picture Cr component ring buffer
MI_1400_MI_MP_WR_CR_OFFS_CNT_SHD	0x009c	W	0x00000000	Current offset counter of main picture Cr component ring buffer

MI_1400_MI_SP_WR_Y_BASE_SHD	0x00a0	W	0x00000000	Base address shadow register for self picture Y component ring buffer
MI_1400_MI_SP_WR_Y_SIZE_SHD	0x00a4	W	0x00000000	Size shadow register of self picture Y component ring buffer
MI_1400_MI_SP_WR_Y_OFFS_CNT_SHD	0x00a8	W	0x00000000	Current offset counter of self picture Y component ring buffer
MI_1400_MI_SP_WR_CB_BASE_AD_SHD	0x00b0	W	0x00000000	Base address shadow register for self picture Cb component ring buffer
MI_1400_MI_SP_WR_CB_SIZE_SHD	0x00b4	W	0x00000000	Size shadow register of self picture Cb component ring buffer
MI_1400_MI_SP_WR_CB_OFFS_CNT_SHD	0x00b8	W	0x00000000	Current offset counter of self picture Cb component ring buffer
MI_1400_MI_SP_WR_CR_BASE_AD_SHD	0x00bc	W	0x00000000	Base address shadow register for self picture Cr component ring buffer
MI_1400_MI_SP_WR_CR_SIZE_SHD	0x00c0	W	0x00000000	Size shadow register of self picture Cr component ring buffer
MI_1400_MI_SP_WR_CR_OFFS_CNT_SHD	0x00c4	W	0x00000000	Current offset counter of self picture Cr component ring buffer
MI_1400_MI_RD_Y_PIC_START_AD	0x00c8	W	0x00000000	Y component image start address
MI_1400_MI_RD_Y_PIC_WIDTH	0x00cc	W	0x00000000	Y component image width
MI_1400_MI_RD_Y_LLENGTH	0x00d0	W	0x00000000	Y component original line length
MI_1400_MI_RD_Y_PIC_SIZE	0x00d4	W	0x00000000	Y component image size
MI_1400_MI_RD_CB_PIC_START_AD	0x00d8	W	0x00000000	Cb component image start address
MI_1400_MI_RD_CR_PIC_START_AD	0x00e8	W	0x00000000	Cr component image start address
MI_1400_MI_IMSC	0x00f8	W	0x00000000	Interrupt Mask ('1': interrupt active, '0': interrupt masked)
MI_1400_MI_RIS	0x00fc	W	0x00000000	Raw Interrupt Statu
MI_1400_MI_MIS	0x0100	W	0x00000000	Masked Interrupt Status
MI_1400_MI_ICR	0x0104	W	0x00000000	Interrupt Clear Register
MI_1400_MI_ISR	0x0108	W	0x00000000	Interrupt Set Register
MI_1400_MI_STATUS	0x010c	W	0x00000000	MI Status Register
MI_1400_MI_STATUS_CLR	0x0110	W	0x00000000	MI Status Clear Register
MI_1400_MI_SP_WR_Y_PIC_WIDTH	0x0114	W	0x00000000	Y component image width for self picture

MI_1400_MI_SP_WR_Y_PIC_HEIGHT	0x0118	W	0x00000000	Y component image height for self picture
MI_1400_MI_SP_WR_Y_PIC_SIZE	0x011c	W	0x00000000	Y component image size for self picture
MI_1400_MI_RD_CTRL	0x0120	W	0x00000000	DMA read control register
MI_1400_MI_RD_START	0x0124	W	0x00000000	DMA start register
MI_1400_MI_RD_STATUS	0x0128	W	0x00000000	DMA status register
MI_1400_MI_WR_PIXEL_CNT	0x012c	W	0x00000000	Counter value for defect pixel list
MI_1400_MI_MP_WR_Y_BASE2	0x0130	W	0x00000000	Base address 2 (ping pong) for main picture Y component
MI_1400_MI_MP_WR_CB_BASE2	0x0134	W	0x00000000	Base address 2 (ping pong) for main picture CB component
MI_1400_MI_MP_WR_CR_BASE2	0x0138	W	0x00000000	Base address 2 (ping pong) for main picture CR component
MI_1400_MI_SP_WR_Y_BASE2	0x013c	W	0x00000000	Base address 2 (ping pong) for self picture Y component
MI_1400_MI_SP_WR_CB_BASE2	0x0140	W	0x00000000	Base address 2 (ping pong) for self picture CB component
MI_1400_MI_SP_WR_CR_BASE2	0x0144	W	0x00000000	Base address 2 (ping pong) for self picture CR component
MI_1400_MI_WR_XTD_FORMAT_CTRL	0x0148	W	0x00000000	Extended Storage Format Control for main, self and dma read path
MI_1400_MI_WR_ID	0x0154	W	0x65432100	AXI write id group1
MI_1400_MI_MP_WR_Y_IRQ_OFFS2	0x01e0	W	0x00000000	Fill level interrupt2 offset value for main picture Y, JPEG or raw data
MI_1400_MI_MP_WR_Y_IRQ_OFFS2_SHD	0x01e4	W	0x00000000	Shadow register of fill level interrupt2 offset value for main picture Y component, JPEG or raw data
MI_1400_MI_MP_WR_Y_LLENGTH	0x01e8	W	0x00000000	Line length of main picture Y component
MI_1400_MI_WR_CTRL2	0x0400	W	0x00000000	New path control register
MI_1400_MI_WR_ID2	0x0404	W	0x00000000	AXI write id group2
MI_1400_MI_RD_CTRL2	0x0408	W	0x00250000	DMA path control register
MI_1400_MI_RD_ID	0x040c	W	0x00000000	AXI read id group
MI_1400_MI_RD_FIFO_LEVEL	0x041c	W	0x00000000	DMA read fifo level for generating hurry signal
MI_1400_RAW0_WR_BASE	0x0420	W	0x00000000	Base address for mipi raw0 tx;raw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW0_WR_SIZE	0x0424	W	0x00000000	Size of raw0 tx dataraw write function move to VICAP, not support in ISP3.X....

MI_1400_RAW0_WR_LENGTH	0x0428	W	0x00000000	Line length of raw0 tx (virtual width)raw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW0_WR_BASE_SHD	0x042c	W	0x00000000	Base address shadow register for raw0 tx data ring bufferraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW1_WR_BASE	0x0430	W	0x00000000	Base address for mipi raw1 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW1_WR_SIZE	0x0434	W	0x00000000	Size of raw1 tx dataraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW1_WR_LENGTH	0x0438	W	0x00000000	Line length of raw1 tx (virtual width)raw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW1_WR_BASE_SHD	0x043c	W	0x00000000	Base address shadow register for raw1 tx data ring bufferraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW2_WR_BASE	0x0440	W	0x00000000	Base address for mipi raw2 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW2_WR_SIZE	0x0444	W	0x00000000	Size of raw2 tx dataraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW2_WR_LENGTH	0x0448	W	0x00000000	Line length of raw2 tx (virtual width)raw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW2_WR_BASE_SHD	0x044c	W	0x00000000	Base address shadow register for raw2 tx data ring bufferraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW3_WR_BASE	0x0450	W	0x00000000	Base address for mipi raw3 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW3_WR_SIZE	0x0454	W	0x00000000	Size of raw3 tx dataraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW3_WR_LENGTH	0x0458	W	0x00000000	Line length of raw3 tx (virtual width)raw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW3_WR_BASE_SHD	0x045c	W	0x00000000	Base address shadow register for raw3 tx data ring bufferraw write function move to VICAP, not support in ISP3.X....

MI_1400_RW0_WR_LAST_FRAME_ADDR	0x0460	W	0x00000000	Last address for raw0 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RW1_WR_LAST_FRAME_ADDR	0x0464	W	0x00000000	Last address for raw1 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RW2_WR_LAST_FRAME_ADDR	0x0468	W	0x00000000	Last address for raw2 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RW3_WR_LAST_FRAME_ADDR	0x046c	W	0x00000000	Last address for raw3 txraw write function move to VICAP, not support in ISP3.X....
MI_1400_RAW0_RD_BASE	0x0470	W	0x00000000	Base address for mipi raw0 rxraw write function move to VICAP, not support in ISP3.X....

12.4.2.2 MI

MI_1400_MI_WR_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:28	RW	0x0	sw_sp_wr_output_format Selects output format of self picture. For possible restrictions see sub-chapter "Picture Orientation" in chapter "Self Path Output Programming". 3'b111: Reserved 3'b110: RGB 888 3'b101: RGB 666 3'b100: RGB 565 3'b011: YCbCr 4:4:4 3'b010: YCbCr 4:2:2 3'b001: YCbCr 4:2:0 3'b000: YCbCr 4:0:0 Note: - Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path. - For RGB output format the SP input format must be YCbCr 4:2:2
27:26	RW	0x0	sw_sp_wr_input_format Selects input format of self picture. For possible restrictions see sub-chapter "Picture Orientation" in chapter "Self Path Output Programming". 2'b11: YCbCr 4:4:4 2'b10: YCbCr 4:2:2 2'b01: YCbCr 4:2:0 2'b00: YCbCr 4:0:0 Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.
25:24	RW	0x0	sw_sp_wr_format Defines how YCbCr self picture data is written to memory. Must be set to 00 if RGB conversion is active. Note that with RGB conversion active the output format is always interleaved. 2'b00: Planar 2'b01: Semi planar, for YCbCr 4:2:x 2'b10: Interleaved (combined), for YCbCr 4:2:2 only 2'b11: Reserved Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.

23:22	RW	0x0	sw_mp_wr_format Defines how YCbCr main picture data is written to memory. Ignored if JPEG data is chosen. In YCbCr mode the following meaning is applicable 2'b00: Planar 2'b01: Semi planar, for YCbCr 4:2:x 2'b10: Interleaved (combined), for YCbCr 4:2:2 only 2'b11: Reserved In RAW data mode the following meaning is applicable 2'b00: RAW 8 bit 2'b01: Reserved 2'b10: RAW 12 bit 2'b11: Reserved Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the main path.
21	RW	0x0	sw_mi_wr_init_offset_en Enables updating of the offset counters shadow registers for main and self picture to the programmed register init values. MI_MP/SP_Y/CB/CR_OFFS_CNT_INIT -> MI_MP/SP_Y/CB/CR_OFFS_CNT_SHD The update will be executed either when a forced software update occurs (in register MI_INIT bit cfg_upd = 1) or when an automatic config update signal arrives at the MI input port. The latter is split into main and self picture. So only the corresponding main/self shadow registers are affected. After a picture skip has been performed init_offset_en selects between skip restart and skip init mode (see bit skip in register MI_INIT).
20	RW	0x0	sw_mi_wr_init_base_en Enables updating of the base address and buffer size shadow registers for main and self picture to the programmed register init values. MI_MP/SP_Y/CB/CR_BASE_AD_INIT -> MI_MP/SP_Y/CB/CR_BASE_AD_SHD MI_MP/SP_Y/CB/CR_SIZE_INIT -> MI_MP/SP_Y/CB/CR_SIZE_SHD The update will be executed either when a forced software update occurs (in register MI_INIT bit cfg_upd = 1) or when an automatic config update signal arrives at the MI input port. The latter is split into main and self picture. So only the corresponding main/self shadow registers are affected.

19:18	RW	0x2	sw_mi_wr_burst_len_chrom_org Burst length for Cb or Cr data affecting write port. 2'b00: 4-beat bursts 2'b01: 8-beat bursts 2'b10: 16-beat bursts 2'b11: Reserved Ignored if 8- or 16-beat bursts are not supported. If rotation is active, then only 4-beat bursts will be generated in self path, regardless of the setting here. Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the main and self path.
17:16	RW	0x2	sw_mi_wr_burst_len_lum_org Burst length for Y data affecting write port. 2'b00: 4-beat bursts 2'b01: 8-beat bursts 2'b10: 16-beat bursts 2'b11: Reserved Ignored if 8- or 16-beat bursts are not supported. Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the main and self path.
15	RW	0x0	sw_mi_wr_last_pixel_sig_en enables the last pixel signalization 1'b1: Enabled 1'b0: Disabled
14	RW	0x0	sw_sp_wr_auto_upd automatic update of configuration registers for self path at frame end. 1'b1: Enabled 1'b0: Disabled
13	RW	0x0	sw_mp_wr_auto_upd automatic update of configuration registers for main path at frame end. 1'b1: Enabled 1'b0: Disabled Note: If mp pingpong enable, it needs to be set "1".
12	WO	0x0	sw_sp_wr_pingpong_en pingpong mode of configuration registers for self path at frame end. 1'b1: Enabled 1'b0: Disabled

11	RW	0x0	sw_mp_wr_pingpong_en pingpong mode of configuration registers for main path at frame end. 1'b1: Enabled 1'b0: Disabled
10	RW	0x0	sw_mi_wr_422noncosited Enables self path YCbCr422non-co-sited -> YCbCr444 interpolation (M5_v6, M5_v7 only) 1'b1: YCbCr422 data are non_co-sited (Cb and Cr samples are centered between Y samples) so modified interpolation is activated 1'b0: YCbCr422 data are co-sited (Y0 Cb0 and Cr0 are sampled at the same position) Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.
9	RW	0x0	sw_mi_wr_cbcr_full_range Enables CbCr full range for self path YCbCr -> RGB conversion (M5_v6, M5_v7 only) 1'b1: CbCr have full range (0..255) 1'b0: CbCr have compressed range range (16..240) Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.
8	RW	0x0	sw_mi_wr_y_full_range Enables Y full range for self path YCbCr -> RGB conversion (M5_v6, M5_v7 only) 1'b1: Y has full range (0..255) 1'b0: Y has compressed range (16..235) Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.
7	RW	0x0	sw_mi_wr_byte_swap Enables change of byte order of the 32 bit output word at write port 1'b1: Byte order is mirrored but the bit order within one byte doesnt change 1'b0: No byte mirroring Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the main and self path.

6	RW	0x0	sw_mi_wr_rot Rotation 90 degree counter clockwise of self picture, only in RGB mode. For picture orientation and operation modes see sub-chapter "Picture Orientation" in chapter "Self Path Output Programming". For RGB 565 format the line length must be a multiple of 2. There are no restrictions for RGB 888/666. 1'b1: Enabled 1'b0: Disabled Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path. In rotation mode only 4-beat bursts are supported for self-path. not support rotation90 function in the newset version now;
5	RW	0x0	sw_mi_wr_v_flip Vertical flipping of self picture. For picture orientation and operation modes see sub-chapter "Picture Orientation" in chapter "Self Path Output Programming". For Y component the line length in 4:2:x planar mode must be a multiple of 8, for all other component modes a multiple of 4 and for RGB 565 a multiple of 2. There are no restrictions for RGB 888/666. 1'b1: Enabled 1'b0: Disabled Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.
4	RW	0x0	sw_mi_wr_h_flip Horizontal flipping of self picture. For picture orientation and operation modes see sub-chapter "Picture Orientation" in chapter "Self Path Output Programming". For Y component the line length in 4:2:x planar mode must be a multiple of 8, for all other component modes a multiple of 4 and for RGB 565 a multiple of 2. There are no restrictions for RGB 888/666. 1'b1: Enabled 1'b0: Disabled Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.

3:0	RW	0x0	sw_mi_wr_path_enable Enables data pathes of MI according to the following table: 4'b0000: Disabled, no data is transferred 4'b0001: YUV data output, mainpath only (mp_enable only) 4'b0010: Self-path only, output data format depending on other settings (sp_enable only) 4'b0011: YUV data output in mainpath and self-path image data active 4'b0100: JPEG data output, mainpath only (jpeg_enable only) 4'b0101: Not allowed 4'b0110: JPEG data output in mainpath and self-path image data active 4'b0111: Not allowed 4'b1000: RAW data output, mainpath only (raw_enable only) 4'b1001: Defect pixel data on self-path, image data on mainpath 4'b1010: Defect pixel data on mainpath, image data on self-path 4'b1011: Not allowed 4'b1100: Defect pixel data on self-path, JPEG data on mainpath 4'b1101: Defect pixel data on mainpath only 4'b1110: Defect pixel data on self-path only 4'b1111: Defect pixel data on self-path, RAW data on mainpath Programmed value becomes effective (visible in shadow register) after a soft reset, a forced software update or an automatic config update. Affects MI_IN and MI_OUT module.

MI_1400_MI_WR_INIT

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0	reserved
16	RW	0x0	sw_mp_wr_vir_stride_old 1'b0: mp virstual stride mode 1'b1: mp no virtual stride mode
15:7	RO	0x0	reserved
6	RW	0x0	sw_mi_update_last_pixel_en If this bit set 1, MI IN and MI OUT module will update at the time of dual crop module sent out the last pixel
5	RW	0x1	sw_mi_update_mode 1'b0: Old mode 1'b1: New mode, all path will update when frame_end In new mode, all path regs of MI will be updated at right time; (not support input RAW/JEPG mode)
4	WO	0x0	sys_mi_cfg_upd Forced configuration update. Leads to an immediate update of the shadow registers. Depending on the two init enable bits in the MI_CTRL register (init_offset_en and init_base_en) the offset counter, base address and buffer size shadow registers are also updated.
3	RO	0x0	reserved

2	RW	0x0	sw_mi_skip Skip of current or next starting main picture: Aborts writing of main picture image data of the current frame to RAM (after the current burst transmission has been completed). Further main picture data up to the end of the current frame are discarded. No further makroblock line interrupt (mblk_line), no wrap around interrupt for main picture (wrap_mp_y/cb/cr) and no fill level interrupt (fill_mp_y) are generated. Skip does not affect the generation of the main path frame end interrupt (mp_frame_end). Skip does not affect the processing of self picture and its corresponding interrupts namely the self path frame end interrupt (sp_frame_end). The byte counter (register MI_WR_BYTE_CNT) is not affected. It produces the correct number of JPEG or RAW data bytes at the end of the current (skipped) frame. After a skip has been performed the offset counter for the main picture at the start of the following frame are set depending on the bit init_offset_en in register MI_WR_CTRL: - Skip restart mode (init_offset_en = 0) The offset counters of the main picture are restarted at the old start values of the previous skipped frame. - Skip init mode (init_offset_en = 1) The offset counters of the main picture are initialized with the register contents of the offset counter init registers without any additional forced software update or automatic config update.
1:0	RO	0x0	reserved

MI_1400_MI_MP_WR_Y_BASE

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	sw_mp_wr_y_base Base address of main picture Y component ring buffer, JPEG ring buffer or raw data ring buffer. Programmed value becomes effective (visible in corresponding shadow register) after a soft reset, a forced software update or an automatic config update. --- MI_MP_Y_BASE_AD_INIT --- Note: This register protects from non-aligned access. The bits 0 to 2 are hard wired to "000". As a consequence any byte address that is written to the register will automatically be re-mapped to the next lower 64 bit aligned address: write(MI_MP_Y_BASE_AD_INIT, address_value) is equivalent to write(MI_MP_Y_BASE_AD_INIT, address_value & 0xFFFFFFF8). Anyhow, in order to avoid confusion it is NOT recommended to use non-aligned address values for access. It is also NOT recommended to actively consider the register slice for register access in order to avoid unneccessary mask and shift operations. In addition, if camerIC provides AXI interfaces the programmed base address shall be burst aligned with respect to the burst length configured in MI_WR_CTRL. Set control bit init_base_en before updating so that a forced or automatic update can take effect.

MI_1400_MI_SP_WR_Y_LLENGTH

Address: Operational Base + offset (0x004c)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14:0	RW	0x0000	sw_sp_wr_y_llength_tmp Line length of self picture Y component or RGB picture in pixel, also known as line stride. If no line stride is used, line length must match image width. For Y component the line length in 4:2:x planar mode must be a multiple of 8, for all other component modes a multiple of 4 and for RGB 565 a multiple of 2. There are no restrictions for RGB 888/666. In planar mode the line length of the Cb and Cr component is assumed according to the YCbCr format, i.e. half for 4:2:x and the same size for 4:4:4. In semi planar 4:2:x mode the line length of the Cb and Cr component is assumed the same size. Note: Line length always refers to the line length of the output image. This is particularly important when rotating. Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.

MI_1400_MI_RD_Y_PIC_START_AD

Address: Operational Base + offset (0x00c8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_mi_rd_y_pic_start_ad Image start address of the y component Note: Must be multiple of 4 in interleaved mode.

MI_1400_MI_RD_Y_PIC_WIDTH

Address: Operational Base + offset (0x00cc)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14:0	RW	0x0000	sw_mi_rd_y_pic_width Image width of the Y component in pixel. For YCbCr 4:2:x the image width must be a multiple of 2. In planar mode the image width of the Cb and Cr component is assumed according to the YCbCr format, i.e. half for 4:2:x and the same size for 4:4:4. In semi planar 4:2:x mode the image width of the Cb component (which includes Cr) is assumed the same size. In interleave mode no Cb/Cr image width is used.

MI_1400_MI_RD_Y_LLENGTH

Address: Operational Base + offset (0x00d0)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14:0	RW	0x0000	sw_mi_rd_y_llength Line length of the Y component of the original image in memory For an uncropped image, where lines follow each other without offset (no line stride), line length must match image width. For Y component the line length in 4:2:x planar mode must be a multiple of 8, for all other component modes a multiple of 4. In planar mode the line length of the Cb and Cr component is assumed according to the YCbCr format, i.e. half for 4:2:x and the same size for 4:4:4. In semi planar 4:2:x mode the line length of the Cb component (which includes Cr) is assumed the same size. In interleave mode no Cb/Cr line length is used.

MI_1400_MI_RD_Y_PIC_SIZE

Address: Operational Base + offset (0x00d4)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:0	RW	0x0000000	sw_mi_rd_y_pic_size Image size of the Y component in pixel which has to be the Y line length multiplied by the Y image height (dma_y_llength * dma_y_pic_height). In planar mode the image size of the Cb and Cr component is assumed according to the YCbCr format, i.e. a quarter for 4:2:0, half for 4:2:2 and the same for 4:4:4. In semi planar mode the image size of the Cb component (which includes Cr) is assumed half for 4:2:0 and the same size for 4:2:2. In interleave mode no Cb/Cr image size is used.

MI_1400_MI_SP_WR_Y_PIC_WIDTH
Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14:0	RW	0x0000	sw_sp_wr_y_pic_width Image width of the self picture Y component or RGB picture in pixel. For YCbCr 4:2:x and RGB 565 the image width must be a multiple of 2. If no line stride is used but flipping required, the image width must be a multiple of 8 for 4:2:x planar or 4 for 4:4:4 planar/4:2:x semi planar. There are no restrictions for RGB 888/666. In planar mode the image width of the Cb and Cr component is assumed according to the YCbCr format, i.e. half for 4:2:x and the same size for 4:4:4. In semi planar 4:2:x mode the image width of the Cb component (which includes Cr) is assumed the same size. In interleave mode no Cb/Cr image width is used. Note: Image width always refers to the picture width of the output image. This is particularly important when rotating. Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.

MI_1400_MI_SP_WR_Y_PIC_HEIGHT

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:15	RO	0x0	reserved
14:0	RW	0x0000	sw_sp_wr_y_pic_height Image height of the y component or RGB picture in pixel. In planar and semi planar mode the image width of the Cb and Cr component is assumed according to the YCbCr format, i.e. half for 4:2:0 and the same for 4:2:2 and 4:4:4. Note: Image height always refers to the picture height of the output image. This is particularly important when rotating. Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.

MI_1400_MI_SP_WR_Y_PIC_SIZE

Address: Operational Base + offset (0x011c)

Bit	Attr	Reset Value	Description
31:25	RO	0x0	reserved
24:0	RW	0x0000000	sw_sp_wr_y_pic_size Image size of the Y component or RGB picture in pixel which has to be the Y line length multiplied by the Y image height (sp_y_llength * sp_y_pic_height). In planar mode the image size of the Cb and Cr component is assumed according to the YCbCr format, i.e. a quarter for 4:2:0, half for 4:2:2 and the same for 4:4:4. In semi planar mode the image size of the Cb and Cr component is assumed half for 4:2:0 and the same size for 4:2:2. Note: Programmed value becomes effective immediately. So write to the register only if no picture data is sent to the self path.

MI_1400_RAW0_WR_BASE

Address: Operational Base + offset (0x0420)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	sw_raw0_wr_base Base address of raw0 tx data ring buffer. Programmed value becomes effective (visible in corresponding shadow register) after a soft reset, a forced software update or an automatic config update. --- RAW0_WR_BASE --- Note: This register protects from non-aligned access. The bits 0 to 2 are hard wired to "000". As a consequence any byte address that is written to the register will automatically be re-mapped to the next lower 64 bit aligned address: write(RAW0_WR_BASE, address_value) is equivalent to write(RAW0_WR_BASE, address_value & 0xFFFFFFF8). Anyhow, in order to avoid confusion it is NOT recommended to use non-aligned address values for access. It is also NOT recommended to actively consider the register slice for register access in order to avoid unneccessary mask and shift operations. In addition, if camerIC provides AXI interfaces the programmed base address shall be burst aligned with respect to the burst length configured . Set control bit init_base_en before updating so that a forced or automatic update can take effect.
3:0	RO	0x0	reserved

MI_1400_RAW0_WR_SIZE

Address: Operational Base + offset (0x0424)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:4	RW	0x0000000	sw_raw0_wr_size Size of raw0 data ring buffer. Programmed value becomes effective (visible in corresponding shadow register) after a soft reset, a forced software update or an automatic config update. --- RAW0_WR_SIZE --- Note: This register protects from non-aligned access. Refer to RAW0_WR_BASE register description for details. Set control bit init_base_en before updating so that a forced or automatic update can take effect.
3:0	RO	0x0	reserved

MI_1400_RAW0_WR_LENGTH

ISP_BLS_3000_SAMPLES

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4:0	RW	0x00	BLS_SAMPLES This number to the power of two gives the number of measure samples for each Bayer position. Range 0x00: 2^0=1 to 0x12: 2^18=262144. This number is also the divider for the accumulator for each Bayer position. The accumulation will be stopped, if the number of measured pixels for the current Bayer position is equal to the number of samples. The measure windows must be positioned that way that the number of included pixels of each Bayer position included by both windows is equal or greater than the number of measure samples calculated by 2^BLS_SAMPLES. NOTE: The number of pixels of one Bayer position is 1/4 of the number of all Pixels included by the measure windows.

3:2	RO	0x0	reserved
1	RW	0x0	bpt_cor_en Table based correction enable 1'b1: Table based correction is enabled; 1'b0: Table based correction is disabled.
0	RW	0x0	bpt_det_en Bad pixel detection write enable 1'b1: Bad pixel detection write to memory is enabled; 1'b0: Bad pixel detection write to memory is disabled. --- ISP_DPCC_BPT_CTRL --- Note: This register controls the behaviour of the table based bad pixel correction module. It can be switched on and off independently of the DPCC detection and correction block. Different correction algorithms for the table based correction are available and are defined by this register. The default setting after reset enables a correction algorithm with most accurate correlation to surrounding pixels. Detection for the table based correction can be configured independently from the on-the-fly DPCC detection scheme.

ISP_DPCC_3400_BPT_NUMBER

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:0	RW	0x000	bp_number Number of current Bad Pixel entries in bad pixel table (BPT) --- ISP_DPCC_BPT_NUMBER --- Note: Bit width of bp_number depends on size of BP RAM which is defined during chip synthesis.

ISP_DPCC_3400_BPT_ADDR

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x000	bp_table_addr Table RAM start address for read or write operations. The address counter is incremented at each read or write access to the data register (auto-increment mechanism). --- ISP_DPCC_BPT_ADDR --- Note: MKOE tbc: Orignial register mode was rwh which is no longer supported with new version of SIG -> rwhh.

ISP_DPCC_3400_BPT_DATA

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	bpt_v_addr Bad Pixel vertical address (pixel position)
15:13	RO	0x0	reserved
12:0	RW	0x0000	bpt_h_addr Bad Pixel horizontal address (pixel position) --- ISP_DPCC_BPT_DATA --- Note: MKOE tbc: Orignial register mode was rwh which is no longer supported with new version of SIG -> rwhh. The programmed table value is immediately written into the RAM. The RAM address is generated per auto-increment. The parameter RAMs for Lens Shade Correction and Bad Pixel Correction can only be programmed, if the RGB Bayer path is switched on via ISP_CTRL register (ISP_MODE bits).

ISP_LSC_2200_R_TABLE_ADDR

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8:0	RW	0x000	r_ram_addr Table address in RAM for samples of the R color component. Will be automatically incremented by each read or write access to the table. Valid addresses are in the range 0 to 152. --- ISP_LSC_R_TABLE_ADDR --- Note: The table values are written into an internal RAM. The RAM address is generated per auto-increment. The tables values will be read back by a continuous read access to the corresponding register. The read address is auto-incremented for each read access to that register and is reset to a specific value by a write access to the ISP_LSC_TABLE_ADDR register. Table set 0 access by SW at table address 0~152. Table set 1 access at table address 153~305.

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:13	RW	0x0000	b_sample_1 Correction factor at sample point (fixed point number: 3 bits integer with 10-bit fractional part, range 1~7.999)
12:0	RW	0x0000	b_sample_0 Correction factor at sample point (fixed point number: 3 bits integer with 10-bit fractional part, range 1~7.999) --- ISP_LSC_B_TABLE_DATA --- Note: The programmed sample value is immediately written into the RAM. The RAM address is generated per auto-increment. The parameter RAMs for Lens Shade Correction and Bad Pixel Correction can only be programmed, if the RGB Bayer path is switched on via ISP_CTRL register (ISP_MODE bits). Table set 0 access by SW at table address 0~153. Table set 1 access at table address 154~307.

SELF_RESIZE_0C00_1000_SCALE_HY

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	scale_hy This register is set to the horizontal luminance downscale factor or to the reciprocal of the horizontal luminance upscale factor. --- SRSZ_SCALE_HY --- Note: The size of the output picture is calculated as follows: Upscaling: (size_in - 1) / (size_out - 1)) = scale downscaling: (size_out - 1) / (size_in - 1)) = scale, where size_in/out is the width or height of the in/output picture. The value of the respective SRSZ_SCALE register then has to be int(scale x 2^14) for upscaling and int(scale x 2^14)+1 for downscaling. For downscaling this formula has no restriction. In upscaling processes the limit is factor 5. If a format conversion is performed, the scale factors have to be different for the luminance and the chrominance component, respectively. For example, for a format conversion from 4:2:2 to 4:2:0 the scale register value for the vertical chrominance component should be half of the vertical luminance scale register value.

0	RW	0x0	sw_ynr_en YNR enable bit

YNR_2700_RNR_MAX_R

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:14	RO	0x0	reserved
13:0	RW	0x3754	sw_ynr_rnr_max_r 9 bit integer and 5 bit fraction M(9bit),E(5bit).1/R^2= M/(2^E) ,M and E will be calculated automatically by driver. Use RNR module when no exgain. RNR module will reduce the influence of LSC.

YNR_2700_LOWNR_CTRL0

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:16	RW	0x0100	sw_ynr_low_bf_inv1 5 bit integer and 9 bit fraction. This signal will adjust the strength of bilateral filtering of LBFT5X5 module.Note: this signal is reciprocal value which means the smaller of this signal, the bigger of reducing noise function.
15:14	RO	0x0	reserved
13:0	RW	0x0100	sw_ynr_low_bf_inv0 5 bit integer and 9 bit fraction. This signal will adjust the strength of bilateral filtering of BFT3X3 module. Note: this signal is reciprocal value which means the smaller of this signal, the bigger of reducing noise function.

YNR_2700_LOWNR_CTRL1

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:24	RO	0x0	reserved
23:16	RW	0x00	sw_ynr_low_peak_supress 1 bit integer and 7 bit fraction. This signal will adjust restrain the big hot pixel. The bigger of this signal, the more strength of reducing the isolated big hot pixel.
15:11	RO	0x0	reserved
10:0	RW	0x080	sw_ynr_low_thred_adj 5 bit integer and 6 bit fraction. Adjust the threshold of low frequency filter. The bigger this signal, the stronger reduing noise.

YNR_2700_LOWNR_CTRL2

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:25	RO	0x0	reserved
24:16	RW	0x010	sw_ynr_low_dist_adj 7 bit integer and 2 bit fraction. Adjust the distance weight of LBFT5X5 bilateral filter . The bigger of this sinal, the smaller of reduing noise effect.
15:10	RO	0x0	reserved
9:0	RW	0x007	sw_ynr_low_edge_adj_thresh 11 bit integer, and 0 bit fraction. Adjust the edge weight of LBFT5X5 bilateral filter . The bigger of this signal, the smaller of reduing noise effect.

YNR_2700_LOWNR_CTRL3

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:24	RW	0x40	sw_ynr_low_bi_weight 1 bit integer and 7 bit fraction, use for ori ydata merge with bft3x3 outdata. The bigger of this signal, the bigger strength of low frequency reduing noise.
23:16	RW	0x64	sw_ynr_low_weight 1 bit integer and 7 bit fraction. The weight of reducing value. The bigger of this signal, the bigger strength of low frequency reducing noise.
15:11	RO	0x0	reserved
10:0	RW	0x133	sw_ynr_low_center_weight 1 bit integer and 10 bit fraction. The weight of LBFT5X5 module of center data. The bigger of this signal, the smaller strength of low frequency reduing noise.

YNR_2700_HIGHNR_CTRL0

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:22	RO	0x0	reserved
21:16	RW	0x3a	sw_ynr_hi_min_adj 0 bit integer and 6 bit fraction. This signal is used for holding the edge of stripes. The bigger this signal, the stronger holding the edge of stripes.
15:11	RO	0x0	reserved
10:0	RW	0x080	sw_ynr_high_thred_adj 5 bit integer and 6 bit fraction. Adjust the threshold of high frequency filter. The bigger this signal, the stronger reduing noise.
